The CONDENSED CHEMICAL DICTIONARY	1

Numerical List of Manufacturers

1. Stauffer Chemical Company, 380 Madison Ave., New York 17, N.Y.
3. Abbott Laboratories, North Chicago, Ill.
4. Rhode Island Laboratories, Inc., 100 Pulaski St., West Warwick, R.I.
5. The Firestone Tire and Rubber Co., Akron 17, Ohio
7. Cluett, Peabody & Co., Inc., 530 Fifth Ave., New York 36, N.Y.
8. Scientific Oil Compounding Co., Inc., Cunilate Div., 1637-55 S. Kilbourn Ave., Chicago 23, Ill.
9. Knoll Pharmaceutical Co., Orange, N.J.
10. Van Dyk & Company, Inc., Main and William Sts., Belleville 9, N.J.
11. Koppers Company, Inc., Koppers Bldg., Pittsburgh 19, Pa.
12. Sindar Corporation, 321 W. 44 St., New York 36, N.Y.
13. The Formica Company, 4614 Spring Grove Ave., Cincinnati 32, Ohio
14. Resistoflex Corporation, Roseland, N.J.
15. Armour Industrial Chemical Co., Div. of Armour and Co., 110 N. Wacker Dr., Chicago 6, Ill.
16. Arthur H. Thomas Company, P.O. Box 779, Philadelphia 5, Pa.
17. Heresite & Chemical Co., Manitowoc, Wis.
18. Central Scientific Co., Subsidiary of Cenco Instruments Corp., 1700 Irving Park Rd., Chicago 13, Ill.
19. Fries Bros. Inc., P.O. Box 8, Carlstadt, N.J.
20. Corning Glass Works, Corning, N.Y.
21. Neville Chemical Company, Neville Island, Pittsburgh 25, Pa.
22. UBS Chemical Company, Div. of A. E. Staley Mfg. Co., 491 Main St., Cambridge 42, Mass.
23. Rohm & Haas Company, Washington Square, Philadelphia 5, Pa.
24. Wyeth Laboratories, Inc., P.O. Box 8299, Philadelphia 1, Pa.
25. Pennsylvania Refining Company, Butler, Pa.
27. Thiokol Chemical Corp., Chemical Div., 780 N. Clinton Ave., Trenton 7, N.J.
28. E. I. du Pont de Nemours & Co., Inc., Wilmington 98, Del.
29. Enjay Chemical Co., Div. of Humble Oil & Refining Co., 15 W. 51 St., New York 19, N.Y.
30. Corn Products Sales Co., Corn Products Div., 717 Fifth Ave., New York 22, N.Y.
31. Handy & Harman, 82 Fulton St., New York 38, N.Y.
33. The Penetone Company, Tenafly, N.J.
35. Firestone Plastics Co., P.O. Box 690, Pottstown, Pa.
36. Reichhold Chemicals, Inc., 525 N. Broadway, White Plains, N.Y.
37. Rayonier, Inc., 161 E. 42 St., New York 17, N.Y.
38. Sierra Talc Company, Box 390, South Pasadena, Calif.
40. Virginia-Carolina Chemical Corporation, Richmond, Va.
41. Atlas Mineral Products Co., Mertztown, Pa.
42. Warwick Chemical Co., Div. of Sun Chemical Corp., Wood River Junction, R.I.
45. Sonneborn Chemical and Refining Corp., 300 Park Avenue South, New York 10, N.Y.
46. Acheson Colloids Co., Port Huron, Mich.
47. The Duriron Co., Inc., Dayton, Ohio
48. Crown Zellerbach Corp., Chemical Products Div., Camas, Wash.
49. W. A. Cleary Corp., New Brunswick, N.J.
50. Allied Chemical Corp., General Chemical Div., 40 Rector St., New York 6, N.Y.
51. Esso Standard Div. of Humble Oil & Refining Co., 15 W. 51 St., New York 19, N.Y.
52. Rubber Corporation of America, New South Road, Hicksville, N.Y.
53. National Starch and Chemical Corp., Box 50, Grand Central Post Ofc., New York 17, N.Y.
54. Carrier Corp., Carrier Pkwy., Syracuse 1, N.Y.
55. Food Machinery & Chemical Corp., 161 E. 42 St., New York 17, N.Y.
56. Canadian Industries Ltd., Box 10, Montreal, Quebec, Canada
57. American Cyanamid Co., 30 Rockefeller Plaza, New York 20, N.Y.
58. Monsanto Chemical Co., 800 N. Lindbergh Blvd., St. Louis 66, Mo.
60. Cerro Sales Corp., Subsidiary of Cerro Corp., 300 Park Ave., New York 22, N.Y.
61. Shawinigan Resins Corporation, Springfield 1, Mass.
62. Hooker Chemical Corporation, Durez Plastics Div., 8 Walck Rd., North Tonawanda, N.Y.
63. The Richardson Company, Melrose Park, Ill.

THE CONDENSED CHEMICAL DICTIONARY

64. Spencer Kellogg & Sons, Inc., Buffalo 5, N.Y.
65. The Borden Chemical Co., Div. of The Borden Co., 350 Madison Ave., New York 17, N.Y.
67. Climax Molybdenum Co., 1270 Avenue of the Americas, New York 20, N.Y.
69. R. T. Vanderbilt Co., Inc., 230 Park Ave., New York 17, N.Y.
70. G. D. Searle & Co., P.O. Box 5110, Chicago 80, Ill.
71. Smith, Kline & French Laboratories, 1530 Spring Garden St., Philadelphia 1, Pa.
72. Hanson-Van Winkle-Munning Co., Matawan, N.J.
73. Glyco Chemicals, Div. of Chas. L. Huisking & Co., Inc., 417 Fifth Ave., New York 16, N.Y.
74. Nuodex Products Co., Div. of Heyden Newport Chemical Corp., Elizabeth, N.J.
75. American LaFrance Corporation, Elmira, N.Y.
76. Ceresit Corp., 3227 S. Shields Ave., Chicago 16, Ill.
77. American Celcure Wood Preserving Corp., 1074 E. Eighth St., Jacksonville 6, Fla.
78. Jacques Wolf & Co., Subsidiary of Nopco Chemical Co., 60 Park Pl., Newark 1, N.J.
79. Newport Industries Company, Div. of Heyden Newport Chemical Corp., 342 Madison Ave., New York 17, N.Y.
80. Visking Company, Div. of Union Carbide Corp., 6733 W. 65 St., Chicago 38, Ill.
81. Wood Ridge Chemical Corp., Park Place East, Wood-Ridge, N.J.
82. Graphite Metallizing Corp., 1050 Nepperhan Ave., Yonkers, N.Y.
83. Synthetic Chemicals, Inc., 335 McLean Blvd., Paterson 4, N.J.
84. Olin Mathieson Chemical Corp., Chemicals Div., 10 Light St., Baltimore 3, Md.
85. Shulton, Inc., 697 Route 46, Clifton, N.J.
86. Colgate-Palmolive Co., 105 Hudson St., Jersey City 2, N.J.
88. American Potash & Chemical Corp., 300 W. Sixth St., Los Angeles 54, Calif.
89. Atlas Powder Co., Wilmington 99, Del.
90. Brazil Oitica, Inc., 80 Broad St., New York 4, N.Y.
91. Schwarz BioResearch, Inc., 230 Washington St., Mount Vernon, N.Y.
92. Masonite Corporation, 111 W. Washington St., Chicago 2, Ill.
93. Tennessee Corporation, 617-29 Grant Bldg., Atlanta 1, Ga.
94. The C. P. Hall Co., 414-418 S. Broadway, Akron 8, Ohio
96. H. N. Hartwell & Son, Inc., 947 Park Square Bldg., Boston 16, Mass.
97. Chesebrough-Pond's Inc., 485 Lexington Ave., New York 17, N.Y.
98. Floridin Company, P.O. Box 989, Tallahassee, Fla.
99. Minerals & Chemicals Philipp Corporation, 20 Essex Turnpike, Menlo Park, N.J.
100. Eli Lilly and Company, Indianapolis 6, Ind.
101. Commerce Chemical Corp., Div. of Commerce Oil Corp., 1271 Ave. of the Americas, New York 20, N.Y.
103. Arthur S. Hoyt Co., P.O. Box 24, Hicksville, N.Y.
104. Witco Chemical Co., Inc., 122 E. 42 St., New York 17, N.Y.
105. Polak's Frutal Works, Inc., Middletown, N.Y.
107. American Norit Co., Inc., 6301 Glidden Way, Jacksonville 8, Fla.
108. Hagan Chemicals & Controls, Inc., P.O. Box 1346, Pittsburgh 30, Pa.
109. Arapahoe Chemicals, Inc., 2855 Walnut St., Boulder, Colo.
110. United Carbon Co., Inc., 410 Park Ave., New York 22, N.Y.
111. American Manganese Bronze Co., Holmesburg, Philadelphia 36, Pa.
112. The Chemstrand Corporation, 350 Fifth Ave., New York 1, N.Y.
114. Pabst Brewing Company, Merchandise Mart, Chicago 54, Ill.
115. Eastman Kodak Co., 343 State St., Rochester 4, N.Y.
116. Allis-Chalmers Mfg. Co., Box 512, Milwaukee 1, Wis.
117. Alox Corp., P.O. Box 556, Niagara Falls, N.Y.
118. California Industrial Minerals Co., P.O. Box 1666, Fresno 17, Calif.
119. B. F. Goodrich Chemical Co., Div. of The B. F. Goodrich Co., 3135 Euclid Ave., Cleveland 15, Ohio
121. Marathon, Div. of American Can Co., Menasha, Wis.
122. G & A Laboratories, Inc., Box 1217, Savannah, Ga.
123. Merck & C., Inc., Rahway, N.J.
124. Marine Colloids, Inc., 24 State St., New York 4, N.Y.
125. Shell Chemical Co., Div. of Shell Oil Co., 50 W. 50 St., New York 20, N.Y.
126. The Pacific Lumber Co., 100 Bush Ave., San Francisco 4, Calif.
128. Bareco Wax Co., Div. of Petrolite Corp., 917 Enterprise Bldg., Tulsa 3, Okla.
129. Weyerhaeuser Timber Co., P.O. Box 1645, Tacoma 1, Wash.
133. Columbian Carbon Co., 380 Madison Ave., New York 17, N.Y.
134. The Harshaw Chemical Co., 1945 E. 97 St., Cleveland 6, Ohio
135. Illinois Zinc Co., Div. of Hydrometals, Inc., 230 N. Michigan Ave., Chicago 1, Ill.
136. The Atlantic Refining Co., Chemicals Div., 2600 S. Broad St., Philadelphia 1, Pa.
137. Jefferson Chemical Co., Inc., Box 4128, N. Austin Station, Austin, Texas
138. Heyden Newport Chemical Corp., Heyden Chemical Div., 342 Madison Ave., New York 17, N.Y.
139. The Moores Lime Company, Springfield, Ohio
140. Pennsylvania Industrial Chemical Corp., 120 State St., Clairton, Pa.
141. The Sherwin-Williams Co., Pigment, Color & Chemical Div., 260 Madison Ave., New York 16, N.Y.
142. Enthone, Inc., Subsidiary of American Smelting & Refining Co., Box 1900, New Haven 8, Conn.
144. Air Reduction Chemical & Carbide Co., 150 E. 42 St., New York 17, N.Y.
145. Lithcote Corporation, 5000 W. Lake St., Melrose Park, Ill.

THE CONDENSED CHEMICAL DICTIONARY

147. Chipman Chemical Co., Inc.,
Bound Brook, N.J.
148. National Lead Co., DeLore Div.,
Mississippi River and River Des Peres,
St. Louis 11, Mo.
149. Dow Corning Corp., Midland Mich.
150. Plant Protection, Ltd., Chipman Chemical
Co., Inc., Bound Brook, N.J.
151. California Chemical Co., Oronite Div.,
200 Bush St., San Francisco 20, Calif.
152. Swift & Company, Union Stock Yards,
Chicago 9, Ill.
154. Wallace & Tiernan Incorporated, Lucidol
Div., 1740 Military Rd., Buffalo 5, N.Y.
155. Wilbur B. Driver Company, Newark, N.J.
157. American Molasses Co., The Nulomoline
Div., 120 Wall St., New York 5, N.Y.
158. Minnesota Mining and Mfg. Co., Chemical
Div., 900 Bush Ave., St. Paul 6, Minn.
159. Royce Chemical Co., Carlton Hill, N.J.
160. Simplex Wire & Cable Co.,
Cambridge 39, Mass.
161. H. I. Thompson Fiber Glass Co., 1733
Cordova St., Los Angeles 7, Calif.
162. Winthrop Laboratories, 1450 Broadway,
New York 18, N.Y.
164. Rumford Chemical Works, Rumford 16, R.I.
165. Apex Chemical Co., Inc., 200 S. First
St., Elizabethport 1, N.J.
166. Hoskins Manufacturing Co., 4445 Lawton
Ave., Detroit 8, Mich.
167. Kendall Refining Company, Bradford, Pa.
168. Lake States Yeast & Chemical Div. of
St. Regis Paper Co., Rhinelander, Wis.
169. The LaMotte Chemical Products Co.,
Chestertown, Md.
170. Morningstar-Paisley, Inc., 630 W. 51 St.,
New York 19, N.Y.
171. Protexol Corporation, Kenilworth, N.J.
172. Victor Chemical Works, Div. of Stauffer
Chemical Co., 155 N. Wacker Dr.,
Chicago 6, Ill.
173. Wallerstein Company, Div. of Baxter
Laboratories, Inc., Wallerstein Sq.,
Mariners Harbor, Staten Island 3, N.Y.
175. Allied Chemical Corp., Plastics Div.,
40 Rector St., New York 6, N.Y.
176. American Products Mfg. Co., 8127-33
Oleander St., New Orleans 18, La.
177. Columbia-Southern Chemical Corp.,
One Gateway Center, Pittsburgh 22, Pa.
179. The General Tire & Rubber Co.,
Chemical Div., Akron 9, Ohio
181. Chemagro Corp., 220 E. 42 St.,
New York 17, N.Y.
182. Nalco Chemical Company, 6216 W. 66 Pl.,
Chicago 38, Ill.
183. Natural Gas Odorizing Co., Inc.,
Box 1645, Houston 1, Tex.
184. The Permutit Company, Div. of Pfaudler
Permutit Inc., 50 W. 44 St.,
New York 36, N.Y.
186. Gunk Laboratories, Inc., 5829 W. 66 St.,
Chicago 38, Ill.
188. Fritzsche Brothers, Inc., Port Authority
Bldg., 76 Ninth Ave., New York 11, N.Y.
189. Wallace & Tiernan Incorporated, Harchem
Div., Box 178, Newark 1, N.J.
190. Hoffmann-La Roche Inc., Nutley 10, N.J.
191. Owens-Corning Fiberglas Corporation,
Toledo 1, Ohio
192. U.S. Industrial Chemicals Co., Div. of
National Distillers and Chemical Corp.,
99 Park Ave., New York 16, N.Y.
194. Stoner-Mudge Co., Div. of American-
Marietta Co., 2000 Westhall St.,
Pittsburgh 33, Pa.
195. Standard Dry Wall Products, Inc.,
New Eagle, Pa.
196. The American Agricultural Chemical Co.,
Chemical Sales Div., 100 Church St.,
New York 7, N.Y.
197. Allied Chemical Corp., Nitrogen Div.,
40 Rector St., New York 6, N.Y.
199. The Alpha-Molykote Corp., 65 Harvard
Ave., Stamford, Conn.
200. APCO Oil Corp., Liberty Bank Bldg.,
Oklahoma City 2, Okla.
201. Philadelphia Quartz Co., Publit Ledger
Bldg., Independence Sq.,
Philadelphia 6, Pa.
202. The Baker Castor Oil Co., Subsidiary of
National Lead Co., Bayonne, N.J.
203. Wyandotte Chemicals Corporation,
Wyandotte, Mich.
204. Pennsalt Chemicals Corp., 3 Penn
Center, Philadelphia 2, Pa.
205. A.C. Horn Co., Bldg. Matls. Div. East,
750 Third Ave., New York 17, N.Y.
206. Imperial Chemical Industries Ltd.,
Imperial Chemical House, Millbank,
London, S.W. 1, England
207. Imperial Chemical (Pharmaceuticals)
Ltd., Imperial Chemical House,
Millbank, London, S.W. 1, England
209. Michigan-Standard Alloy Casting Div.,
Consolidated Foundries & Mfg. Corp.,
1999 Guoin St., Detroit 7, Mich.
210. Ionac Chemical Co., Div. of Pfaudler
Permutit Inc., Birmingham, N.J.
212. Miles Chemical Co., Div. of Miles
Laboratories, Inc., Elkhart, Ind.
214. Union Carbide Corporation, 270 Park
Ave., New York 17, N.Y.
216. Amoco Chemicals Corp., 130 E.
Randolph Dr., Chicago 1, Ill.
217. Filtrol Corp., 3250 E. Washington Blvd.,
Los Angeles 23, Calif.
218. Great Lakes Carbon Corp., 333 N.
Michigan Ave., Chicago 1, Ill.
219. Geigy Industrial Chemicals, Div. of
Geigy Chemical Corp., P.O. Box 430,
Yonkers, N.Y.
220. Thermal American Fused Quartz Co.,
1820 Salem St., Dover, N.J.
221. Archer-Daniels-Midland Co., 700 Inves-
tors Bldg., Minneapolis 32, Minn.
223. C.J. Osborn Company, 1301 W.
Blancke St., Linden, N.J.
224. The Quaker Oats Co., Merchandise Mart
Plaza, Chicago 54, Ill.
225. Bromine Producers Co., Adrian, Mich.
226. Aluminum Co. of America, 1501 Alcoa
Bldg., Pittsburgh 19, Pa.
227. Givaudan-Delawanna, Inc., 321 W. 44 St.,
New York 36, N.Y.
228. West Virginia Pulp and Paper, Industrial
Chemical Sales Div., 230 Park Ave.,
New York 17, N.Y.
229. West Virginia Pulp and Paper,
Polychemicals Div.,
Charleston, S.C.

THE CONDENSED CHEMICAL DICTIONARY

230. Advance Solvents & Chemical Div. of
Carlisle Chemical Works, Inc.,
New Brunswick, N.J.
231. Brown Company, 650 Main St.,
Berlin, N.H.
232. L. B. Holliday & Co., Ltd.,
Huddersfield, England
233. The Dow Chemical Company,
Midland, Mich.
235. National Rosin Oil Products, Inc.,
1270 Avenue of the Americas,
New York 20, N.Y.
236. Baroid Div., National Lead Co.,
P.O. Box 1675, Houston 1, Tex.
238. Chemical Development Corp.,
Danvers, Mass.
239. Clay-Adams, Inc., 141 E. 25 St.,
New York 10, N.Y.
241. Davison Chemical Co., Div. of W. R.
Grace & Co., Baltimore 3, Md.
242. Emery Industries, Inc., Carew Tower,
Cincinnati 2, Ohio
243. Allied Chemical Corp., National Aniline
Div., 40 Rector St., New York 6, N.Y.
244. Diamond Alkali Co., Union Commerce
Bldg., Cleveland 14, Ohio
245. General Electric Co., 1 River Rd.,
Schenectady 5, N.Y.
247. Johns-Manville, 22 E. 40 St.,
New York 16, N.Y.
248. U.S. Rubber Corp., Naugatuck Chemical
Div., Naugatuck, Conn.
249. Norton Company, 551 New Bond St.,
Worcester 6, Mass.
250. Foots Mineral Co., 18 W. Chelton Ave.,
Philadelphia 44, Pa.
251. Republic Steel Corporation, Republic
Bldg., Cleveland 1, Ohio
252. Arizona Chemical Co., 30 Rockefeller
Plaza, New York 20, N.Y.
253. California Chemical Co., Ortho Div.,
Lucas St. & Ortho Way,
Richmond, Calif.
255. Lukens Steel Company, Coatesville, Pa.
256. Eastman Chemical Products, Inc.,
Subsidiary of Eastman Kodak Co.,
260 Madison Ave., New York 16, N.Y.
258. Morton-Withers Chemical Co., Div. Chas.
Pfizer & Co., Inc., 2110 High Point Rd.,
Greensboro, N.C.
259. General Mills, Inc., Chemical Div.,
S. Kensington Rd., Kankakee, Ill.
260. Kessler Chemical Co., Inc., State Road
& Cottman Ave., Philadelphia 35, Pa.
261. American Viscose Corp., P.O. Box 455,
Marcus Hook, Pa.
263. Scott Bader & Co. Ltd., Wollaston,
Wellingborough, Northamptonshire,
England
265. The Goodyear Tire & Rubber Co.,
Akron 16, Ohio
266. Hercules Powder Company, Inc.,
910 Market St., Wilmington 99, Del.
267. Kenrich Petrochemicals, Inc., 57-02
48 St., Maspeth 78, N.Y.
268. The New Jersey Zinc Co., 160 Front St.,
New York 38, N.Y.
269. Worthington Corporation, Harrison, N.J.
270. The Mearl Corporation, 41 E. 42 St.,
New York 17, N.Y.
271. American Lignite Products Co., Ione, Calif.
272. Ames Co., Inc., Elkhart, Ind.
274. Beckman Instruments, Inc., 2500 Fuller-
ton Rd., Fullerton, Calif.
275. Cabot Corp., 425 High Street.,
Boston 10, Mass.
276. Shawinigan Chemicals Limited, P.O. Box
6072, Montreal, Quebec, Canada
277. Xylos Rubber Co., Div. of The Firestone
Tire & Rubber Co., Akron 1, Ohio
278. Firestone Synthetic Rubber & Latex Co.,
381 W. Wilbeth Rd., Akron 1, Ohio
280. The Carborundum Co., P.O. Box 337,
Niagara Falls, N.Y.
281. Continental-Diamond Fibre Corp., Sub-
sidiary of The Budd Co., Newark, Del.
282. Wallace & Tiernan Incorporated, Box 178,
Newark 1, N.J.
283. The International Nickel Co., Inc.,
Huntington Alloy Products Div.,
Huntington 17, W.Va.
284. West Chemical Products, Inc., West
Disinfecting Div., 42-16 West St.,
Long Island City 1, N.Y.
285. J. M. Huber Corporation, 630 Third Ave.,
New York 17, N.Y.
287. Beaunit Mills, Inc., Elizabethton, Tenn.
288. Metal & Thermit Corporation,
Rahway, N.J.
289. The Lockrey Co., Lubricants Div.,
Southampton, N.Y.
292. Allied Chemical Corp., Solvay Process
Div., P.O. Box 271, Syracuse 1, N.Y.
293. Interchemical Corporation, 67 W. 44 St.,
New York 36, N.Y.
294. The Glidden Co., Chemicals Div.,
Hammond, Ind.
296. The Glidden Co., Chemicals Div., 3901
Hawkins Point Rd., Baltimore 26, Md.
299. Chas. Pfizer & Co., 800 Second Ave.,
New York 17, N.Y.
300. Arkansas Co., Inc., P.O. Box 210,
Newark 1, N.J.
301. Burroughs Wellcome & Co. (U.S.A.) Inc.,
One Scarsdale Rd., Tuckahoe, N.Y.
302. Bee Chemical Company, Logo Div.,
2700 E. 170 St., Lansing, Ill.
303. Phillips Petroleum Co.,
Bartlesville, Okla.
304. National Lead Co., New Products Develop-
ment, 105 York St., Brooklyn 1, N.Y.
305. Ciba Pharmaceutical Products Inc.,
Summit, N.J.
306. Hooker Chemical Corporation,
Niagara Falls, N.Y.
307. General Aniline & Film Corp., Dyestuff
and Chemical Div., 435 Hudson St.,
New York 14, N.Y.
308. Westinghouse Electric Corporation,
East Pittsburgh, Pa.
309. Nopco Chemical Company, 60 Park Pl.,
Newark 1, N.J.
311. W. R. Grace & Co., Grace Chemical Div.,
Box 4915, Memphis 7, Tenn.
312. Evans Chemetics, Inc., 250 E. 43 St.,
New York 17, N.Y.
313. Ethyl Corp., 100 Park Ave. Bldg.,
New York 17, N.Y.
314. Parr Instrument Co., Inc. 211 53 St.,
Moline, Ill.

THE CONDENSED CHEMICAL DICTIONARY

315. Lederle Laboratories, Div. of American Cyanamid Co., Pearl River, N.Y.
317. Bolidens Gruvaktiebolag, Sturegatan 22, Stockholm, Sweden
318. The Aktivin Div., Heyden Newport Chemical Corp., 342 Madison Ave., New York 17, N.Y.
319. Commercial Solvents Corp., 260 Madison Ave., New York 16, N.Y.
321. Schering Corporation, 60 Orange St., Bloomfield, N.J.
322. Kelco Company, 75 Terminal Ave., Clark, N.J.
323. Pittsburgh Chemical Co., A Subsidiary of Pittsburgh Coke & Chemical Co., Grant Bldg., Pittsburgh 19, Pa.
324. Anaconda American Brass Company, Waterbury 20, Conn.
325. Arnold, Hoffman & Co., Inc., 55 Canal St., Providence 1, R.I.
326. U.S. Stoneware Co., Tallmadge Rd., Tallmadge, Ohio
327. The Upjohn Company, 7171 Portage Rd., Kalamazoo, Mich.
328. Onyx Chemical Corporation, 190 Warren St., Jersey City 2, N.J.
329. Mallinckrodt Chemical Works, Second and Mallinckrodt St., St. Louis 7, Mo.
330. Parke, Davis & Company, Joseph Campau Ave. at the River, Detroit 32, Mich.
331. Socony Mobil Oil Co., Inc., 150 E. 42 St., New York 17, N.Y.
332. The National Filter Media Corp., 1717 Dixwell Ave., New Haven 14, Conn.
333. Maas & Waldstein Co., 2121 McCarter Highway, Newark 4, N.J.
334. A. R. Maas Chemical Co., Div. of Stauffer Chemical Co., 4570 Ardine St., South Gate, Calif.
336. Titanium Pigment Corp., Subsidiary of National Lead Co., 111 Broadway, New York 6, New York.
337. National Lead Co., Titanium Alloy Mfg. Div., 111 Broadway, New York 6, N.Y.

Interstate Commerce Commission

Shipping Regulations

In the Condensed Chemical Dictionary many entries include a separate line or section entitled "Shipping Regulations." This states briefly the category of hazard involved for definitely dangerous materials, and the corresponding shipping label. Where no information on shipping regulations is given, or where the statement "Shipping regulations: None" appears, and the shipper has any reason to believe that hazards may exist, we would advise getting in touch with the Bureau of Explosives, New York, or other authorities indicated in the following paragraphs, for information concerning regulations that may possibly have been put in effect since the compilation of this edition of the Dictionary.

The categories of dangerous materials, and their labels, as set up by the Interstate Commerce Commission and the Bureau of Explosives, are indicated in abbreviated terms in the Condensed Chemical Dictionary, as follows:

1. Flammable gas or flammable compressed gas.
Red gas label.
2. Flammable liquid. Red label.
3. Flammable solid. Yellow label.
4. Oxidizing material. Yellow label.
5. Corrosive liquid. White label.
6. Radioactive material. Red or blue label.
7. Nonflammable compressed gas. Green label.
8. Poison. Poison label.
Class A. Poison gas or liquid.
Class B. Poisonous liquid or solid.
9. Explosives.

The Interstate Commerce Commission regulations also include detailed requirements on packaging and containers, on maximum quantities per container and per shipment, and on classes of materials as distinct from individual materials. The Commission's regulations are published under the title: "Regulations for transportation of explosives and other dangerous articles by land and water, in rail freight service, and by motor vehicle (highway), and water, including specifications for shipping containers." Copies of these regulations may be obtained under various plans on application to The Bureau of

THE CONDENSED CHEMICAL DICTIONARY

Explosives, 63 Vesey Street, New York 7, N.Y.; or from the Superintendent of Documents, or other tariff agents. These regulations are amended periodically as new data are obtained and such amendments are described in supplements issued from time to time by the Bureau of Explosives.

The Interstate Commerce Commission regulations are binding upon all common carriers by land or water, including transport by motor vehicles using the public highways.

Regulations as to transportation of dangerous cargo by water are prescribed by the U.S. Coast Guard as per Title 46, Code of Federal Regulations Parts 146 through 149, published by the U.S. Government Printing Office, and obtainable from the Superintendent of Documents, Washington D.C. The National Cargo Bureau Inc., 99 John St., New York 38, N.Y., provides information and recommendations regarding cargo stowage.

Rulings as to what products, and in what quantities, may be transported by air are made by the U.S. Civil Aeronautics Board but the packaging and labeling of such air shipments is subject to the regulations of the Interstate Commerce Commission as interpreted by the Bureau of Explosives.

The Board of Transport Commissioners for Canada has adopted regulations identical with those of the U.S. Interstate Commerce Commission as interpreted by the Bureau of Explosives, so consequently the information on this subject in this book applies generally to Canada as well as the United States.

Various states, municipalities, and other public agencies such as those responsible for tunnels, etc., have special regulations and laws of various types.

Interstate Commerce Commission. Regulations for the transportation of explosives and other dangerous articles are prescribed by the Interstate Commerce Commission under the authority of the federal law, Act of Congress, approved June 25, 1948.

Section 835 of this law states, "The Interstate Commerce Commission shall formulate regulations for the safe transportation within the limits of the jurisdiction of the United States of explosives and other dangerous articles ... which shall be binding upon all common carriers engaged in interstate or foreign commerce, and upon all shippers.

"The Commission ... may make changes ... made desirable by new information or altered conditions.

"Such regulations shall be in accord with the best known practicable means for securing safety in transit, covering the packing,

THE CONDENSED CHEMICAL DICTIONARY

marking, loading, handling while in transit, and the precautions necessary to determine whether the material when offered is in proper condition to transport....

"The Interstate Commerce Commission may utilize the services of the Bureau for the Safe Transportation of Explosives and Other Dangerous Articles, and may avail itself of the advice and assistance of any department, commission, or board of the Government."

Bureau of Explosives. The Bureau of Explosives was organized by the American Railway Association in 1906 to secure safety in the transportation of explosives. Its membership consists of practically all of the railroads and express companies in the United States and Canada, and a large number of steamship companies, as well as manufacturers of explosives and other dangerous articles, manufacturers of shipping containers for such articles, and trade associations comprised of such manufacturers. The Bureau of Explosives endeavors, through its corps of inspectors, its chemical laboratory and its headquarters to educate shippers' and carriers' employees in the requirements of the regulations, and to secure their enforcement.

Method of Procedure. Regulations are ordinarily prepared by the Bureau of Explosives after consultation with shippers and others interested and are then submitted to the Interstate Commerce Commission by the Bureau of Explosives for approval and publication. These regulations and the Act of September 1, place upon the shipper of a dangerous article the duty of properly preparing a shipment for transportation, knowing its characteristics, and instructing his employees in the requirements of the regulations and securing compliance therewith. If a shipper has no knowledge of the dangerous characteristics of the material which he desires to ship, he should confer with the Bureau of Explosives and, if necessary, submit a sample for examination and report.

Interpretation of the Regulations and Their Use in the Condensed Chemical Dictionary. Although these regulations have been drawn with great care, nevertheless, in their interpretation, differences of opinion may arise even among experts. Many factors must be considered in determining whether a substance is hazardous. A small amount of an oil in a bottle in a laboratory may not present any fire hazard, whereas a 50,000-gallon tank of the same oil may.

The editors and publishers of this book believe that the interpretation given is the most comprehensive and accurate attempt made to guide shippers and other handlers of materials in bulk, to ship their product in accordance with the law.

Nevertheless, these interpretations are not offered, nor must they be construed, as official publications either of the Interstate Commerce Commission or of the Bureau of Explosives. Accordingly, the obligation to definitely determine the hazardous character of a commodity rests with the shipper..

Editors' Statement

The editors take pleasure in acknowledging the assistance of the many persons who helped make the task of this latest revision possible. Appreciation is expressed to the managements of the several hundred companies whose products are listed and to their chemists, engineers, and the sales, library, patent and legal representatives who provided commercial information not otherwise available. Especially helpful scientific assistance was given by Warren W. Miller, W. S. Hodgkiss, C. H. Jeglum, H. B. Comstock, H. A. R. Zehrlaut, H. J. Poel, D. F. King, B. A. Cohrssen, R. E. Maizell, D. M. C. Reilly, E. A. Carpovich and T. C. George.

The highly essential and complex tasks of screening, assembling, confirming, editing, cross checking and proofreading were done with the help of Jo N. Hays, Virginia B. Hetrick, Jeanne B. O'Brian, and Ursula Miller. The majority of the typing for photoreproduction was done by Beverly Lightner, Shirley Kempl and Marilyn Lent.

Suggestions for further improvement will be welcomed.

Safety Information ~ Warnings and Labels

M. C. A. Warning Labels. To achieve uniform and more adequate labeling of hazardous chemical products the Labels and Precautionary Information (LAPI) Committee of the Manufacturing Chemists' Association, Inc., Washington, D.C., has prepared a manual entitled "Warning Labels" for the benefit and guidance of its members. In this dictionary we have quoted the permissive Danger, Warning, and Caution labels advised and information as to their use.

Individual statutes, regulations or ordinances may require that particular information be included in a label or that a specific label be affixed to a container. In each case, the requirements of these laws should be studied. The warning labels suggested in this manual should be used in addition to, or in combination with, any label required by law.

Federal statutes and regulations affecting the labeling of chemical materials include Federal Caustic Poison Act and regulations; Federal Insecticide, Fungicide, and Rodenticide Act and regulations; Federal Food, Drug and Cosmetic Act and regulations; as well as the Interstate Commerce Commission Regulations for Transportation of Explosives and Other Dangerous Articles and others. Copies are obtainable at nominal cost from the Superintendent of Documents, Washington, D.C., or directly from the agencies that administer the laws.

State and local governments frequently regulate chemical labeling through statutes, ordinances, and regulations affecting poisons; insecticides, fungicides, rodenticides and herbicides; foods, drugs, and cosmetics; agricultural and horticultural materials; the practice of pharmacy; and other subjects. Copies are usually obtainable from state or local Departments of Health, Agriculture, Pharmacy, or other regulatory agencies.

The safety information given does not purport to indicate relative degrees of hazard of a product or the manner in which it may prove to be hazardous. The omission of such warning does not mean that the substances are harmless, especially if they are improperly handled. This book is not intended to furnish complete toxicity data on chemical substances. Such information should be obtained from the supplier or manufacturer of each product.

Trademarks

The constantly increasing development and use of trademarks, trade names and brand names to designate chemical products has played an important part in chemistry and its related fields.

. For this reason, the publisher has incorporated in this book the descriptions of many chemical specialties and products which have come to be identified either officially or unofficially by trademarks, trade names or brand names claimed to connote origin of product, as distinguished from chemical composition.

In such cases the trademark, trade name or brand name has been enclosed in quotation marks, followed by a description of the product and a reference by number to the alleged or reputed manufacturer of the product so described. While every reasonable effort for accuracy has been made in such cases, the absence of trademark, trade name or brand name designation does not indicate that proprietary rights may not exist in the word involved. Neither the editors nor the publisher assume any responsibility for the accuracy of any such description or for the validity or ownership of any such trademark, trade name or brand name.

Reinhold Publishing Corporation

Explanation of Arrangement

Articles are in a straight alphabetical arrangement. This is strictly according to the complete title of the article, written as if it were one word, with exceptions noted below. For example, the article on **waxes** would follow **wax distillate**; **woodbine** precedes **wood copper**, etc.

Exceptions to the alphabetical arrangement are the usual organic prefixes: **ortho-**, **meta-**, **para-**, **alpha-**, **beta-**, etc., **sec-**, **tert-**, **sym-**, **as-**, **uns-**, **cis-**, **trans-**, **d-(dextro-)**, **l-(levo-)**, **n-(normal)**, **N-(attachment to the nitrogen atom)**, **C-(attachment to the carbon atom)**, **O-(attachment to the oxygen atom)**, and all numbers denoting structure.

Thus **alpha** is disregarded inside as well as outside the word, so **dimethyl-alpha-naphthylamine** is filed as **dimethylnaphthylamine** and follows **dimethylmethane**. Of course, where names are identical except for prefixes, they are filed accordingly, so **ortho-**, **meta-**, and **para-dichlorobenzenes** are filed in the order **meta-**, **ortho-**, and **para-**.

The prefixes **iso-**, **di-**, **tri-**, **tetra-**, **cyclo-**, and **bis-** are considered integral parts of the names, so **dimethylamine** is under **D**, and **isobutane** under **I**. Similarly, the prefixes for inorganic salts are considered part of the name, as **sodium orthophosphate**, filed as "s-o-d-i-u-m-o-r."

There is no grouping of articles under the larger classes such as the alcohols or oils. However, minor class terms are often inverted, as **starch, chlorinated**; **starch, permanent**. Where an article is headed by a two-name title, as **starch, permanent**, no attempt has been made to cross reference it under the second name, **permanent starch**.

Entries containing numbers only are listed after the **Z** entries. Otherwise numbers are ignored in making the alphabetical arrangement. Thus "**3M Brand**" is alphabetized as "m-b-r-a-n-d," "**PE-16-Clear**" is alphabetized as "p-e-c-l-e," "**#20 Hot Galvanizing Flux**" is alphabetized as "h-o-t-g-a," and "**O & W Compound**" is alphabetized as "o-w-c-o-m."

A

A. Abbreviation for angstrom (q. v.).

A. Formerly symbol for argon, now Ar.

"A-1." ⁵⁸ Trade name for thiocarbamilide, (q. v.).

"A-32." ⁵⁸ Trade name for a rubber accelerator, a reaction product of butyraldehyde and butylidene aniline, of complex chemical structure.

Properties: Red-yellow to orange-brown oily liquid, slightly turbid when cold; sp. gr. 0.98; flash point approx. 175°F; moisture, no separation on standing; soluble in benzene, chloroform, acetone, and solvent naphtha.

Containers: 150-, 400-lb steel drums.

Uses: Rubber accelerator, often useful as an activator of thiazole-type accelerators. Excellent for hard rubber.

"A-100." ⁵⁸ Trade name for a reaction product of butyraldehyde, acetaldehyde, and aniline.

Properties: Dark reddish-brown oily liquid; sp. gr. 1.04, flash point approx. 185°F; moisture, no separation on standing; soluble in benzene, chloroform, acetone, and solvent naphtha.

Containers: 150-lb steel drums.

Uses: Accelerator for hard rubber vulcanizates, either natural or synthetic.

AA. Abbreviation for allyl alcohol; also for adenylic acid.

"AA" Oil. ²⁰² Trademark for a cold pressed #1 castor oil having light color, high purity and low acidity, meeting U.S.P. and Federal Specification JJJ-C-86 (Grade 1) requirements.

"AA Quality." ¹⁹⁶ Trademark for a line of fertilizers of various compositions, types and grades, also used for ground phosphate rock.

abaca (Manila hemp). The strongest of all vegetable fibers, obtained from the leaves of *Musa textilis*, a tree of the banana family. The fibers are 4-8 ft long, light in weight, soft, lustrous, nearly white in color, and do not swell or stiffen when wet.

Sources: Philippines, Central America, Sumatra.

Grades: Sold in 18 grades based on color and length.

Uses: Heavy cordage and twine, especially for marine use; manila paper; fine tissue paper.

Shipping regulations: None.*

"Abalyn." ²⁶⁶ Trademark for a pale liquid resin, a methyl ester of rosin used as a solvent, penetrant, and plasticizer.

"Abasin." ¹⁶² Trademark for acetylcarbromal (q. v.).

abelmoschus. See ambrette seed.

Abel's reagent. An etching reagent used in the microanalysis of carbon steels. It consists of a 10% solution of chromic acid (CrO_3).

abies bark. The bark of firs and spruces, used in tanning.

abietates. Salts of abietic acid. Abietic acid is the most abundant acid in the mixture obtained by treating rosin with acetic acid. If the crude acid is employed the metal abietates are identical with resinates, although theoretically an abietate is a definite compound derived from abietic acid, $\text{C}_{19}\text{H}_{29}\text{COOH}$.

abietic acid (abietinic acid; sylvic acid) $\text{C}_{19}\text{H}_{29}\text{COOH}$ (having a phenanthrene ring system). A major active ingredient of rosin, where it occurs with other acids of closely related structure and properties, i.e., the resin acids. The term abietic acid is often applied to these mixtures, separation of which is difficult and not achieved in technical grade material.

Properties: Yellowish resinous powder; m.p. 172-175°C; optical rotation -106° ; soluble in alcohol, ether, chloroform, and benzene; insoluble in water.

Derivation: Rosin, colophony, pine resin; tall oil.

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden kegs; drums; multiwall paper sacks.

Uses: Resinates of heavy metals as varnish driers; esters in lacquers and varnishes; fermentation (lactic and butyric acid ferments' growth promoter, preventive of raw material infection and decomposition); also in manufacture of soaps.

Shipping regulations: None.*

abietic acid, ethyl ester. See ethyl abietate.

abietinic acid. See abietic acid.

"Abitol." ²⁶⁶ Trademark for a colorless, tacky, very viscous liquid; mixture of tetra-, di-, and dehydroabietyl alcohols made from rosin.

Properties: Viscous, pale, sticky liquid; hydroxyl value, approximately 5%; acid

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

number, about 0.3, color (Lovibond, 50 mm tube) 0.5 amber, sp. gr. (20/20°C) 1.007; refractive index 1.528 (20°C), viscosity (200°C) 30 poises, (270°C) 1.85 poises, (340°C) 0.15 poises. Soluble in and miscible with a wide variety of organic materials.

Uses: Suggested uses are plasticizers, tackifiers, resins, and adhesive modifiers.

ablation compounds (as used in space technology). Materials used as coatings on rockets and missiles for the purpose of cooling their outer surfaces. For instance, a base of magnesium oxide can be protected by a coating of iron, nickel and chromium oxides. These evaporate preferentially up to 4500°F, leaving a thin layer of molten magnesium oxide over the sintered base.

A-bomb. See atomic bomb.

"Abopon." ⁷³ Brand name for proprietary product. Sodium boro-phosphate complex. Water-white viscous liquid.

Properties: Sp. gr. (25°C) 1.68; pH (10% solution) 7.7. Soluble in water, diethylene glycol, glycerin; insoluble in ethyl alcohol, methyl alcohol, toluol, mineral spirits, mineral oil, vegetable oil.

Containers: 1-gal can (14 lbs), 5-gal can (70 lbs), 55-gal drum (800 lbs).

Uses: Paper (flameproofing agent, adhesive, sizing, stiffening, glazing, weighting); textiles (scouring), cosmetics (replaces gums in finger-waving solutions); polishes (abrasive and pigment suspensions); paints, lacquers, etc. (sealer for porous surfaces prior to painting), insulation (flameproofing agent for cotton coatings for insulating wire. Poor conductor of heat and electricity and can be used as a binder for other insulated materials). Suggested for water inks, metal cleaning, suspending and binding agent for coloring materials for ceramics and glass enamels.

abradants. See abrasives.

abrasives (abradants). Substances used to wear off or grind objects in order to give them the desired size, shape, or finish. The smoothness of the finish produced by an abrasive depends upon the size or coarseness of the grains. The principal factors in abrasive power, in order of importance, are hardness, brittleness, and refractoriness. The hardness of the abrasive determines what materials can be ground with it since the grains will not cut or scratch anything harder than themselves (see Mohs' scale). Brittleness, with the resulting fracture of the abrasive grains under stress, presents fresh, sharp surfaces, increasing the efficiency of grinding. Refractoriness of the abrasive grain is its resistance to deterioration under the high, local temperatures produced during grinding, it is often less important than the strength and temperature resistance of the bonding agent used to hold the abrasive grains together. The principal types of

bonds are: silicate (waterglass); vitreous or ceramic; shellac; rubber; resinoid (especially alkylid resin); and metallic (made by powder metallurgy). As examples of abrasives, see also boron carbide, corundum, diamond, and silicon carbide.

absinthe. Green liqueur containing oils of wormwood, angelica, anise and marjoram. Toxic. Its manufacture is prohibited by law in the United States.

absinthe oil. See wormwood oil.

absinthin $C_{30}H_{40}O_8$. A glycoside from absinthium.

Properties: Lustrous needles, very bitter taste. M.p. 68°C; slightly soluble in water and petroleum ether; soluble in alcohol, ether, benzene, and chloroform.

Derivation: Extraction from absinthium.

Containers: Glass bottles.

Uses: Medicine; flavoring.

absinthium (wormwood). Leaves and tops of wormwood plant, *Artemisia absinthium*. Also used for the plant itself and for the oil distilled from the leaves and tops.

Occurrence: Europe, northern and western Asia, and Africa, cultivated in United States.

Grades: Technical.

Containers: Bags; boxes.

Uses: Manufacture of absinthin and absinthe; essential oils (raw material), flavor in beverages and condiments, perfumery (aromatic waters and lotions); medicine.

Shipping regulations: None.*

absolute (as in perfumery). See concrete (2).

absolute alcohol. Expression for dehydrated ethyl alcohol, at least 99% pure.

absolute temperature. The fundamental temperature scale used in theoretical physics and chemistry, and in certain engineering calculations such as the change in volume of a gas with temperature. Absolute temperatures are expressed either in degrees Kelvin or in degrees Rankine, corresponding respectively to the centigrade and Fahrenheit scales. Degrees Kelvin are obtained by adding 273 to the centigrade temperature, while degrees Rankine are obtained by adding 460 to the Fahrenheit temperature. The nearest practical approach to the absolute zero is the melting point of helium which is below -272°C.

"Abson." ¹¹⁹ Trade name for a line of acrylonitrile-butadiene-styrene (ABS) resins and compounds. Tough, dimensionally stable over a wide temperature range, chemical resistant and light weight. Used in automotive, appliance and business machine industries.

absorption. Most commonly means the taking up of a gas or vapor by a liquid (physical or physiochemical absorption), or the taking up of energy (heat, light, x-rays) by any material (spectral absorption).

Ammonia is separated from coal gas by passage through water or sulfuric acid

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

solutions which take up (absorb, dissolve) the ammonia. As in this example, chemical combination often accompanies absorption, but there are very many instances where the process is entirely physical. The occlusion of hydrogen by certain metals (palladium) is usually termed absorption.

Absorption should be distinguished from adsorption, in that the latter is a surface phenomenon, i. e., the material taken up is distributed over the surface of the adsorbing material. In absorption the material taken up is distributed throughout the body of the absorbent.

Spectral absorption is illustrated when certain wave lengths of sunlight are absorbed by ordinary glass, thereby warming it slightly (the light energy is changed to heat) and depriving the transmitted light of certain wavelengths, particularly those of the ultraviolet spectrum. Transparent liquids are often identified and analyzed by passing a beam of light through them and noting the extent of absorption of original light.

absorption oils (scrubbing oil; wash oil).

Generally refer to a moderately high boiling oil distilled from petroleum (i. e., a gas oil) or coal tar, and used for separating desired gases or vapors by dissolving them from some mixture. Thus the vapors of natural gasoline are separated from certain natural gases by passage up a tower through which a stream of an absorption oil is passed; and benzene, toluene, and xylene are recovered from coal gas by a similar procedure.

ABS resins. Acrylonitrile-butadiene-styrene resins (q. v.).

Abysinian gold

1. (Talmi gold). Brass having a thin facing of gold applied by rolling, used for costume jewelry.
2. A yellow or gold-colored aluminum bronze containing 5-10% aluminum, the remainder being copper.

Ac. Symbol for actinium.

AC. Abbreviation for allyl chloride.

acacia. See arabic, gum.

acacia bark. Bark of acacia tree, used as an astringent because of its tannin content.

acacia cavenia. See cassie oil.

acacia farnesiana. See cassie oil.

acajou nut. See semecarpus nut.

acaricide. A substance, such as tetraethylpyrophosphate, having the power to kill acarids, i. e., mites and ticks.

acaroid resin. See accroides gum.

"Accel." ¹²³ Trademark for a lactic acid starter culture for use in food processing.

accelerator

1. A substance which accelerates the

vulcanization of rubber or permits vulcanization at lower temperature, thus reducing time and cost of manufacture and improving the finished products. Accelerators comprise various organic compounds of nitrogen and sulfur, among the most important of which are diphenylguanidine, hexamethylenetetramine, mercaptobenzothiazole, tetramethyl- and tetraethylthiuram disulfides, thiocarbonyl, and zinc dimethyldithiocarbamate. A few inorganic types are still used to a minor extent, e. g., antimony pentasulfide, calcium oxide, magnesium oxide, and zinc oxide.

2. See particle accelerator.

Accelerator "8." ²⁸ Trademark for formaldehyde-para-toluidine.

Properties: White powder.

Containers: Drums (100 lbs, net).

Use: To accelerate and improve the vulcanization of natural rubber.

"Accelerator 49." ⁵⁷ A proprietary product. Di-substituted guanidine half way between diphenylguanidine and di-ortho-tolylguanidine in accelerating strength. Used as a primary accelerator and as an activator for other primary accelerators.

Accelerator "552." ²⁸ Trademark for piperidinium pentamethylene dithiocarbamate $\text{CH}_2(\text{CH}_2)_4\text{NC(S)NH}_2(\text{CH}_2)_4\text{CH}_2$. A cream-colored crystalline powder; sp. gr. 1.20; melts with decomposition at not lower than 167°C.

Use: To accelerate vulcanization of natural and synthetic rubber and latex compounds; as peptizer or plasticizer for neoprene.

Containers: 125-lb drums.

Accelerator "808." ²⁸ Trademark for butyraldehyde-aniline condensation product.

Properties: Amber liquid.

Containers: Drums (250 lbs, net).

Use: To accelerate and improve the vulcanization of natural and synthetic rubber and latex compounds.

Accelerator "833." ²⁸ Trademark for butyraldehyde-monoethylamine condensation product. Reddish-amber liquid; sp. gr. 0.86.

Containers: 225-lb drums.

Use: To accelerate and improve the vulcanization of natural and synthetic rubber, especially for neoprene type cements.

"Accelerator B." ⁵⁸ Brand name of a rubber accelerator consisting of 2 parts "Thiurad" and 1 part "Thiotax," the ratio commonly used for butyl rubber stocks.

Containers: 150-lb fiber drums.

"Accobond" 3900 Cellulosic Film Resin. ⁵⁷ Trademark. Aqueous cationic melamine-formaldehyde resin syrup soluble in all proportions in water.

Use: As an agent for bonding coatings and printings to cellulosic films.

"Accobrite" Rosin Sizes. ⁵⁷ Trademark for a series of pale or light colored rosin sizes for the paper industry.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

"Accocol" 741 Dispersant. ⁵⁷ Trademark for a complex sulfonic acid condensate used in controlling pitch troubles in paper making, and dispersion of inks, pigments, and asphalt.

"Accomite." ⁵⁷ Trademark for a blasting agent.

"Acco" Rosin Sizes. ⁵⁷ Trademark for a series of dry and liquid rosin sizes for the paper industry.

"Accospense." ⁵⁷ Trademark for a series of aqueous dispersions of chemically manufactured pigments. These dispersions, shipped in polyethylene-lined containers of 30-gal capacity, find use in latex paints and other aqueous systems.

"Accostrength." ⁵⁷ Trademark for a synthetic water-soluble polymer used to improve the dry strength of paper.

"Acco" Streptomycin D. ⁵⁷ A proprietary product, contains not less than 45% active streptomycin as the sulfate salt.

Properties: A light tan powder, soluble in water.

Containers: 12.5-lb can.

Uses: For agricultural usage in the control of plant diseases.

accroides gum (black-boy gum, xanthorrhoea resin, acaroid resin, Botany Bay gum).

Properties: Red or yellow gum, soluble in alcohol.

Derivation: A resin obtained from several species of the xanthorrhoea tree (Australia grass tree).

Occurrence: Australia.

Grades: Technical.

Containers: Bags.

Uses: Varnishes, lacquers, rosin substitute, leather (finishing agent), sealing wax compositions, paper (finishing agent); toilet soaps, medicine.

Shipping regulations: None.*

accuracy. The extent to which a measured or enumerated value differs from the true value, the true value being assumed or accepted on the basis of independent evidence. See also precision.

"Ace Alkali." ²⁹² Trademark for a solid alkaline composition containing predominantly caustic alkali. Used for machine washing of bottles and other heavy duty cleansing.

acecoline. See acetylcholine chloride.

"Acele." ²⁸ Trademark for a cellulose acetate fiber available in natural and color-scaled normal tenacity continuous filament yarns in various deniers and lusters.

Properties: Sp. gr. 1.32; tensile strength (psi), 18,000-24,000; break elongation 28%, moisture regain 6%, soluble in glacial acetic acid, acetone, acetonitrile, butyrolactone, dimethyl formamide; dioxane-1,4.

Containers: Tubes and cones in cases; beams.

Uses: Textiles.

acenaphthene (naphthyleneethylene; ethylene-naphthalene) $C_{10}H_6(CH_2)_2$.

Properties: White needles; sp. gr. 1.024 (99/4°C); freezing point 93.6°C; b.p. 277.5°C; refractive index (100°C) 1.6048.

Soluble in hot alcohol; insoluble in water.

Derivation: From coal-tar.

Grades: Technical; 98%.

Containers: Wooden barrels or fiber drums.

Uses: Dye intermediates; chemicals, pharmaceuticals; insecticide; fungicide; plastics; horticulture.

Shipping regulations: None.*

1,2-acenaphthenedione. See acenaphthenequinone.

acenaphthenequinone (1,2-acenaphthenedione) $C_{10}H_6(CO)_2$.

Properties: Yellow needles; m.p. 261-263°C, insoluble in water; soluble in alcohol.

Derivation: By oxidizing acenaphthene, using glacial acetic acid and sodium or potassium dichromate.

Grades: Technical.

Use: Dye synthesis.

acetal (diethylacetal, 1,1-diethoxyethane, ethylenediethyl ether) $CH_3CH(OC_2H_5)_2$.

Properties: Colorless, volatile liquid; agreeable odor, nutty after-taste. Stable to alkalis but readily decomposed by dilute acids. Forms a constant boiling mixture with ethyl alcohol. Soluble in alcohol, and ether, sparingly soluble in water.

Constants: Sp. gr. 0.831, b.p. 103-104°C; vapor pressure 20.0 mm (20°C); flash point (closed cup) 37°F; specific heat 0.520, refractive index 1.38193 (20°C), wt (lbs/gal) 6.89. Typical specifications: Acetal 97% min., boiling range 97-112°C; color water-white, metals none, chlorides, sulfates none, water none, sp. gr. 0.826-0.830 at 20°C, wt/gal 6.89 lbs at 20°C.

Derivation: By the partial oxidation of ethyl alcohol, the acetaldehyde first forming condensing with the alcohol.

Grades: Technical.

Containers: Nonreturnable: 1-gal cans, net wt: 6 lbs, 5-gal cans, net wt: 30 lbs, 55-gal drums, net wt: 365 lbs. Returnable: 5-gal carboys, net wt: 30 lbs; 12-gal carboys, net wt: 75 lbs.

Danger: Extremely flammable.

Uses: Medicine, solvent; cosmetics, organic synthesis, perfumes.

Shipping regulations: Flammable liquid. Red label.*

acetaldehyde (acetic aldehyde; aldehyde, ethanal, ethyl aldehyde) CH_3CHO .

Properties: Colorless, flammable liquid; pungent, fruity odor. Sp. gr. 0.783 (18/4°C), b.p. 20.2°C, m.p. -123.5°C; vapor pressure 740.0 mm (20°C); flash point -40°F (open cup), specific heat 0.650; refractive index 1.3316 (20°C); wt. 6.50 lbs/gal (20°C), miscible with water, alcohol, ether, benzene, gasoline, solvent naphtha, toluene, xylene, turpentine and acetone.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: (a) Oxidation of ethyl alcohol vapor over platinum black or other catalyst; (b) direct oxidation of propene and butane; (c) hydration of acetylene by means of mercuric sulfate or ferric sulfate catalysts, or by high-pressure reaction with an alcohol; (d) by-product in the fermentation production of ethyl alcohol; oxidation of ethylene over a platinum catalyst.

Grades: Technical; 99%.

Containers: 5-, 10-, 55-, and 110-gal steel drums; 10,000-gal tank cars.

Uses: (in approximate order of volume): Acetic acid; n-butyl alcohol; acetic anhydride (other than that obtained from acetic acid); 2-ethylhexanol; pentaerythritol; 2-methyl-5-ethylpyridine; chloral, phenol and urea condensation products, intermediate for drugs, perfumes, photographic agents.

Danger: Extremely flammable. May form explosive peroxides under air pressure. MCA warning label.

Shipping regulations: Flammable liquid. Red label.*

acetaldehyde ammonia. See aldehyde ammonia.

acetaldehyde cyanohydrin. See lactonitrile.

acetaldol. See aldol.

acetal resins. A type of polymers or synthetic resins obtained by controlled polymerization of formaldehyde (CH_2O) to obtain a linear molecule of the type $-\text{O}-\text{CH}_2-\text{O}-\text{CH}_2-\text{O}-\text{CH}_2-$. Single molecules may have over 1000 $-\text{CH}_2\text{O}-$ units. The molecule has no side chains so that dense crystals are formed causing acetal resins to be much more like metals than any other resin. These polymers are comparatively hard, rigid, strong, tough and resilient (not brittle), dimensionally stable under exposure to moisture and heat, resistant to chemicals and solvents, resistant to flexing and creep, and have a high gloss and slippery low friction surface.

Typical Properties: Sp. gr. 1.425; thermal conductivity 0.13 Btu/hr/sq ft/°F/ft; coefficient of thermal expansion 4.5×10^{-5} per °F; specific heat 0.35 Btu/lb/°F; water absorption 0.41%/24 hrs; flammability 1.1 in/min; tensile strength 10,000 psi, elongation 15%; hardness (Rockwell) R120; impact strength (notched) 1.4 ft lb/in; flexural strength 14,100 psi; shear strength 9,500 psi.

Uses: In appliance parts; gears; bushings; bearings; movie projector and typewriter parts. See also "Delrin."

acetamide (acetic acid amine, ethanamide) CH_3CONH_2 .

Properties: Colorless deliquescent crystals. Mousy odor. Soluble in water and alcohol; slightly soluble in ether.

Constants: Sp. gr. 1.159; m.p. 82°C; b.p. 223°C; refractive index 1.4274 (78.3°C).

Typical specifications (technical grade): Acetamide 99% min; free acid, acetic 0.3% max; chlorides none; sulfates none; color grayish; odor slight, mousy; m.p.

77-79°C.

Typical Specifications (C. P. odorless grade): Acetamide 99.5-99.9%; free acid, acetic trace; chlorides none; sulfates none; color white; odor none; m. p. 79-81°C; nonvolatile 0.04% max.

Derivation: By the interaction of ethyl acetate and ammonium hydroxide.

Method of purification: Crystallization.

Grades: Technical; C. P. odorless.

Containers: Nonreturnable: 5-, 25-, 50-, 100-lb fiber cartons; 200-lb fiber containers. All net weight.

Uses: Organic synthesis (reactant, solvent, peroxide stabilizer), general solvent; lacquers; explosives; soldering flux; hygroscopic agent; wetting agent; penetrating agent.

Shipping regulations: None.*

acetamido-. Prefix for $\text{CH}_3\text{CONH}-$. Also called acetamino- or acetylamino-.

5-acetamido-8-amino-2-naphthalenesulfonic acid. $\text{C}_{10}\text{H}_5(\text{SO}_3\text{H})(\text{NH}_2)(\text{CH}_3\text{CONH})$.

Properties: Reddish-brown paste containing approximately 40% solids.

Grade: Technical.

Use: Intermediate.

para-acetamidobenzenesulfonyl chloride.

See para-acetylaminobenzenesulfonyl chloride.

para-acetamidobenzoic acid. See para-acetylaminobenzoic acid.

acetamidocyanoacetic ester. See ethyl acetamidocyanoacetate.

3-acetamido-4-hydroxybenzenearsonic acid.

See acetylaminohydroxyphenylarsonic acid.

8-acetamido-2-naphthalenesulfonic acid magnesium salt $[\text{C}_{10}\text{H}_6(\text{CH}_3\text{CONH})(\text{SO}_3)]_2\text{Mg}$.

Properties: Brownish-gray paste containing approximately 80% solids.

Grade: Technical.

Use: Intermediate.

para-acetamidophenol. See para-acetylaminophenol.

5-acetamido-1,3,4-thiadiazole-2-sulfonamide. See acetazolamide.

2-acetamidothiophene $\text{C}_4\text{H}_3\text{S}(\text{CH}_3\text{CONH})$.

Properties: Fine tan crystals; practically odorless; stable; m.p. 158-160°C.

Use: Organic synthesis.

3-acetamido-2,4,6-triiodobenzoic acid. See acetrizoic acid.

"Acetamine."²⁸ Trademark for a group of azo dyes and developers made for application to acetate yarn, and especially suited to the coloration of nylon.

acetamino-. See acetamido-.

acetaminophen. See para-acetylaminophenol.

para-acetaminophenetol. See acetophenetidin.

para-acetaminophenyl allyl ether (allyl para-acetylaminophenolate; allyl para-acetaminophenolate) $\text{C}_6\text{H}_4(\text{NHCOCH}_3)(\text{C}_3\text{H}_5\text{O})$.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Scales or plates; m.p. 94°C; soluble in alcohol; less so in water.

acetanilide (N-phenylacetamide, antifebrin) $C_6H_5NH(COCH_3)$.

Properties: White, shining crystalline scales or white, crystalline powder; odorless, stable in air, slightly burning taste, sp. gr. 1.2105, m.p. 114-116°C; b.p. 305°C; soluble in hot water, alcohol, ether, chloroform, acetone, glycerol and benzene.

Typical specifications: Melting range 112-114°C, ash 0.05% max, completely soluble in 95% ethyl alcohol.

Derivation: By the acetylation of aniline with glacial acetic acid.

Method of purification: Crystallization.

Grades: Technical, C. P.

Containers: 1-lb cartons, 150-, 200-lb barrels; bottles; fiber drums, multiwall paper sacks.

Use: Medicine; rubber accelerator, preservative for hydrogen peroxide, stabilizer for cellulose ester "dopes" and lacquers; manufacture of intermediates (para-nitroaniline, para-nitroacetanilide, para-phenylenediamine), synthetic camphor; pharmaceutical chemicals, dye-stuffs; precursor in penicillin manufacture.

Shipping regulations: None.*

acetanilidine. See methacetin.

acetanisole. See para-methoxyacetophenone.

acetarsone. See acetylaminohydroxyphenylarsonic acid.

acetate

1. A compound derived from acetic acid, CH_3COOH , by replacing the acid hydrogen by a metal or a radical, so that the resulting compound contains the acetate radical or group (CH_3COO-). See ethyl acetate, copper acetate, etc.

2. Generic name for a manufactured fiber in which the fiber-forming substance is cellulose acetate. Where not less than 92% of the hydroxyl groups are acetylated, the term triacetate may be used as a generic description of the fiber (Federal Trade Commission). This fiber was formerly called "acetate rayon" or "acetate silk." The term "rayon" may not now be used for this type fiber.

acetate C-8. See n-octyl acetate.

acetate C-9. See nonyl acetate.

acetate C-10. See decyl acetate.

acetate C-11. See undecylenyl acetate.

acetate C-12. See dodecyl acetate.

acetate dyes. These are for the most part insoluble azo or anthraquinone dyes that have been highly dispersed to make them capable of penetrating and dyeing acetate fibers. A second class is insoluble amino azo dyes that are made water soluble by treatment with formaldehyde and bisulfite. After absorption by the fiber the resulting sulfonic acids hydrolyze and regenerate the

insoluble dyes.

acetate fiber. See acetate (2).

acetate film. A durable, highly transparent film with nondeforming characteristics, produced from cellulose acetate resin. It is grease-, oil-, dust-, and air-proof and hygienic.

Available forms: Rolls and cut-to-size sheets.

Uses: Principally for laminations; foliation; document preservation, pressure sensitive tape, magnetic sound recording tape; window cartons and envelopes, packaging of items, such as textiles, paper specialties, tomatoes, avocados, mushrooms and for bottle overwraps.

acetate green. A chrome-green pigment with yellowish blue tone in which the yellow is made from lead acetate.

acetate of lime. Commercial term for calcium acetate and sometimes applied particularly to the calcium acetate made from pyroligneous acid and milk of lime. There are a brown and gray acetate of lime. For further data see calcium acetate.

acetate process. A process for making cellulose acetate resin or fiber by treating cellulose (wood pulp or cotton linters) with acetic acid, acetic anhydride, and sulfuric acid as catalyst. The cellulose is fully acetylated (three acetate groups per glucose unit) and at the same time the sulfuric acid causes appreciable degradation of the cellulose polymer so that the product contains only 200-300 glucose units per polymer chain. At this point in the process the cellulose acetate ordinarily is partially hydrolyzed by the addition of water until an average of 2-2.5 acetate groups per glucose unit remain. This product is thermoplastic and soluble in acetone. Fibers are produced by forcing an acetone solution through orifices of the spinner into a stream of warm air, which evaporates the solvent. Fibers are also produced in a similar manner from cellulose triacetate, which is insoluble in acetone but soluble in methylene chloride. See "Arnel."

acetazolamide (5-acetamido-1,3,4-thiadiazole-2-sulfonamide) $(CH_3CONH)C_2N_2S(SO_2NH_2)$.

Properties: White to faintly yellowish white crystalline powder, odorless, m.p. 258°C, slightly soluble in water, very slightly soluble in alcohol.

Grades: U.S.P. XVI.

Use: Medicine.

acetazolamide sodium. $C_4H_5N_4NaO_5S_2$.

Properties: Soluble in water, solution

(1 in 10) has a pH range 9.0-10.0.

Grades: U.S.P. XVI.

Use: Medicine.

acethydrazidepyridinium chloride. See

Girard's "P" reagent.

acetic acid (ethanoic acid, vinegar acid, methanecarboxylic acid) CH_3COOH . Glacial

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

acetic acid is the term for the pure compound, in distinction to the frequently encountered water solutions known as acetic acid. Vinegar is a dilute acetic acid.

Properties: Clear, colorless, acid liquid; very pungent odor. M. p. 16.63°C; b. p. 118°C (765 mm), 80°C (202 mm); sp. gr. 1.0492 (20/4°C); wt/gal (20°C) 8.64 lbs; viscosity (20°C) 1.22 cps; flash point (open cup) 110°F; refractive index 1.3715 (20°C). Miscible with water, alcohol, glycerin, and ether; insoluble in carbon disulfide.

Derivation: (a) By oxidation of acetaldehyde with air at 60–80°C in the presence of manganous acetate or cobalt acetate; (b) by bacterial oxidation of dilute ethyl alcohol; (c) recovery from pyroigneous acid by solvent extraction with ether or ethyl acetate (Coahran process), by absorption (Suida process), or by azeotropic distillation (Othmer process); (d) by catalytic combination of methanol and carbon monoxide at 700 atmospheres and 350°C; (e) by liquid-phase oxidation of butane, with a cobalt or manganese catalyst.

Grades: U. S. P. XVI (glacial and dilute); C. P.; technical (80; 99.5%); commercial (6, 28, 30, 36, 56, 60, 70, 80, and 99.5%); N. F. XI (diluted).

Containers: 5-lb bottles; 6-, 13-gal carboys; 8.5-, 13-, 55-, 100-gal barrels and drums; tankcars.

Uses: Manufacture of acetic anhydride and acetate esters, especially vinyl acetate; very widely used as an acid, solvent, and reagent in the production of rubber, plastics, acetate fibers, pharmaceuticals, dyes, insecticides, photographic chemicals, etc, textile printing.

Caution! Causes severe burns. MCA warning label.

acetic acid amine. See acetamide.

acetic acid, glacial. See acetic acid.

acetic aldehyde. See acetaldehyde.

acetic anhydride (acetyl oxide; acetic oxide) $(\text{CH}_3\text{CO})_2\text{O}$.

Properties: Colorless, very mobile, strongly refractive liquid; very strong acetic odor, sp. gr. 1.0830 (20/20°C), b. p. 139.9°C; f. p. –73.1°C; flash point 150°F; wt/gal (20°C) 9.01 lbs. Miscible with alcohol, ether, and acetic acid; soluble in cold water; decomposes in hot water to form acetic acid.

Typical specifications: Sp. gr. 1.080–1.085 (20/20°C); color not darker than a .00001 N iodine solution; purity not less than 96.0%; chlorides none; sulfates none; phosphates none; nitrates none; heavy metals none; paraffin none; KMnO_4 test 2 cc. shall not reduce more than 0.1 cc. of 1 N KMnO_4 ; sulfur compounds not more than .009%; average weight 9.01 lbs/gal (20°C).

Derivation: (a) By oxidation of acetaldehyde with air in the presence of manganous acetate or cobalt acetate; (b) by reaction of acetylene and glacial acetic acid in the

presence of mercuric sulfate to form ethylidene diacetate, which is subsequently decomposed by distillation over sodium pyrophosphate or zinc chloride, forming acetic anhydride and acetaldehyde; (c) from ketene and glacial acetic acid.

Grades: C. P., technical (75, 85, 90–95%).

Containers: Various bottles; 5-gal carboys; 55-gal aluminum drums; tankcars.

Uses: Mainly for cellulose acetate fibers and plastics; dehydrating and acetylating agent in production of pharmaceuticals, dyes, perfumes, explosives, etc.

Caution! Causes severe burns. Vapor harmful. MCA warning label.

acetic ester. See ethyl acetate.

acetic ether. See ethyl acetate.

acetic oxide. See acetic anhydride.

acetin (monoacetin; glyceryl monoacetate)

$\text{C}_3\text{H}_5(\text{OH})_2\text{OOCCH}_3$. Acetin may also refer to glyceryl di- or triacetate, also known as diacetin and triacetin (q. v.).

Properties: Colorless, thick liquid; hygroscopic; sp. gr. 1.206 (20/4°C); b. p. 158°C (165 mm); 130°C (3 mm), soluble in water, alcohol; slightly soluble in ether; insoluble in benzene.

Derivation: By heating glycerol and strong acetic acid, distilling off the weak acetic acid formed and again heating with strong acetic acid and distilling.

Method of purification: Rectification.

Impurities: Uncombined acetic acid.

Grades: Technical.

Containers: 500-gm bottles; 1-, 10-, 50-lb tins; 500-lb drums.

Uses: Gelatinizing smokeless powders; preparing noncongealing dynamites; production of dinitroacetyl glycerin; tanning; solvent for basic dyes, indulin dyes, Perkin's violet dye.

Shipping regulations: None.*

acetoacetanilide (acetylacetanilide)

$\text{CH}_3\text{COCH}_2\text{CONHC}_6\text{H}_5$.

Properties: White, crystalline solid; m. p. 85°C. Resembles ethyl acetoacetate in chemical reactivity. Slightly soluble in water, soluble in dilute sodium hydroxide, alcohol, ether, acids, chloroform, and hot benzene.

Typical specifications: M. p. 83.0–85.0°C; iron none; aniline none; solubility, 2 g soluble in 100 cc. of 5% NaOH, color above solution not darker than 0.00003 N iodine; appearance white, flaky solid; purity not less than 97.0% by the CO_2 evolution method; density 25 lbs/cu ft.

Derivation: By reacting ethyl acetoacetate with aniline, eliminating ethyl alcohol. Acetoacetanilide may also be prepared from aniline and diketene.

Grades: Technical.

Containers: Fiber drums. Net content: 3, 15, 125 lbs. Paper-lined wooden barrels, net weight 175 lbs.

Uses: Organic synthesis; dyestuffs (intermediate in the manufacture of the dry

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

colors generally referred to as Hansa and benzidine yellows).

Fire hazard: None.

Shipping regulations: None.*

acetoacet-ortho-anisidide

Properties: White crystalline powder; m.p. 86.6°C, sp. gr. 1.1320 (86.6/20°C); flash point (open cup) 325°F.

Containers: 1-gal cans, 5-, 55-gal drums.

Uses: Intermediate for azo pigments.

acetoacet-ortho-chloranilide

Properties: White crystalline powder; m.p. 107°C, b.p. decomposes, sp. gr. 1.1920 (107/20°C); flash point (open cup) 350°F. Almost insoluble in water.

Containers: 1-gal cans, 5-, 55-gal drums.

Use: Intermediate for azo pigments.

acetoacet-para-chloranilide

Properties: White crystalline powder; m.p. 133°C, b.p. decomposes; flash point (open cup) 320°F. Very slightly soluble in water.

Containers: 200-lb drums.

Use: Intermediate for azo pigments.

acetoacetic acid (acetylacetic acid, diacetic acid, acetone carboxylic acid)

Properties: Colorless oily liquid, soluble in water, alcohol, and ether; decomposes below 100°C into acetone and carbon dioxide.

Uses: Organic syntheses.

acetoacetic ester. See ethyl acetoacetate.

acetoacet-para-phenetidine

Properties: Crystalline powder; m.p. 108.5°C, b.p. decomposes, sp. gr. 1.0378 (108.5/20°C), flash point (open cup) 325°F.

Containers: 1-gal cans; 5-, 55-gal drums.

Use: Intermediate for azo pigments.

acetoacet-ortho-toluidide

Properties: Fine, white granular powder, m.p. 106°C; slightly soluble in water.

Grades: Technical.

Containers: Paper-lined wooden barrels.

Net weight 250 lbs.

Uses: Intermediate in the manufacture of Hansa and benzidine yellows.

acetoacet-meta-xylylidide

Properties: White to light yellow crystalline solid; m.p. 89-90°C, sp. gr. (20°C) 1.238, solubility in water (25°C) 0.5%.

Use: Organic synthesis.

acetoaminosalol. See para-acetylaminophenyl salicylate.

para-acetoanisol. See para-methoxyacetophenone.

acetobromal. See diethylbromoacetamide.

aceto-caustin. See trichloroacetic acid.

acetocinnamone. See benzylidene acetone.

acetoglycerides. Term commonly used to refer to acetylated monoglycerides although commercial acetoglycerides will contain di- and tri-glycerides. See acetostearin.

acetoin. See acetylmethylcarbinol.

acetol (acetonyl alcohol; hydroxyacetone; acetyl carbinol; pyruvic alcohol).

Properties: Colorless liquid; sp. gr. 1.0824 at 20/20°C; b.p. 146°C; m.p. -17°C.

Soluble in water, alcohol, and ether.

Derivation: (a) By action of potassium acetate or potassium formate on a solution of bromo- or chloroacetone in dry methanol; (b) by bacterial fermentation of propylene glycol.

Grades: Technical.

Use: Solvent for nitrocellulose.

acetoluidide. See acetyl ortho-, or para-toluidine.

acetomerocetol

Properties: White solid; m.p. 155-157°C; freely soluble in alcohol; soluble in ether or chloroform; sparingly soluble in benzene; practically insoluble in water.

Grade: N. N. D.

Use: Medicine.

acetone (dimethylketone, ketopropane, pyroacetic ether, 2-propanone) CH_3COCH_3 .

Properties: Colorless liquid; characteristic odor, flammable. M.p. -94.3°C, b.p. 56.1°C; refractive index (20°C) 1.3591, sp. gr. (15°C) 0.7972; wt/gal (15°C) 6.64 lbs; flash point (open cup) 15°F. Miscible with water, alcohol, ether, chloroform and most oils.

Derivation: (a) Oxidation of isopropyl alcohol with catalyst such as brass or copper (in one variation, hydrogen peroxide is produced commercially); (b) fermentation of carbohydrates by bacterial organism; (c) oxidation of cumene; (d) vapor-phase oxidation of butane.

Grades: Technical; C. P.; N. F. XI; electronic.

Containers: 1-gal cans; 1-, 5-, 30-, 54-gal drums; 350-lb barrels; 8000-gal tank cars; tank trucks.

Uses (in approximate order of volume):

Synthesis of acetic anhydride; derivatives such as diacetone alcohol; mesityl oxide, etc.; solvent for cellulose acetate; solvent in paints, lacquers, and adhesives; absorbent for acetylene; general solvent uses; epoxy resins; fibers; pharmaceuticals; rubber antioxidants; very pure grade in electronics industry to dry and cleanse parts.

Danger! Extremely flammable. MCA warning label.

Shipping regulations: Flammable liquid. Red label.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

acetone-bromoform. See tribromo-tert-butyl alcohol.

acetone carboxylic acid. See acetoacetic acid.

acetone chloroform. See chlorobutanol.

acetone cyanohydrin (alpha-hydroxyisobutyronitrile; 2-methyl-lactonitrile)
 $(\text{CH}_3)_2\text{COHCN}$.

Properties: Colorless liquid; b.p. 82°C (23 mm); m.p. -20°C; density 0.932 (19°C); refractive index $n_{20/D}$ 1.3996; flash point 165°F; soluble in water, alcohol, and ether. Distillation not recommended because of decomposition to hydrocyanic acid and acetone. Insoluble in petroleum ether.

Derivation: By condensing acetone with hydrocyanic acid.

Grades: Technical (97-98% pure).

Containers: 6-gal carboys; 380-lb drums.

Uses: Insecticides; intermediate for organic synthesis, especially methyl methacrylate.

Shipping regulations: Poison, class B. Poison label.*

acetonedicarboxylic acid. See beta-ketoglutaric acid.

acetone oxime. See acetoxime.

acetone sodium bisulfite. See sodium acetone bisulfite.

acetonitrile (methyl cyanide) CH_3CN .

Properties: Colorless, limpid liquid, aromatic odor; poisonous; sp. gr. 0.783, m.p. -41°C, b.p. 82°C. Soluble in water and alcohol.

Typical specifications: Sp. gr. 0.782-0.785 (20°C), boiling range 80-82°C, purity 99% (min).

Derivation: By heating acetamide with glacial acetic acid; from dimethyl sulfate and sodium cyanide.

Grades: Technical.

Containers: Drums; tanks.

Uses: Organic synthesis of vitamin B pharmaceuticals and others; perfumes; extracts, denaturant; purification of a variety of chemicals; specialized solvent, especially for extractive distillation; crystallization medium; fiber synthesis.

Shipping regulations: Poison, Class B. Poison label.*

acetonyl acetone (1,2-diacetylene; hexanedione-2,5; 2,5-diketohexane)
 $\text{CH}_3\text{COCH}_2\text{CH}_2\text{COCH}_3$.

Properties: Colorless liquid. Soluble in water; sp. gr. 0.9734 (20/20°C), b.p. (760 mm) 192.2°C; vapor pressure 0.43 mm at 20°C; freezing point -5.4°C; flash point 185°F; wt 8.1 lbs/gal (20°C); xylene nitrocellulose dilution ratio 1.8.

Typical specifications: Sp. gr. 0.971-0.976 at 20/20°C; boiling range 185-195°C (760 mm); acidity not more than 0.02% (as acetic).

Derivation: By-product in the production of acetaldehyde from acetylene.

Grades: Technical.

Containers: 1-gal cans; 5-, 55-gal drums. Net content: 8, 40, 430 lbs.

Caution! Volatile solvent; avoid prolonged breathing of vapor; use with adequate ventilation.

Uses: Solvent for cellulose acetate; roll-coating inks; tanning agent; lacquers; stains.

acetonyl alcohol. See acetol.

3-(alpha-acetonylbenzyl)-4-hydroxycoumarin.
 See warfarin.

acetophenetidin (para-acetylphenetidin; para-acetaminophenetol; phenacetin; para-ethoxyacetanilide) $\text{CH}_3\text{CONHC}_6\text{H}_4\text{OC}_2\text{H}_5$.

Properties: White crystals or powder; odorless and stable in air. Soluble in alcohol, chloroform and ether; slightly soluble in water; has slightly bitter taste.

Constants: M.p. 135°C.

Derivation: By the interaction of para-phenetidin and glacial acetic acid, or of ethyl bromide and para-acetaminophenol.

Method of purification: Crystallization.

Grades: Technical; U.S.P. XVI.

Containers: 100-, 200-, 1000-lb drums.

Uses: Medicine.

Shipping regulations: None.*

acetophenone (phenyl methyl ketone; hyponone; acetylbenzene) $\text{C}_6\text{H}_5\text{COCH}_3$.

Properties: Colorless liquid with sweet, pungent odor and taste. B.p. 201.7°C; f.p. 19.7°C; sp. gr. (20/20°C) 1.030; wt/gal (20°C) 8.75 lbs; refractive index (20°C) 1.5363, flash point (Cleveland open cup) 180°F. Slightly soluble in water; soluble in organic solvents.

Derivation. (a) Friedel-Crafts process with benzene and acetic anhydride or acetyl chloride, (b) by-product from the oxidation of cumene to produce acetone and phenol; (c) oxidation of ethyl benzene.

Method of purification: Distillation and crystallization.

Grades: Technical.

Containers: Glass bottles; 1-gal cans; 5-, 55-gal drums; tank cars; tank trucks.

Uses: Perfumery; tear gas, by chlorination; solvent, intermediate for pharmaceuticals, resins, etc.

Shipping regulations: None.*

acetopropionic acid. See levulinic acid.

"Acetoquat." ⁴⁰⁰ Trade name for a series of quaternary ammonium salts.

"Acetoquat BZA." Benzalkonium chloride.

"Acetoquat CDAC." Cetyltrimethylbenzylammonium chloride. See cetalkonium chloride.

"Acetoquat CPB." Cetylpyridinium bromide.

"Acetoquat CPCX." Cetylpyridinium chloride.

"Acetoquat CTAB." Cetyltrimethylammonium bromide.

"Aceto-Slip." ⁴⁰⁰ Trade name for a refined oleamide (q.v.).

acetostearin

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Acetylated glyceryl monostearate. It is a solid with the peculiar combination of flexibility and nongreasiness. Derived from glyceryl monostearate or mixed glycerides by acetylation with acetic anhydride. Suggested uses are as a superior protective coating for food and as a plasticizer.

acetotoluidide. See acetyl-ortho- or -para-toluidine.

acetoxime (acetone oxime, 2-propanone oxime) $(\text{CH}_3)_2\text{CNOH}$.

Properties: Colorless crystals, both basic and acidic in properties. Chloral-like odor. Fairly readily hydrolyzed by dilute acids. Soluble in alcohols, ethers, and water.

Constants: Sp. gr. 0.97 (20/20°C), b.p. 136.3°C, m.p. 61°C.

Grades: Technical.

Uses: Organic synthesis (intermediate), solvent for cellulose ethers, primer for Diesel fuels.

ortho-acetoxybenzoic acid. See acetylsalicylic acid.

10-acetoxy-1-hydroxy-cis-7-hexadecene. See gyplure.

12-acetoxy-1-hydroxy-cis-9-octadecene. See gyplure.

4(para-acetoxyphenyl)-2-butanone. See Q-lure.

acetozone. See acetylbenzoyl peroxide.

acetrizolic acid (3-acetamido-2,4,6-triodobenzoic acid) $\text{CH}_3\text{CONHC}_6\text{H}_2\text{COOH}$.

Properties: White, odorless powder. Soluble in alcohol and in solutions of alkali hydroxides, slightly soluble in ether, very slightly soluble in chloroform, practically insoluble in benzene. M.p. (dec) 278-283°C.

Use: Medicine.

aceturic acid (N-acetylglycine, acetylaminopropionic acid, acetylglycocoll) $\text{CH}_3\text{CONHCH}_2\text{COOH}$.

Properties: Long needles, m.p. 206-208°C; soluble in water and alcohol, slightly soluble in acetone, chloroform, glacial acetic acid, practically insoluble in ether, benzene. Forms stable salts with organic bases.

Use: Medicine.

acetylacetanilide. See acetoacetanilide.

acetylacetic acid. See acetoacetic acid.

acetylacetone $\text{CH}_3\text{COCH}_2\text{OCCH}_3$ (diacetyl-methane, pentanedione-2,4).

Properties: Very mobile, colorless liquid. Unpleasant odor. When cooled, solidifies to lustrous, pearly spangles. The liquid is affected by light. It turns a brownish color and there is formation of resinous products. B.p. 140.5°C (760 mm), sp. gr. (20/20°C) 0.9753, wt 8.1 lbs/gal; coefficient of expansion 0.00105 (20°C); vapor pressure 7.0 mm (20°C), freezing point

-23.5°C, viscosity 0.0058 poise (20°C).

Soluble in water (acidified by hydrochloric acid); fairly soluble in plain water; soluble in alcohol, chloroform, ether, benzene, acetone, and glacial acetic.

Derivation: By condensing ethyl acetate with acetone.

Containers: 5-gal cans; 55-gal drums.

Uses: Solvent for cellulose acetate; intermediate; metal chelates.

acetylamino-. See acetamido-.

acetylaminopropionic acid. See aceturic acid.

para-acetylaminobenzaldehyde thiosemicarbazone. See thiosemicarbazone.

para-acetylaminobenzenesulfonyl chloride

(para-acetamidobenzenesulfonyl chloride, N-acetylsulfamyl chloride)

$(\text{CH}_3\text{CONH})\text{C}_6\text{H}_4(\text{SO}_2\text{Cl})$.

Properties: Light tan to brownish powder or fine crystals. M.p. 149°C, soluble in benzene; chloroform, and ether.

Containers: 150-lb steel drums.

Use: As an intermediate in the manufacture of sulfa drugs.

ortho-acetylaminobenzoic acid. See acetyl-anthranilic acid.

para-acetylaminobenzoic acid (para-acetamidobenzoic acid) $\text{CH}_3\text{CONHC}_6\text{H}_4\text{COOH}$.

Properties: Needle-like crystals. Soluble in alcohol, slightly soluble in water.

Constants: M.p. 256.5°C (dec).

Derivation: Oxidation of acetyl-para-toluidine by potassium permanganate.

Grades: Technical.

Use: Chemical (intermediate).

acetylaminohydroxyphenylarsonic acid (acetarsone, N-acetyl-4-hydroxy-meta-arsanilic acid, 3-acetamido-4-hydroxybenzenearsonic acid) $(\text{HO})(\text{CH}_3\text{CONH})\text{C}_6\text{H}_3\text{AsO}(\text{OH})_2$.

Properties: White to slightly yellow powder containing 27% arsenic, odorless, slight acid taste, soluble in alkali and alkali carbonate solutions; slightly soluble in water, insoluble in alcohol.

Grades: N. F. XI.

Use: Medicine.

Shipping regulations: None.*

1-acetyl-amino-8-naphthol-3,6-disulfonic acid

(acetyl H-acid) $\text{CH}_3\text{CONHC}_{10}\text{H}_4\text{OH}(\text{SO}_3\text{H})_2$.

Properties: Slightly soluble in water.

Derivation: Acetylation of H acid.

Grades: Technical.

Uses: Dyestuffs (reds).

para-acetylaminophenol (APAP; N-acetyl-para-aminophenol, acetaminophen, para-acetamidophenol, para-hydroxyacetanilide)

$\text{CH}_3\text{CONHC}_6\text{H}_4\text{OH}$.

Properties: Crystals; odorless, slightly bitter taste; sp. gr. 1.293 (21/4°C); m.p. 168°C; slightly soluble in water and ether; soluble in alcohol; pH saturated aqueous solution 5.5-6.5.

Derivation: Interaction of para-aminophenol and an aqueous solution of acetic anhydride.

Grade: N. F. XI.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Uses: Chemical intermediate in making pharmaceuticals; stabilizer for hydrogen peroxide; medicine.

para-acetylaminophenyl salicylate (aceto-aminosalol, para-acetylaminosalol; phenetsal) $C_6H_4(NHCOCH_3)OOCCH_2CH_2OH$.
Properties: Fine, white, crystalline scales, odorless, tasteless. Soluble in alcohol, ether, benzene, dilute solutions of the alkalis and hot water; insoluble in light hydrocarbon solvents, decomposed by strong alkalis. M.p. 187-188°C.
Derivation: By reducing para-nitrophenol salicylate to para-aminophenol salicylate and acetylating the latter.
Method of purification: Recrystallization.
Grades: Technical, pure.
Containers: Tins, glass bottles.
Use: Medicine.
Shipping regulations: None.*

para-acetylaminosalol. See para-acetylaminophenyl salicylate.

para-acetylanisole. See para-methoxyacetophenone.

acetylthranilic acid (ortho-acetylaminobenzoic acid) $CH_3CONHC_6H_4COOH$.
Properties: Needles, plates, rhombic crystals (crystallized in glacial acetic acid), m.p. 185°C, slightly soluble in water, soluble in hot alcohol, ether and benzene.

Derivation: By oxidation of ortho-acetyl-toluidine with potassium permanganate in the presence of magnesium sulfate or potassium chloride.

Grades: Technical.

Uses: Chemical (organic synthesis, anthranilic acid).

acetylation. Introduction of an acetyl radical (CH_3CO-) into the molecule of an organic compound having OH or NH_2 groups. The usual reagents for this purpose are acetic anhydride or acetyl chloride. Thus ordinary ethyl alcohol C_2H_5OH may be converted to $C_2H_5OCOCH_3$ (ethyl acetate). Cellulose is similarly converted to cellulose acetate by treatment with a mixture containing acetic anhydride. Acetylation is commonly used to determine the number of hydroxyl groups in fats and oils (see acetyl value).

acetylbenzene. See acetophenone.

acetylbenzoyl peroxide (acetozone, benzozone) $C_6H_5CO \cdot O_2 \cdot COCH_3$.

Properties: White crystals, decomposed by water, alkaloids, organic matter and some organic solvents, decomposes slowly and evaporates when gently heated, and instantaneously (possibly explosively) if quickly heated, ground or compressed. The commercial product is mixed with a neutral drying powder and contains 50% acetylbenzoyl peroxide, m.p. 36.6°C, b.p. 130°C (19 mm), moderately soluble in ether, chloroform, carbon tetrachloride, and water, slightly soluble in mineral oils and alcohol.

Uses: Medicine (active germicide); disinfectant.

Shipping regulations: In solution, oxidizing material. Yellow label. Solid; not accepted.*

acetyl bromide CH_3COBr .

Properties: Colorless, fuming liquid; turns yellow in air; reacts violently with water or alcohol; fumes irritate the eyes, soluble in ether, chloroform and benzene. Constants: B.p. 81°C; m.p. -96°C; sp. gr. 1.663 (16/4°C).

Derivation: By the interaction of acetic acid and phosphorus pentabromide.

Grades: Technical.

Containers: Metal bottles; iron drums.

Uses: Organic synthesis; manufacture of dyes.

Shipping regulations: Corrosive liquid, White label.*

N-acetyl-N-bromodiethylacetyl urea. See acetylcarbromal.

alpha-acetylbutyrolactone (alpha-acetyl-gamma-hydroxybutyric acid, gamma-lactone) $C_6H_8O_3$.

Properties: Liquid with ester-like odor. Sp. gr. 1.18-1.19 (20°C), b.p. (30 mm) 142-144°C, soluble in water.

Derivation: Prepared from sodium acetoacetate and ethylene oxide in absolute alcohol.

Toxicity: Avoid swallowing and skin contact.

Use: Intermediate.

acetyl carbinol. See acetol.

acetylcarbromal (N-acetyl-N-bromodiethylacetylurea) $(C_2H_5)_2CBrCONHCONHCOCH_3$.

Properties: Crystals, slightly bitter taste; m.p. 109°C. Slightly soluble in water; freely soluble in alcohol, and ethyl acetate.

Use: Medicine.

acetyl chloride CH_3COCl .

Properties: Colorless, flammable, highly refractive, fuming liquid, strong odor; irritating to eyes; sp. gr. 1.1051; m.p. -112°C, b.p. 51-52°C; soluble in ether, acetone, acetic acid, violent reaction with water and alcohol.

Derivation: By mixing glacial acetic acid and phosphorus trichloride in the cold and heating a short time to drive off hydrochloric acid. The acetylchloride is then distilled.

Containers: Iron drums, 110-lb carboys. Protect from moisture.

Uses: Organic preparations (acetylating agent); dyestuffs, pharmaceuticals.

Danger: Flammable, causes severe burns. MCA warning label.

Shipping regulations: Corrosive liquid, White label.*

acetylcholine (acetyethanoltrimethylammonium hydroxide)

$CH_3COOCH_2CH_2N(CH_3)_3OH$. A derivative of choline important in the mechanism of nerve action. The enzyme cholinesterase hydrolyzes acetylcholine into comparatively inactive choline and acetic acid and is

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

3-(N-acetyl-sulfanilamido)-6-methoxy-pyridazine) $C_{11}H_{14}N_4O_4S$.

Properties: Crystals; tasteless. Decomposes 186-187°C.

Grade: N. N. D.

Use: Medicine.

N-acetylsulfanilamide. See sulfacetamide.

N-acetylsulfanilamide sodium. See sulfacetamide sodium.

N-acetylsulfanilyl chloride. See para-acetylamino benzenesulfonyl chloride.

acetylsulfisoxazole

$NH_2C_6H_4SO_2N(COCH_3)C_3NO(CH_3)_2$.

Properties: White to slightly off-white, crystalline solid with slight characteristic odor, m. p. 192-195°C. Practically insoluble in water, slightly soluble in alcohol, chloroform, and ether.

Grade: U. S. P. XVI.

Use: Medicine.

acetyltannic acid (tannyl acetate, diacetyltannin) $C_{14}H_{18}O_9(COCH_3)_2$.

Properties: Yellowish-white or grayish-white powder, darkening on exposure to light; soluble in ethyl acetate, aqueous solution of sodium borate or sodium phosphate, slightly soluble in water and alcohol.

Derivation: Heating tannin with acetic anhydride in presence of glacial acetic acid.

Use: Medicine.

Shipping regulations: None.*

acetyltannin. See acetyltannic acid.

2-acetylthiophene (methyl 2-thienyl ketone)

$CH_3COC_4H_3S$.

Properties: Colored oil, m. p. 10-11°C, b. p. 213.5°C, very slightly soluble in ether.

Use: Organic intermediate.

acetyl-ortho-toluidine (ortho-acetotoluidide)

$CH_3CONHC_6H_4CH_3$.

Properties: Colorless crystals, m. p. 110°C, b. p. 296°C, sp. gr. 1.168 (15°C), soluble in alcohol, ether, benzene, chloroform, glacial acetic acid, slightly soluble in cold water, insoluble in hot water.

Derivation: By boiling glacial acetic acid with ortho-toluidine and distilling the product.

Grades: Technical.

Use: Organic synthesis.

acetyl-para-toluidine (para-acetotoluidide)

$CH_3CONHC_6H_4CH_3$.

Properties: Colorless needles, m. p. 153°C, b. p. 307°C, density 1.212 (15/4°C), slightly soluble in water, soluble in alcohol, ether, ethyl acetate, glacial acetic acid.

Grades: Technical.

Containers: Wooden barrels or fiber drums.

Uses: Dyes.

Shipping regulations: None.*

acetyl triallyl citrate

$CH_3COOC_3H_4(COOC_2CH=CH_2)_3$.

Properties: Liquid, boiling range 142-143°C (0.2 mm); sp. gr. 1.140 (20°C), refractive

index n_D 25/D 1.4665, flash point 171-174°C.

Use: Cross linker for polyesters; monomer for polymerization.

acetyl tributyl citrate

$CH_3COOC_3H_4(COOC_4H_9)_3$.

Properties: Colorless, odorless liquid.

Distillation range (1 mm) 172-174°C; pour point -75°F, sp. gr. (25°C) 1.046; wt/gal (25°C) 8.74 lbs; refractive index (25°C) 1.4408, viscosity (25°C) 42.7 cps. Insoluble in water.

Derivation: Esterification and acetylation of citric acid.

Grades: Technical.

Containers: Metal drums, tanks.

Uses: Plasticizer for vinyl resins, especially for food packaging.

acetyl triethyl citrate

$CH_3COQC_3H_4(COOC_2H_5)_3$.

Properties: Colorless, odorless liquid.

Distillation range (1 mm) 131-132°C, pour point -45°F, sp. gr. (25°C) 1.135, wt/gal (25°C) 9.47 lbs, refractive index (25°C) 1.4386, viscosity (25°C) 53.7 cps. Slightly soluble in water.

Derivation: Esterification and acetylation of citric acid.

Grades: Technical.

Containers: Metal drums, cans.

Uses: Plasticizer for cellulose, particularly ethyl cellulose.

Shipping regulations: None.*

acetyl tri-2-ethylhexyl citrate $C_{12}H_{28}O_8$.

Properties: Liquid, b. p. 225°C (1 mm), insoluble in water.

Grades: Technical.

Use: Low-volatility plasticizer for the vinyls.

acetyl-dl-tryptophan. See tryptophan.

acetyl value. The number of milligrams of

KOH required for neutralization of acetic acid obtained by the saponification of one gram of acetylated fat or oil sample.

Acetylation is carried out by boiling the sample with an equal amount of acetic anhydride, washing and drying. Saponification values on the acetylated and on untreated fat are determined. From the results the acetyl value is calculated. It is a measure of the number of free hydroxyl groups in the fat or oil.

achillea (milfoil, yarrow). The flowering tops of the perennial herb, *Achillea millefolium*.

Occurrence: Europe, America.

Chief constituents: Volatile oil, tannin, achillein.

Use: Medicine.

"Achrocidin." ⁵⁷ Trademark for a tetracycline-antihistamine-analgesic compound.

"Achromycin." ^{57, 315} Trademark for tetracycline, $C_{22}H_{24}N_2O_8$ (q. v.).

"Aciban." ⁵⁷ Trademark for an antacid.

acicular. Needle-shaped, used in describing crystals or the particles in powders.

acid. In common everyday language an acid is

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

any one of a large class of chemical substances which have one or more of the following properties: sour taste, ability to make litmus dye turn red, and to cause other indicator dyes to change to characteristic colors, ability to react with and dissolve certain metals to form salts, ability to react with bases or alkalies to form salts. Chemists have long defined an acid as a compound that contains the element hydrogen in its formula, this hydrogen being replaceable by metals to form salts. A later definition of acid, entirely consistent with the preceding one, is as a substance whose molecules yield hydrogen ions (H^+) in water or under other suitable conditions. These definitions are adequate to explain the chemistry of most well known and common acids. Extensive chemical research has shown that for a complete understanding it is desirable to define an acid as a substance that produces the positive ion of solvent in which the acid is dissolved, or as any substance (molecule or ion) which will release a proton or hydrogen ion. Thus an acid is a proton donor. These more general definitions include the simpler concepts mentioned at first, and also explain many reactions not otherwise easily understood. The names of Brønsted and Lewis are associated with the latter definitions.

It should also be mentioned that some acid oxides (oxides of nonmetals) are sometimes improperly referred to as acids, because these acid oxides react in water to form acids. Thus phosphoric oxide, P_2O_5 , is sometimes called phosphoric acid, and As_2O_3 is commonly called arsenic acid. See also base, alkali; neutralization; pH.

1, 2, 4 acid. See 1-amino-2-naphthol-4-sulfonic acid.

acid amide. See amide.

acid ammonium tartrate. See ammonium bitartrate.

acid ammonium valerate. See ammonium valerate.

acid anhydride. An oxide of a nonmetallic element or an organic radical which is capable of forming an acid when united with water, or which can be formed by the abstraction of water from the acid molecule, or which can unite with basic oxides to form salts.

acid calcium phosphate. See calcium phosphate, monobasic.

acid dyes. These are usually azo, triarylmethane or anthraquinone dyes with acid substituents such as nitro-, carboxy-, or sulfonic acid. They are most frequently applied in acid solution to wool and silk, and no doubt combine with the basic groups of the proteins of those animal fibers. Orange II (C.I. 151), black 10 B (C.I. 246), and acid alizarine blue B (C.I. 2054) are examples.

acid ethylsulfate. See ethylsulfuric acid.

acid glaucine blue. See peacock blue.

acidic oxides. The oxides of nonmetals, e.g. SO_2 , CO_2 , P_2O_5 , SO_3 , which form acids when combined with water. See also acid anhydrides.

acidimetry. The determination of the concentration of acid solutions or of the quantity of acid in a sample or mixture. This is usually done by titration with a solution of base of known strength (standard solution) and an indicator is used to establish the end point. See also pH.

acid lining. Silica brick lining used in Bessemer or open hearth furnaces.

acid liquor, sulfite. See sulfite acid liquor.

acid magnesium citrate. See magnesium citrate, dibasic.

acid magnesium phosphate. See magnesium phosphate, monobasic.

acid methyl sulfate. See methylsulfuric acid.

acid of sugar. Oxalic acid (q. v.).

acidogen nitrate. See urea nitrate.

"Acidolene." ²⁴⁴ Trademark for a series of sulfonated oils made from neatsfoot, sperm, cod, fish and coconut oil.

Containers: Non-returnable steel drums averaging 400-425 lbs net.

Uses: Primarily used by the leather industry and referred to as fatliquors. Also used wherever an oil emulsifiable in water is needed for plasticizing or softening.

acid open hearth slag. See slag.

acid phosphatase. An enzyme found in blood serum which catalyzes the liberation of inorganic phosphate from phosphate esters. Optimum pH 5; is less active than alkaline phosphatase.

Uses: Biochemical research.

acid phosphate. An acid salt of phosphoric acid such as NaH_2PO_4 , $CaHPO_4$, etc. Also used to refer specifically to calcium phosphate monobasic, $Ca(H_2PO_4)_2$, or superphosphate of lime.

acid potassium oxalate. See potassium binoxalate.

acid potassium sulfate. See potassium bisulfate.

acids. See under specific title, e.g., sulfuric acid, not acid, sulfuric.

"Acidulin." ¹⁰⁰ Trademark for glutamic acid hydrochloride (q. v.).

acid value. The number of milligrams of potassium hydroxide neutralized by the free acids present in one gram of oil. The determination is done by titrating the sample in hot 95% ethyl alcohol and using phenolphthalein as an indicator.

"Acintene." ²⁵² Trademark for a group of pinene, terpene, and turpentine products.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v

- "Acintene" A: alpha-Pinene. Close boiling solvent.
- "Acintene" B: beta-Pinene. Used for terpene resins, synthetic pine oil.
- "Acintene" DP: Dipentene. A solvent used in reclaimed rubber manufacture and rubber compounding.
- "Acintene" N: Liquid terpene polymer. Used as a vehicle constituent for printing inks; as a plasticizer for resins and rubber; caulking compounds; mastic tile adhesives.
- "Acintene" L: Turpentine still residue. For use in printing inks and resins; as a rubber softener; as a replacement for pine tar.
- "Acintene" P: Solvent grade refined sulfate wood turpentine. Meets ASTM and Federal Specifications. Used in the manufacture of shoe polishes, wax preparations, cleaning compounds, and as oil additives.
- "Acintol," ²⁵² Trademark for a series of tall oils and tall oil derivatives.
- "Acintol" C: Crude tall oil, a mixture of rosin and fatty acids containing a small amount of unsaponifiable matter.
- "Acintol" FA-1 and FA-2 Fractionated Tall Oils: Tall oil fatty acids. Acintol FA-1 has a Gardner color of 8, 4% rosin acids and 4% unsaponifiables. Acintol FA-1 Special has a Gardner color of 4+, 3.8% rosin acids and 1.3% unsaponifiables. Acintol FA-2 has a Gardner color of 3+, 1.0% rosin acids and 1.0% unsaponifiables. Acintol FA-3 has a Gardner color of 4+, 0.6% rosin acids and 0.7% unsaponifiables.
- "Acintol" D Distilled Tall Oil: Fractionated tall oil characterized by light color, uniform composition, high acid and saponification numbers, and high linoleic acid content.
- "Acintol" H Tall Oil Heads: A by-product of tall oil fractionation. High saturated fatty acid content and a low rosin content.
- "Acintol" R Tall Oil Rosin: A rosin suitable for many applications where wood and gum rosins have been used.
- "Acintol" P Tall Oil Pitch: Light-colored semisolid product of uniform composition.
- "ACL," ⁵⁸ Trademark for bleaching compounds used in bleaches, cleansers, sanitizers, etc.
- "ACL" 85 is trichloroisocyanuric acid (90% available chlorine).
- "ACL" 70 is dichloroisocyanuric acid (70% available chlorine).
- "ACL" 60 is sodium dichloroisocyanurate, (61% available chlorine).
- "ACL" 59 is potassium dichloroisocyanurate (60% available chlorine).
- Containers: Fiber drums with polyethylene liners.
- "Aclar," ⁵⁰ Trademark for a series of fluorohalocarbon films. Retain useful properties from -320°F to +390°F. Used in packaging applications, where a transparent, vapor and/or gas barrier are required. Used in electronic and electrical applications because of insulating and heat resistant properties. Extreme chemical resistance and ability to seal make it useful as a tank lining, etc.
- "Acofor," ⁷⁹ Trade name for distilled tall oil fatty acids.
- Properties: Sp. gr. 0.905 (25°C); refractive index (20°C) 1.471; flash point (open cup) 367°F; acid number 192; saponification number 194; unsaponifiable matter 2.5%.
- Containers: 55-gal drums; tank cars.
- Uses: Paint and varnish; inks; soaps; disinfectants; textile oils; core oils, etc. See also "Aconew Extra," "Aconew 500."
- acoin. See di-para-anisyl-para-phenetyl-guanidine hydrochloride.
- "Acolin," ⁷⁹ Trade name for distilled tall oil, specially processed to improve color and odor.
- Properties: Sp. gr. 0.947 (25°C); refractive index 1.488 (20°C); flash point 370°F (open cup); acid number 178; saponification number 182, iodine value 143.
- Containers: 55-gal drums; tank cars.
- Uses: Paint and varnish; inks; soaps; disinfectants; textile oils; core oils.
- "Aconew 500," ⁷⁹ Trade name for distilled tall oil fatty acids.
- Properties: Sp. gr. 0.898 (25°C); refractive index 1.468, acid number 195; saponification number 197; iodine value 128; unsaponifiable matter 1.5%.
- Containers: 55-gal drums; tank cars.
- Uses: Paint and varnish, inks; soaps; disinfectants; textile oils, core oils, etc. See also "Aconew Extra" and "Acofor."
- "Aconew Extra," ⁷⁹ Trademark for distilled tall oil fatty acids.
- Properties: Sp. gr. (25/25°C) 0.898; refractive index 1.468 (20°C); flash point (open cup) 370°F, acid number 195; saponification number 197; unsaponifiable matter 1.5%.
- Containers: 55-gal drums; tank cars.
- Uses: Paint and varnish; inks; soaps; disinfectants, textile oils; core oils. See also "Aconew 500," "Acosix" and "Acofor."
- aconite (monkshood, wolfsbane; friar's cowl).
- Derivation: Dried tuberous root or leaves of the perennial herbaceous plant *Aconitum napellus*. Poisonous!
- Occurrence: Mountainous regions of Europe, Asia and North America.
- Grades: Technical.
- Containers: Burlap bags and bales.
- Uses: Medicine.
- Shipping regulations: None.*
- aconitic acid (propene-1,2,3 tricarboxylic acid) $\text{H}(\text{COOH})\text{C}:\text{C}(\text{COOH})\text{CH}_2(\text{COOH})$.
- Properties: White to yellowish crystalline solid; m. p. (about) 195°C with decomposition; soluble in water and alcohol.
- Derivation: (a) By dehydration of citric acid with sulfuric acid; (b) extraction from sugar cane bagasse, *Aconitum napellus* and other natural sources.
- Uses: Preparation of plasticizers and wetting agents; antioxidant; organic syntheses.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

aconitine $C_{34}H_{49}NO_{11}$.

Properties: White crystalline alkaloid; feeble bitter taste; intensely poisonous! Soluble in alcohol, ether, benzene, and chloroform; very slightly soluble in water.

Constants: M. p. 204°C; specific rotation, in chloroform, +17.3°.

Derivation: By extraction and crystallization from the root of *Aconitum napellus*.

Containers: $\frac{1}{8}$ -, $\frac{1}{4}$ -, 1-oz vials, 5-, 10- and 15-grain vials.

Uses: Medicine, in form of the base or as the hydrobromide, hydrochloride, nitrate.

Shipping regulations: None.*

Salts obtained by interaction of the acid and alkaloid:

Hydrobromide $C_{34}H_{49}NO_{11} \cdot HBr \cdot 2 \frac{1}{2} H_2O$.

M. p. (dec.) 180°C; specific rotation -30.5°.

Hydrochloride $C_{34}H_{49}NO_{11} \cdot HCl \cdot 3 \frac{1}{2} H_2O$.

M. p. (dec.) 171°C; specific rotation -31.3°.

Nitrate $C_{34}H_{49}NO_{11} \cdot HNO_3$.

M. p. (dec.) about 200°C; specific rotation (2% aqueous solution) -35°.

aconitine hydrobromide. See aconitine.

aconitine hydrochloride. See aconitine.

aconitine nitrate. See aconitine.

acorn sugar. See quercitol.

"Acosix." ⁷⁹ Trademark for distilled tall oil.

Properties: Sp. gr. 0.936 (25°C); refractive index 1.484 (20°C); flash point (open cup) 367°F; acid number 190; saponification number 192; iodine number 150; unsaponifiable matter 2.0%.

Containers: 55-gal drums; tank cars.

Uses: Paint and varnish; inks; soaps; disinfectants; textile oils; core oils.

See also "Aconew Extra", "Acosix 700" and "Acolin."

"Acosix 700." ⁷⁹ Trade name for distilled tall oil.

Properties: Sp. gr. 0.936 (25°C); refractive index 1.484 (20°C); flash point (open cup) 367°C; acid number 190; saponification number 192; iodine number 150; unsaponifiable matter 2%.

Containers: 55-gal drums; tank cars.

Uses: Paint and varnish; inks; soaps; disinfectants; textile oils; core oils, etc.

See also "Acosix" and "Acolin."

"A-C" Polyethylenes. ¹⁷⁵ Trademark for a line of low molecular weight polyethylenes.

Properties: Translucent white; tasteless; excellent electrical properties; abrasion resistant; resistant to water and most chemicals; sp. gr. 0.92; slightly soluble in turpentine, petroleum naphtha, xylene, and toluene at room temperature; soluble in xylene, toluene, trichloroethylene, turpentine, and mineral oils at 180°F; practically insoluble in water; slightly soluble in methyl acetate, acetone, and ethanol up to the boiling point of these solvents.

Grades: Nos. 6 and 6A: Average molecular weight, 2000; m. p. 219-26°F; hardness

3-5; viscosity 180 cps (140°C).

No. 7: Average molecular weight 2000; m. p. 223-30°F; hardness 2-3; viscosity 220 cps (140°C).

No. 615: Average molecular weight 5000; m. p. 224-32°F; hardness 3-4; viscosity 4000 cps (140°C).

Nos. 617 and 617A: Average molecular weight 1500; m. p. 210-17°F; hardness 6-9; viscosity 100 cps (140°C).

No. G-201: Average molecular weight 2000; m. p. 201-8°F; hardness 6-9; viscosity 230 cps (140°C).

No. 629: M. p. 213-21°F; acid number 14-17; hardness 3-6; viscosity 160 cps (140°C).

Containers: 50-lb multiwall paper bags.

Uses: In coating containers and paper; in printing inks, paints and paste polishes; as rubber lubricants and mold release agents; emulsifiable grade (No. 629) in various liquid polishes, textile finishes, and paper sizes.

acraldehyde. See acrolein.

"Acrawax." ⁷³ Brand name for proprietary product. Modified fatty acid ester.

Properties: Hard, light-brown, synthetic wax. Good luster. Soluble (hot) in ethyl alcohol, toluol, butyl acetate and turpentine. Partly soluble in mineral oil and mineral spirits. Insoluble in water. Blends with carnauba wax, rosin, shellac, stearic acid, estergum, etc.

Constants: Sp. gr. (24°C) 1.04; m. p. 95-97°C; flash point 230°C (open cup).

Containers: 1-gal can (8 lbs); 5-gal can (40 lbs); 55-gal drum (400 lbs).

Uses: For the manufacture of polishes, dental waxes, record waxes, wax coatings, etc.

"Acrawax" B. ⁷³ Brand name for a proprietary product. Claimed to be a modified fatty acid ester.

Properties: A hard, brown wax of good luster. Soluble (hot) in mineral spirits, alcohol, toluol, butyl acetate, mineral oil. Insoluble in water. This product differs from "Acrawax" in that it is compatible with paraffin wax and forms gels with mineral spirits and kerosene.

Constants: Sp. gr. 0.955 (25°C); flash point 235°C (open cup); m. p. 81° to 84°C.

Containers: 1-gal, 5-gal cans; 55-gal drums. Net weight: 8, 50, 400 lbs.

Uses: Flattening agent for paints, enamels and varnishes.

"Acrawax" C. ⁷³ Brand name for proprietary product.

Properties: Hard, brown synthetic wax, having a good luster. Soluble (hot) in toluol, mineral spirits, mineral oil, vegetable oil and turpentine. Insoluble in water and isopropanol. Blends with paraffin wax, carnauba wax, candelilla, rosin. This product is of interest where a high-melting wax which is not brittle is desired.

Constants: M. p. 140-142°C; flash point 283°C (open cup); sp. gr. 0.975 (25°C).

Containers: 1-gal can (8 lbs); 5-gal can

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

(40 lbs); 55-gal drum (400 lbs).

Uses: In the manufacture of polishes, electrical insulation, waterproofing, record waxes, dental waxes and special wax combinations. Because of its high flash point, "Acrax" C can be used for many purposes where ordinary waxes are unsuitable due to fire hazards.

acridine $C_{13}H_9N$ (tricyclic).

Properties: Small colorless needles. When the dust or vapor is inhaled it causes violent sneezing; solutions of acridine and salts irritate the skin. Soluble in alcohol, ether or carbon disulfide; sparingly soluble in hot water.

Constants: Sublimes at $100^{\circ}C$; m. p. $111^{\circ}C$; b. p. above $360^{\circ}C$.

Derivation: (a) By extraction with dilute sulfuric acid from the anthracene fraction from coal tar and adding potassium dichromate. The acridine chromate precipitated is recrystallized, treated with ammonia and recrystallized. (b) It has been obtained synthetically by a number of processes.

Uses: Manufacture of dyes; derivatives, especially acriflavine, proflavine; analytical reagent.

Shipping regulations: None.*

acriflavine (neutral acriflavine; euflavine; tryptaflavine neutral) $C_{14}H_{14}N_3Cl$. A mixture of 3,6-diamino-10-methylacridinium chloride and 3,6-diaminoacridine.

Properties: Brownish or orange, odorless, granular powder. Soluble in 3 parts of water; incompletely soluble in alcohol; nearly insoluble in ether and chloroform; the aqueous solutions fluoresce green on dilution.

Derivation: Synthetic.

Method of purification: Crystallization.

Containers: Amber glass bottles.

Uses: Antiseptic and bacteriostat.

Shipping regulations: None.*

acriflavine hydrochloride (tryptaflavine; flavine) $C_{14}H_{13}N_3Cl_2$. A mixture, as above.

Properties: Brownish-red, odorless, crystalline powder. Soluble in 3 parts of water; somewhat soluble in alcohol; nearly insoluble in ether and chloroform. Aqueous solutions are dark-red in color and fluoresce green on dilution. An aqueous solution (1:250) is distinctly acid.

Derivation: Synthetic.

Method of purification: Crystallization.

Containers: Amber glass bottles.

Uses: Antiseptic and bacteriostat.

Shipping regulations: None.*

acriflavine, neutral. See acriflavine. †

"Acrilan." ¹¹² Trademark for a synthetic fiber made from acrylonitrile.

Properties: Tensile strength (psi) 37,000-40,000; elongation 36%; sp. gr. 1.17; moisture regain 1.2% ($70^{\circ}F$, 65% relative humidity); shrinks 5% at $485^{\circ}F$. Resistant to mineral acids; fair to good resistance to weak alkalis. Insoluble in alcohol, acetone, benzene, carbon tetrachloride, and

petroleum ether; soluble in dimethyl sulfide, maleic anhydride, ethylene carbonate, nitriles, and nitrophenols.

Derivation: A solution of polymerized acrylonitrile is forced through minute holes of a spinneret, the solvent is removed, and the resulting fiber is stretched.

Uses: Woven and knitted clothing fabrics; carpets; drapes; upholstery; electrical insulation; laminates.

"Acriviolet." ²⁴³ Trademark for dye mixture used as oral antiseptic.

acroleic acid. See acrylic acid.

acrolein (propenal; acrylic aldehyde; allyl aldehyde; acraldehyde) CH_2CHCHO .

Properties: Colorless or yellowish liquid; flammable; disagreeable choking odor; violent action on the eyes; poisonous! Soluble in water, alcohol and ether. Polymerizes readily unless inhibitor (hydroquinone) is added. Very reactive.

Constants: B. p. $52.7^{\circ}C$; m. p. $-87.0^{\circ}C$; sp. gr. ($20/20^{\circ}C$) 0.8427; wt/gal ($20^{\circ}C$) 7.03 lbs; flash point (Cleveland open cup) below $0^{\circ}F$.

Derivation: (a) By the oxidation of allyl alcohol or propylene; (b) by heating glycerol with magnesium sulfate; (c) from propylene by use of special bismuth-phosphorus-molybdenum catalyst.

Method of purification: Rectification.

Grades: Technical.

Containers: 1-gal cans; 5-, 55-gal drums; tanks.

Uses: War gas (lachrymator); resins; intermediate for polyurethane and polyester resins, methionine, pharmaceuticals.

Fire hazard: Dangerous.

Shipping regulations: Flammable liquid. Red label.*

acrolein dimer (2-formyl-3,4-dihydro-2H-pyran) $OCH:CHCH_2CH_2CHCHO$.

Properties: Liquid; sp. gr. 1.0775 ($20^{\circ}C$); b. p. $151.3^{\circ}C$; freezing point $-100^{\circ}C$; flash point (open cup) $118^{\circ}F$; soluble in water.

Containers: 55-gal drum.

Uses: Intermediate for resins, pharmaceuticals, dyestuffs.

"Acronal." ⁴⁴⁰ Trademark for an aqueous dispersion of polyacrylates or copolymers of acrylates with other vinyl compounds. Solids content between 40 and 50%. At room temperature dry to films which vary from soft and very tacky to relatively hard and block resistant.

Uses: Coating, impregnating and laminating paper, fabrics, non-wovens, fibers, etc.; adhesives raw materials and binders for leatherboard.

"Acronize." ⁵⁷ Trademark for chlortetracycline.

"Acronol." ²⁰⁶ Brand name for a line of basic dyes for cotton, rayon, silk, and paper.

acrylamide $CH_2CHCONH_2$.

Properties: Colorless, odorless crystals; m. p. $84.5^{\circ}C$; b. p. (25 mm) $125^{\circ}C$; sp. gr.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

1.122 (30°C); soluble in water, alcohol, acetone; insoluble in benzene, heptane. The solid is stable at room temperature but may polymerize violently on melting. Monomer is toxic.

Derivation: Hydration of acrylonitrile with sulfuric acid (84.5%) and neutralization.

Grade: Technical (approximately 97% pure). Containers: Fiber drums.

Uses: Synthesis of dyes, etc.; polymers or copolymers as plastics, adhesives, paper and textile sizes, soil conditioning agents.

Shipping regulations: None.*

acrylate resins (acrylic resins). Thermoplastic polymers or copolymers of acrylic acid, methacrylic acid, esters of these acids, or acrylonitrile. The latter, and the methyl and ethyl esters are the most frequently used starting materials. These colorless monomer liquid esters polymerize readily in the presence of light, heat, or catalysts such as benzoyl peroxide, and must always be stored or shipped with inhibitor present to avoid spontaneous and explosive polymerization. The resins range from soft, sticky semifluid materials to hard solids. Molding powders are granular solids, often cube cut or minute spherical granules. The polymethacrylates are harder than the corresponding polyacrylates and the methyl esters form harder resins than the ethyl or butyl esters. Polymethylmethacrylate, well known examples of which are "Lucite" and "Plexiglas," is outstanding for its clarity and transparency, which lead to important uses. An almost unique property is that of carrying light around corners and reflecting it out the edges of a piece of cast polymer. Additional characteristics of the acrylate resins are low water absorption, low specific gravity, good shock resistance and high dielectric strength. These resins are stable to outdoor weathering, and also chemically stable at moderate temperatures, and resistant to action of water, aqueous salt solutions, and to moderate concentrations of acid and base. The acrylates are soluble in aromatic hydrocarbons, chlorinated hydrocarbons, esters, and ketones. They are compatible with many plasticizers. Insoluble, thermosetting resins can be obtained as cross-linked polymers by addition of acrylic anhydride, glycol esters of acrylic or methacrylic acid, or acrylamide.

Uses: Aircraft canopies and windows; automotive instrument dials, horn buttons, tail light lenses; comb and brush backs, lighting fixtures, pen and pencil barrels; refrigerator parts, costume jewelry and decorative ware and trim; binder in rocket propellants; contact lenses and optical parts; dentures; surgical instruments; safety glass; protective coatings including lacquers, paints, and finishes; adhesives; plasticizers and modifiers for vinyls and other resins; lubricating oil additives; textile and leather finishes and coatings; display fixtures and signs; aerosol snow. The

synthetic fibers "Orlon," "Acrilan," "Dynel," and "Vinyon N" are also acrylate resins or acrylics since they are copolymers of acrylonitrile. Acrylic rubbers including acrylonitrile rubber are also of this general class.

See also polyacrylic acid.

acrylic acid (acroleic acid; ethylenecarboxylic acid; vinylformic acid; propenoic acid)
 $H_2C:CHCOOH$.

Properties: Colorless, corrosive liquid; acid odor. Polymerizes readily. Miscible with water, alcohol and ether.

Constants: B. p. 140.9°C; m. p. 12.1°C; sp. gr. (20/20°C) 1.052; vapor pressure (20°C) 3.1 mm; wt/gal (20°C) 8.6 lbs; refractive index (20°C) 1.4224; flash point (open cup) 130°F.

Derivation: (a) Oxidation of acrolein; (b) hydrolysis of acrylonitrile; (c) molecular rearrangement of beta-propiolactone; (d) by Reppe process from acetylene, carbon monoxide and water.

Grades: Technical (esterification and polymerization grades); glacial (97%).

Containers: Bottles; drums; tank cars.

Uses: Intermediate; as monomer for acrylate resins.

acrylic acid resins. See acrylate resins.

acrylic aldehyde. See acrolein.

acrylic esters. See acrylate resins.

acrylic fiber. Generic name for a manufactured fiber in which the fiber-forming substance is any long chain synthetic polymer composed of at least 85% by weight of acrylonitrile units $-CH_2CH(CN)-$ (Federal Trade Commission). See "Acrilan," "Orlon," "Creslan," "Zefran."

acrylic resin molding powders. See acrylate resins.

acrylic resins. Same as acrylate resins.

acrylic rubber. A synthetic rubber made at least in part from acrylonitrile, the outstanding example being acrylonitrile rubber.

"Acryloid" Coating Resins. ²³ Trademark for acrylic ester polymers in organic solvent solutions or 100% solids form, water-white and transparent. Films range from very hard to very soft.

Use: Exceptionally resistant surface coatings, such as heat-resistant and fumeproof enamels, vinyl and plastic printing, fluorescent coatings, clear and pigmented coatings on metals.

"Acryloid" Modifiers. ²³ Trademark for thermoplastic acrylic polymers in powder form. Various grades facilitate processing or improve physical properties of rigid or semi-rigid poly(vinyl chloride) formulations.

"Acryloid" Oil Additives. ²³ Trademark for acrylic polymers supplied in special oil solution or in diester lubricant.

Use: Viscosity-index improvement, pour-

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

point depression of lubricating oils and hydraulic fluids, sludge dispersancy in lubricating and fuel oils.

acrylonitrile (propenenitrile; vinyl cyanide)
 $H_2C:CHCN$.

Properties: Colorless, mobile liquid; mild odor; fumes are toxic; freezing range -83° to $-84^\circ C$; b. p. $77.3-77.4^\circ C$ (760 mm); sp. gr. 0.8004 ($25^\circ C$); flash point (Tag open cup) $32^\circ F$. Soluble in all common organic solvents; partially miscible with water.

Derivation: (a) Addition of hydrogen cyanide to acetylene in the presence of cuprous chloride catalyst; (b) catalytic dehydration of ethylene cyanohydrin; (c) from propylene, air and ammonia.

Grade: Over 99% pure.

Containers: 5-gal cans; 55-gal drums; tank cars; tank trucks.

Uses: Synthetic rubber; plastics; synthetic fibers ("Acrilan," "Dynel," and "Orlon"); organic synthesis; grain fumigant; paper industry.

Danger! Vapor hazardous. Flammable.

Shipping regulations: Flammable liquid.

Red label.*

acrylonitrile-butadiene rubber. See acrylonitrile rubber.

acrylonitrile-butadiene-styrene resins (ABS resins). Thermoplastic resins with uniform molecular structure, high impact strength, high heat distortion strength, good electrical and low-temperature properties; resistant to action of most solvents, oils, and chemicals.

"Acrylon" Rubber.⁶⁵ Trademark for a group of synthetic acrylic rubbers outstanding in resistance to oil, grease, ozone, and oxidation.

Uses: Gaskets and rubber parts for contact with oils and diester lubricants.

"Acrysol."²³

"Acrysol" Thickeners. Trademark for aqueous solutions of sodium polyacrylate or other polymeric acrylic salts. Viscous solutions, powerful thickening action on rubber latices and polymer emulsions. ASE-type is alkali-soluble acrylic emulsion, forms clear, viscous solution of thickener upon addition of alkali.

Use: Thickeners in paints, fabric coatings and backings, adhesives.

"Acrysol" Warp Sizes. Trademark for polyacrylic acid and copolymer products in aqueous solutions or dispersions. Some grades are solutions of sodium polyacrylate.

Use: Warp size for synthetic fibers, cotton and rayon; modifier of starch sizes.

ACS. Abbreviation for American Chemical Society.

"Actameg."⁵⁸ Trademark for bithionol (q. v.).

"Actane."¹⁴² Trademark for fluoride-containing additive supplied in powder form for acid pickling solutions to dissolve siliceous

films on metals as well as to assist in etching aluminum and other metals.

ACTH (adrenocorticotropin; corticotropin).

A protein consisting essentially of a single chain of amino acids; 19- and 23-unit amino acid chains have been synthesized. The 23-unit substance is 100% biologically active. ACTH is one of the hormones secreted by the anterior lobe of the pituitary gland. It stimulates an increase in the secretion of the adrenal cortical steroid hormones.

Properties: White powder; freely soluble in water; soluble in 60-70% alcohol or acetone. Solutions are stable to heat. Molecular weight is approximately 3500.

Source: Extracted from whole pituitary glands of swine, sheep and ox. Normally isolated from swine.

Units: Pure ACTH has 150-200 potency units per mg.

Uses: Medicine; biochemical research; nutrition; veterinary medicine.

"Actifed."³⁰¹ Trademark for a combination of triprolidine hydrochloride and pseudoephedrine hydrochloride (q. v.).

"Actidil."³⁰¹ Trademark for triprolidine hydrochloride (q. v.).

"Acti-Dione."³²⁷ Trademark for the crystalline antibiotic cycloheximide ($C_{15}H_{23}NO_4$) isolated from cultures of *Streptomyces griseus*.

Properties: Very soluble in chloroform, methanol and acetone; moderately soluble in 99% isopropanol, n-butanol, and amyl acetate; very slightly soluble in carbon tetrachloride and the saturated hydrocarbons; solubility in water, 2%; the solutions are stable at pH 3 to 7 for several weeks; rapidly destroyed at pH above 8.5; m. p. $114-118^\circ C$.

Uses: May be added as the crystalline material to bacteriological media to facilitate the isolation or counting of bacteria in the presence of yeasts or molds; as "Actispray" for cherry leaf spot, cedar-apple rust, and cedar-hawthorn rust; as "Acti-Dione Fer-rated"; "Acti-Dione"; and "Acti-Dione-Thiram" for turf diseases; "Acti-Dione" for powdery mildew on roses and other ornamentals; and as "Acti-Dione" (concentrate and ready-to-use) for white pine blister rust.

Hazards: Should be handled with caution as it is a potent skin irritant in high concentration or long exposure.

"Actidip."²⁷³ Trademark for a mildly alkaline powder having the property of refining crystal size in phosphate baths when used just prior to the phosphate. Commercially available in 100-lb fiber drums.

actinides. See actinide elements.

actinide elements (actinide series). The term applied to the group of chemical elements of increasing atomic number, starting with actinium and extending through the recently discovered element number 103. The names, chemical symbols, and atomic

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

numbers of the members of the series are: actinium, Ac, 89; thorium, Th, 90; protoactinium, Pa, 91; uranium, U, 92; neptunium, Np, 93; plutonium, Pu, 94; americium, Am, 95; curium, Cu, 96; berkelium, Bk, 97; californium, Cf, 98; einsteinium, Es, 99; fermium, Fm, 100; mendelevium, Md, 101; nobelium, No, 102. Element 103, discovered in 1961, tentatively named lawrencium, is expected to be the last member of the series. These names and symbols are those approved in the 1957 Report of the IUPAC. The symbols Ei and Mv formerly in use have been superseded.

The name actinide is given to the series by analogy with the lanthanide series of elements, the rare earths, since the successive differences between members of the series are due to a similar change in their atomic structure. Chemically, the early members of the actinide series show a greater variability in their reactions and kinds of compounds formed than do the lanthanides, but the later members have the same close similarity to each other.

All of these elements are unstable and undergo radioactive decay. Only two of the series, uranium and thorium, occur naturally in any significant quantity. The longest lived isotopes of protoactinium and actinium are members of the decay chain that starts with uranium-235. Numerous other isotopes of these elements have been prepared by synthesis through nuclear reactions carried out in nuclear reactors or accelerators.

The name transuranic has frequently been given to the elements with atomic number greater than 92. They were first made by the methods of heavy element build-up starting with the then heaviest known element uranium. While many isotopes of the elements from 93 to 101 are known, none have half lives long enough to allow the accumulation of any significant quantity, with the notable exception of plutonium which is made in quantity for nuclear weapons. Many show the property of fission by means of thermal neutrons, and some of the heavier ones undergo fission spontaneously. The general instability increases as the elements have higher atomic numbers, and all of the known isotopes of the heaviest have very short half-lives, making the problem of the synthesis of the as yet unknown members more and more difficult. There is much interest in making number 104, which should not be an actinide, but be similar to hafnium in its chemistry, and the confirmation of this point would check the theory.

actinide series. See actinide elements.

actinium Ac. A radioactive element found in nature as a constituent of all uranium ores, one ton of pure pitchblende containing 0.15 mg of actinium. Actinium has an atomic number of 89 and is classified as the first member of the actinide series of elements. The longest lived isotope, Ac-227, decays

with emission of alpha and beta particles and has a half-life of 21.7 years. The most important source of actinium is pile neutron bombardment of radium. Actinium is similar chemically to the more basic of the rare earth elements and may be precipitated with them as the oxalate. Except for the sulfides, the compounds of actinium are colorless. Compounds of the types $\text{Ac}(\text{OH})_3$, Ac_2O_3 , AcCl_3 , etc., have been prepared.

actinium decay series (actinium series). A series of little known radioactive elements, of which natural actinium is the best known and most stable member. These elements are produced in the radioactive decay of uranium 235 into actinium 227 and of the latter into lead of atomic weight 207. The lead is the stable end product of the series.

actinium series. See actinium decay series.

actinolite $\text{Ca}_2(\text{Mg}, \text{Fe})_5\text{Si}_8\text{O}_{22}(\text{OH})_2$. A natural hydroxy-calcium-magnesium-iron silicate. Properties: Color green; luster vitreous to silky; fibrous to granular; fibers brittle. Constants: Sp. gr. 2.3-3.2; hardness 5-6. Occurrence: Canada, United States, Europe. Uses: A minor asbestos mineral; building material.

actinomycin. A family of antibiotics produced by Streptomyces; reported to be active against E. coli, other bacteria, fungi and to have cytostatic and radiomimetic activity. There are many forms of actinomycin and two of commercial importance include A and C. Actinomycin has been suggested for use in cancer.

"Actispray." ³²⁷ See "Acti-Dione."

activated alumina. A highly porous and granular form of aluminum oxide having preferential adsorptive capacity for moisture from gases, vapors, and some liquids. When saturated, it can be revived or reactivated by the application of heat within the temperature range of 350-600°F to drive off the moisture. The cycle of adsorption and reactivation can be repeated many times. Available in granules ranging in size from a powder to pieces approximating 1 1/2 inches. The 8 to 14 and 1/4" to 8 mesh are the more commonly used sizes. The average weight approximates 50 lbs/cu ft.

Activated alumina is also effective for the removal of oil vapor from commercial gases, such as oxygen, hydrogen, carbon dioxide, natural gas, etc., introduced as lubrication during compression.

It is also used as a catalyst or catalyst carrier; to remove fluorides from drinking water; and in chromatography.

activated carbon. See active carbon.

activated charcoal. See active carbon.

activated clays. Clays whose adsorbent character or bleaching action has been enhanced by treatment with acid. Bentonite clay is most frequently treated in this fashion.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

activated sludge. See sewage sludge.

activation.

1. Process of heating an adsorbent such as charcoal (see adsorption). This is usually done in the presence of steam or other inert gas in order to condition the adsorbent so that it will be able to exert its powers of adsorption to a maximum degree. The same procedure is used to regenerate or reactivate an adsorbent after it has been in use for a period of time. See, for example, active carbon.
2. Physico-chemical concept for a process which increases the internal energy of molecules and so allows them to undergo chemical reaction when otherwise they would not do so.

activation analysis. An extremely sensitive and specific technique for identifying and measuring very small amounts of various elements. A sample is exposed to neutrons in a nuclear reactor and from the characteristics of the induced radiation, the trace elements present are identified. The technique is particularly useful when concentrations of the elements are too small to be measured by ordinary means. Trace elements have thus been determined in drugs, fertilizers, foods, fuels, glass, minerals, dusts, water, toxicants, etc.

activator.

1. A substance which increases the effectiveness of a rubber vulcanization accelerator. Zinc oxide is the most important example but zinc laurate, zinc stearate, and litharge are also used.
2. A substance which is required in trace quantities to impart luminescence to certain crystals. Silver and copper are activators for zinc sulfide and cadmium sulfide pigments.

active amyl alcohol. See 2-methyl-1-butanol.

active carbon (activated carbon; activated charcoal). Any form of carbon characterized by high adsorptive capacity for gases, vapors and colloidal solids. The carbon, char or charcoal is produced by destructive distillation of wood, peat, lignite, nut shells, bones, vegetable or other carbonaceous matter, but must usually be "activated" to develop adsorptive power. Activation is usually achieved by heating to high temperatures (800-900°C) with steam or carbon dioxide, which brings about a porous particle structure. In some cases hygroscopic substances, such as zinc chloride and/or phosphoric acid or sodium sulfate, are added prior to the destructive distillation or activation, to increase adsorptive capacity. The carbon content of active carbons ranges from about 10% for bone charcoal to 98% for some wood chars. The internal surface area of active carbon has been estimated to be about 3600 square feet per gram. The density ranges from 0.08 to nearly 0.5. The chief uses are: bone charcoal, coal and chars from light woods and lignites are suitable for adsorb-

ing color and other impurities from liquids. Chars from medium dense woods and shells are suitable for general vapor and solvent recovery. Only chars of considerable density and structural hardness, especially prepared for such use, are satisfactory for gas-mask and toxic-vapor adsorption.

Grades: Various; N. F. XI.

Shipping regulations: (As activated charcoal) flammable solid. Yellow label required for express only. *

activity. The number of atoms, or a quantity proportional to the number of atoms, of a radioactive substance decaying per unit time. The unit of activity is the curie. The specific activity is the activity per unit weight of the radioactive material. Frequently the term activity will be used synonymously with radioactivity.

activity series. See electromotive series.

"Acto." ⁵¹ Trademark for refined petroleum sodium sulfonate. Used as an oil-soluble emulsifier and surface-active agent.

"Actol." ⁵¹ Trademark for a naphthenic base crankcase oil for use where low cost is prime factor.

ADA. Abbreviation for acetonedicarboxylic acid. See beta-ketoglutaric acid.

"Adakane." ²²¹ Trademark for a line of saturated long chain hydrocarbons. Available in various grades for specific applications in lubricants, solvents, inert carriers for organic compounds, liquid radiation shield, denaturant, substitute for purified kerosene.

"Adalin." ¹⁶² Trademark for carbromal or bromodiethylacetylurea (q. v.).

adamantine spar. See corundum.

adamsite. See phenarsazine chloride.

"Addition Agent 774." ²⁸

Properties: Pale amber, mildly alkaline water solution of organic wetting agents; faint amine odor.

Containers: 9-lb (1-gal) bottles; 125-lb fiber drums.

Uses: As antipitting agent in "Coppralyte" copper plating; as antifume agent in "Durobrite" zinc plating.

addition polymers. Polymers formed by the direct addition or combination of the monomer molecules with one another, without the formation of low molecular weight by-products such as water.

adducts. See inclusion complexes.

"Adecene." ²²¹ Trademark for a line of fatty olefins. Available in various grades for applications in viscosity index improvers, pour-point depressants, detergents, lead scavengers, leather treating, textile and paper chemicals, adhesives, plastics, polymers and protective coatings.

"Ademol." ⁴¹² Trademark for flumethiazide (q. v.).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Aden gum. See arabic gum.

adenin. $C_{19}H_{28}O_8$.

Properties: Light yellow, amorphous powder m. p. 84-85°C; dextrorotatory; soluble in alcohol; insoluble in water.

Derivation: From the juice of *Adenium honghel*.

Use: Medicine.

adenine (6-aminopurine) $C_5H_5N_5$. A purine found in ribonucleic acids and deoxyribonucleic acids, nucleosides, nucleotides, and many important coenzymes.

Properties: White, odorless microcrystalline powder with sharp salty taste. M. p. 360-5°C (dec.). Very slightly soluble in cold water; soluble in boiling water, acids and alkalies; slightly soluble in alcohol; insoluble in ether and chloroform. Aqueous solutions are neutral.

Derivation: By extraction from tea; by synthesis from uric acid; prepared from yeast ribonucleic acid.

Use: Medicine and biochemical research.

adenine hydrochloride $C_5H_5N_5 \cdot HCl \cdot \frac{1}{2} H_2O$.

Properties and uses similar to adenine.

adenine riboside. See adenosine.

adenine hemisulfate $(C_5H_5N_5)_2 \cdot H_2SO_4 \cdot 2H_2O$.

Properties and uses similar to adenine.

adenohypophyseal luteotropin. See luteotropin.

adenosine (adenine riboside; 9-beta-D-ribofuranosyladenine) $C_{10}H_{13}N_5O_4$. The nucleoside composed of adenine and ribose.

Properties: White, crystalline, odorless powder with mild, saline or bitter taste. M. p. 229°C. Quite soluble in hot water; practically insoluble in alcohol.

Derivation: Isolation following hydrolysis of yeast nucleic acid.

Use: Biochemical research.

adenosine diphosphate (5'-adenylphosphoric acid; ADP, adenosine diphosphoric acid) $C_{10}H_{15}N_5O_{10}P_2$. A nucleotide of great importance in the maintenance of life. It is found in all living cells and is important in the storage of energy for chemical reactions.

Derivation: (a) From adenosine triphosphate by hydrolysis with the enzyme adenosine-triphosphatase from lobster or rabbit muscle; (b) By yeast phosphorylation of adenosine.

Use: Biochemical research.

Commercially available as the sodium or barium salt.

adenosinediphosphoric acid. See adenosine diphosphate.

adenosine monophosphate. See adenylic acid.

adenosine-3'-phosphoric acid. See adenylic acid.

adenosine-5'-phosphoric acid. See adenylic acid.

adenosine triphosphate (5'-adenyldiphosphoric acid; ATP) $C_{10}H_{16}N_5O_{13}P_3$. A nucleotide of great importance to the body. It serves

as a source of energy for many chemical reactions in the body, especially those reactions associated with muscular activity.

Properties: White amorphous powder; odorless; very faint sour taste. Very soluble in water; insoluble in alcohol, ether, and organic solvents; stable in acidic solutions; decomposes in alkaline solution.

Derivation: Isolation from muscle tissue; yeast phosphorylation of adenosine.

Use: Experimental work in physiology and biochemistry.

Commercially available as the disodium, dipotassium, and dibarium salts.

5'-adenyldiphosphoric acid. See adenosine triphosphate.

adenylic acid (adenosine monophosphate; AA; adenosine phosphoric acid; AMP). The monophosphoric ester of adenosine; i. e., the nucleotide containing adenine, D-ribose and phosphoric acid. The phosphate may be esterified to either the 2, 3, or 5 carbon of ribose yielding adenosine-2'-phosphate, adenosine-3'-phosphate, and adenosine-5'-phosphate, respectively. Yeast adenylic acid, previously believed to be adenosine-3'-phosphate, is now thought to be a mixture of the C2' and C3' compounds. Muscle adenylic acid (A5MP) has been shown to be adenosine-5'-phosphate. Adenylic acid is a constituent of many important coenzymes.

Properties (muscle adenylic acid): Crystalline solid, m. p. 196-200°C. Readily soluble in boiling water. Gives only traces of furfural when boiled with 20% hydrochloric acid.

(yeast adenylic acid monohydrate): Long crystalline rods. Decomposes 195°C. Anhydrous form decomposes at 208°C. Almost insoluble in cold water; slightly soluble in boiling water. Gives quantitative yield of furfural when distilled with 20% HCl.

Derivation: Yeast adenylic acid by precipitation from yeast nucleic acid. Muscle adenylic acid by precipitation from tissues; by hydrolysis of ATP with barium hydroxide; by enzymatic phosphorylation of adenosine.

Uses: Medicine and biochemical research.

5'-adenylphosphoric acid. See adenosine diphosphate.

adepts. See lard.

"Ad-Flex." ²⁶⁵ Trademark for vulcanizable synthetic rubber produced by the polymerization of diolefin or diolefin/mono-olefin mixture further modified by addition of low molecular weight mercaptans.

adhesion

1. The phenomenon of holding surfaces together with an adhesive (q. v.).
2. The phenomenon of the sticking of two surfaces together due to molecular attraction for each other.

adhesive. A substance capable of holding materials together by surface attachment.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Note: Adhesive is the general term and includes among others cement (pyroxylin and rubber), glue, mucilage and paste. All of these terms are loosely used interchangeably. Various descriptive adjectives are applied to the term adhesive to indicate certain characteristics as follows: Physical form, that is, liquid adhesive, tape adhesive.

Chemical type, that is, silicate adhesive, resin adhesive.

Materials bonded, that is, paper adhesive, metal-plastic adhesive, can label adhesive. Conditions of use, that is, hot-setting adhesive. (ASTM definition: ASTM D 907-52).

See also dextrin, furan resin; sodium silicate. *

"Adhevia." ²⁰⁶ Brand name for proprietary adhesion agents for tar and bitumen.

adiabatic. A process, condition, or operation during which there is no gain or loss of heat from the surroundings.

adiphenine hydrochloride (diethylaminoethyl diphenylacetate hydrochloride) $(C_6H_5)_2CHCOOC_2H_5N(C_2H_5)_2 \cdot HCl$.

Properties: Crystals; m.p. 113°C. Soluble in water; almost insoluble in alcohol and ether.

Use: Medicine.

adipic acid (hexanedioic acid; 1,4-butanedicarboxylic acid) $COOH(CH_2)_4COOH$.

Properties: White, crystalline solid. M.p. 152°C; b.p. (100 mm) 265°C; sp. gr. (20/4°C) 1.360, flash point (closed cup) 385°F. Slightly soluble in water; soluble in alcohol and acetone. Relatively stable. Derivation: Oxidation of cyclohexane, cyclohexanol, or cyclohexanone with air or nitric acid.

Grades: Technical.

Containers: Glass bottles, tins; 50-lb multiwall paper bags; drums.

Uses: Manufacture of nylon and polyurethane foams; preparation of esters for use as plasticizers and lubricants; ingredient of baking powders, insecticides, adhesives.

Shipping regulations: None. *

adipocerite. Synonym for hatchettite (q. v.).

"Adipol" 10A Plasticizer. ⁵⁵ Trade name for diisooctyl adipate (q. v.).

"Adipol" BCA Plasticizer. ⁵⁵ Trademark for dibutoxyethyl adipate (q. v.).

"Adipol" DIBA Plasticizer. ⁵⁵ Trade name for diisobutyl adipate (q. v.).

"Adipol" 2EH Plasticizer. ⁵⁵ Trademark for di-2-ethylhexyl adipate (q. v.).

"Adipol" ODY Plasticizer. ⁵⁵ Trademark for n-octyl n-decyl adipate (q. v.).

"Adipol" XX Plasticizer. ⁵⁵ Trademark for di-isodecyl adipate (q. v.).

adiponitrile $NC(CH_2)_4CN$. An intermediate in the manufacture of nylon 66. M.p. 1-3°C. It can be hydrolyzed to adipic acid or hydrogenated to form hexamethylenediamine.

Industrially, there are two important synthetic methods for adiponitrile: (1) from furfural, through the intermediate furan, tetrahydrofuran, and 1,4-dichlorobutane; and (2) from butadiene via 1,4-dicyanobutene-2.

"Adiprene" C. ²⁸ Trademark for a urethane rubber. Reaction product of a diisocyanate and a polyalkylene ether glycol.

Properties: Amber colored solid in stick form; sp. gr. 1.07.

Containers: 50-lb drums.

Use: A synthetic rubber for products that must have exceptional abrasion resistance, high tensile strength and low temperature brittle point.

"Adiprene" L-100. ²⁸ Trademark for a liquid urethane rubber. Reaction product of a diisocyanate and a polyalkylene ether glycol.

Properties: Honey-colored liquid; viscosity 14,000-19,000 cps at 30°C; sp. gr. 1.06.

Containers: 450-lb drums.

Uses: A fluid elastomer which can be converted into a tough elastic solid rubber having excellent resistance to abrasion, oxidation and ozone.

"Adiprene" L-167. ²⁸ Trademark for a liquid urethane rubber. Reaction product of a diisocyanate and a polyalkylene ether glycol.

Properties: Honey-colored liquid; viscosity 6000-8000 cps at 30°C; sp. gr. 1.06.

Containers: 450-lb drums.

Use: A type of "Adiprene" L-100 which will give harder vulcanizates.

"Admex." ²²¹ Trademark for a line of plasticizers consisting variously of epoxidized soybean oil, monomeric esters and polyesters. Typical member:

"Admex" 710, epoxidized soybean oil.

Properties (approximate): A light colored liquid; sp. gr. 0.994 (25/25°C); 8.25 lbs/gal (25°C); insoluble in water, viscosity 400 cps (25°C).

Uses: Plasticizers for polyvinyl chloride and copolymers, cellulose and other natural and synthetic resins.

admiralty metal. A non-ferrous alloy containing 70-73% copper, 0.75-1.20% tin, and the remainder zinc. It offers good resistance to dilute acids and alkalis, sea water, and moist sulfurous atmospheres. Sp. gr. (20°C) 8.53; liquidus temperature 935°C; solidus temperature 900°C.

Uses: Condenser, evaporator, and heat exchanger tubes, plates, and ferrules.

adobe clay. See brick clay.

"Adogen." ²²¹ Trademark for a line of fatty nitrogen chemicals including amines, amides, nitriles and quaternary ammonium compounds. Available in various grades for specific applications in fabric softeners, ore separation, detergents, petroleum additives, corrosion inhibitors, bactericides, printing inks, anti-block and slip agents, water proofing formulations and chemical intermediates.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Adol." ²²¹ Trademark for a line of industrial fatty alcohols, saturated and mono-unsaturated. Available in a variety of grades for specific applications in detergents, vinyl plastics, shampoos, corrosion inhibitors, agricultural chemicals and synthetic waxes.

ADP. See adenosine diphosphate.

adraganthin. See bassorin.

adrenal cortical hormones. See corticoid hormones.

"Adrenalin(e)." ³³⁰ Trademark for epinephrine (q. v.).

adrenocorticotrophic hormone. See ACTH.

"Adroyd." ³³⁰ Trade name for oxymetholone (q. v.).

adsorbent. A substance which has the ability of condensing or holding other substances on its surface. Active carbon, activated alumina, and silica gel are examples.

"Adsorbol." ³⁸ Trademark for a montmorillonite clay produced in both activated and natural form in both granular and in 200-mesh powder. Used to remove odors and colors in oils, fats, fatty acids and similar substances.

adsorption. The taking up of a gas, vapor or dissolved material on the surface of a solid. All solids have on their surface some adsorbed material. Certain finely divided materials, particularly active carbon (q. v.) and silica gel, can adsorb relatively large quantities of other materials. The process of adsorption must be distinguished from absorption.

adsorption indicator. A substance used in analytical chemistry to detect the presence of a slight excess of another substance or ion in solution as the result of a color produced by adsorption of the indicator on a precipitate present in the solution. Thus a precipitate of silver chloride will turn red in a solution containing even a minute excess of silver ion (silver nitrate solution), if fluorescein is present. In this example, fluorescein is the adsorption indicator.

"Advacar." ²³⁰ Trademark for a series of water-dispersible paint driers.

"Advacide." ²³⁰ Trademark for a series of fungicides and mildewcides for paints, etc., wood and fabric preservatives.

"Advasol." ²³⁰ Trademark for a series of liquid soluble paint driers of a linoleum base. Supplied in high metal concentrations: lead 24%, calcium 4%, cobalt 6%, manganese 6%, iron 6%, zinc 5%.

"Advawax." ²³⁰ Trademark for a line of wax modifiers.

"Advawax P." A master batch of high molecular weight polybutene and paraffin wax designed to facilitate incorporation of the rubbery polymer into additional wax.

"Advawax M." A master batch of high molec-

ular weight polybutene and amber colored microcrystalline wax; designed to facilitate incorporation of the rubbery polymer into additional wax.

"Advawax 280." A hard, high melting point synthetic wax for use in lacquers, varnishes, as a plastic lubricant and anti-blocking agent, as an extender or substitute for carnauba wax.

"Advawet." ²³⁰ Trademark for a series of wetting agents for emulsion paints, latex paints, and vinyl plastisols.

"AD-X2." ⁴³⁷ Trademark for a treated mixture of salts including sodium sulfate and magnesium sulfate. Used as additive to lead storage batteries to reduce effects of sulfation.

aerate. To impregnate or saturate a material (usually a liquid) with air, or some similar gas. This is usually achieved by bubbling the air through the liquid, or by spraying the liquid into air.

"Aero" Brand Cyanide. ⁵⁷ Trademark for calcium cyanide sold in the form of black flakes and used primarily for leaching of gold and silver ores.

"Aerobrite." ⁵⁷ Trademark for a metal processing aid.

"Aerocarb." ⁵⁷ Brand name for mixtures containing salts of sodium, potassium, and barium used as a molten bath for case-hardening and heat treatment of steel.
Containers: Steel drums.
Shipping regulations: Poison Class B. Poison label. *

"Aerocase." ⁵⁷ Brand name for mixtures of calcium chloride and sodium chloride, used as a molten bath activated with calcium cyanide, to case-harden and heat-treat steel.

Containers: Steel drums.

Shipping regulations: Calcium cyanide component, Poison, Class B. Poison label. *

"Aero" Catalysts. ⁵⁷ Trademark for a line of various special catalysts used mostly in the manufacture of ammonia and sulfuric acid.

"Aerocat" Cracking Catalysts. ⁵⁷ Trademark for a line of synthetic silica-alumina catalysts used for refining of petroleum in fluid catalytic cracking units.

"Aero" Cyanamid. ⁵⁷ Brand name.
Properties: Gray to black dry material of various finenesses.

Containers: 50- and 100-lb bags.

Uses: For direct application to soil; formulating complete fertilizers and special uses such as leaf removal, vine killing, wood control and disease control.

"Aero" Cyanate. ⁵⁷ Brand name for product containing 92% potassium cyanate.

Properties: White flakes.

Containers: 5-lb can; 40-lb pail; 100-lb drum.

Uses: Weed control in onions. Weed control

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

in other crops being investigated.

Caution! Avoid breathing dust or spray mist. Avoid prolonged or repeated contact with skin. MCA warning label.

"Aerofat." ⁵⁷ Trademark for a flotation agent.

"Aerofloat." ⁵⁷ Trademark for aryl dithiophosphoric acids (liquids) and alkyl dithiophosphoric acid salts (solids) used as mining flotation reagents to promote frothing properties.

"Aerofloc" Promoters. ⁵⁷ Trademark for a group of synthetic water soluble polymers used as flocculating agents to improve solid-liquid separations by thickening and filtration.

"Aeroform" Catalysts. ⁵⁷ Trademark for a line of alumina-based catalysts used for the up-grading of gasoline in either fixed bed or fluid reforming units.

"Aerofroth" Frothers. ⁵⁷ Trademark for a group of surface-active agents used primarily as foaming agents or frothers in flotation processing of ores and minerals.

"Aeroheat" Neutral Salts. ⁵⁷ Trademark for various mixtures containing alkaline chlorides, carbonates, nitrates and nitrites. Used in the form of molten baths in the hardening, quenching, annealing and tempering of ferrous and non-ferrous metals.

"Aero" Hydrocyanic Acid Discoids. ⁵⁷ Trademark for proprietary product containing hydrocyanic acid absorbed in cellulose discs.

Properties: Off-white cellulose discs which evolve hydrocyanic acid gas.

Containers: 1-lb can, 2 1/2-lb can.

Use: For killing household and shipboard pests.

Shipping regulations: Class B poison. Poison label. *

"Aerolin." ⁵⁷ Trademark for bating for use in the treatment of hides in the manufacture of leather.

"Aero" Liquid Hydrocyanic Acid. ⁵⁷ Brand name for a proprietary product; hydrocyanic acid in liquid form of 96-98% commercial purity.

Containers: Steel cylinders. Drums for citrus fumigation in California only.

Uses: For fumigation of mills, warehouses and food-processing plants; fumigation of food and tobacco in chambers; also citrus fumigation.

"Aerolube." ⁵⁷ Trademark for a line of additives for motor and industrial oils to improve oxidation stability, wear, and other properties.

"Aeromet." ⁵⁷ Trademark for metallurgical additive in steel making where nitrogen content is desired; also applied to iron and steel for desulfurization.

Containers: Bulk freight cars and in moisture-resistant paper bags in fiber drums.

"Aeromine" Promoters. ⁵⁷ Trademark for a

group of cationic flotation reagents used in float flotation processing of ores and minerals, primarily silica and silicates.

"Aero" Nitriding Compound. ⁵⁷ Trademark for cyanide-carbonate mixture used for cyanide nitriding of steels.
Containers: Steel drums.

"Aeronox." ⁵⁷ Trademark for a line of anti-oxidants for use in industrial oils and lubricants.

"Aero-Phos." ⁵⁷ Proprietary product; finely ground Florida natural phosphate, 31%, 33%, 35% P₂O₅.

Properties: Light tan material generally 85% through a 200-mesh screen.

Containers: Bulk freight car and 100-lb bags.

Use: For direct application to the soil as a fertilizer.

"Aeropills." ⁵⁷ Proprietary product, ammonium nitrate fertilizer containing 33.5% nitrogen (16.75% nitrate nitrogen; 16.75% ammonia nitrogen).

Properties: Light cream colored pellets of small uniform size.

Containers: 80 or 100 lb. bags.

Uses: For direct application and in fertilizer mixtures.

"Aerosize" Sizing Compounds. ⁵⁷ Trade name for a series of aqueous high free rosin emulsions used for treatment of paper and paper board to impart water, ink, and lactic acid resistance. May be used to give a surface sizing effect as on floor coverings.

aerosol.

1. Colloidal suspension of liquid or solid particles in a gas. For example, the insecticide DDT may be dissolved in "Freon" and kept under pressure. When released the solvent vaporizes rapidly leaving an aerosol of DDT. The "smog" causing so much trouble in Los Angeles and other industrial regions is an aerosol. In chemical warfare aerosols play an important part as screening smokes, etc.

2. Term also used for aerosol bomb, a container filled with liquefied gas and dissolved or suspended ingredients which can be dispersed as a spray or aerosol.

aerosol propellants. A compressed gas or vapor whose expansion carries another substance or mixture from a container when a valve is opened and pressure is thus released. Most non-food aerosol propellants (for insecticides, paints, perfumes), are fluorocarbons, as, for example, dichlorodifluoromethane. Compressed nitrogen and propane are used for aerosol shaving creams and toothpastes, and compressed nitrous oxide, carbon dioxide, and nitrogen are used for foods, as in aerosol whipped cream.

"Aerosol" Wetting Agents. ⁵⁷ Brand name for neutral wetting agents obtainable in various types. They do not decompose on heating and are soluble in practically all nonaqueous media as well as in water.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- "Aerosol" OT 100%: A nearly pure (99.5-100%) nontoxic, nonvolatile, practically odorless ester of a sulfonated dicarboxylic acid which resembles paraffin in appearance, is somewhat soft and plastic, practically nonhygroscopic and is supplied in pellet form. Solubility in water: 1.5 g/100 cc (25°C), 5.5 g/100 cc (70°C).
- "Aerosol" OT Aqueous: A somewhat opaque, slightly gelatinous 10% (or 25%) dispersion of "Aerosol" OT 100% in water.
- "Aerosol" OT Clear: A water-white, free-pouring liquid consisting of "Aerosol" OT 100% in 70%, 25% and 10% concentrations in water and a mutual solvent.
- "Aerosol" OT-B: Free flowing white powder containing 85% "Aerosol" OT and 15% sodium benzoate.
- "Aerosol" OS: Light tan colored powder containing approximately 80% active ingredient, the remainder being sodium sulfate.
- "Aerosol" AY: A nonvolatile, practically odorless substance similar in appearance to "Aerosol" OT but markedly less plastic. Solubility in water: 39.2 g/100 cc (25°C), 50.2 g/100 cc (70°C).
- "Aerosol" MA: A product similar to "Aerosol" AY. Solubility in water: 34.3 g/100 cc (25°C), 44.7 g/100 cc (70°C).
- "Aerosol" 18: Light cream colored paste containing 35% active ingredient, 65% water. Readily dispensable in water, yielding a pearly, opalescent dispersion that becomes clear when heated. Of value as a detergent for fabrics in hard water.
- "Aerosol" C-61: A cationic surface active agent.
- Uses: Wetting agent; antiseptics; cosmetics, detergents; inks; cleaning; degreasing metals, case-hardening processes for metals, paints; varnishes, and lacquers; paper; printing inks; shampoos; toilet preparations; acid treatment of oil wells; embalming fluids; manufacture of crystalline materials; settling operations; breaking mineral oil emulsions; wall-paper removers; shoe cleaners and polishes.
- "Aerosporin." ³⁰¹ Trademark for polymyxin B, an antibiotic used in medicine.
- "Aerospray." ⁵⁷ Trademark for a resin emulsion to prevent dust loss, rain erosion or coal fines.
- "Aerotex" Accelerator 187. ⁵⁷ A buffered inorganic salt catalyst. Accelerator for melamine and urea formaldehyde resins, particularly where a rapid rate of cure is required.
- "Aerotex" Accelerator AS. ⁵⁷ An acid salt catalyst used primarily to cure "Permel" Resin B.
- "Aerotex" Accelerator MX. ⁵⁷ A buffered inorganic salt catalyst for melamine formaldehyde resins. Increases the efficiency of melamine formaldehyde resins.
- "Aerotex" Accelerator S. ⁵⁷ A catalyst for use with silicone water repellent emulsions, only.
- "Aerotex" Accelerator UTX. ⁵⁷ A non-ammoniacal catalyst for urea and melamine formaldehyde resins. Resins catalyzed with this product polymerize at a moderate uniform rate which minimizes overcuring.
- "Aerotex" Buffer DCY. ⁵⁷ An organic, nitrogen containing compound which is added to thermosetting resin baths to prevent amine type or formaldehyde odors in resin-treated fabrics.
- "Aerotex" Cream 450. ⁵⁷ Trademark. A urea formaldehyde resin used as an anticreasing agent, a durable resin finish, a finishing agent, an antislip finishing agent and for shrinkage control.
- "Aerotex" CSN. ⁵⁷ Trademark for a 25% solids aqueous solution of a cationic organic compound. Pale yellow liquid; pH 6-7; imparts antistatic properties to acrylic, acetate, polyester, nylon, wool, and resin-treated cellulose fibers and fabrics.
- "Aerotex" Fire Retardant NDC. ⁵⁷ A water-soluble phosphate mixture. This product is a non-durable fire retardant for cellulosic textiles. It gives a non-hygroscopic finish resistant to tensile strength loss when exposed to high temperatures.
- "Aerotex" Fire Retardant NDS. ⁵⁷ A water-soluble phosphate mixture. This product is a non-durable fire retardant finish for textiles which produces a somewhat softer hand than "Aerotex" Fire Retardant NDC. It may be applied by padding or spraying.
- "Aerotex" Resins. ⁵⁷ Trademark for a group of synthetic resins used in finishing textile fabrics.
- "Aerotex" Resin 110: A resin emulsion used for finishing cotton and as a sizing for hat felts.
- "Aerotex" Resin 120: An oil-in-water type of emulsion of a thermoplastic resin. Useful as a durable finish for cellulosic textiles to increase the abrasion resistance, improve hand, and produce a durable finish.
- "Aerotex" Resin 133: A thermoplastic copolymer used in creaseproofing formulations with melamine formaldehyde resins to modify the hand and increase the wrinkle recovery properties and the tensile strength of textiles.
- "Aerotex" Resin 159: A dispersion of a thermoplastic resin used primarily for stiffening textile fabrics.
- "Aerotex" Resin 180: A urea formaldehyde resin used as a bodying agent and also to insolubilize starch finishes.
- "Aerotex" Resin 801: A modified urea formaldehyde resin used for creaseproofing, shrinkage control and increasing the body of rayon and cotton fabrics. This product has excellent stability.
- "Aerotex" Resin 802: A modified urea formaldehyde resin used for producing durable body, wrinkle recovery and shrinkage control on rayon fabrics. It is a durable finishing agent which produces an anti-slip finish on all fibers.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

"Aerotex" Resin 803: A modified urea formaldehyde resin which gives a very stiff finish on all fibers. It produces a stiff, wrinkle resistant finish on rayon.

"Aerotex" Resin 7513: A resin emulsion used as a finish for cotton and synthetics; also useful for building body of finish, along with "Aerotex" Resin M3.

"Aerotex" Resin M3: A melamine formaldehyde resin used for textile treatment to achieve crease resistance, shrinkage control, durable glazed finishes. Also used as a gasfading inhibitor for acetate dyes.

"Aerotex" Resin P-114: A resin dissolved in mineral spirits used in resin bonded pigment applications as a pigment binder.

"Aerotex" Resin P-116: A solution of a resin in mineral spirits. This product is used to prepare a printing emulsion for resin bonded pigments.

"Aerotex" Resin P-117: A solution of a resin in xylol. This product is used to prepare a printing emulsion for resin bonded pigments.

"Aerotex" Resin P-200: A solvent soluble modified melamine formaldehyde resin used in resin bonded pigment applications to improve scrub resistance.

"Aerotex" Resin UM: A melamine formaldehyde resin used for producing crease resistance, shrinkage control and durable mechanical finishes with a soft hand to textile fabrics.

"Aerotex" Softener H. ⁵⁷ Trademark. A durable synthetic type textile softener of mixed cationic and anionic agents. Especially suited for use in conjunction with most of the synthetic resin processes because of its compatibility, being equally efficient on wool, cotton, or synthetic fibers.

"Aerotex" Softener W. ⁵⁷ An anionic emulsion which acts as a softening agent and improves the luster and sewability of fabrics. Used as a plasticizing agent for "Aerotex" Resin 159.

"Aerotex" Syrup 55. ⁵⁷ A modified urea-formaldehyde resin for use with other thermosetting resins or alone to produce durable stiffness on textile fabrics.

"Aerotex" Syrup 250 (Conc.). ⁵⁷ Trademark. A urea formaldehyde resin used as an antislip finishing agent and for durable finishes on textiles.

"Aerotex" Thickener 37. ⁵⁷ A water-soluble polymer which is used as a thickener and as an additive to warp sizes to improve the abrasion resistance, flexibility and size adhesion.

"Aerotex" Water Repellent S. ⁵⁷ This product is a silicone emulsion for producing water repellency on textile fabrics.

aesculin. See esculin.

AET. See aminoethylisothiuronium bromide hydrobromide.

"Afaxin." ¹⁶² Trademark for synthetic oleo-

vitamin A.

affinity. Chemical affinity is loosely used to express the tendency for a mixture of substances to react chemically. The free energy decrease is a quantitative measure of chemical affinity.

African pepper. See capsicum.

"Afrox." ⁸⁹ Trademark for a foaming agent used to remove water and cuttings from drill holes in drilling oil wells by air or gas methods.

after-chromed dyes. Those which are improved in color or fastness by treatment with sodium dichromate, copper sulfate or similar materials, after the fabrics are dyed.

Ag. Symbol for silver.

agalite. A variety of talc (q.v.) from New Jersey. Used in paper coatings.

agalmatolite. A variety of pyrophyllite (q.v.).

agar. See agar-agar.

agar-agar. (Japanese, Bengal, Ceylon, or Chinese isinglass or gelatin, macassargum; Laysan caranga; sometimes erroneously called vegetable glue or gelatin).

Properties: Consists in part, at least, of a mixed sulfate of calcium and a polysaccharide containing galactose. Dried mucilaginous substance extracted from various species of Gelidium and Algae. Unground, in thin, translucent membranous pieces; ground, pale, buff powder. Soluble in boiling water; insoluble in cold water; swells slowly in water. Insoluble in organic solvents.

Occurrence: Pacific and Indian Oceans; Japan Sea; also off southeastern U.S. coast.

Grades: Technical; U.S.P. XVI.

Containers: Multiwall paper sacks; fiber drums; bales.

Uses: Culture medium in bacteriology; sizing for silk; adhesives; substitute for gelatin; pharmaceutical preparations; photography (ingredient of sensitized emulsions); ingredient of vegetarian foods; sausage casing manufacture; food stuffs (thickening agent in milk, cream, ice cream, etc., substitute for white of egg); medicine; as coating or paste base in many specialties.

Shipping regulations: None.*

agaric (toughwood; spunk; tinder; larch agaric; German fungus). The dried fruit body of a fungus, Polyporus officinalis.

Properties: Light colored, spongy irregular-shaped pieces; faint odor; disagreeable taste.

Chief constituent: Agaric acid.

Occurrence: Upon European larch and various coniferous trees in western United States and Canada; commercially, principally from larch forests near Archangel.

Use: Medicine.

agaric acid (agaricinic acid; agaric acid)
 $C_{19}H_{36}OH(COOH)_3 \cdot 1 \frac{1}{2} H_2O$.

Properties: White, microcrystalline powder;

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

odorless; tasteless; m. p. 141.5°C with decomposition. Soluble in hot water, alcohol, and alkali solutions; barely soluble in cold water, ether, and chloroform.

Derivation: From agaric (q. v.).

Uses: Medicine; synthesis (esters and salts).

agaric acid. See agaric acid.

agaricin. A preparation containing active agaric acid, obtained from agaric by alcoholic extraction.

Use: In medicine (similar to agaric).

agaricinic acid. See agaric acid.

agate. A form of native silica or quartz (q. v.) essentially a variegated chalcedony. The colors are either banded, irregularly clouded, or, due to visible impurities as in moss agate which has brown moss-like or dendritic forms, as of manganese oxide, distributed through the mass. The bands differ in porosity and may be colored artificially.

Uses: Gems; pestles and mortars; burnishers or polishers for gold workers and bookbinders; textile rollers; pivot supports for balances and magnetic needles; balls for ball mills, spatulas for mixing corrosive substances.

agave fibers. Hard, strong fibers obtained from various species of Agave, especially sisal (q. v.). They are used in rope, cordage, and sacking but are not as strong or water-resistant as abaca. See also cantala; henequen; istle.

age. See Fermi age.

age-resisters. See antioxidants.

"Agerite Alba." ⁶⁹ Trade name for a proprietary product, para-benzyloxyphenol.

Properties: Light powder; sp. gr. 1.26; faint pleasant odor; none in rubber stocks; m. p. 115-120°C; nontoxic. Discoloration, essentially none in indirect sunlight; minimum in direct sunlight. Very slightly soluble in water; practically insoluble in petroleum hydrocarbons; soluble in benzene and alkalis.

Uses: Antioxidant in white and light-colored rubber products.

"Agerite DPPD." ⁶⁹ Trademark for a proprietary product, N,N'-diphenyl-para-phenylenediamine.

Properties: Dark blue to black powder, sp. gr. 1.28 ± .03; melting range 145-152°C, moderately soluble in acetone, benzene, carbon disulfide, chloroform; slightly soluble in alcohol, petroleum hydrocarbons; insoluble in water.

Uses: Flex-crack resisting rubber antioxidant.

"Agerite Gel." ⁶⁹ Trademark for a proprietary product, ditolylamines with a selected petroleum wax.

Properties: Grayish-white, soft, waxy solid; sp. gr. 1.01; odor faint; m. p. about 65°C; nontoxic. Insoluble in water; soluble in gasoline, chloroform, benzene, and carbon

disulfide.

Use: Antioxidant in practically any rubber stock, especially sponge rubber.

"Agerite Hipar." ⁶⁹ Trademark for a proprietary product, phenyl-beta-naphthylamine, plus isopropoxydiphenylamine, plus diphenyl-para-phenylenediamine.

Properties: Gray-brown soft powder; sp. gr. 1.19; odor, slight, none in rubber stocks; m. p. 75-90°C; nontoxic. Insoluble in water; slightly soluble in petroleum hydrocarbons; soluble in benzene.

Uses: Antioxidant in tire treads, rubber soling, and other goods where flex-cracking resistance is important.

"Agerite HP." ⁶⁹ Trademark for a proprietary blend of phenyl-beta-naphthylamine and N,N'-diphenyl-para-phenylenediamine.

Properties: Gray to brown powder; sp. gr. 1.21 ± .03; melting range 89-96°C; soluble in acetone, benzene, chloroform, carbon disulfide; moderately soluble in alcohol, gasoline; insoluble in water.

Uses: Flex-crack resisting antioxidant.

"Agerite Iso." ⁶⁹ Trademark for a proprietary product, para-isopropoxydiphenylamine.

Properties: Tan to gray flakes; sp. gr. 1.15 ± .03; melting range 80-86°C; very soluble in acetone, benzene, chloroform, carbon disulfide; soluble in alcohol; moderately soluble in gasoline, petroleum ether; insoluble in water.

Uses: Antioxidant for tires.

"Agerite Powder." ⁶⁹ Trademark for phenyl-beta-naphthylamine.

$C_{10}H_7NHC_6H_5$.

Properties: Gray; odor very faint; m. p. 106-107°C; sp. gr. 1.19; nontoxic in ordinary handling. Insoluble in water; moderately soluble in gasoline, alcohol; soluble in chloroform, benzene, acetone, and carbon disulfide.

Use: Antioxidant in tire treads, inner tubes, wire insulation, mechanicals, and footwear.

"Agerite Resin." ⁶⁹ Trademark for aldol- α -naphthylamine. $C_{10}H_7NCH_2CH_2CHOHCH_3$.

Properties: Cherry red resin; odor characteristic; m. p. 80-100°C; sp. gr. 1.16. Insoluble in water, gasoline; sparingly soluble in alcohol, soluble in chloroform, benzene, and carbon disulfide.

Use: Antioxidant in tire carcasses, tubes, uncured tape, black soles.

"Agerite Resin D." ⁶⁹ Trademark for a polymerized trimethyldihydroquinoline.

Properties: Reddish-brown, brittle resin in small pellets. Odor faint, not objectionable; sp. gr. 1.08; m. p. 60-90°C; nontoxic. Insoluble in water and petroleum hydrocarbons. Easily soluble in benzene. Use: Antioxidant in rubber products such as tire carcasses, inner tubes, wire insulation, belting, brake lining, air-bags, and steam hose.

"Agerite Spar." ⁶⁹ Trademark of a proprietary product, mixed mono-, di-, and tristyrena-

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ted phenols.

Properties: Light straw colored liquid; sp. gr. $1.08 \pm .02$; very soluble in petroleum hydrocarbons, alcohol, esters; insoluble in water.

Uses: General purpose, reasonably non-staining and nondiscoloring rubber antioxidant.

"Agerite Stalite." ⁶⁹ Trademark of a proprietary product, mixture of mono-, and dioctylated diphenylamines.

Properties: Reddish brown, viscous liquid; sp. gr. $0.99 \pm .02$; very soluble in alcohol, benzene, carbon disulfide, gasoline; insoluble in water.

Uses: General purpose antioxidant for all elastomers.

"Agerite Stalite S." ⁶⁹ Trademark of a proprietary product, a purified mixture of mono- and dioctylated diphenylamines.

Properties: Light tan, friable powder; sp. gr. $0.97 \pm .03$; melting range $89-103^{\circ}\text{C}$; very soluble in alcohol, benzene, carbon disulfide, gasoline.

Uses: General purpose antioxidant in all rubbers.

"Agerite Superflex." ⁶⁹ Trademark for a proprietary diphenylamine-acetone reaction product.

Properties: Dark brown liquid; sp. gr. $1.10 \pm .02$; very soluble in acetone, benzene, chloroform, carbon disulfide; slightly soluble in gasoline; insoluble in water.

Uses: Flex-crack resisting antioxidant for dark rubber, such as tires and heavy duty mechanicals.

"Agerite Superlite." ⁶⁹ Trademark for a proprietary product, a mixture of polybutylated bisphenol A.

Properties: Amber liquid; sp. gr. $0.945-0.965$; very soluble in benzene, chloroform, gasoline; insoluble in water.

Uses: Essentially nondiscoloring, nonstaining, rubber antioxidant.

"Agerite White." ⁶⁹ Trademark for sym-dibeta-naphthyl-para-phenylenediamine. $\text{C}_{10}\text{H}_7\text{NHC}_6\text{H}_4\text{NHC}_{10}\text{H}_7$.

Properties: Grayish-white; odor very faint; m. p. $230-235^{\circ}\text{C}$; sp. gr. 1.20 ; nontoxic in ordinary handling. Insoluble in water; moderately soluble in chloroform, acetone, carbon disulfide, benzene, and gasoline.

Uses: Preventive of deterioration caused by copper and as an all-purpose antioxidant in pure gum stocks, thread, bands, bathing caps, proofing, stocks containing factice; acid-cured stocks and latex compound.

agglutination. Aggregation of suspended bacteria into lumps that usually settle out. Sometimes applied to other similar suspended particles but usually applied to the clumping together of bacteria under the action of antitoxins.

aglucone. The nonsugar-like portion of a glucoside molecule. See glycosides.

aglycones. The nonsugar hydrolytic products of glycosides. See glycosides.

"Agrico." ³⁰⁶ Trademark for a line of fertilizers of various compositions, types and grades.

agricultural chemicals. Chemicals used to increase the productivity and quality of farm crops. They include fertilizers, soil conditioners, fungicides, insecticides, and weed-killing agents.

"Agrilon." ⁶⁵ Trademark for synthetic electrolytes.

"Agrimul." ³⁰⁹ Trademark for an insecticide emulsifier.

"Agri-Mycin." ²⁹⁹ Trademark for an agricultural preparation containing streptomycin.

"Agrinite." ¹⁹⁶ Trademark for an organic fertilizer.

"Agri-Phos." ¹⁹⁶ Trademark for a superphosphate fertilizer.

"Agri-Strep." ¹²³ Trademark for agricultural antibiotics.

"Agritracin." ³⁴² Trademark for antibiotic sprays and dusts to combat plant diseases.

"Agrox." ¹⁵⁰ Trademark for a mercurial seed disinfectant, containing 6.70% phenyl mercury urea.

Containers: 14-oz and 3-lb tins; 50- and 100-lb drums.

Uses: On cereal crops, cotton, rice, and flax for protection against bunt, smut, seed rot, and seed blight.

"Agrozyme." ¹²³ Trademark for an enzyme preparation for use in animal and poultry feed.

ague tree. See sassafras bark.

"Ahco" 1250. ³²⁵ Trademark for a polyvinyl acetate emulsion. Produces durable, stiff finish on textiles. Used for backfilling, bodying, binding.

"Ahco" Assistant 100. ³²⁵ Trademark for a water soluble polymer. Stripping assistant for vat dyed fibers.

"Ahco" Base Oil 90. ³²⁵ Trademark for an oleic acid-ethylene oxide condensate. Emulsifier for mineral oil, kerosene, fatty acid esters.

"Ahcobond S." ³²⁵ Borated resin used as a water soluble resin binder and plasticizer for textile sizing.

"Ahco" DD-50. ³²⁵ Trademark for a blend of mineral oil with sulfonated oils and esters. Used as textile softener and shrink-proofing oil.

"Ahcofix" C. ³²⁵ Resinous condensation product; a water-colored syrupy liquid used as a fixation product for direct dyes.

"Ahcols." ³²⁵ A series of sulfated oils for dyeing and finishing assistants.

"Ahcoquinone." ³²⁵ Brand name for a series of acid and mordant dyestuffs.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

"Ahcotex" W-100. ³²⁵ Trademark for emulsifiable mineral oil. Lubricant for wool rawstock and cottonyarns. *

"Ahcovat." ³²⁵ Brand name for series of anthraquinonoid vat dye stuffs.

"Ahcovat" Solubles. ³²⁵ Brand name for a series of leuco vat esters.

"Ahcovels" A, G. ³²⁵ Fatty carbamides. Cationic substantive softening agents.

"Ahcovels" E, F, R, RM. ³²⁵ Fatty carbamide salts. Anionic substantive softening agents.

"Ahcowet." ³²⁵ Trade name for a series of synthetic surface-active agents.

"Ahcowet" 129. Sulfated fatty acid ester. Anionic wetting and non-foaming agent for continuous high-speed vat dye baths.

"Ahcowet" ANS. Alkylaryl sulfonate. Anionic detergent and penetrant in 50% aqueous solution used as dye bath assistant for sulfur and direct colors, "boil off" assistant, carbonizing agent.

"Ahcowet" N. Ethylene oxide condensate. Non-ionic general purpose detergent and wetting agent in 25% aqueous solution.

"Ahcowet" RS. Sulfated ester. Anionic wetting and rewetting agent for textile processing. 65% aqueous solution.

"Ahcowet" SDS. Sulfonated alkyl ester. Anionic general-purpose surface active agent in 65% aqueous solution. For general wetting and for emulsification problems.

"Ahcowet" VL. Ethylene oxide condensate. Non-ionic dispersant and retardant for vat dyes used as a dispersant for acetate dyes. 20% aqueous solution.

A. I. Ch. E. Abbreviation for American Institute of Chemical Engineers.

air. A mixture of gases, the composition of which varies with altitude and other conditions at the collection point. A rule of thumb composition for dry clean air is 79.1% nitrogen and 20.9% oxygen by volume, or 76.8% nitrogen, 23.2% oxygen by weight. An average composition at surface altitudes is

	By volume %	By weight %
Nitrogen.....	78.09	75.54
Oxygen.....	20.93	23.14
Argon.....	0.93	1.27

Pure air also contains very small percentages of the rare gases neon, krypton, xenon and helium. Air as ordinarily encountered also always contains appreciable quantities of water vapor and carbon dioxide. See also liquid air.

Shipping regulations: Compressed air: Nonflammable gas. Green label. *

air classification. The separation of solid particles according to weight and/or size, by suspension in and settling from an air stream of appropriate velocity.

"Aircoflex." ¹⁴⁴ Trademark for plasticizers

tailored to modify homopolymer and copolymer emulsion systems.

airfloat clays. Clays of fine state of subdivision as the result of separation by an air process, after grinding.

"Air-Flo Green." ¹⁴⁷ Brand name for a mosquito larvicide containing copper meta-arsenite.

Containers: 100-lb drums; granular 35-lb bags.

air gas. Infrequently used term for a gas obtained by blowing air over a bed of incandescent solid fuel. An air gas is also obtained by blowing air through layers of the very volatile petroleum distillates; i. e., those having gravities from 80-90° Bé.

air hardening steel. See steel, self hardening.

ajava oil. See ajowan oil.

"Ajax." ¹⁷² Trade name for a hydrated monocalcium phosphate.

Properties: Brilliant white, free-flowing* granular material, especially sieved to eliminate both coarse and extremely fine particles. Purity complies with all Food and Drug laws.

Containers: 100-lb paper bags.

Uses: Manufacture of household baking powder, phosphated flours, and prepared mixes; frits for vitreous enamels.

ajowan oil (ajava oil, ptychotis oil).

Properties: Colorless or brownish-colored essential oil; strong thymol odor; sharp burning taste. Soluble in alcohol and ether. Chief known constituents: Thymol, thymene, pinene, para-cymene, dipentene and terpinene.

Constants: Sp. gr. 0.910-0.930; optical rotation, 0° to +5°; refractive index n_D 20/D 1.485-1.510.

Derivation: By distillation of the fruits of *Carum copticum*. Native to India, Egypt, Persia, and Afghanistan.

Uses: Medicine, perfumery, and formerly for preparation of thymol.

Shipping regulations: None. *

"Akroflex" C. ²⁸ Trademark for a rubber antioxidant containing 35% diphenyl-para-phenylenediamine C₆H₄(NHC₆H₅)₂, and 65% phenyl-alpha-naphthylamine ("Neozone" A). Properties: Dark gray waxy pellets, sp. gr. 1.23; f.p. not lower than 75°C.

Use: To improve the aging and service life of natural and synthetic rubbers; anticrosslinking agent for SBR (styrene butadiene rubber).

"Akroflex" CD contains 35% diphenyl-para-phenylenediamine and 65% phenyl-beta-naphthylamine ("Neozone" D). Dark gray pellets; sp. gr. 1.22.

"Aktivin." ³¹⁸ Proprietary product. Technical grade of para-toluene-sulfo-sodiumchloramide with 20% available chlorine: CH₃C₆H₄SO₂NCINa·3H₂O.

Properties: White powder soluble in water with practically neutral reaction. Not

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

soluble in organic solvents. Stable; a 10% solution in water loses 10% of its available chlorine after 2 hours boiling. Oxidizing and disinfecting agent. Not toxic in ordinary sense. Compatible and stable with alkaline compounds such as caustic soda, soda ash, soda phosphates, silicates, etc.; not compatible with ammonia and ammonium compounds and acids.

Types: "Aktivin," "Aktivin" S, "Aktivin" S Special.

Containers: 25-, 50-, 100-lb drums; 250-lb barrels.

Uses: Disinfecting agent for technical purposes, i.e., in breweries, etc. Oxidizing and bleaching agent in textile manufacturing, starch solubilizing in preparation of starch size and finish for textiles.

"Aktone." ²⁸⁵ Trademark for a modified urea activator for thiazole and thuram accelerators for GR-S, cold rubber, and natural rubber. White flakes; m.p. 100°C; sp. gr. 1.32; stable to heat and storage. Containers: 50-lb multiwall bags.

"Akweons." ¹⁵² Trade name for a series of wetting agent-emulsifier type acid additives to control acid fumes, corrosion and flash rusting in acid pickling operations. Containers: 5 and 55 gallons.

"Akwillizer." ¹⁵² Trade name for brominated cottonseed oil used primarily to balance the specific gravity of the low specific gravity flavoring oils used in the citrus drink industry.

Properties: Sp. gr. 1.33 ± .005; color is light amber; practically odorless and tasteless.

Containers: 1-gal jugs; 55-gal drums.

"AK-33X." ³¹³ See "Ethyl," Antiknock Compound-TEL-Motor 33 Mix.

Al. Symbol for aluminum.

alabamine. Obsolete name for astatine.

alabaster. See gypsum.

"alacreatine." See N-amidinoalanine.

"Alamac." ²⁵⁹ Trademark for the acetic acid salts of the "Alamines."

Derivation: From primary aliphatic amines of coconut, tallow, and other fatty acids.

Grades: Technical and distilled.

Containers: 1-, 5-gal pails; 55-gal steel drums.

Uses: Mineral flotation; biostats; emulsifiers; corrosion inhibitors; pigment treating; surface active agents.

"Alamide." ²⁵⁹ Trade name for a series of high molecular weight, aliphatic amides, such as palmitamide and stearamide, produced by reacting ammonia with fatty acids.

Uses: Intermediates for durable water repellents and finishes for textiles and paper; mold release and antiblocking agents.

"Alamine." ²⁵⁹ Trademark for a series of high molecular weight, primary, secondary and tertiary aliphatic amines. A wide range of chain lengths and degrees of un-

saturation are available.

Derivation: From fatty acids.

Grades: Technical and distilled.

Containers: 1-, 5-gal pails; 55-gal steel drums; tank cars; tank trucks.

Uses: Corrosion inhibitors; flotation agents; petroleum product additives; surface active agents; emulsifiers; biostats; hard rubber additives; plastics additives; pigment treating; chemical intermediates.

"Alanap." ²⁴⁸ Trademark for N-1-naphthyl-phthalamic acid.

Properties: Crystalline solid; m.p. 185°C; almost insoluble in water; slightly soluble in acetone, benzene, and ethanol; not stable in solutions above pH 9.5 nor at temperatures in excess of 180°C; non-corrosive.

Uses: Selective, pre-emergence herbicide for weed control on cucurbits, asparagus, peanuts, nursery stock and turf (crabgrass control). A solution of the sodium salt, "Alanap-3," is used on cotton and soybeans. Also available in a granular form, "Alanap 10G."

Hazards: Do not store near seeds or fertilizers; relatively nontoxic to warmblooded animals but normal precautions in handling should be taken.

alanine (alpha-alanine; alpha-aminopropionic acid; 2-aminopropanoic acid)

$\text{CH}_3\text{CH}(\text{NH}_2)\text{COOH}$. A naturally occurring nonessential amino acid.

Properties: Colorless crystals, soluble in water; slightly soluble in alcohol; insoluble in ether; optically active.

DL-alanine, m.p. 295°C with decomposition; sublimes at 200°C.

L(+)-alanine, m.p. 297°C with decomposition.

D(-)-alanine, m.p. 295°C with decomposition.

L(+)-alanine hydrochloride: prisms; m.p. 204°C with decomposition.

L(+)-alanine, N-acetyl; crystals; m.p. 116°C.

L(+)-alanine, N-benzoyl; crystals; m.p. 152-154°C.

Derivation: Hydrolysis of protein (silk, gelatin, zein); organic synthesis.

Grades: Reagent; technical.

Containers: Drums (DL-form).

Uses: Microbiological investigations; studies of amino acid metabolism; biochemical research.

beta-alanine (3-aminopropanoic acid; beta-aminopropionic acid). $\text{NH}_2\text{CH}_2\text{CH}_2\text{COOH}$.

The only known naturally occurring amino acid with the amino group in the beta position (see amino acid).

Properties: White prisms; m.p. 198°C with decomposition. Soluble in water; pH (50% solution) 6.0-7.3; slightly soluble in alcohol; insoluble in ether. Hydrochloride: plates and leaflets; m.p. 122.5°C; platinichloride: yellow leaflets; m.p. 210°C (dec).

Derivation: Hydrolysis of protein; by the addition of ammonia to beta-propiolactone, and by other processes based on the reaction of ammonia with acrylonitrile, etc.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: Fiber drums.

Uses: Biochemical studies; organic synthesis; in the production of calcium pantothenate (q. v.); buffer in electroplating.

alant starch. See inulin.

beta-alanylhistidine. See carnosine.

alapurin. See lanolin, anhydrous.

"Alathon." ²⁸ Trademark for polyethylene resin (q. v.), including linear varieties.

"Albacer." ⁷³ Brand name for proprietary product; a fatty acid ester.

Properties: White, hard synthetic wax of high luster. Soluble (hot) in naphtha, turpentine, toluol, mineral oil, vegetable oil, carbon tetrachloride, butyl acetate. Insoluble in water, ethyl alcohol, methyl alcohol. This product, when melted, changes to a heavy-bodied, non-gelatinous liquid which sets very slowly.

Constants: M. p. 95-96°C; sp. gr. (25°C) 0.968; saponification value 180-185.

Containers: 1-gal can (8 lbs); 5-gal can (50 lbs); 55-gal drum (430 lbs).

Uses: Compatible with synthetic resins, mineral oils, vegetable oils and other waxes.

albahaca oil. See tolu oil.

"Albaoil." ²⁴⁴ Trademark for series of sulfonated castor oils varying in percentage of oil.

Containers: Non-returnable steel drums averaging 400-425 lbs net.

Uses: By leather manufacturers as fatliquor and as a plasticizer in finishes; also in the textile and other industries.

albargin. A silver drug, containing 14.8-15% silver.

Properties: Yellow, shining powder, sometimes coarse. Acts slowly on albumin, incompatible with tannin and chlorides. Slowly reduced by light. Soluble in water; odorless.

Containers: Amber-colored bottles.

Use: Medicine.

Shipping regulations: None.*

"Albasol." ³⁰⁹ Trademark for a series of chemicals suitable for rendering mineral oils emulsifiable.

"Alberene Stone." ⁴²⁷ Trademark for a natural talc type rock widely used for chemical laboratory benches and similar uses because it is highly homogeneous, very dense and tough, and highly resistant to acid and alkali. Some grades are serpentine rather than talc. Density 185 lbs/cu ft; fusion point 2200°F; water absorption 0.07-0.10% by weight in 48 hours; dielectric strength 37-70 kilovolts; transverse physical strength 3000 (talc) to 5000 (serpentine) psi.

albertite. A natural, jet black, brittle hydrocarbon, an asphaltic pyrobitumen, distinguished from other varieties of bitumen by being almost insoluble in carbon disulfide, and infusible. Hardness 2; sp. gr.

about 1.1; fracture conchoidal.

"Albigen." ⁴⁴⁰ Trademark for a water-soluble polymer used in the textile industry for stripping vat and other dyestuffs. Has no affinity for the fiber; promotes the stripping effect of alkaline hydrosulfite solutions.

Uses: Prevents staining of whites in the wet treatment of fabrics dyed or printed with direct dyestuffs.

"Albone." ²⁸ Trademark for technical grade hydrogen peroxide.

"Albone" 35: H₂O₂ content 35% by weight; active oxygen 16.5% by weight; wt/gal 9.44 lb at 20°C; density 1.133 g/cc at 20°C; pH (Beckman meter) 3.4-3.8.

"Albone" 50: H₂O₂ content 50% by weight; active oxygen 23.5% by weight, wt/gal 9.98 lb at 20°C; density 1.196 g/cc at 20°C; pH (Beckman meter) 2.4-2.7.

Containers: 27.5-gal drums; tank trucks; 4000-, 6000- and 8000-gal tank cars.

albumen. Egg white. See also albumin.

albumen glue. See glue.

albumin. A simple naturally occurring protein soluble in water, coagulated by heat, may be thrown out of solution by saturation with ammonium sulfate, hydrolyzes only to alpha-amino acids or their derivatives. Found in egg white (ovalbumin), in blood (serum albumin), in milk (lactalbumin).

albumin, blood. (albumin, serum).

Properties: Brown amorphous lumps soluble in water and alcohol.

Derivation: Ox-blood is allowed to coagulate and the serum separated by centrifuging. The decanted liquor is filtered, decolorized and subsequently evaporated.

Grades: Technical, light and dark.

Containers: 100-, 332-lb drums; 300-lb barrels.

Uses: Photographic papers; textile printing; dye preparations; foodstuffs; sweetmeats; baked products; medicine; albuminate preparations; clarifying agent; leather adhesive; glue; in pesticides.

Shipping regulations: None.*

albumin colors. Colors used in textile printing and so called because they are mechanically held to the fiber through the agency of coagulated albumin.

albumin, egg (ovalbumin). Principal protein found in egg white. Is sold either as liquid or solid.

Preparation: Fresh white separated from the yolk, diluted with water, beaten to froth and subsequently filtered and evaporated.

Grades: Technical; edible.

Containers: 150-, 200-, 225-lb cases.

Uses: Leather industry; foodstuffs; clarifying agent; photography; adhesive for cork liners of bottle caps; manufacture of varnishes; ivory substitutes; fixing certain dyes; sugar refining.

Shipping regulations: None.*

albumin, milk (whey albumin; lactalbumin). Casein is coagulated from milk by rennet

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

or by dilute acids, filtered and dried.

Grades: Technical.

Containers: Wooden kegs.

Uses: Adhesives; varnishes; ivory substitutes.

Shipping regulations: None.*

albuminoids. See scleroproteins.

albumin, serum (technical). See albumin, blood.

albumin, serum (normal human).

Properties: Light yellow to cream colored lumps; practically odorless. About 96% of the total protein is albumin.

Derivation: Fractionation of human blood and careful drying.

Grades: U.S.P. XVI. May be dispensed in solution.

Use: Medicine.

albumin tannate (tannin albuminate).

Properties: Yellowish-white powder; odorless. Contains about 50% tannin. Decomposed by aqueous solutions of alkali hydroxides and carbonates. Slowly soluble in artificial gastric juice; almost insoluble in water, alcohol, chloroform, and ether.

Derivation: Interaction of dilute aqueous solutions of egg albumin and tannic acid.

Use: Medicine.

Shipping regulations: None.*

albumin, whey. See albumin, milk.

"Albusol." ³²⁹ Trademark for a stabilized, egg-albumin solution used in photo-engraving and photo-lithographic processes to replace dry albumin or eggs.

ALCA. Abbreviation for American Leather Chemists' Association.

alcanin. See alkanna.

"Alcian." ²⁰⁶ Brand name for a proprietary line of dyestuffs.

"Alcoa." ²²⁶ Trademark for a line of aluminum products (ingot, sheet, wire, tubing, castings, powder, foil, extrusions, collapsible tubes, electrical conductors, closures and screw machine products), aluminum compounds and fluorine compounds.

"Alcoblaks." ¹³³ A series of carbon black dispersions in various alcohols. Used for pigmenting specialty coatings.

alcohol. The term as used in common parlance applies to ethyl alcohol. Chemically, alcohol is a generic term applied to a series of hydroxyl (OH) compounds, the simplest of which has the general formula $C_nH_{2n+1}OH$. There may also be alcohols of the less saturated hydrocarbons. Alcohols may be mono-, di- or tri-hydric, etc., according to the number of hydroxyl radicals (OH) they contain, and primary, secondary or tertiary, according to the position of the hydroxyl radical in the formula. Alcohols having many hydroxyl radicals are called polyhydric alcohols, polyalcohols, or polyols. The phenol se-

ries of compounds are sometimes known as aromatic alcohols, but are not comparable in properties. Among the various alcohols covered in this book are: ethyl, allyl, amyl, benzyl, butyl, cetyl, isobutyl, isopropyl, phenylethyl, propyl. Alternative names for these compounds use the ending -ol, thus, methanol, octanol, glycerol. In general the ending -ol in the name of an organic compound signifies the presence of an OH radical, and alcoholic properties are to be expected, although they may be markedly modified by other elements present in the molecule.

Uses: Many alcohols are especially useful as solvents, and as fairly simple hydrocarbon derivatives, are much used in synthesizing other derivatives.

alcohol, absolute. See ethyl alcohol.

alcohol, C-7. See 1-heptanol.

alcohol, C-8. See 1-octanol.

alcohol, C-9. See nonyl alcohol.

alcohol, C-10. See 1-decanol.

alcohol, C-11. See 1-undecanol and undecylenic alcohol.

alcohol, C-12. See lauryl alcohol.

alcohol, C-16. See cetyl alcohol.

alcohol, caustic. See sodium ethylate.

alcohol, dehydrated. See ethyl alcohol.

alcohol dehydrogenase. An enzyme found in animal and plant tissue which acts upon ethyl alcohol and other alcohols producing acetaldehyde and other aldehydes.

Use: Biochemical research.

alcohol, denaturants. See denaturants for alcohol.

alcohol, denatured. See denatured alcohol.

alcohol, grain. Synonym for ethyl alcohol, and applying to that made from grain.

alcohol, industrial. Ninety-five per cent alcohol which has been made unfit for beverage use with a difficultly separable material. See denatured alcohol.

"Alcond DX-100." ⁷² Trade name for a dry acid containing a blend of inorganic salts for desmutting or deoxidizing solution for aluminum and etched aluminum. Used prior to anodizing or application of conversion coatings; also to prepare aluminum surfaces for spotwelding where extremely low surface resistance is required.

"Aldactone." ⁷⁰ Trademark for a brand of spironolactone, 3-(3-oxo-7 alpha-acetylthio-17 beta-hydroxy-4-androsten-17 alpha-yl) propionic acid-gamma-lactone, $C_{24}H_{32}O_4S$, m.p. 135°C.

Use: Medicine.

"Aldaromes." ¹⁸⁸ Trademark for compositions of aromatic chemicals and essential oils used in embalming fluids and sprays to mask or cover the unpleasant odor of formalde-

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

hyde. Will not decompose when in contact with formaldehyde; give clear solutions in 40% formaldehyde. Not water-soluble.

aldehyde. A generic term applied to a class of organic compounds containing the group R-CHO and holding an intermediate position between the alcohols and the acids derived from the alcohols by oxidation:
 $\text{CH}_3 \cdot \text{CH}_2 \cdot \text{OH}$ $\text{CH}_3 \cdot \text{CHO}$ $\text{CH}_3 \cdot \text{CO} \cdot \text{OH}$
 ethyl alcohol acetaldehyde acetic acid
 Acetaldehyde is commonly called simply aldehyde. Among the various aldehydes covered in the book are: formaldehyde and anisic, cinnamic, isobutyl, decyl, propyl, pyruvic, etc., aldehydes.

aldehyde ammonia (acetaldehyde ammonia; 1-aminoethanol) $\text{CH}_3\text{CHOH}\text{NH}_2$.

Properties: White crystalline solid; stable in closed containers, resinifies on long exposure to air. Very soluble in water and alcohol.

Constants: M. p. 97°C; b. p. 110°C (partly decomposed).

Derivation: Action of acetaldehyde on ammonia.

Methods of purification: Crystallization.

Grades: Technical.

Containers: 5-, 10-, 25-, 100-lb drums.

Uses: Accelerator for vulcanization of thread rubber; organic synthesis (source of acetaldehyde and ammonia).

Shipping regulations: None.*

aldehyde, C-7. See heptanal.

aldehyde, C-8. See octanal.

aldehyde, C-9. See nonanal.

aldehyde, C-10. See decanal.

aldehyde, C-11. See undecylenic aldehyde.

aldehyde, C-12 lauric. See lauryl aldehyde.

aldehyde, C-12 MNA. See methyl nonyl acetaldehyde.

aldehyde, C-14 (so-called). See gamma-undecalactone.

aldehyde, C-16 (so-called). See ethyl methyl phenyl glycidate.

aldehyde, C-18 (so-called). See gamma-nonyl lactone.

aldehyde collidine. See methylethylpyridine.

aldehydine. See 2-methyl-5-ethylpyridine.

"Aldo 25." ⁷³ Trademark (propylene glycol stearate, self-emulsifying).

Properties: White, wax-like solid; sp. gr. 0.94; m. p. 43-46°C; pH (3% dispersion) 9.2-10.0. Dispersible in hot water; soluble (hot) in alcohols and hydrocarbons.

Containers: 8-, 50-lb containers; 450-lb drums.

Uses: Edible emulsifying agent in baking and nongreasy cosmetic creams and ointments; emulsifying agent for oils, solvents and waxes where slightly alkaline cream-like products are required.

"Aldo 28." ⁷³ Trademark (glyceryl mono-

stearate, self-emulsifying).

Properties: Yellow, bead form; faint odor; m. p. 57-61°C; pH (3% aqueous dispersion at 25°C) 9.0-10.0; sp. gr. (25/20°C) 0.97. Soluble in alcohol, hydrocarbons, mineral oils, vegetable oils; dispersible in hot water.

Containers: 8-, 50- and 400-lb containers.

Uses: Suggested as emulsifying agent for edible and pharmaceutical emulsions, greaseless creams. Protective coatings for edible hygroscopic powders, etc. Addition to shortenings, cooking oils, fats, etc., to improve whiteness and smoothness of the finished material.

"Aldo 33." ⁷³ Trademark (glyceryl mono-stearate, neutral grade).

Properties: White, bead form; faint odor; m. p. 57-61°C; sp. gr. (25/25°C) 0.97. Insoluble in water; completely soluble in hot alcohol, hydrocarbons, mineral oil, vegetable oils.

Containers: 8-, 50-lb containers; 400-lb drums.

Uses: Suggested as addition in baked goods, bread, cake to improve shelf life, texture and assured volume. In creamed icings, candy emulsifier, water-in-oil emulsifying agent, ice cream emulsifier, plasticizer for the polyvinyl acetals, shortenings, cooking oils, fats, etc., to improve smoothness and color. As a synthetic wax for waterproofing, insulation, polishes, dental waxes, etc.

"Aldo 40." ⁷³ Trademark (glyceryl oleo stearate).

Properties: White, plastic, soft-solid. Soluble (hot) in alcohols and hydrocarbons; dispersible (in high concentrations) in hot water.

Containers: 425-lb drums; 8-, 40-lb containers.

Uses: Edible emulsifier for food products; antistaling and softening agent for bread.

"Aldocet." ⁷³ Trademark for acetostearin.

Properties: Solid, white wax; tasteless, bland odor; sp. gr. 0.97 (25°C); m. p. 36-46°C; free fatty acid 5% max; saponification value 345-362; iodine value 5 max; soluble in certain proportions in methanol, ethanol, toluol, and naphtha; when heated it is soluble in vegetable or mineral oils, acetone, and ethyl acetate; non-hygroscopic.

Containers: 425-lb (net) drums.

Uses: Coatings for cheese, dried fruits, vegetables, meat and fish; plasticizer for chewing gum and brittle waxes; special industrial and textile fiber coatings; replacement in certain applications for cocoa butter, beeswax, partially hydrogenated fats, etc.

aldol (acetaldol; oxybutyric aldehyde; beta-hydroxybutyraldehyde) $\text{CH}_3\text{CHOHCH}_2\text{CHO}$.

Properties: Clear water-white to pale yellow syrupy liquid. Decomposes into crotonaldehyde and water on distillation under atmospheric pressure. Miscible with

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

water, alcohol, ether, organic solvents.
 Constants: Sp. gr. 1.1098 (15.6/4°C); b.p. 83°C (20 mm); vapor pressure <0.1 mm (20°C); specific heat 0.737; weight 9.17 lbs/gal (20°C). Flash point 181.4°F; freezing point below 0°C.

Derivation: By condensation of acetaldehyde.
 Grades: Technical (98%).

Containers: 1-, 5-gal cans; 5-, 10-, 55-, 100-gal drums; tank cars.

Uses: Synthesis of rubber accelerators and age resisters; perfumery; engraving; ore flotation; solvent for pyroxylin and many organic substances; solvent mixtures for cellulose acetate; fungicides; organic synthesis; printer's rollers; cadmium plating; dyes; drugs; dyeing assistant; synthetic resins.

Shipping regulations: None.*

aldolase (zymohexase). An enzyme present in muscle involved in glycolysis and anaerobic glycolysis. It catalyzes production of dihydroxyacetone, phosphate and phosphoglyceric aldehyde from fructose 1,6-diphosphate.

Use: Biochemical research.

aldosterone (electrocortin) $C_{21}H_{28}O_5$. An adrenal cortical steroid hormone which is the most powerful mineralocorticoid. It is probably the chief regulator of sodium, potassium, and chloride metabolism, approximately 30 times as active as deoxycorticosterone.

Properties: Crystals; m.p. 108-112°C.

Derivation: Isolated from adrenal's; has been synthesized.

Use: Medicine.

"Aldox." ²⁰⁴ Trademark for an acidic powdered compound used to deoxidize aluminum prior to spot welding or to desmut aluminum subsequent to etching. Commercially available in 400-lb fiber drums.

aldrin (HHDN) $C_{12}H_8Cl_6$. The assigned common name for an insecticidal product containing from 22 to 95% of HHDN or 1,2,3,4,10,10-hexachloro-1,4,4a,5,8,8a-hexahydro-1,4,5,8-endo-exodimethanonaphthalene. Accepted as generic name by Ent. Soc. See also dieldrin and endrin.

Properties: Brown to white crystalline solid; m.p. 104-105.5°C; insoluble in water, soluble in most organic solvents. Not affected by alkalis or dilute acids, compatible with most fertilizers, herbicides, fungicides, and insecticides. May be formulated as emulsifiable concentrate, wettable powder or dust.

Grade: Technical.

Containers: Fiber drums.

Uses: Insecticide.

MCA warning labels (technical grade and formulations, 10% and over):

Warning! Poisonous by skin contact or inhalation; rapidly absorbed through the skin; spray mist extremely hazardous. (formulations less than 10%): Caution! May be fatal by skin contact, inhalation or swallowing. (Similar labels required by

U. S. D. A.).

Shipping regulations: Liquid formulations containing more than 60% aldrin and dry formulations containing more than 65% aldrin: Class B Poison. Poison label.*

"Alert." ⁵¹ Trademark for a white, high melting, adhesive lubricant for textile twister rings; also suitable for food handling machinery, etc.

"Alert 80, 101." ¹⁵¹ Trademark for mercaptan type gas odorants, recommended for odorization of natural gas.

"Alevaire." ¹⁶² Trademark for superinone.

"Alfane." ⁴¹ Trade name for an acid-, solvent-resistant, synthetic-resin cement of the epoxy type used as a mortar cement up to temperatures of 200°F.

Alfin catalysts. Catalysts obtained from alkali alcoholates derived from a secondary alcohol which is a methyl carbinol and olefins possessing the grouping $-CH=CH-CH_2-$, which may even be part of a ring as in toluene.

The interaction of the alkali alcoholate, sodium isopropoxide, with the olefin halide, allyl chloride, gives a slurry of sodium chloride on which sodium isopropoxide and allyl sodium are adsorbed. This slurry is a typical Alfin catalyst used to convert olefins such as ethylene, propylene and butenes into polyolefin polymers.

"Alflorone." ¹²³ Trade name for fludrocortisone (9-alpha-fluorohydrocortisone).

"Alfrax." ²⁸⁰ Trademark for refractory products composed principally of electrically fused aluminum oxide grain. Available as bonded refractories and refractory cements.

Properties: High refractoriness; strength at elevated temperatures; chemical stability and low thermal expansion.

Bonded Refractories.

"Alfrax" K. Approximately 90% crystalline aluminum oxide. The thermal conductivity curve is a straight line between 20 Btu/sq ft/in. thickness/°F/hr at 1000°F and 25 Btu at 2600°F. Porosity averages 20%, permeability is very low.

Uses: Brick and special shapes for use in furnace and kiln constructions; tile for furnace or kiln hearths, muffle plates for continuous tunnel kilns.

"Alfrax" B. Approximately 85% aluminum oxide. The thermal conductivity is 10 Btu/sq ft/in thickness/°F/hr. Porosity averages 30%, permeability higher than "Alfrax" K refractories.

Uses: Bricks and shapes for oil and gas fired combustion chamber linings.

"Alfrax" BI. Light weight insulating refractories having a large percentage of sealed pores. The thermal conductivity is 7 Btu/sq ft/in. thickness/°F/hr. Weight of standard 9 inch straight brick, 4.5 lbs.

Uses: Linings of furnaces and kilns both electric and fuel fired. Will withstand

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

temperatures of 3300°F and can be used as primary linings except where slagging conditions prevail.

Refractory Cements.

No. 20 is a coarse plastic material, No. 22 is somewhat finer, and No. 25 is considerably finer. Used in laying "Alfrax" brick and in ramming monolithic linings for non-ferrous melting furnaces.

"Algaecide." ¹⁰⁸ A pelletized, chlorine releasing biocide.

Containers: 14-oz bottles; 20-lb cans.

Uses: To kill algae or slimy bacteria growths in cooling tower systems and evaporative condensers.

algaroth powder. See antimony oxychloride.

algarroba bean. See carob seed.

"Algeeclear." ²⁸² Trademark for copper sulfate compounded with an organic dispersing agent; contains 67% active ingredient and 33% copper complexing agent.

Properties: Finely ground powder; average bulk density 67 lb/cu ft; sp. gr. 1.1.

Containers: 25-lb multiwall bags; 5-lb packages in 30-lb cartons; 250-lb drums.

Uses: Algicide for swimming pools, ponds, lakes, reservoirs, cooling towers.

Caution: Keep away from nose and mouth. Do not breathe the dust.

"Algepon." ³⁰⁰ Trademark for series of dyeing, stripping and discharge printing assistants for various applications in textile processing. Several types are each formulated for a specific function:

"Algepon" AK: A quaternary compound used for the removal of pigment colors from textiles.

"Algepon" LN: A nonionic compound used as a leveling and retarding agent for dyeing blends of natural and synthetic fibers.

"Algepon" PD: A complex quaternary compound for use in discharge printing of difficultly dischargeable pigment colors such as the phthalocyanines; incorporated into the conventional printing pastes containing gums, hydrosulfite, etc.

"Algepon" VA: A cationic compound used as a leveling and retarding agent in the dyeing of vat colors. Also effective for stripping vat and naphthol dyes.

"Algepon" XR: A highly efficient stripping assistant for vat dyes.

algicide. Chemical agent added to water to destroy algae. Copper sulfate is commonly employed as an algicide for large water systems.

"Algimaster." ⁴²⁶ Trademark for a composition containing the active ingredients alkyl quaternary ammonium bromides, organic, polyamine, amine hydrobromides.

Containers: 1-qt polyethylene bottles.

Uses: Control of algae in swimming pool water.

Shipping regulations: None.*

algin. Term referring to alginic acid and its derivatives (i.e., sodium, ammonium,

potassium, propylene glycol alginate, etc.). Alginic acid is $(C_6H_7O_6)_n$, a polyuronic acid composed of beta-D-mannuronic acid residues linked so that the carboxyl group of each unit is free, while the aldehyde group is shielded by a glycosidic linkage.

Properties: White to dark brown powder, possessing marked hydrophilic colloidal properties. Soluble in water; insoluble in organic solvents. Properties of algin products vary with their source and method of manufacture, usually lying within the following approximate limits:

pH of water solutions	3.5-10
viscosity of 1% by weight	
water solution	1.0-100 poises
moisture content	5-20%
particle size	10-200 mesh
color	white to dark brown

Derivation: Extracted from brown seaweed or kelps, chiefly from the giant kelp, *Macrocystis pyrifera*, on the Pacific coast, and from the horsetail kelp, *Laminaria digitata*, on the Atlantic coast. In refined grades of algin the natural cellulose present is removed by filtration, and the product is bleached and purified. Technical grades may contain some cellulose and be unbleached.

Grades: Refined (food); technical (commercial); N.F. XI (sodium alginate).

Containers: Drums; fiber containers; 1- and 5-lb bottles; multiwall paper sacks; 50-, 100-, 200-, 700-lb drums.

Uses: In general, wherever a hydrophilic colloid possessing marked suspending, thickening, emulsifying, stabilizing, and waterholding properties is required. Specific uses are in the food industry; tooth paste; cosmetics; pharmaceuticals; textile sizing; coatings; waterproofing agent for concrete; boiler water treatment; oil-well drilling muds; adhesives; fibers; storage of gasoline as a solid.

Shipping regulations: None.*

algin fibers. Filaments or threads composed of metal alginates.

Derivation: By projecting a fine stream of an aqueous solution of alkali alginate into a bath containing a salt of a metal which forms an insoluble alginate.

Properties: Sodium alginate fibers are water-soluble, but calcium alginate fibers become swollen and are dissolved in alkaline solution. Beryllium fibers (colorless) and the chromium fibers (grayish to green to purple) are alkali resistant and possess an affinity for mordant dyes.

Uses: Sodium or calcium alginate threads are used as a support in weaving fine woolen threads and can be completely dissolved in a suitable alkaline solution leaving the pure wool fabric. Beryllium alginate fibers may be used in fireproof fabric for public buildings. Calcium alginate fibers may be spun into silk substitutes. •

* alginic acid. See algin.

alginoid iron. See ferric alginate.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

algiron. See ferric alginate.

"Algol." ³⁰⁷ Brand name of proprietary line of vat dyestuffs.

"Algosol." ³⁰⁷ Brand name of proprietary line of water-soluble leuco derivatives of vat dyestuffs.

"Algrain." ³¹⁹ Trademark for a highly refined grain alcohol.

Use: Pharmaceuticals, perfumes, toilet waters, flavoring extracts.

"Algran." ¹⁴⁷ Brand name for free-flowing granular insecticide containing 20 or 25% aldrin.

Containers: 50-lb bags.

Uses: For control of soil and turf-inhabiting insects.

"Alkase." ⁷⁰ Trademark for hyaluronidase.

"Alipal." ³⁰⁷ Trademark for a series of anionic surfactants.

"Alipal" CO-433. Sodium salt of sulfate ester of an alkyl phenoxypolyoxyethylene ethanol; 28% active.

Properties: Amber liquid; soluble in water, ethylene glycol; insoluble in carbon tetrachloride, corn oil, kerosene, mineral oil, xylene; stable in hard water, alkaline solutions and in mild acid.

Uses: Surfactant with foaming, wetting, and dispersing properties; detergent base for high foaming formulations, and shampoos, scrub soaps and hard surface detergents, lime soap dispersant.

"Alipal" CO-436. Ammonium salt of sulfate ester of an alkyl phenoxypolyoxyethylene ethanol; 58% active.

Properties: Amber liquid; soluble in water, ethylene glycol; stable in hard water and in mild acid solutions.

Uses: Detergent with good wetting, foaming, and dispersing properties; detergent base in high foaming liquid formulations; surfactant in cosmetic preparations; emulsifier for copolymerization of vinyls; anti-static agent for natural and synthetic fibers.

aliphatic. Organic compounds whose molecules do not have their carbon atoms arranged in a ring structure. This category therefore includes all the paraffin hydrocarbons and their saturated and unsaturated derivatives of all types.

"Aliphatic Ester Sulfate." ³²⁸ Brand name for sodium fatty acid ester sulfate product that serves as a dyeing assistant and a softener in textile processing.

"Aliquat." ²⁵⁹ Trademark for a series of aliphatic quaternary salts.

Derivation: Primary, secondary, and tertiary aliphatic amines and diamines. Aliphatic chain lengths from C₈ to C₁₈ available.

Containers: 1-, 5-gal pails; 55-gal steel drums; tank trucks; tank cars.

Uses: Textile softeners and conditioners; foam rubber stabilizers; biostats and emulsifiers; clay and talc treating; anti-static agents; chemical intermediates;

corrosion inhibitors.

aliquot. A part which is a definite fraction of a whole; as, aliquot samples for testing or analysis.

"Alite." ³²⁶ Trademark for a series of sintered metallic oxides.

"Alitrile." ²⁵⁹ Trade name for a series of high molecular weight, aliphatic nitriles produced from fatty acids from tallow, hydrogenated tallow, coconut and soybean oils, and palmitic and stearic acids.

Uses: Lubricating oil additives; plasticizers.

alizarin (1,2-dihydroxyanthraquinone; anthraquinonic acid) C₆H₄(CO)₂C₆H₂(OH)₂. Parent form of many dyes and pigments.

Properties: Orange-red crystals; brownish-yellow powder. Soluble in alcohol and ether; sparingly soluble in water. C.I. No. 1027.

Constants: M. p. 289°C b. p. 430°C (sublimable).

Derivation: Anthracene is oxidized to anthraquinone, the sulfonic acid of which is then fused with caustic soda and potassium chlorate, the melt is run into hot water and the alizarin precipitated with hydrochloric acid. Occurs naturally in madder root.

Grades: Technical.

Containers: Wooden barrels; kegs; fiber containers.

Uses: Manufacture of dyes, production of lakes; both dye and intermediate.

Shipping regulations: None.*

alizarin assistant. The same as Turkey red oil (q. v.).

alizarin dyes. A name sometimes used synonymously with mordant dyes, since many of the latter are related chemically to alizarin.

alizarin oil. The same as Turkey red oil (q. v.).

alizarin red. See madder lake.

alizarin yellow R (para-nitrobenzene azosalcylate sodium salt)
O₂NC₆H₄NNC₆H₄OHCOONa.

Properties: Yellow brown powder, soluble in water.

Use: Acid base indicator in pH range 10.1 (yellow) to 12.0 (violet) (see indicators); also a biological stain.

"Alizarol." ²⁴³ Trademark of acid mordant dyes.

"Alizurool." ²⁰⁶ Brand name for the proprietary dyestuff "Alizurool Green 2YS," which is an alizarin type dye used in textile printing.

"Alkalate." ²⁴⁴ Trademark for a compound consisting of sodium sesquisilicate base intimately combined with sodium phosphate. Properties: White, crystalline granular product; soluble in water; total Na₂O content 38.2%; per cent of total Na₂O in active form 32.4%; per cent of total Na₂O in inactive form 5.8%; compounded to balance the effect of bicarbonates and soil conditions. Containers: 125-lb plywood drums; 350-lb

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

fiber drums; 350-lb wooden barrels.

Uses: Laundries, dairies and creameries. For general free rinse cleaning in high bicarbonate areas.

alkali. A term applied to the hydroxides and carbonates of the alkali metals and the radical ammonium.

In commerce the term is used to designate the main products of the alkali industry and embraces the hydroxide and carbonates of sodium (or combinations thereof) and the hydroxide and carbonate of potassium; such products being known as caustic soda, soda ash, bicarbonate ("bicarb") of soda, sal soda (washing soda), caustic potash, modified sodas (neutral sodas), causticized ash, etc. For additional data on these see under each item.

The term is also applied more generally to any strong base in aqueous solution, i. e., a substance which gives a high concentration of hydroxyl ion when dissolved in water. Calcium oxide and barium hydroxide are included in this sense.

See also base.

alkali blue. A class name for a series of pigment dry powders prepared by the phenylation of para-rosaniline or fuchsine, followed by drowning in hydrochloric acid, washing and sulfonating. Alkali blue, on a weight basis, has the highest tinting strength of all blue pigments, approximately 5 to 6 times greater than iron blue and 50% stronger than phthalocyanine blue.

This pigment class also has excellent resistance to bleed in water, acid, oils, fats and waxes but bleeds profusely in alcohol and lacquer thinner. Has poor stability in alkali and soap and fair permanency in both fulltone and tint.

Containers: 250-lb barrels.

Uses: Printing inks; some inside paints.

alkali blue, flushed. The chemical type described under alkali blue, but marketed as an ink. Alkali blue presscake is "flushed" with vehicle to replace the water in the pulp and provide for a commercially acceptable ink.

Containers: 125-, 250-lb barrels.

Uses: Printing inks, toning of black inks.

alkali cellulose. The product formed by steeping wood pulp with sodium hydroxide, this being the first step in the manufacture of viscose rayon, and other cellulose derivatives.

alkali lignin. Material recovered by allowing alkaline solutions to act upon wood while under pressure, with subsequent treatment with acid.

alkali metals. Metals comprising Group IA of the periodic system; potassium, sodium, lithium, rubidium, cesium, and francium. Except for francium (q. v.), the alkali metals are all soft, silvery metals, which may be readily fused and volatilized, the melting and boiling points becoming lower with increasing atomic weight. The specific

gravity increases with, but less rapidly than, the atomic weight, the atomic volume therefore becoming greater as the series is ascended. They are the most strongly electro-positive of the metals. They react vigorously, at times violently with water; within the group itself the basicity increases with atomic weight, that of cesium being the greatest. All burn readily in air and are very reactive.

alkalimetry. The measurement of the concentration of bases or of the amount of free base present in a solution by titration or some other means of analysis.

alkaline earth metals. Divalent metals of Group II of periodic table; beryllium, magnesium, calcium, strontium, barium, and radium.

alkaline earths. The oxides of the alkaline earth metals.

alkaloids. A group of basic nitrogenous organic compounds of vegetable origin which exhibit a powerful toxic action on the human or animal system. They are usually derivatives of the nitrogen ring compounds: pyridine, quinoline, isoquinoline, pyrrole, and are designated by the ending -ine. Though some are liquids, they are usually colorless, crystalline solids, having a bitter taste, which combine with acids without elimination of water. They are soluble in alcohol; insoluble, or sparingly soluble in water. Examples are atropine, morphine, nicotine, quinine, cocaine and strychnine.

"Alkamortar H-W." ⁴⁴⁶ Trade name for a ceramic air-setting mortar, resistant to caustic solutions of moderate concentrations at atmospheric temperatures.

Uses: Bonding acid resistant brick and in limited installations when alkaline conditions prevail.

alkane.

1. General term for a saturated aliphatic hydrocarbon; a paraffin hydrocarbon. Its formula is C_nH_{2n+2} . Examples range from methane, CH_4 , through eicosane, $C_{20}H_{42}$, and higher homologs.

2. A trade designation for dodecylbenzene (q. v.).

"Alkane." ¹⁵¹ Trademark for a colorless liquid alkyl aromatic synthesized from petroleum hydrocarbons; used as raw material for both household and industrial detergents.

alkanesulfonic acid, mixed RSO_3H (R is methyl, ethyl, propyl, mixed). Trade designation for a mixture of methane-, ethane-, and propane-sulfonic acids. A strong non-oxidizing, nonsulfonating liquid acid which is thermally stable at moderately elevated temperatures.

Properties: Light amber liquid with spur odor; very corrosive; miscible with water, and saturated fatty acids.

Typical specifications: M.p. below $-40^\circ C$; b.p. $120-140^\circ$ (1 mm); sp. gr. 1.38 ($20^\circ C$);

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

pH (1% solution) 1.15.

Containers: 5-, 25-, 70-lb carboys.

Uses: Catalyst; intermediate; reaction medium.

alkanet. See *alkanna*.

alkanna. (*alkanet*; *orcanette*; *anchusa*; *dyer's alkanet*). Root of an herbaceous perennial plant *Alkanna* (*Anchusa*) *tinctoria*.

Occurrence: Asia Minor, southeastern Europe.

Containers: Bags.

Use: For its coloring principle, *alkannin* (*alcannin*; *anchusin*) which is used for coloring pharmaceuticals, oils, leathers, and in an indicator paper (red for acids, green-blue for alkalis).

alkannin. See *alkanna*.

"Alkanol." ²⁸ Trademark for a group of surface active agents which, by reducing surface tension, promote wetting, rewetting, penetration, dispersion, emulsification, or detergency.

alkanolamines. Compounds such as ethanolamine, $\text{HOCH}_2\text{CH}_2\text{NH}_2$, or triethanolamine, $(\text{HOCH}_2\text{CH}_2)_3\text{N}$, in which nitrogen is attached directly to the carbon of an alkyl alcohol.

"Alkarb." ⁸⁸ Trademark for an alkali metal carbonate mixture.

Properties: Melts over a range, becoming completely liquid at 850°C; hygroscopic.

Derivation: From lepidolite lithium ore.

Typical analysis: Potassium carbonate 70.4%; rubidium carbonate 23.1%; cesium carbonate 2.2%; sodium carbonate 2.9%; lithium carbonate 1.1%.

Containers: 100-lb multiwall paper bags; bulk hopper cars.

Uses: Glass and enamel raw material; carbon dioxide absorbent; detergents and heat treating salts.

Hazard: May cause skin irritation.

"Alkar" Process. ⁴¹⁶ Patented process for catalytic alkylation of a variety of aromatic hydrocarbons with numerous olefins to yield the corresponding alkylaromatic in either monoalkylated or polyalkylated form. The olefin reactant may be present in low concentration in feed stream. Alkylaromatic products yields are essentially quantitative and characterized by high purity.

Uses: Production of high purity ethylbenzene from benzene and ethylene, but not limited to this application.

"Alkaterge." ³¹⁹ Trade name for oil-soluble surface active agents.

Grades and Properties:

"Alkaterge-A." Color, Gardner (1933) 7; m.p. -41°C; sp. gr. (25/25°C) 0.883; refractive index (25°C) 1.4631; flash point (COC) 325°F; solubility in water (ml/100 ml) 0.005.

"Alkaterge-C." Color, Gardner (1933) 15; m.p. -40°C; sp. gr. (25/25°C) 0.925; flash point, (COC) 400°F; solubility in

water (ml/100 ml) 0.005.

"Alkaterge-E." Color, Gardner (1933) 7; m.p. -50°C; sp. gr. (25/25°C) 0.924; refractive index (25°C) 1.4738; flash point (COC) 395°F; solubility in water (ml/100 ml) 0.4.

"Alkaterge-T." Color, Gardner (1933) 7; m.p. 59°C; flash point (COC) none; solubility in water (ml/100 ml) 0.01.

Uses: Auxiliary emulsification agents; anti-foam agents; dispersing agents; spreading agents; pigment-grinding assistants; acid acceptors and in numerous other applications.

alkavervir. Mixture of alkaloids obtained by selective extraction of *Veratrum viride*, N. F., with various organic solvents and selective precipitation from acidic and basic solutions.

Properties: Light yellow powder which provokes sneezing. Freely soluble in alcohol and acetone; practically insoluble in water.

Grade: N. N. D.

Use: Medicine.

"Alkazene." ²³³ Trademark applied to a series of alkyl and halogenated alkylbenzenes, useful as solvents, gauge fluids, etc.

alkermes. See *kermes*.

"Alkolene." ²⁴⁴ Trademark for series of slightly alkaline oils emulsified with soap.

Containers: Non-returnable steel drums averaging 400-425 lbs net.

Uses: Used in the leather industry.

"Alkophos." ⁵⁸ Trade name for aluminum acid phosphates in liquid (Grades C and E) and solid (Grades B and D) form.

Containers: B, 200-lb barrels; C, 150-lb carboys, 600-lb lacquer-lined drums; D, 400-lb barrels; E, 650-lb lacquer-lined drums.

Uses: Bonding agents for refractories, for high temperature cements and for refractory paints.

"Alkor." ⁴¹ Trade name for a synthetic, furan-type resin cement which is acid- and alkali-proof and used as a mortar cement where temperatures do not exceed 380°F.

beta-alkoxy proprionitrile. See *beta-isopropoxypropionitrile*.

"Alkron." ⁸⁸ Trademark for anti-dusting, wettable powders and emulsifiable solutions containing parathion in various concentrations.

"Alk-Tri." ²³³ Trademark for trichloroethylene (q. v.).

alkyd resins. Alkyd resins in general are made by the union of dibasic acids or anhydrides—usually phthalic anhydride, with a polybasic alcohol such as glycerine. Modification is accomplished by use of other anhydrides (maleic), dibasic acids, glycols, polyols and also other substances. The most common of the latter are various natural oils or the acids derived from them. Use of linseed oil or linoleic acid or similar

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

drying oil materials produces an oxidizing alkyd, while use of essentially saturated oils and their derivatives produces non-oxidizing types. Hard resin types are produced by using rosin or similar resins as modifying agents. Their retention of initial appearance after long exposure to severe weather, heat resistance, color retention, toughness, adhesion, flexibility, and ease of application, explain the extensive uses. They can be made to close specification of viscosity, acid number and color.

These resins have value in protective and decorative coatings for metals, wood, paper, textiles, in adhesives, printing inks rubber compounding and floor coverings. They are also used as vehicles in architectural, automotive and industrial finishes, water-thinned paints, nitrocellulose lacquers, urea- and melamine-formaldehyde enamels, aluminum vehicles, bulletin colors, grinding vehicles and marine paints.

alkyl. A paraffin hydrocarbon radical which may be represented as derived from an alkane by dropping one hydrogen from the formula. Examples are ethyl, C_2H_5- ; propyl, $CH_3CH_2CH_2-$; isopropyl, $(CH_3)_2CH-$; etc. Corresponding aromatic radicals are known as aryl.

alkyl aryl polyethyleneglycol ethers. See isoocetylphenoxy polyoxyethylene ethanol for a typical example of this class of compound. They are used as surface-active agents, as in detergents.

alkylaryl sulfonates. Class name for a widely used group of anionic synthetic detergents. The aryl portion is usually benzene, and the alkyl portion often dodecyl or decyl. Typical are sodium tridecylbenzene sulfonate, and sodium dodecylbenzene sulfonate. See the latter for further details.

alkylate. Generic term, particularly in the oil industry, applied to the product of an alkylation process. (See "Alkylation Process, HF;" alkylation process, sulfuric acid.) Alkylate (consisting of branched paraffin hydrocarbons with high octane number) generally is blended in varying proportions with other hydrocarbon mixtures also boiling in the gasoline boiling range to produce military and civilian aviation gasolines and motor fuels of commerce. (See also detergent alkylate.)

alkylation. A process used in petroleum refining which consists in causing the chemical combination of isoparaffin hydrocarbons with olefins. For example, isobutane combines with ethylene to give neohexane or, 2,2-dimethylbutane. A pressure of 3000 psi and a temperature of 900-1000°F are required. Sulfuric acid and hydrofluoric acid are often used as catalysts. The products of alkylation (alkylates) are usually branched paraffin hydrocarbons with high octane number, and therefore of value in preparing automobile and airplane fuels.

"Alkylation Process, HF." ⁴¹⁶ Patented process employing virtually anhydrous liquid hydrogen fluoride as catalyst in combining an isoparaffin with an olefin to produce an "alkylate" product composed of the corresponding branched-chain paraffins. Used extensively by oil industry to produce very high octane gasoline blending component, usually from isobutane and butylenes (sometimes the olefin is a C_3 - C_4 mixture, less frequently propylene only or amylenes only), the alkylate being a mixture of branched-chain paraffins, generally octanes. Apparatus for continuous catalyst regeneration is part of process equipment.

alkylation process, sulfuric acid. Sulfuric acid also is used as an alkylation catalyst. It requires a considerably different and more complex arrangement of apparatus than hydrogen fluoride alkylation, since refrigeration is required. "Spent" acid (88-92% H_2SO_4) must be continuously withdrawn for reconstitution in a separate acid plant and make-up acid (98% H_2SO_4) added.

alkyldimethylbenzylammonium chloride. See, for example, benzalkonium chloride.

alkyl fluophosphates. See, for example, diisopropyl fluophosphate.

allanite (orthite)
(Ca, Ce, La)₂(Al, Fe)₃(OH)(SiO_4)₃. A natural complex silicate of calcium, aluminum, iron, the cerium metals (see rare earth metals), and yttrium metals in smaller quantities. Occurs in igneous rocks.

Properties: Color black to brown or grayish; pitchy, submetallic luster; streak greenish gray to brown.

Constants: Sp. gr. 3.5-4.2, hardness 5.5-6.

Occurrence: Greenland, Sweden, U.S.S.R., Madagascar, New York, Connecticut, New Jersey, North Carolina, Texas, Virginia.

Use: Source of cerium.

allantoin (glyoxyldiureid; 5-ureidohydantoin)
 $C_4H_6N_4O_3$. The end product of purine metabolism in mammals other than man and other primates; it results from the oxidation of uric acid.

Properties: White to colorless, odorless, tasteless powder or crystals; m.p. 230-236°C (dec.). One gram is soluble in 190 cc water or 500 cc alcohol; readily soluble in alkalis.

Preparation: Produced by oxidation of uric acid. Also present in tobacco seeds, sugar beets, wheat sprouts, and in mammalian excretions.

Grade: C.P.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

allene (propadiene; dimethylenemethane)

$H_2C:C:CH_2$.

Properties: Gas; unstable; m.p. -146°C; b.p. -32°C.

Containers: Cylinders.

Use: Intermediate.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

"Allercur." ²⁹⁹ Trademark for clemizole hydrochloride.

allethrin $C_{19}H_{26}O_3$ (2-allyl-4-hydroxy-3-methyl-2-cyclopenten-1-one ester of chrysanthemum monocarboxylic acid). A synthetic insecticide structurally similar to pyrethrin and used in the same manner. Accepted by Ent. Soc. as generic name. For other synthetic analogs see barthrin, cyclothrin, ethythrins, furethrin. Pyrethrin I differs in having a 2,4-pentadienyl group in place of the allyl of allethrin.

Properties: Clear, amber colored, viscous liquid. Sp. gr. (20/20°C) 1.005-1.015; refractive index (20°C) 1.5040. Insoluble in water; incompatible with alkalis; soluble in alcohol, carbon tetrachloride, kerosene, and nitromethane.

Derivation: Synthetically (glycerine, acetylene, and ethyl acetate are the major raw materials).

Grades: 90% technical (about 90% pure, with 10% of isomers or related compounds); 20% technical; 2.5% technical.

Containers: Drums.

Use: Insecticide.

Shipping regulations: None.*

"Allexcel." ³⁴² Trademark for allethrin-containing insecticidal concentrates.

allicin ($C_6H_{10}OS_2$). An antibacterial substance extracted from garlic (allium).

Properties: Colorless oily liquid; irritating to the skin, sharp garlic odor; unstable, decomposing rapidly when heated; slightly soluble in water, very soluble in alcohol, benzene and ether.

Use: Medicine.

allium (garlic). The fresh bulb of the perennial plant *Allium sativum*.

Uses: As condiment, in medicine, and as source of garlic oil.

allo-. A prefix designating the more stable of two geometrical isomers (Chemical Abstracts).

allomaleic acid. See fumaric acid.

allo-ocimene $(CH_3)_2C(CH_3)CCH_3CHCH_3$.

Properties: Clear, almost colorless liquid. Boiling range (5-95%) 89-91°C (20 mm), sp. gr. (15/15°C) 0.824; refractive index (20°C) 1.5278. Polymerizes and oxidizes readily.

Uses: Component of varnishes and a variety of polymers.

allophanamide. See biuret.

allo-threonine. See threonine.

allotrope (allotropic form). One of several possible forms of an element, e.g., carbon may occur as diamond, carbon black and graphite.

alloxan (mesoxalylurea) $C_4H_4O_4N_2 \cdot H_2O$ and $4H_2O$.

Properties: White crystals, become pink on exposure to air; colorless, aqueous solution imparts pink color to skin; sometimes explodes if bottled; m. p. 170°C (dec.);

soluble in water and alcohol.

Derivation: Oxidation of uric acid in acid solution.

Uses: Organic synthesis; experimental work in nutrition, physiology, and biochemistry; cosmetics.

alloxazine $C_{10}H_6O_2N_4$.

Properties: Greyish-green powder; decomposes above 300°C; insoluble in water, alcohol, and ether; soluble in aqueous alkalis.

Derivation: Occurs naturally in some plant pigments.

Uses: Intermediate in preparation of pharmaceuticals and dyes.

"750 Alloy." ¹⁶⁶ An iron-chromium-aluminum resistance material. For electric heating elements up to 2050°F.

"815 Alloy." ¹⁶⁶ An iron-chromium-aluminum resistance material. For electric heating elements up to 2150°F.

"875 Alloy." ¹⁶⁶ An iron-chromium-aluminum resistance material for electric heating elements up to 2350°F.

"Alloy 815-R." ¹⁶⁶ An iron-chromium-aluminum material. This alloy is resistant to corrosion, has high strength and ductility and low temperature coefficient; used for a wide range of precision resistor applications.

alloys. A solid or liquid mixture of two or more metals; or of one or more metals with certain nonmetallic elements by fusing the components. The properties of alloys are often greatly different from those of the component metals, making them more satisfactory for many uses than any pure metals. The composition and uses of various alloys are listed under their specific names.

alloy steels. Steel possessing distinctive properties depending on the presence of some element or elements other than carbon or on the presence of these elements and carbon. Low alloy steels are those having less than 5% of such added constituents.

allspice. See pimenta.

allspice oil. See pimenta oil.

allyl para-acetaminophenolate. See para-acetaminophenyl allyl ether.

allyl acetone $CH_2CHCH_2CH_2COCH_3$.

Properties: Colorless liquid; sp. gr. (20/4°C) 0.846; wt/gal (20°C) 6.99 lbs.

Containers: 5-gal steel drums; 55-gal resin steel drums.

Uses: Intermediate in pharmaceutical synthesis; perfume materials; fungicides; insecticides; fine chemicals.

allyl para-acetylaminophenolate. See para-acetaminophenyl allyl ether.

allyl alcohol (AA; 2-propen-1-ol; propenyl alcohol) CH_2CHCH_2OH .

Properties: Colorless liquid with pungent mustard-like odor; irritating to the eyes; poisonous! B. p. 96.9°C; m. p. -129°C;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

sp. gr. (20/4°C) 0.8520; wt/gal (20°C) 7.11 lbs; refractive index $n_{20/D}$ 1.4131; flash point (Tag open cup) 90°F. Miscible with water, alcohol, chloroform, ether, petroleum ether.

Derivation: (a) Hydrolysis of allyl chloride (from propylene) with dilute caustic; (b) isomerization of propylene oxide over lithium phosphate catalyst at 230-270°C; (c) dehydration of propylene glycol.

Method of purification: Rectification.

Grades: Technical.

Containers: 1-, 5-gal pails; 55-gal drums; tank cars.

Uses: Preparation of esters for use in resins and plasticizers; intermediate for pharmaceuticals and other organic chemicals; manufacture of glycerol and acrolein; military poison gas; herbicide.

Danger! Extremely hazardous liquid and vapor. Rapidly absorbed through skin. Flammable. MCA warning label.

Shipping regulations: Poison, class B. Poison label.*

allyl aldehyde. See acrolein.

allyl amine (2-propenyl amine) $C_3H_5NH_2$.

Properties: Colorless to light yellow liquid; strong ammoniacal odor; attacks rubber and cork, causes sneezing and lachrymation; b.p. 55-58°C; sp. gr. 0.759-0.761 (20/20°C); refractive index $n_{22/D}$ 1.4194. Soluble in water, alcohol, ether, and chloroform.

Grades: C.P.; technical.

Containers: 1-, 5-, 10-lb bottles; 5-, 30-, 55-gal drums; tank cars.

Uses: Pharmaceutical intermediate (e.g., mercury diuretics); possible use as resin intermediate.

allylbarbituric acid. N. F. X name for 5-allyl-5-isobutylbarbituric acid (q.v.). 5-Allylbarbituric acid is $C_7H_9N_2O_3$, solid, m.p. 164-166°C. Insoluble in water; soluble in alcohols. Used as an intermediate in pharmaceuticals, tobacco flavors, resins, etc.

allyl bromide (3-bromopropene; bromoallylene) C_3H_5Br .

Properties: Colorless to light yellow liquid; irritating, unpleasant odor. Caution! Lachrymator; burns skin. Flammable. Sp. gr. 1.398 (20/4°C); m.p. -119°C; b.p. 71.3°C; refractive index 1.4654; soluble in alcohol, ether, chloroform, carbon tetrachloride, carbon disulfide; very slightly soluble in water.

Grades: Technically pure (95% minimum purity by bromine titration).

Containers: Returnable 5-gal carboys, 55-lbs net, 92 lbs gross.

Uses: Organic synthesis; preparation of resins and perfume intermediates.

Shipping regulations: Flammable liquid. Red label.*

5-allyl-5-sec-butylbarbituric acid. See talbutal.

allyl caproate (allyl hexanoate; 2-propenyl

hexanoate) $CH_3(CH_2)_4COOCH_2CHCH_2$.

Properties: Colorless to pale yellow liquid; pineapple odor. Insoluble in water; soluble in 1 volume of 80% alcohol.

Constants: Sp. gr. 0.885-0.888; refractive index 1.424-1.426; b.p. 186-188°C.

Grades: Technical.

Containers: Glass bottles; demijohns; aluminum containers.

Uses: Perfumery; flavors.

Shipping regulations: None.*

N-allyl ortho-(carboxymethoxy)benzamide

$HOOCH_2OC_6H_4CONHCH_2CH:CH_2$.

Properties: Buff-colored crystals; relatively insoluble in water; m.p. 115-123.5°C.

allyl chloride (3-chloropropene; alpha-chloropropylene; AC; chloroallylene) CH_2CHCH_2Cl .

Properties: Colorless liquid with unpleasant pungent odor; b.p. 45.0°C; f.p. -134.5°C; sp. gr. (20/4°C) 0.9382; wt/gal (20°C) 7.83 lbs; refractive index $n_{20/D}$ 1.416; flash point (Tag open cup) -20°F. Insoluble in water; miscible with alcohol, chloroform, ether, and petroleum ether.

Derivation: By gas-phase direct chlorination of propylene at 15 psi and 400-500°C.

Method of purification: Distillation.

Grades: Technical.

Containers: 1-, 5-gal pails; 55-gal drums; tank cars.

Uses: Preparation of allyl alcohol and other allyl derivatives; thermosetting resins for varnishes, plastics, adhesives; synthesis of pharmaceuticals and insecticides.

Danger! Vapor harmful. Flammable. MCA warning label.

Shipping regulations: Flammable liquid. Red label.*

allyl chlorocarbonate (allyl chloroformate)

C_3H_5OOCCL .

Shipping regulations: Corrosive liquid.

White label.*

allyl chloroformate. See allyl chlorocarbonate.

allyl cyanide (3-butenenitrile; vinylacetoneitrile) $CH_2:CHCH_2CN$.

Properties: Liquid; agreeable onion-like odor; sp. gr. 0.8341; m.p. -87°C; b.p. 119°C. Slightly soluble in water.

Derivation: Prepared by treating dry cuprous cyanide with allyl bromide.

Source: Found in some mustard oils.

Use: Cross-linking agent in polymerization.

allyl-9,10-epoxystearate

$CH_2:CHCH_2OCO(CH_2)_7CHOHC(CH_2)_2CH_3$.

Properties: Sp. gr. 0.9217; b.p. decomposes; freezing point 4°C. Insoluble in water.

allyl hexanoate. See allyl caproate.

2-allyl-4-hydroxy-3-methyl-2-cyclopenten-1-one ester of chrysanthemum monocarboxylic acid. See allethrin.

allylidene diacetate $CH_2:CHCH(OOCCCH_3)_2$.

Properties: Colorless liquid; sp. gr. (20/20°C) 1.0749; lbs/gal (20°C) 8.945;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

b. p. (50 mm) 107°C; vapor pressure (20°C) 0.25; freezing point -37.6°C; viscosity 2.8 cps (20°C); flash point (open cup) 180°F; soluble in water (1.8% by weight).

Uses: Chemical intermediate of primary interest as a source of acrolein, and as a monomer for copolymerization to form resinous materials.

5-allyl-5-isobutylbarbituric acid $C_{11}H_{16}N_2O_3$.

Allylbarbituric acid in N. F. X.

Properties: White crystalline powder, odorless; slightly bitter taste; soluble in alcohol, ether and chloroform; almost insoluble in water; m. p. 138-139°C.

Use: Medicine.

5-allyl-5-isopropyl-barbituric acid (allyl-isopropylmalonylurea; aprobarbital) $C_{10}H_{14}O_3N_2$.

Properties: White crystalline powder; odorless; slightly bitter taste; m. p. 140-141.5°C; insoluble in water and paraffin hydrocarbons; soluble in alcohol, chloroform, and ether.

Grades: N. F. XI.

Use: Medicine.

5-allyl-5-isopropyl barbituric sodium (sodium allyl isopropyl barbiturate; aprobarbital sodium) $C_{10}H_{13}O_3N_2Na$.

Properties: White crystalline powder; odorless; slightly bitter taste; hygroscopic; soluble in water; insoluble in alcohol and ether.

Use: Medicine.

allylisopropylmalonylurea. See 5-allyl-5-isopropylbarbituric acid.

allyl isosulfocyanate. See allyl isothiocyanate.

allyl isothiocyanate (allyl isosulfocyanate, mustard oil, artificial; 2-propenyl isothiocyanate) C_3H_5NCS .

Properties: Colorless to light yellow, oily liquid; pungent and irritating mustard odor; will cause blistering of skin; harmful to lungs; sp. gr. 1.013-1.016 (25/25°C), b. p. 152°C; refractive index $n_{25/D}$ 1.5271; optically inactive; neutral to moistened litmus in freshly distilled alcoholic solution. Soluble in alcohol (suffers deterioration by interaction during storage), ether, carbon disulfide; slightly soluble in water. Derivation: Obtained by distilling sodium thiocyanate and allyl chloride, or by distillation of dried ripe seeds of *Brassica nigra* L. (black mustard seed).

Containers: 5-lb bottles (cases containing 10 x 5 lb bottles), 1-, 2-lb bottles.

Uses: Military poison gas; flavoring ingredient in food, counter-irritant in ointments and mustard plasters.

allyl mercaptan (allyl sulfhydryte; 2-propene-1-thiol) CH_2CHCH_2SH .

Properties: Water-white liquid (darkens on standing); strong garlic odor; sp. gr. 0.925 (23/4°C); b. p. 67-68° (90°C); insoluble in water; soluble in ether and alcohol.

Grades: C. P.

Containers: Bottles.

Uses: Flavoring agent of garlic type; pharmaceutical intermediate; rubber vulcanization accelerator intermediate.

Shipping regulations: None.*

4-allyl-1,2-methylenedioxybenzene. See safrole.

N-allylnormorphine hydrochloride. See nalorphine hydrochloride.

allyl resins. A special class of vinyl resins derived from esters of allyl alcohol and dibasic acids. Common monomers are allyl diglycol carbonate, also known as diethylene glycol bis(allyl carbonate), diallyl phthalate, diallyl isophthalate, and diallyl maleate. Polymerization occurs through the unsaturated allyl double bond to form thermosetting resins which are highly resistant to chemicals, moisture, abrasion, and heat. The allyl resins are used as laminating adhesives since they cure without the application of heat or pressure. They are also used in varnishes and molding compositions.

N-allylsalicylamide $HOC_6H_4CONHCH_2CH_2CH_2$.

Properties: Normally a sticky solid, light yellow to light brown; m. p. 48-52°C.

allyl sulfhydryte. See allyl mercaptan.

allyl sulfide (diallyl sulfide; thioallyl ether) $(CH_2CHCH_2)_2S$.

Properties: Colorless liquid with garlic odor. B. p. 139°C; sp. gr. (27/4°C) 0.888; refractive index $n_{27/D}$ 1.4877. Insoluble in water; miscible with alcohol, ether, chloroform, and carbon tetrachloride.

Grades: Technical.

Containers: Bottles.

Uses: Component of artificial oil of garlic.

Shipping regulations: None.*

allylsulfocarbamide. See allylthiourea.

allylsulfourea. See allylthiourea.

allylthiourea (allylsulfocarbamide; rhodalline; thiosynamine; allylsulfourea) $C_3H_5NHCSNH_2$.

Properties: White crystalline solid; slight garlic odor, bitter taste; sp. gr. 1.22; m. p. 78°C. Toxic! Soluble in water, ether, and solutions of borax, benzoates, urethane; insoluble in benzene; slightly soluble in 70% alcohol.

Derivation: Made by warming a mixture of equal parts of allyl isothiocyanate and absolute alcohol with an equal amount of 30% ammonia.

Grades: Technical (95% min purity); commercial (90% purity, approx).

Containers: Bottles; fiber drums, 25 lbs net, 28 lbs gross; steel drums; bottles (technically pure grade).

Uses: Medicine; corrosion inhibitor; organic synthesis.

Shipping regulations: None.*

allyltrichlorosilane $CH_2CHCH_2SiCl_3$.

Properties: Colorless liquid; b. p. 117.5°C; sp. gr. 1.217 (27°C); refractive index

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

n 20/D 1.487; flash point (Cleveland open cup) 95°F. Readily hydrolyzed by moisture, with the liberation of hydrochloric acid; polymerizes easily.

Derivation: Reaction of allyl chloride with silicon (copper catalyst).

Grades: Technical.

Use: Intermediate for silicones; glass fiber finishes.

Shipping regulations: Corrosive liquid.

White label.*

almond, bitter (*amygdala amara*; bitter almond). Ripe seed of *Prunus amygdalus* var. *amara*; chief constituents 35-50% fixed oil, about 3% amygdalin.

Occurrence: Italy, Spain and southern France.

Grades: Technical.

Containers: Barrels; burlap bags.

Uses: Preparation of amygdalin; recovery of the essential oil; flavoring compounds.

Shipping regulations: None.*

almond meal. Residue obtained after expressing oil from almonds.

Grades: Technical.

Containers: 200-lb barrels.

Uses: Cosmetics, manufacturing bitter almond water; perfume base, cooking; confectionery.

Shipping regulations: None.*

almond oil, bitter (*amygdala amara* oil). An essential oil derived by steam distillation from the meal or seeds of *Prunus amygdalus*, Stokes (*Amygdalus communis*, L.) the almond tree, or *Prunus armeniaca*, L., the apricot tree. Only a small amount of the commercial oil is derived from almonds. Bitter almond oil may be deprived of its hydrocyanic acid. It changes to a crystalline mass on exposure to the air, hence should be kept in tightly closed completely filled containers.

Grades: (a) Containing hydrocyanic acid; (b) hydrocyanic acid free.

Properties: (a) Colorless oil subsequently becoming yellow; bitter almond (or benzaldehyde) odor. Toxic; smell cautiously! Hydrocyanic acid content may run up to 11%. (b) Colorless oil subsequently becoming yellow. Oxidizes more rapidly than the oil containing hydrocyanic acid. Miscible with alcohol, ether and oils. Slightly soluble in water.

Chief known constituents: (a) Benzaldehyde (may be 95%); hydrocyanic acid, benzaldehyde cyanhydrin.

Constants: (a) Sp. gr. 1.038-1.060 (25/25°C); optical rotation about +0.167°; refractive index n_D 1.5442; (b) Sp. gr. 1.050-1.055 (15°C); b. p. 179°C; optically inactive; refractive index 1.542-1.546.

Adulteration: Nitrobenzene, synthetic benzaldehyde.

Containers: 1-, 5-, 10-lb bottles; 25-lb tins.

Uses: Flavor for cosmetics and medicines; perfumes. May be used as flavor in foods only if free from hydrocyanic acid.

almond oil, expressed. See almond oil, sweet.

almond oil, sweet (almond oil, expressed).

A fixed nondrying oil. Note that sweet almond oil is the expressed oil; bitter almond oil is the steam-distilled oil.

Properties: Yellowish oily liquid; almost odorless; bland taste; sp. gr. 0.910-0.915 (25/25°C); clear at -10°C, congeals near -20°C; saponification number 190-200; iodine number 95-105. Soluble in ether, chloroform, benzene; slightly soluble in alcohol; insoluble in water.

Derivation: Expressed from the seed of *Prunus amygdalus*.

Chief constituents: Oleic, linoleic, myristic, palmitic acids.

Grades: Technical; N. F. XI.

Containers: Iron drums; tins; glass bottles.

Uses: Lubricant for delicate mechanisms; medicine (emollient); cosmetic creams.

Shipping regulations: None.*

almond, sweet (*amygdala dulcis*; Jordan almond). Ripe seed of *Prunus amygdalus* var. *dulcis*.

Constituents: About 50% fixed oil, proteids, emulsin, sugar.

Occurrence: Europe and California.

Uses: Food, medicine (nutrient, demulcent); source of sweet almond oil.

aloe

Properties: Orange-brown to blackish-brown opaque, resin-like masses; saffron-like odor; strongly bitter taste. Also sold as dark yellow powder.

Derivation: Dried juice of leaves of *Aloe pernyi*; and other species of *Aloe*.

Principal varieties: Socotrine (east coast of Africa, and Arabia); Barbados or Curacao (West Indies); Cape (South Africa).

Grades: Technical, U. S. P. XVI.

Containers: Cases; kegs, bags.

Use: Medicine.

Shipping regulations: None.*

aloe-emodin (rhabarberone) C₁₅H₁₀O₅. 1,8-dihydroxy-3-hydroxymethylanthraquinone. An isomer of emodin.

Properties: Orange needles. M. p. 223-224°C; sublimes readily. Soluble in hot alcohol, benzene, ether, ammonia water, and sulfuric acid.

Occurrence: Free and as glycoside in aloe, senna, and rhubarb.

Use: Medicine.

aloe oil. An oil obtained from Socotrine aloe.

aloin (barbaloin). A mixture of active principles obtained from aloe. Varies in properties according to variety of aloe used.

Properties: Yellow crystals with bitter taste; darkens on exposure to air; odorless or slight odor of aloe; soluble in acetone, alkalies, water, and alcohol; slightly soluble in ether.

Grades: Technical; N. F. XI.

Containers: Barrels; drums; kegs.

Uses: Medicine; proprietary laxatives; electroplating baths; stimulates fermentation.

Shipping regulations: None*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

alon. A cellulose acetate fiber originated in Japan which is spun as viscose rayon from an aqueous solution and then acetylated in the fiber form.

"Alox" Compounds. ¹¹⁷ Trademark for mixtures of organic acids, oxyacids, and esters derived from oxidation of petroleum hydrocarbons. Derivatives such as methyl esters and metallic soaps are available.

Uses: Corrosion inhibitors, temporary protective coatings; lubricity additives; upper cylinder lubricant additives; blown rapeseed oil replacement in marine engine lubricants.

Shipping regulations: According to flash points. *

"Aloxite." ²⁸⁰ A trademark for aluminum oxide made by fusing materials high in alumina, such as bauxite, and for articles made therefrom.

Properties: Abrasive aluminum oxide made by electric furnace fusion of refined alumina is a white crystalline material, hardness, 9.03 in Mohs' scale; sp. gr. 3.92-3.96. Abrasive aluminum oxide made by the electric furnace fusion and treatment of bauxite varies in color from light brown to deep brown, hardness 9.07 in Mohs' scale, sp. gr. 3.94-4.00. Claimed to be a very good electrical insulator, fairly good heat conductor, highly refractory.

Containers: Multiwall paper sacks.

Uses: Abrasive grains and powders, grinding wheels, stones; razor hones; refractory cements; filter plates and tubes; diffuser plates and tubes; porous undergrain plates and coated abrasive products.

"Alpco." ²⁷¹ Trademark for a series of high melting point mineral waxes and resins, used for carbon paper inks, polishes, paper, plasticizers, surfactants, dispersants, casting waxes and surface coatings

"Alperox." C. ¹⁵⁴ Trademark for technical lauroyl peroxide (q. v.).

alpha. A prefix denoting the position of a substituting group of atoms (radical) in the main group of a compound. The Greek letters alpha, beta, gamma, etc., are usually not identical with the International Union of Chemistry numbering system, 1, 2, 3, etc., since they do not start from the same carbon atom. Thus acids start lettering from the carboxylic (COOH) group: $\text{CH}_3\text{CH}_2\text{COOH}$ propionic acid, $\text{CH}_3\text{CHClCOOH}$ alpha-chloropropionic acid, $\text{CH}_2\text{ClCH}_2\text{COOH}$ beta-chloropropionic acid. (The International systematic names are propanoic acid, 2-chloropropanoic acid and 3-chloropropanoic acid). Alpha, beta, etc. are also used to designate attachment to the side chain of a ring compound. Thus alpha-chlorotoluene, (benzyl chloride) $\text{C}_6\text{H}_5\text{CH}_2\text{Cl}$, may be distinguished from ortho-chlorotoluene, $\text{CH}_3\text{C}_6\text{H}_4\text{Cl}$. Specific alpha compounds will be found under the name of the compound, viz: beta-alanine. See alanine.

"Alphalin." ¹⁰⁰ Trademark for vitamin A, U. S. P. (q. v.).

"Alphanol." ³⁰⁷ Trademark for line of acid dyestuffs.

alpha particle. The nucleus of the helium atom, having mass about four times that of the hydrogen atom, and a doubly positive charge compared with the unit positive atomic charge on the proton. Produced in the normal disintegration of radium, and in many other nuclear changes. Used as a bombarding particle in cyclotron and similar nuclear experimentations.

alphaprodine hydrochloride (pivalidene hydrochloride) $\text{C}_{16}\text{H}_{23}\text{NO}_2 \cdot \text{HCl}$. 1,3-dimethyl-4-phenyl-4-piperidyl propionate hydrochloride.

Properties: White, crystalline bitter powder; amine-like odor; m. p. 218-220°C; stable to air, light and heat. Freely soluble in alcohol, chloroform, and water; very slightly soluble in ether, pH (1% solution) 4.5-5.2.

Grade: N. N. D.

Use: Medicine.

"Alphazurine." ²⁴³ Trademark of triphenylmethane acid blues.

"Alrowet" D-65. ²¹⁹ Trademark for sodium dioctyl sulfosuccinate $\text{C}_8\text{H}_{17}\text{OOCCH}_2\text{CH}(\text{SO}_3\text{Na})\text{COOC}_8\text{H}_{17}$. Miscible with water and soluble in most organic solvents.

Uses: Dispersant for paints, inks, polishes; drycleaning aid, polymerization emulsifier, textile penetrant and dyeing assistant.

alseroxylon. Fat-soluble alkaloidal fraction of the purified extract of *Rauwolfia serpentina*.

Grade: N. N. D.

Use: Medicine.

"Altax." ⁶⁹ Trademark for a proprietary benzothiazyl disulfide.

Properties: Cream to light yellow powder, sp. gr. $1.51 \pm .03$, moderately soluble in benzene, carbon disulfide, chloroform; insoluble in water, dilute caustic, gasoline.

Uses: Primary accelerator in natural and nitrile rubber and SBR, plasticizer and vulcanization retarder in neoprene Type G, cure modifier in neoprene Type W, oxidation cure activator in butyl. For extruded and molded goods, tire and tubes, wire and cable, sponge.

"Altex." ²⁰⁶ Brand name of proprietary line of union dyestuffs.

althea (marshmallow). Dried root of *Althea officinalis*, deprived of brown corky layer.

Occurrence: Europe; United States.

Grades: Technical; N. F. XI.

Containers: Bags.

Use: Medicine.

Shipping regulations: None. *

althein. See asparagine.

alum. Refers to hydrated double sulfates of aluminum and univalent metals such as potassium, sodium or ammonium. These usually crystallize easily from solutions

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

containing proper proportions of the dissolved sulfates, the compositions being $K_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24H_2O$, $(NH_4)_2SO_4 \cdot Al_2(SO_4)_3 \cdot 24H_2O$, etc. These are distinguished as potash alum, ammonium alum. The formulas are sometimes written as $KAl(SO_4)_2 \cdot 12H_2O$. The term alum is also applied to analogous compounds of other trivalent metals such as iron and chromium. Thus $(NH_4)_2SO_4 \cdot Fe_2(SO_4)_3 \cdot 24H_2O$ is ammonium ferric alum. Aluminum sulfate itself, or its hydrates are sometimes incorrectly referred to as alums, especially in the paper industry.

Alum, N. F. XI, refers either to ammonium alum or potassium alum.

alum, ammonia. See aluminum-ammonium sulfate.

alum, burnt (alum, exsiccated) $AlNH_4(SO_4)_2$ or $AlK(SO_4)_2$. Aluminum-ammonium sulfate or aluminum-potassium sulfate heated just sufficiently to drive off the water of crystallization.

Properties: White, odorless powder; sweetish, astringent taste. Soluble in hot and slowly soluble in cold water; insoluble in alcohol.

Grades: N. F. XI.

Use: Medicine.

alum, chrome. See chromium-potassium sulfate.

alum, chrome ammonium. See chromium-ammonium sulfate.

"Alumel," ¹⁶⁶ Trademark product. An alloy consisting of about 94% nickel, with small, carefully controlled amounts of silicon, aluminum and manganese. It is chiefly used as the negative element in "Chromel-Alumel" thermocouples and lead wire.

"Alumex," ²⁸⁵ Trademark for a china clay; particle size 55-60% minus 2 microns, 20-25% plus 5 microns; oil absorption 30 cc/100 grams clay; pH 4.5-5.5.

alum, exsiccated. See alum, burnt.

alumina. See aluminum oxide.

alumina, activated. See activated alumina.

"Alumina Ceramics, High Strength," ⁴⁴⁴ Available as dense (AD) or porous (AP) varieties.

"AD"-85: 85% Al_2O_3 . Tensile strength 17,000 psi (76°F); 8,000-9,000 psi (2000°F); sp. gr. 3.40; color, white; sp. heat 0.18 Btu/lb; thermal conductivity 92 Btu/hr/sq ft/°F/in. at 72°F, 50 at 600°F; thermal coefficient of expansion $5.68 \times 10^{-6}/^{\circ}C$ (25-200°C).

"AD"-94: 94% Al_2O_3 . Tensile strength 25,000-27,000 psi (76°F); 9,000-10,000 psi (2000°F); sp. gr. 3.61; color, white; sp. heat 0.188 Btu/lb; thermal conductivity 140 Btu/hr/sq ft/°F/in. at 72°F, 74 at 600°F; thermal coefficient of expansion $6.67 \times 10^{-6}/^{\circ}C$ (25-200°C).

"AD"-99: 99% Al_2O_3 . Tensile strength

34,000-35,000 psi (76°F); 21,000-22,000 psi (2000°F); sp. gr. 3.90; color, white; sp. heat 0.2 Btu/lb; thermal conductivity 202 Btu/hr/sq ft/°F/in. at 72°F, 108 at 600°F; thermal coefficient of expansion $6.7 \times 10^{-6}/^{\circ}C$ (25-200°C).

"AP-100": 100% Al_2O_3 . Sp. gr. 3.1; color, white; thermal conductivity 105 Btu/hr/sq ft/°F/in. at 72°F, 57 at 600°F

alumina, fused. See "Alundum."

alumina gel. See aluminum hydroxide, gelatinous.

alumina trihydrate (aluminum hydroxide; aluminum hydrate; hydrated alumina; hydrated aluminum oxide) $Al_2O_3 \cdot 3H_2O$ or $Al(OH)_3$.

Properties: White crystalline powder, balls or granules; sp. gr. 2.42; insoluble in water; soluble in mineral acids and caustic soda.

Derivation: From bauxite; the ore is dissolved in strong caustic and aluminum hydroxide precipitated from the sodium aluminate solution by neutralization (as with carbon dioxide) or by autprecipitation (Bayer process).

Grades: Technical; C. P.

Containers: Bags; drums; tonnage lots.

Uses: Glass, ceramics, iron-free aluminum and aluminum salts; manufacture of activated alumina; base for organic lakes.

Finely divided form (0.1-0.6 microns) used for rubber reinforcing pigment, paper coating, filler, cosmetics.

Shipping regulations: None.*

aluminite (websterite) $Al_2O_3 \cdot SO_3 \cdot 9H_2O$. A natural hydrous aluminum sulfate.

Properties: Color white; streak white; luster dull or earthy; sp. gr. 1.66; hardness 1-2. Usually occurs in white chalky masses in clay beds.

Occurrence: Germany; England.

Uses: Tanning; water proofing; dyeing; paper making; water purification.

aluminium. See aluminum.

aluminosilicates. Compounds of aluminum silicate with metal oxides or other radicals. Used as catalysts in the refining of petroleum; to soften water. See also zeolites.

aluminum (aluminium) Al. Element of atomic number 13, of group III of the periodic system. A silvery, ductile metal. Most abundant metal in earth's crust.

Properties: Sp. gr. 2.708; m. p. 660°C; b. p. 1800°C. Soluble in strong acids and alkalis; insoluble in water. Pure (99+%) aluminum is resistant to ordinary corrosion and most acids; is attacked by caustic alkalis, the halogens and their acids.

Derivation: Purified aluminum oxide (q. v.) is made from bauxite. Aluminum metal is then made by the electrolysis of the oxide in a bath of molten cryolite. The original process was called the Hall process (q. v.) and various modifications of this are now in use. A recent process

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

involves an extra step in which aluminum chloride vapors are passed over the partially reduced aluminum oxide in a reversible process which continually generates the free metal.

Forms available: Ingots; pigs; innumerable structural shapes; foil; flakes; powder (technical and U. S. P. XVI grade). A superpure grade (99.99%) is made by further electrolytic reduction of the commercial grade. Foamed aluminum is now made by mixing zirconium hydride with molten aluminum.

Uses (in approximate order of volume):

Military (aircraft, ships, etc.); building materials; consumer durable goods; transportation; machinery and equipment; construction (electric power construction); destructive uses; electrical and communications equipment, containers and packaging; exports; chemicals; photography; miscellaneous.

Powder: Usual metal powder uses; protective ointment; solid fuel propellant. Superpure grade: Electronics; catalyst in petroleum refining; jewelry; roofing; car trim; cladding for aluminum alloys for aircraft.

Flakes: As insulation for liquid fuels.

Caution: Aluminum powder forms flammable and explosive mixtures with air.

aluminum acetate (waterproofing salts).

(1) Normal $\text{Al}(\text{C}_2\text{H}_3\text{O}_2)_3$; (2) basic $\text{Al}(\text{C}_2\text{H}_3\text{O}_2)_2\text{OH}$.

Properties: (a) Known only in solution; (b) amorphous, white powder; insoluble in water.

Derivation: By the interaction of aluminum hydroxide and acetic acid. The product is recovered by crystallization.

Grades: Technical; C. P.; also sold in solution; U. S. P. XVI (solution).

Containers: Wooden barrels; boxes; drums; carboys (solutions).

Uses: Waterproofing cloth; fireproofing fabrics; mordant in textile dyeing; preparation of lakes; embalming fluids; medicine; calico printing.

Shipping regulations: None.*

See also mordant rouge.

aluminum acetotartrate. Consists of approximately 70% basic aluminum acetate and 30% tartaric acid.

Properties: Colorless crystals or white powder; slight acetic odor; astringent, acidulous taste; slowly soluble in cold water; insoluble in alcohol.

Use: Medicine.

aluminum acetylacetonate $\text{Al}(\text{C}_5\text{H}_7\text{O}_2)_3$.

Properties: Solid; m. p. 189°C ; b. p. 315°C . Soluble in benzene and alcohol.

Uses: Deposition of aluminum; catalyst.

aluminum acetylsalicylate (aluminum aspirin) $[\text{C}_6\text{H}_4(\text{OCOCH}_3)(\text{COO})]_2\text{AlOH}$.

Properties: White to offwhite granules or powder; odorless or slight odor; m. p., decomposes. Insoluble in water and organic solvents; soluble with decomposition in

alkali, hydroxides and carbonates.

Derivation: Reaction of aluminum hydroxide with acetylsalicylic acid.

Grade: N. F. XI.

Uses: Medicine.*

aluminum alkyls (aluminum trialkyls).

Catalysts used in the Ziegler process.

See triethylaluminum and triisobutylaluminum.

aluminum alloys. Alloys based on aluminum containing variable amounts of manganese, silicon, copper, magnesium, lead, bismuth, nickel, chromium, zinc, and titanium. A wide range of uses and properties is possible. Alloys may be obtained for casting or working, heat-treatable or non-heat-treatable, with a wide range of strength and corrosion resistance, machinability and weldability.

aluminum aminoacetate, basic. See dihydroxyaluminum aminoacetate.

aluminum-ammonium chloride (ammonium-aluminum chloride) $\text{AlCl}_3 \cdot \text{NH}_4\text{Cl}$.

Properties: White crystals; soluble in water. M. p. 304°C .

Uses: Used in treatment of furs.

aluminum ammonium sulfate (alum, ammonia; ammonium alum, alum N. F.)

$\text{Al}_2(\text{SO}_4)_3 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 24\text{H}_2\text{O}$ or

$\text{AlNH}_4(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$.

Properties: Colorless crystals; odorless; strong astringent taste. Soluble in water, glycerine, insoluble in alcohol.

Constants: Sp. gr. 1.645; m. p. 94.5°C ; b. p., loses $20\text{H}_2\text{O}$ at 120°C .

Derivation: By crystallization from a mixture of ammonium and aluminum sulfates.

Method of purification: Recrystallization.

Grades: Technical, lump, ground, powdered; C. P.; N. F. XI.

Containers: 100-lb bags; 100-, 250-, 350-, 360-lb drums.

Uses: Medicine; mordant in dyeing, water and sewage purification; sizing paper; tanning; clarifying agent; ingredient in baking powder.

Shipping regulations: None.*

aluminum anodized. The resistance of aluminum to abrasion may be increased by anodic treatment in certain electrolytes, usually sulfuric acid, chromic acid, or oxalic acid. The coating appears to be amorphous aluminum oxide. Anodic coatings may be colored by impregnation with organic dyes or mineral pigments.

aluminum aspirin. See aluminum acetylsalicylate.

aluminum borate $2\text{Al}_2\text{O}_3 \cdot \text{B}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ (approx.).

Properties: White, granular powder; decomposed by water.

Derivation: By the interaction of aluminum hydroxide and boric acid.

Method of purification: Crystallization.

Grades: Technical; C. P.

Containers: 1-lb bottles; wooden barrels.

Use: Glass and ceramic industries.

Shipping regulations: None.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

aluminum boride AlB_{12} .

Properties: Powder; apparent bulk density (fully settled): light, 0.6-0.8 g/cc; dense, 1.2-1.4 g/cc.

Uses: Neutron absorption applications.

aluminum borohydride $\text{Al}(\text{BH}_4)_3$.

Properties: Volatile liquid; b. p. 44.5°C; m. p. -64.5°C. Reacts vigorously with water to liberate hydrogen; ignites spontaneously in air.

Derivation: (1) By reaction of sodium borohydride and aluminum chloride in the presence of a small amount of tributyl phosphate; (2) by reaction of aluminum trimethyl and diborane.

Uses: Intermediate in organic synthesis; jet fuel additive.

aluminum brass. An alloy containing 76% copper, 21.5 to 22.25% zinc, 1.75 to 2.50% aluminum. Sp. gr. 8.33; mean coefficient of thermal expansion (32-212°F) 0.97 to 1.02×10^{-5} ; thermal conductivity (at 20°C) 58 Btu/ft²/ft²/°F/hr; melting range 1710 to 1780°F; specific heat at 20°C 0.09 cal/g/°C. Available cold rolled, drawn, tubes. Methods of fabrication include deep drawing, flanging, riveting, and brazing. Typical physical properties of an 1.0 in. diameter annealed tube with 0.065 in. wall: tensile strength 60,000 psi; yield point 27,000 psi; per cent elongation in 2 in. 55%; machining quality 30 based on free cutting brass as 100.

Uses: Condenser, evaporator, and heat exchanger tubes and ferrules.

aluminum bromide (a) AlBr_3 ; (b) $\text{AlBr}_3 \cdot 6\text{H}_2\text{O}$.

Properties: White to yellowish, deliquescent crystals; exists as double molecules Al_2Br_6 in the vapor, soluble in water, alcohol, carbon disulfide or ether. The anhydrous form reacts violently with water, liberating hydrogen bromide.

Constants: (a) Sp. gr. 3.01; m. p. 97.5°C; b. p. 265°C; (b) sp. gr. 2.54; m. p. 93°C (decomposes).

Derivation: (a) By passing bromine over heated aluminum; (b) the reaction of hydrobromic acid with aluminum hydroxide.

Method of purification: Crystallization.

Grades: Technical; C. P.

Containers: 1-, 2-, 4-, 8-lb glass jars; air-tight drums.

Uses: Bromination, alkylation, and isomerization catalyst in organic synthesis.

aluminum bronze. A nonferrous alloy containing 88-96.1% copper, 2.3-10.5% aluminum, and small amounts of iron and tin. Sometimes small amounts of other additives are present such as nickel, manganese or zinc. These alloys are characterized by high strength, ductility, hardness and resistance to shock and fatigue. Sp. gr. 7.50-8.19. Chemically there is good resistance to dilute hot or cold solutions of sulfuric acid, acetic acid in the absence of air, hot or cold sodium hydroxide up to 50%, and sea water.

aluminum bronze powder (gold bronze powder).

Composition: Alloy of 90% copper and 10% aluminum reduced from leaf form to powder and polished mechanically and coated with stearic acid.

Grades: Litho, moulding, printing-ink, and radiator.

Uses: As a pigment in paints and inks.

aluminum n-butoxide $\text{Al}(\text{OC}_4\text{H}_9)_3$.

Properties: Yellow to white crystalline solid; m. p. 101.5°C (pure) and 88-96°C (commercial); density 1.0251 (20°C); b. p. 290-310°C (30 mm). Soluble in aromatic, aliphatic and chlorinated hydrocarbons.

Containers: 6-gal open head container.

Uses: Ester exchange catalyst; defoamer ingredient; hydrophobic agent intermediate.

aluminum carbide Al_4C_3 .

Properties: Yellow crystals or powder; decomposes in water with liberation of methane.

Constants: Sp. gr. 2.36. Stable to 1400°C. Derivation: By heating aluminum oxide and coke in an electric furnace.

Grades: Technical.

Containers: Iron drums.

Uses: Generating methane; catalyst; metallurgy; drying agent.

Fire hazard: Dangerous! Keep dry!

aluminum carbonate. A basic carbonate of variable composition; formula sometimes given as $\text{Al}_2\text{O}_3 \cdot \text{CO}_2$. White lumps or powder, insoluble in water, dissolves in hot hydrochloric acid or sulfuric acid. Formerly used as mild astringent, styptic.

Normal aluminum carbonate $\text{Al}_2(\text{CO}_3)_3$ is not known as an individual compound that can be isolated.

Aluminum Chelates. ¹³⁴ Available as:

Aluminum Chelate BEA-1: Chemically modified aluminum secondary butoxide.

Properties: Pale yellow liquid; sp. gr. 1.030 (21°C); aluminum content 8.9-9.1%.

Aluminum Chelate PEA-1: Chemically modified aluminum isopropylate.

Properties: Pale yellow liquid; sp. gr. 1.035 (25°C); aluminum content 9.3-10.0%.

Aluminum Chelate PEA-2: Chemically modified aluminum isopropoxide.

Properties: Pale yellow; soluble in aromatic, aliphatic and chlorinated hydrocarbons; aluminum content 7.8-7.9%.

Uses: Curing of epoxy, phenolic, castor oil alkyds and high molecular weight polymers which are hydroxyl or carboxyl bearing; textile hydrophobing, in solvent based systems; adhesion promotion.

aluminum chloride (a) AlCl_3 (anhydrous); (b) $\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$.

Properties: Yellowish-white, granular crystals or powder; (a) sp. gr. 2.44; m. p. 190°C (2.5 atm.); sublimes readily; the vapor consists of double molecules, Al_2Cl_6 ; (b) sp. gr. 2.40; m. p. decomposes.

Soluble in water, ether and alcohol. The anhydrous form combines violently with

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

water.

Derivation: (a) (1) By reaction of chlorine with molten aluminum; (2) by reaction of alumina or bauxite with coke and chlorine at about 1500°F. (b) By crystallizing the anhydrous form from hydrochloric acid solution.

Impurities: Ferric chloride; titanium chloride; silicon chloride; basic aluminum chloride.

Grades: Technical anhydrous; technical crystals; 50% solution; C. P. crystals; U. S. P. XVI (hydrate).

Containers: Drums; tank cars.

Uses: Petroleum refining and catalysis (Friedels-Craft catalyst); polymerization catalyst for synthetic rubber, plastics, and lubricants; metallurgy; dyes; aluminum chemicals; external medicine.

Warning! Causes burns. Contact with water or moist air liberates hydrochloric acid gas. MCA warning label (anhydrous aluminum chloride).

aluminum chloride solution 32° Bé. Special grade of a solution low in iron content, having an acid reaction but containing no free acid. Typical analysis: $\text{Al}_2\text{Cl}_6 \cdot 12\text{H}_2\text{O}$, 50.3%; Al_2O_3 , 10.6%; Fe, 0.005%.

Containers: Carboys, tank cars; tank trucks.

Uses: Carbonizing fine wool such as piece goods, raw stock or shoddy, resulting in an exceptionally white, lofty wool; carbonizing colored goods where it has very little stripping action; soap manufacture for treatment of glycerin lyes where chloride of alumina is more desirable than sulfate.

aluminum citrate $\text{Al}_2(\text{C}_6\text{H}_5\text{O}_7)_3$; usually contains about 10% water.

Properties: Odorless, fine white powder. Very soluble in water; slowly in cold water but rapidly in warm.

Derivation: Hydrated aluminum oxide dissolved in citric acid.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

aluminum diformate (aluminum formate, basic) $\text{Al}(\text{OH})(\text{CHO}_2)_2 \cdot \text{H}_2\text{O}$.

Properties: White or gray powder. Soluble in water.

Derivation: Aluminum hydroxide is dissolved in formic acid and spray-dried. Solutions are also prepared by treating aluminum sulfate with formic acid, followed by lime.

Grades: Technical solutions (12-20° Bé).

Containers: Carboys.

Uses: Waterproofing; mordanting; antiperspirant compounds.

aluminum dihydroxy glycinate. See dihydroxy aluminum aminoacetate.

aluminum distearate $\text{Al}(\text{OH})(\text{C}_{17}\text{H}_{35}\text{O}_2)_2$.

Properties: White powder; m. p. 145°C; sp. gr. 1.009. Insoluble in water, alcohol, ether. Forms gel with aliphatic and aromatic hydrocarbons.

Uses: The most commonly used aluminum stearate. Thickener in paints, inks, and

greases; water repellent; lubricant in plastics and ropes; in cement production.

aluminum ethylhexoate (aluminum octoate).

A metallic salt of 2-ethylhexoic acid, used as a paint additive.

aluminum fluoride anhydrous AlF_3 .

Properties: White crystals. Sublimes about 1260°C without melting; sp. gr. 2.882.

Slightly soluble in water; insoluble in most organic solvents.

Derivation: Solution of alumina trihydrate in aqueous hydrofluoric acid followed by crystallization and calcination to remove water.

Grades: Technical (82-93% AlF_3).

Containers: Multiwall paper sacks; barrels; fiber drums.

Uses: In the production of aluminum to lower the melting point and increase the conductivity of the electrolyte; as a flux in ceramic glazes and enamels.

aluminum fluoride hydrate $\text{AlF}_3 \cdot 3 \frac{1}{2} \text{H}_2\text{O}$.

Properties: White crystalline powder. Insoluble in water.

Derivation: Action of hydrofluoric acid on alumina hydrate and subsequent recovery by crystallization.

Method of purification: Crystallization.

Grades: Technical; C. P.

Containers: 1-lb bottles; barrels.

Uses: Ceramics (production of white enamel), repressant of alcoholic side fermentations.

aluminum fluosilicate (aluminum silicofluoride)

$\text{Al}_2(\text{SiF}_6)_3$.

Properties: White powder. Slowly soluble in cold water, readily soluble in hot water.

Grades: Technical.

Uses: Artificial gems, enamels, glass.

aluminum formate. See aluminum triformate, and aluminum diformate.

aluminum formate, basic. See aluminum diformate.

aluminum formate, normal. See aluminum triformate.

aluminum formoacetate

$\text{Al}(\text{OH})(\text{OOCH})(\text{OOCCH}_3)$. White powder; soluble in water and alcohol; used in textile water repellents.

aluminum glycinate, basic. See dihydroxy aluminum aminoacetate.

aluminum hydrate. See alumina trihydrate.

aluminum hydroxide. See alumina trihydrate.

aluminum hydroxide, anhydrous. See alumina trihydrate.

aluminum hydroxide, gelatinous (hydrous aluminum oxide; alumina gel)
 $\text{Al}_2\text{O}_3 \cdot x\text{H}_2\text{O}$.

Properties: White, gelatinous precipitate. Constants variable with the composition; sp. gr. about 2.4. Insoluble in water and alcohol; soluble in acid and alkali.

Derivation: By treating a solution of aluminum sulfate or chloride with caustic

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

soda, sodium carbonate or ammonia; by precipitation from sodium aluminate solution by seeding or acidifying (carbon dioxide is commonly used).

Grades: Technical; C. P.; U. S. P. XVI.

Containers: Fiber drums.

Uses: Dyeing mordant; water purification; waterproofing fabrics; manufacture of lake; filtering medium; chemicals (manufacture of aluminum salts); lubricating compositions; manufacture of glassware; sizing paper; ceramic glaze; medicine.

aluminum hydroxystearate

$\text{Al}(\text{OH})[\text{OOC}(\text{CH}_2)_{10}\text{CHOH}(\text{CH}_2)_5\text{CH}_3]_2$.

Properties: White powder; m. p. 155°C ;

sp. gr. 1.045. Less soluble in nonpolar compounds than other aluminum stearates, and more soluble in polar compounds.

Uses: Waterproofing of leather and cements; lubricant for plastics and ropes; ingredient for paint and inks.

aluminum iodide AlI_3 (anhydrous).

Properties: Brown-black crystalline pieces (white when pure); m. p. 191°C ; b. p.

385°C ; sp. gr. 3.9825. Soluble in water with violent reaction; soluble in alcohol, ether, carbon disulfide.

Derivation: By heating aluminum and iodine in a sealed tube.

Method of purification: Crystallization.

Grades: Technical.

Containers: Bottles.

Uses: Organic synthesis.

aluminum isopropoxide. See aluminum isopropylate.

aluminum isopropylate (aluminum isopropoxide) $\text{Al}(\text{OC}_3\text{H}_7)_3$.

Properties: White solid; sp. gr. 1.035(20°C); b. p. $135\text{--}145^\circ\text{C}$ (10–20 mm); $125\text{--}130^\circ\text{C}$

(4–6 mm); m. p. $118\text{--}118.5^\circ\text{C}$. Anhydrous. Soluble in alcohol, benzene; decomposes in water.

Grades: Distilled (purity approximately 100%).

Containers: 1-, 2-, 7 $\frac{1}{2}$ -, 40-lb cans.

Uses: Very efficient dehydrating agent, reducing agent; cross-linking agent; pharmaceutical intermediate; antiperspirant; soaps.

Shipping regulations: None.*

aluminum metaphosphate $\text{Al}(\text{PO}_3)_3$.

Properties: White powder; insoluble in water, m. p. approx. 1537°C .

Containers: 100-lb drums; 275-lb barrels.

Uses: As a constituent of glazes, enamels and glasses, and as a high temperature insulating cement.

aluminum monobasic stearate. See aluminum monostearate.

aluminum monostearate (aluminum monobasic stearate) $\text{Al}(\text{OH})_2[\text{OOC}(\text{CH}_2)_{16}\text{CH}_3]$.

Properties: Fine, white to yellowish white powder; faint characteristic odor; m. p. 155°C , sp. gr. 1.020. Insoluble in water, alcohol and ether. Forms a gel with aliphatic and aromatic hydrocarbons.

Derivation: Mixing solutions of a soluble

aluminum salt and sodium stearate.

Grades: U. S. P. XVI.

Uses: Medicine; manufacture of paints, inks, greases, waxes; drier in protective coatings; thickening for lubricating oils; waterproofing; gloss producer; stabilizer for plastics.

aluminum naphthenate.

Properties: Yellow substance of rubbery consistency with high thickening power.

Derivation: Made by addition of solution of aluminum salt to aqueous solution of alkali naphthenate.

Uses: Paint and varnish drier and bodying agent; detergent in lube oils; the solution in organic solvents has been proposed for insecticides and siccatives.

aluminum beta-naphtholdisulfonate

$\text{Al}_2[\text{C}_{10}\text{H}_7(\text{OH})(\text{SO}_3)_2]_3$.

Properties: White powder, darkens slightly on exposure to air. Its solutions are incompatible with albumin, gelatin solutions, silver salts, soluble nitrates, caustic alkalis, alkaline carbonates; soluble in cold water and glycerol; slightly soluble in alcohol. Coagulates albumin, but soluble in excess.

Use: Medicine.

Shipping regulations: None.*

aluminum nitrate $\text{Al}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$.

Properties: White crystals. Soluble in cold water; decomposes in hot water. Soluble in alcohol and acetone.

Constants: M. p. 73°C ; decomposes at 134°C .

Derivation: Formed by the action of nitric acid on aluminum and crystallization.

Method of purification: Recrystallization.

Grades: Technical, C. P.; 99.75%.

Containers: 1-, 5-lb bottles; multiwall paper sacks; drums.

Uses: Textiles (mordant in printing with alizarin red); leather tanning and finishing; manufacture of electrical incandescent filaments, catalysts in petroleum refining; nucleonics.

Shipping regulations: Oxidizing material.

Yellow label *

aluminum octoate. See aluminum ethylhexoate.

aluminum oleate $\text{Al}(\text{C}_{18}\text{H}_{33}\text{O}_2)_3$.

Properties: Yellowish-white viscous mass.

Insoluble in water, soluble in alcohol, benzene, ether, oil and turpentine.

Derivation: By heating aluminum hydroxide, water and oleic acid. The resultant mixture is filtered and dried.

Grades: Technical.

Containers: Barrels.

Uses: Waterproofing; drier for paints, etc.; thickener for lubricating oils; medicine; as lacquer for metals; as lubricant for plastics.

Shipping regulations: None.*

aluminum oxide (alumina) Al_2O_3 . The mineral corundum is natural aluminum oxide, and emery, ruby, and sapphire are impure crystalline varieties. The mixed mineral bauxite is a hydrated aluminum oxide with

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

a somewhat variable proportion of water and the oxides of iron, silicon and titanium as the principal impurities. This is the source of commercial aluminum oxide used in the production of metallic aluminum.

Properties: These vary according to the method of preparation. White powder, balls or lumps of various mesh. Sp. gr. 3.4-4.0, m. p. 2030°C; insoluble in water; difficultly soluble in mineral acids and strong alkali. The special properties and uses of corundum and hydrated forms of aluminum oxide are described under their individual headings.

Derivation: (a) Leaching of bauxite with caustic soda to separate the alumina from iron oxide, silica and other insoluble matter, followed by precipitation of a hydrated aluminum oxide by hydrolysis and seeding of the solution. The alumina hydrate is then washed, filtered and calcined to remove water and obtain the anhydrous oxide.

See Derivation under alumina trihydrate; also Bayer process. (b) Coal mine waste waters are used to obtain aluminum sulfate, which is then reduced to alumina.

Grades: Technical, C. P.; fibers; high purity, fused.

Containers: Multiwall paper sacks; 50-lb drums; 100-lb barrels.

Uses: The major use is for production of aluminum, but other important uses are for manufacture of abrasives, refractories, ceramics, electrical insulators, catalyst and catalyst supports; crucibles and laboratory wares, for absorbing gases and water vapors; chromatographic analysis; fluxes.

aluminum oxide, hydrous. See aluminum hydroxide, gelatinous.

aluminum palmitate $\text{Al}(\text{OH})_2(\text{C}_{16}\text{H}_{31}\text{O}_2)$.

Properties: White powder; m. p. 200°C, sp. gr. 1.072. Insoluble in alcohol and acetone; forms gel with hydrocarbons.

Derivation: By heating aluminum hydroxide and palmitic acid and water. The resultant mixture is filtered and dried.

Grades: Technical.

Containers: 50-lb paper bags; cartons.

Uses: Waterproofing leather, paper, textiles, thickening for lubricating oils; thickening or suspending agent in paints and inks; production of high gloss on leather and paper; ingredient of varnishes; lubricant for plastics.

aluminum penicillin G. See penicillin.

aluminum phenolsulfonate (aluminum sulfocarbolate) $\text{Al}_2(\text{C}_6\text{H}_4\text{OH}\text{SO}_3)_6$.

Properties: Reddish-white powder with slight phenol odor. Strongly astringent taste. Soluble in water and alcohol, glycerin.

Use: Medicine.

Shipping regulations: None.*

aluminum phosphate AlPO_4 .

Properties: White crystals. Insoluble in water and alcohol, soluble in acids and alkalis.

Constants: Sp. gr. 2.566; m. p. 1500°C.

Derivation: By the interaction of solutions of aluminum sulfate and sodium phosphate.

Grades: Technical, C. P.

Containers: 100-lb bags, drums; 100-, 200-, 700-lb barrels.

Uses: Ceramics, dental cements; cosmetics; paints and varnishes; pharmaceuticals; pulp and paper industry.

Shipping regulations: None.*

aluminum potassium sulfate (potash alum;

alum, N. F.; potassium alum)

$\text{Al}_2(\text{SO}_4)_3 \cdot \text{K}_2\text{SO}_4 \cdot 24\text{H}_2\text{O}$, sometimes written $\text{AlK}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$.

Properties: White odorless crystals having an astringent taste; sp. gr. 1.75; m. p. 92°C; b. p., loses $18\text{H}_2\text{O}$ at 64.5°C; sublimes 400°C; soluble in water; insoluble in alcohol. Solutions in water are acid.

Derivation: (a) Alumite is roasted in reverberatory furnaces. The melt is leached and the salt recovered by crystallization.

(b) Also derived by crystallization from a solution made by dissolving aluminum sulfate and potassium sulfate.

Grades: Technical; lump; ground; powdered; N. F. XI.

Containers: Bags and drums.

Uses: Medicine; dyeing (mordant); baking powder; textiles; paper; matches; leather; paints; catalyst in ammonia synthesis; tanning agent; waterproofing agent; purification of water; aluminum salts.

Shipping regulations: None.*

aluminum resinate.

Properties: Brown mass. Insoluble in water; soluble in oils.

Derivation: By heating soluble aluminum salts and rosin.

Grades: Technical (fused, precipitated).

Containers: Fused: 300-lb barrels. Precipitated: drums.

Uses: Drier for varnishes.

Caution! Combustible.

aluminum-rubidium sulfate (rubidium alum)

$\text{AlRb}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$.

Properties: Colorless crystals. Soluble in water (hot); insoluble in alcohol.

Constants: Sp. gr. 1.867; m. p. 99°C.

aluminum salicylate $\text{Al}(\text{C}_6\text{H}_4\text{OHCOO})_3$.

Properties: Reddish-white powder. Odorless. Soluble in dilute alkalis; insoluble in water, alcohol. Decomposed by acid.

Use: Medicine.

Shipping regulations: None.*

aluminum silicate pigments (ASP). The

aluminum silicates form pigments which are both organophilic (compatible with organic solvents and substances) and hydrophobic.

aluminum silicates. Varying proportions of

Al_2O_3 and SiO_2 . Occur naturally in clays (q. v.). The only stable compound is synthetic (see mullite). See also aluminosilicates.

Uses: Glass; ceramics; pigment and filler for paints, printing inks, rubber and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

plastics; where formed by precipitation with aluminum sulfate from soluble silicate solutions, are used for the beater sizing of paper, coating of pigments, decolorizing mineral oils.

aluminum silicofluoride. See aluminum fluosilicate.

aluminum soaps. See such materials as aluminum oleate, aluminum palmitate, aluminum resinate, etc.

aluminum-sodium chloride (sodium-aluminum chloride) $\text{AlCl}_3 \cdot \text{NaCl}$.

Properties: White or yellowish crystalline powder; hygroscopic. Soluble in water. M. p. 185°C .

Grades: Technical.

Uses: Leather industry; aluminum manufacture.

aluminum-sodium sulfate (SAS; sodium-aluminum sulfate; soda alum; alum, porous) $\text{Al}_2(\text{SO}_4)_3 \cdot \text{Na}_2\text{SO}_4 \cdot 24\text{H}_2\text{O}$.

Properties: Colorless crystals; saline, astringent taste; effloresces in air. Soluble in water; insoluble in alcohol.

Constants: Sp. gr. 1.675; m. p. 61°C .

Derivation: By heating a solution of aluminum sulfate and adding sodium chloride. The solution is allowed to cool, with constant stirring. The alum meal deposited is washed with water and centrifuged.

Method of purification: Recrystallization.

Grades: Pure crystals; technical; C. P.

Containers: 1-, 5-lb bottles; bulk in cars; 200-lb bags; 350-, 400-lb barrels.

Uses: Textiles (mordant, waterproofing); dry colors; ceramics; tanning; paper size precipitant; matches; inks; engraving, sugar refining; water purification; medicine; confectionery; baking powders.

Shipping regulations: None.*

aluminum stearate (aluminum tristearate)

$\text{Al}(\text{C}_{18}\text{H}_{35}\text{O}_2)_3$ (approx.).

Properties: White powder; sp. gr. 1.070; m. p. 115°C . Insoluble in water, alcohol, ether; soluble in alkali, petroleum, turpentine oil. Forms gel with aliphatic and aromatic hydrocarbons.

Derivation: Reaction of aluminum salts with stearic acid.

Grade: Technical.

Containers: 25-, 50-lb bags; cartons; drums.

Uses: Paint and varnish drier; greases; waterproofing agent; cement additive; lubricants; cutting compounds; flattening agent; cosmetics and pharmaceuticals; additive for chewing gums.

Shipping regulations: None.*

aluminum subgallate $\text{Al}_4(\text{C}_7\text{H}_5\text{O}_5)_3 \cdot 4\text{H}_2\text{O}$.

Properties: Brown powder; soluble in dilute acids; insoluble in water.

Derivation: Interaction of solutions of alum and sodium gallate.

aluminum sulfate (known in the trade as alum; pearl alum; pickle alum; cake alum; filter alum; paper makers' alum; patent alum).

(a) $\text{Al}_2(\text{SO}_4)_3$; (b) $\text{Al}_2(\text{SO}_4)_3 \cdot 18\text{H}_2\text{O}$.

Properties: White crystals; soluble in water

(has a sweet taste); insoluble in alcohol.

Stable in air.

Constants: Sp. gr. (a) 2.71, (b) 1.62;

m. p. (a) decomposes at 770°C , (b) decomposes at 86.5°C .

Derivation: (a) By treating pure kaolin or aluminum hydroxide or bauxite with sulfuric acid. The insoluble silicic acid is removed by filtration and the sulfate is obtained by crystallization; (b) similarly from waste coal-mining shale and sulfuric acid.

Grades: Iron-free; technical; C. P.; U. S. P. XVI.

Containers: Bags; fiber drums; multiwall paper sacks; bulk in carloads; solution in rubberlined tank cars or trucks.

Uses: Sizing paper; lakes; alums; mordant for dyeing; water purification; fireproofing cloth; tannage of white leather; catalyst in manufacture of ethane; waterproofing agent for concrete; clarifying agent for fats and oils; ingredient of lubricating compositions; manufacture of satin white; deodorizer and decolorizer in petroleum refinery processes; precipitating agent in sewage-treating plants.

Shipping regulations: None.*

aluminum sulfide Al_2S_3 .

Properties: Yellowish-gray lumps. Odor of hydrogen sulfide gas. In moist air, decomposes and forms a gray powder; decomposed by water.

Constants: Sp. gr. 2.02; m. p. 1100°C .

Grades: Technical.

Use: Preparation of hydrogen sulfide gas.

aluminum sulfocarbolate. See aluminum phenolsulfonate.

aluminum sulfocyanate. See aluminum thiocyanate.

aluminum thiocyanate (aluminum sulfocyanate) $\text{Al}(\text{SCN})_3$.

Properties: Yellowish powder. Soluble in water; insoluble in alcohol and ether.

Grades: Technical.

Containers: Iron drums.

Uses: Textile industry; manufacturing pottery.

Shipping regulations: None.*

aluminum trialkyls. See aluminum alkyls.

aluminum triformate (aluminum formate, normal) $\text{Al}(\text{HCOO})_3 \cdot 3\text{H}_2\text{O}$.

Properties: White, finely divided crystalline powder which has thixotropic properties when damp. At normal temperatures and under average humidity conditions it is quite stable. Solutions for technical purposes are stabilized by the addition of a small amount of aluminum hydroxide or calcium carbonate. Mildly acid in reaction. Contains 12.5% aluminum. Soluble in hot water; slightly soluble in cold water (in making solutions for technical purposes, a water temperature of from 70 – 100°C is said to be best; agitation should be continuously maintained during the dissolving process).

Grades: Powder; 15°, 20° Be. solutions.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: Barrels; kegs; 13-gal carboys.

Uses: Textile (delustering rayon, mordanting, waterproofing, after-treatment of dyeings); paper (sizing); fur dyeing (mordant); and medicine.

aluminum triricinoleate $\text{Al}(\text{C}_{17}\text{H}_{33}\text{OHCOO})_3$.

Properties: Yellowish to brown plastic mass.

Limited solubility in most organic solvents. M.p. 95°C.

Derivation: Castor oil.

Uses: Gelling agent; waterproofing; solvent-resistant lubricants.

aluminum tristearate. See aluminum stearate.

alum meal. Crystals of aluminum potassium sulfate containing small amounts of iron.

alum, N.F. May be either aluminum ammonium sulfate or aluminum potassium sulfate.

"Alumon." ¹⁶⁹ Trademark for aurintricarboxylic acid (ammonium salt) used in the colorimetric determination of aluminum.

alum, papermakers'. See aluminum sulfate.

alum, pearl. Specially prepared aluminum sulfate for the paper making industry.

alum, pickle. Aluminum sulfate prepared to meet specifications of packers and preservers.

alum, porous. See aluminum sodium sulfate.

alum, potash. See aluminum-potassium sulfate.

alum root. See geranium.

alum, rubidium. See aluminum-rubidium sulfate.

alum schist. See alum shale.

alum shale (alum schist; alum slate). A clay containing iron pyrites and aluminum silicate; a source of alum.

alum slate. See alum shale.

alum, soda. See aluminum sodium sulfate.

alum stone. See alunite.

"Alundum." ²⁴⁹ Trademark for a line of fused-alumina refractory and abrasive products. Properties: Sp. gr. 3.93-4.01; fusion point 2000-2050°C depending on purity, coefficient of thermal expansion 0.0000072, mean specific heat (25-100°C) 0.1827-0.200 g cal/g/°C.

Grades and Uses: Available as grains, cements, and refractory shapes.

Grains: Available in all standard mesh sizes for refractory purposes and for increasing alumina content in ceramic bodies. High purity 38500 and 38900

"Alundum" grain is available for electrical insulation in radio and television tube industry. Two degrees of purity are: regular "Alundum" 95% Al_2O_3 and small amounts titania, iron, and silica; No. 38 "Alundum," white, containing 99% Al_2O_3 and traces of soda, iron, titania, and silica.

Cements: Clay-bonded mixtures with ma-

turing temperatures from 600-1000°C for imbedding electrical resistors, metal melting applications, refractory brick setting, etc.

Refractory shapes: Bonded fused-alumina shapes of great variety for very high temperature work both commercial and experimental; high heat conductivity; chemically stable; non-conductive electrically. Can be used at temperatures up to 1800°C depending upon service conditions. Used for all types of furnaces, bricks, plates, muffles, tunnel kilns, enameling furnaces, tubes, laboratory ware.

alunite (alum stone) $\text{KAl}_3(\text{OH})_6(\text{SO}_4)_3$. A naturally occurring basic potassium aluminum sulfate, usually found with volcanic and other igneous rocks.

Properties: Color white, gray or reddish; streak white; luster vitreous to pearly. Often impure from admixture of silica or clayey material. Sodium may replace most of the potassium to form natroalunite. Sp. gr. 2.6-2.8; hardness 4.

Occurrence: Utah, Arizona, California, Colorado, Nevada, Washington; Italy; Australia.

Use: Production of alum potassium compounds, millstones, metallic aluminum; decolorizing and deodorizing agent; fertilizer.

alunogen $\text{Al}_2(\text{SO}_4)_3 \cdot 18\text{H}_2\text{O}$. A natural aluminum sulfate.

Properties: Color white, yellowish or pinkish; streak white; luster vitreous or silky; sp. gr. 1.6-1.8; hardness 1.5-2. Usually occurs as a fibrous crust on aluminum-bearing shales and other aluminous rocks.

Occurrence: New Mexico, Colorado, Europe.

"Alurate." ¹⁹⁰ Trademark for 5-allyl-5-isopropylbarbituric acid (q. v.).

"Alusite." ⁴⁴⁶ Trade name for a 70% alumina brick with relatively low porosity and a PCE value of 38. Good resistance to mechanical abrasion and penetration by molten slags. Used in rotary lime, lime sludge and dolomite kilns, soaking pit curb walls, gas regenerators, non-ferrous metallurgical refining furnaces, in reverberatory and brass melting furnaces, and various lead furnaces.

"Alvar." ²⁷⁶ Trademark for polyvinyl acetal resin by the reaction of acetaldehyde with polyvinyl alcohol. Hard, tough, heat stable resin; good adhesive strength.

Grades: As slightly yellowish free-flowing granules. 7-70, 15-70, 15-80, 5-80, varying in molecular weight and degree of acetyl hydrolysis.

Uses: To impart gloss, toughness and adhesion to cellulose nitrate films for wash primers, solution adhesives; preservation of archeological artifacts; as molding resin.

"Alwax" Sizes. ⁵⁷ Trademark for series of aqueous emulsions of paraffin and microcrystalline waxes.

Uses: In paper industry to impart resistance

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

to water, lactic acid, blood serum, and organic liquids. Improves paper pliability, gives smoother surface, added scuff resistance to container board and improved printing qualities. Coatings are plasticized, more water repellent, and smoother surfaced. These products may be acid- or alkaline-stable types.

Am. Symbol for americium.

amalgam. Any alloy of mercury with one or more other metals. An amalgam may be either solid or liquid. Also a native alloy of silver and mercury. Native gold amalgams are also known.

"Amanol" Nitrogen Solutions. ⁵⁷ Trademark for nitrogen fertilizers containing 41% and 49% nitrogen in the form of aqua ammonia and ammonium nitrate.

Containers: Bulk tank cars or trucks.

Uses: For direct applications and in fertilizer mixtures.

amaranth $C_{20}H_{11}N_2O_{10}Na_3S_3$. A coal tar azo dye, C.I. No. 184.

Properties: Dark red brown powder; soluble in water; very slightly soluble in alcohol.

Derivation: From naphthionic and R acids.

Grade: U.S.P. XVI.

Containers: Glass bottles.

Use: As a red dye.

amaroid. A class of bitter principles found in plants, as ceroxylin; pyrethrosin.

amatol. An explosive mixture of ammonium nitrate and T.N.T. The 50-50 mixture can be melted and poured for filling small shells; the 80% ammonium nitrate mixture is granular and has been used for filling large shells or bombs.

Shipping regulations: Explosive, class A. High Explosive label.*

"Amax." ⁶⁹ Trademark for a proprietary product, N-oxydiethylene benzothiazyl 2-sulfenamide.

Properties: Tan flakes; sp. gr. $1.37 \pm .03$, melting range $70-90^\circ\text{C}$; very soluble in benzene, chloroform, methanol.

Uses: Primary accelerator for natural rubber and SBR; in belting, camelback and tires.

"Amax No. 1." ⁶⁹ Trademark of a proprietary mixture of N-oxydiethylene benzothiazyl-2-sulfenamide and benzothiazyl disulfide.

Properties: Light tan flakes; sp. gr. $1.40 \pm .03$; melting range $70-90^\circ\text{C}$; very soluble in benzene and chloroform; moderately soluble in acetone and methanol.

Uses: Primary accelerator for natural rubber and SBR in belting, camelback and tires.

amazonite (amazon stone). A green gem stone which is a variety of feldspar. The most valuable kinds are apple green in color. The lighter green kinds and those with streaks and specks of yellowish-white or red are of no commercial importance.

Occurrence: United States (North Carolina, Virginia, Colorado); Russia.

amazon stone. See amazonite.

amber (fossil resin). A fossil resin derived from an extinct variety of pine which flourished in the Tertiary Period. Strand amber comes from stratum partly below sea level. It is obtained either by dredging or is picked up off the beach after it has been uncovered and washed out by the action of the waves. Baltic amber is mined.

Properties: It is pale yellow, grading to brown or reddish-brown and it varies from transparent to opaque. The transparent variety contains up to 4% and the opaque variety up to 8% succinic acid, hence the name succinite. Sp. gr. 1.07-1.09; hardness 2-2.5.

Occurrence: Strand: Sicily; Holland; England and other European shores. Baltic: Mined in East and West Prussia.

Uses: Beads, ornaments, mouthpieces for pipes, cigarette holders; varnish; dye and drug manufacture.

ambergris.

Properties: Irregular, gray, grayish-brown or black, streaked or mottled, waxy, opaque masses; peculiar odor. Insoluble in water; soluble in alcohol, chloroform, ether, fats, and oils. M.p. about 60°C ; sp. gr. 0.80-0.92.

Chief constituents: Cholesterol, ambrein, benzoic acid.

Derivation: Morbid concretion from the intestinal tract of the sperm whale. Its discovery is accidental.

Grades: Technical.

Containers: Wooden boxes; bottles.

Uses: Drugs; perfume (fixative). (Obsolescent, being replaced by synthetic fixatives.)

Shipping regulations: None.*

"Amberlac." ²³

"Amberlac" Coating Resins. Trademark for modified alkyd-type resins for quick-drying lacquers. Some grades are resin-modified; some oxidizing and baking grades.

Use: Metal primers; bottle cap coatings; food can coatings; appliance coatings.

"Amberlac" 165. Trademark for synthetic water-soluble polymer. Colorless additive for film formers, improves scuff resistance; prevents sticking of thermoplastic coatings.

Use: High gloss paper coatings; coating of book covers, decorative papers, paper-board.

"Amberlite." ²³

"Amberlite" Ion Exchange Resins. Trademark for insoluble crosslinked polymers of various types in minute bead form. Strong acid, weak acid, strong base, and weak base forms, each having various grades differing in exchange capacity and porosity, for removing simple and complex cations and anions from aqueous and non-aqueous solutions. Reversible in action, can be regenerated and used repeatedly.

Use: Water conditioning (softening and complete deionization); recovery and concentration of metals, antibiotics, vitamins,

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

organic bases; catalysis; decolorization of sugar; manufacture of chemicals.

"Amberlite." Laboratory Grade Exchangers.

Trademark for ion exchange resins made to meet special laboratory needs. High-chemical-purity grades for chromatographic and other analytical work, manufactured to stringent specifications with respect to certain metallic impurities, moisture content and particle size. Less expensive grades, closely controlled with respect to porosity and particle size, for laboratory work not requiring high chemical purity.

"Amberlite" Liquid Exchangers. LA series.

Trademark for high boiling amines, oil soluble with ion exchange properties.

Uses: Extraction of metals and separation of electrolytes.

"Amberlite" Mixed-Bed Exchangers. See "Monobed."

"Amberlite" Nuclear-Grade Exchangers.

Trademark for strong acid and base ion exchange resins manufactured to meet the exacting specifications required for treating water in the primary loop of water-cooled nuclear reactors.

"Amberlite" Pharmaceutical Grade Exchangers. Trademark for ion exchange resins used for prolonged release of drugs, tablet disintegrants, taste masking, diagnostic tests, and therapeutic agents.

amber mica. See phlogopite.

amber oil.

Properties: Colorless or yellow brown, thin, liquid, volatile oil; darkens with age; empyreumatic, balsamic odor. Soluble in alcohol, ether, chloroform, carbon disulfide, and fixed oils. It is dextro-rotatory.

Chief constituents: Phenols; terpenes.

Constants: Sp. gr. 0.85-0.97; depending on purity.

Derivation: From amber, by destructive distillation and redistillation.

Method of purification: Rectification.

Grades: Crude; rectified.

Containers: Tins; glass bottles.

Use: Medicine.

Shipping regulations: None.*

"Amberol." ²³ Trademark for maleic-resin and resin-modified and unmodified phenol-formaldehyde-type and polymers in solid form. Various grades differ in solubility, viscosity in solution, color, hardness, and reactivity. React with various oils to produce fast drying, high gloss protective coatings and vehicles for printing inks.

Uses: Varnishes; enamels; can liners; nitrocellulose sanding sealers; printing inks; tackifying and vulcanization of butyl rubber.

amber seed. See ambrette seed.

"Ambiflo." ²³³ Trademark for polyglycol lubricants.

"Ambitrol." ²³³ Trademark for a freeze depressant concentrate based on ethylene

glycol (q. v.) and containing inhibitors.

amblygonite* $\text{Li}(\text{AlF})\text{PO}_4$ or $\text{AlPO}_4 \cdot \text{LiF}$. A natural fluorophosphate of aluminum and lithium.

Properties: White to pale greenish-, bluish-, yellowish-, grayish- or brownish-white; white streak; vitreous to pearly luster. Contains 10.1% lithia, sometimes with partial replacement by sodium.

Constants: Sp. gr. 3.01-3.09; hardness 6.

Occurrence: California, Maine, Connecticut, South Dakota; Germany; Norway; France.

Use: An important source of lithium; used in glazes and coatings.

"Ambodryl" Hydrochloride. ³³⁰ Trademark for bromodiphenhydramine hydrochloride [beta-(para-bromobenzhydryloxy) ethyl dimethylamine hydrochloride] $\text{C}_{17}\text{H}_{21}\text{BrNO} \cdot \text{HCl}$.

Properties: White to off-white odorless amorphous or crystalline powder possessing a bitter taste; melting range 148-150°C. Soluble in water and alcohol; insoluble in ether.

Use: Medicine.

"Ambraloy-927." ³²⁴ Trade name for an aluminum brass alloy, manufactured under U.S. Patent No. 2,003,685, containing arsenic as an inhibitor to increase its resistance to dezincification. Its nominal composition is copper 77%, zinc 20.96%, aluminum 2%, arsenic 0.04%. Used principally as a condenser tube alloy in power plants, marine service and oil refineries where cooling water is salt or brackish, and where it is resistant to the impinging action of turbulently flowing sea water containing air bubbles.

ambrette seed (amber seed; muskmallow; abelmoschus; musk seed). Seeds of *Hibiscus abelmoschus*, an evergreen shrub. Occurrence: Egypt, India; tropical America. Uses: Manufacture of ambrette seed oil.

ambrette-seed oil, liquid.

Properties: Yellow oil of musk-like odor, freed of the odorless fatty acid. Soluble in 2.5-8 vols. and more of 80% alcohol.

Constants: Sp. gr. 0.905-0.917 at 15°C; optical rotation slightly dextrogyrate, up to +1°20' or rarely levogyrate up to -2°24'; index of refraction 1.474-1.480; acid value 0.8-2.5, ester value 137-190.

Chief known constituents: Ambrettolide, farnesol.

Derivation: By distilling ambrette seed.

Use: Perfumery.

Shipping regulations: None.*

See also ambrette-seed oil, ordinary.

ambrette-seed oil, ordinary.

Properties: Concrete mass resemblingorris oil. Sp. gr. 0.891 (40°C), 0.883 (50°C); acid value 75-140; ester value 70-130.

Derivation: By distilling ambrette seed.

See also ambrette-seed oil, liquid.

* Shipping regulations: None.*

ambrettolide (hexadecen-6-olide) $\text{C}_{16}\text{H}_{32}\text{O}_2$.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Properties:** Colorless liquid, having very powerful musk-like odor.
- Constants:** Sp. gr. 0.955-0.957; refractive index 1.480-1.481.
- Occurrence:** Found in ambrette-seed oil.
- Use:** In perfumery, as a fixative.
- Shipping regulations:** None. *
- ambutonium bromide** $C_{20}H_{27}BrN_2O$
(3-carbamoyl-3,3-diphenylpropyl)ethyl-dimethylammonium bromide.
- Properties:** Crystals; m. p. 228-229°C (decomposes).
- Use:** Medicine.
- "Amcrom."** ⁶⁷ Trademark for copper-chromium alloys in cast or wrought form.
- American ashes.** See potassium carbonate.
- "American" Dynamite.** ⁵⁷ Trademark. Based on U. S. Bureau of Mines specification, it is a line of high-density permissible explosives, approved for mining of coal where gassy and dusty conditions are encountered.
- American hellebore.** See veratrum viride.
- American Indian hemp.** See apocynum.
- American process for zinc oxide pigment.** See Wetherill process.
- American saffron.** See carthamus.
- American spikenard.** See aralia.
- American valerian.** See cypripedium.
- American vermilion.** See chrome red.
- americium** Am. A synthetic radioactive element of atomic number 95, first prepared as the 241 isotope by neutron bombardment of plutonium in a nuclear reactor.
- See actinide elements.**
- Metallic americium is obtained by first preparing americium trifluoride which is reduced with barium vapor at about 1100°C. The metal is silvery white and tarnishes slowly in air; m. p. above 850°C; sp. gr. 11.7. Americium forms compounds of the types AmO_2 , Am_2O_3 , $AmCl_3$, etc.
- amethopterin.** See methotrexate.
- amethyst.** A purple or bluish-colored form of native silica or quartz (q. v.).
- Use:** Gem stone.
- For oriental amethyst see corundum.
- amide (acid amide).** An organic compound containing the structural group $-CONH_2$, and closely related to the organic acids with the grouping $COOH$. Common examples are acetamide CH_3CONH_2 , and urea $CO(NH_2)_2$.
- Amido** is the adjective form of amide, but is also used loosely as a synonym for amino. See amine.
- N-amidinoalanine** (dl- α -guanidinopropionic acid; "alacreatine")
 $NH_2C(:NH)NHCH(CH_3)COOH$.
- Derivation:** Prepared by reacting thiourea with ethyl bromide yielding ethyl isothiurea hydrobromide which is added with alkali to alanine; the desired product splits out with ethyl mercaptan.
- Use:** Biochemical research.
- amidophenols.** See meta-, ortho-, and para-aminophenol.
- amidopyrine.** See aminopyrine.
- amidothiolactic acid.** See cysteine.
- amiduourea hydrochloride.** See semicarbazide hydrochloride.
- amination.** The process of making an amine (RNH_2). The methods commonly used are (a) reduction of a nitro compound and (b) action of ammonia on a chloro-, hydroxy-, or sulfonic acid compound.
- amine.** A class of organic compounds of nitrogen that may be considered as derived from ammonia (NH_3) by replacing one or more of the hydrogen atoms by organic radicals, such as CH_3 or C_6H_5 , as in methyl amine and aniline. The former is a gas at ordinary temperature and pressure, but other amines are liquids or solids. All amines are basic in nature, and will usually combine readily with hydrochloric or other strong acids to form salts.
- amine 220.** ²¹⁴ $C_{17}H_{33}CNC_2H_4NC_2H_4OH$.
- Properties:** Sp. gr. 0.9330 (20/20°C); lbs/gal 7.77 (20°C); b. p. 235°C (1 mm); flash point 465°F.
- Containers:** 1-gal can; 5- and 55-gal drums (7.5, 35, 420 lbs).
- Uses:** Demulsifier used particularly in the recovery of tar from water-gas process emulsions. A powerful cationic wetting agent. Useful in flotation processes involving siliceous minerals and the formation of emulsions and dispersions under acidic conditions.
- amine absorption process.** See Girbotol absorption process.
- "Amine C, O and S."** ²¹⁹
 $CH_3(CH_2)_nC_3H_4N_2C_2H_4OH$. Trade names for high molecular weight imidazolines soluble in organic solvents but sparingly soluble in water at alkaline pHs. React with acids such as hydrochloric to form water-soluble positively charged colloids with unusual tolerance for electrolyte.
- Amine C:** undecyl; m. p. 32°C.
- Amine O:** heptadecenyl; m. p. 5°C.
- Amine S:** heptadecyl; m. p. 42°C.
- Uses:** Fungicides; antistatic treatment for upholstery; water repellent treatment for plaster, detergents; rust preventive oils.
- "Amine D."** ²⁶⁶ Brand name for a technical grade of dehydroabietylamine.
- Properties:** Pale yellow viscous liquid; oil soluble.
- Uses:** Production of bactericides; fungicides; corrosion inhibitors; asphalt additives; flotation agents.
- "Amine D Acetate."** ²⁶⁶ Brand name for acetic acid salt of "Amine D."
- Properties:** Amber, water-soluble, surface active product.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Uses: Bactericide, fungicide; preservative for alkaline dispersions of proteins.

"Amine D Ethylene Oxide Adduct." ²⁶⁶ See "Polyrad "

para-aminoacetanilide (N-acetyl-para-phenylenediamine) $\text{NH}_2\text{C}_6\text{H}_4\text{NHOCCH}_3$

Properties: Colorless crystals, sometimes reddish, soluble in alcohol and ether, slightly soluble in water. M. p. 162°C , b. p. 267°C

Derivation: Acetylation of para-phenylenediamine.

Method of purification: Crystallization.

Grades: Technical.

Containers: Drums

Uses: Intermediates, azo dyes.

Shipping regulations: None *

aminoacetic acid. See glycine.

aminoacetyl-para-phenetidine acetate. See phenocoll acetate

aminoacetyl-para-phenetidine hydrochloride. See phenocoll hydrochloride

D-amino acid oxidase. See amino oxidase.

L-amino acid oxidase. See amino oxidase.

amino acids. Organic acids containing an amino group (e. g., $\text{CH}_3\text{CH}_2\text{NH}_2\text{COOH}$, alanine) All naturally occurring amino acids are alpha amino acids (i. e., with the $-\text{NH}_2$ group attached to the carbon atom next to the $-\text{COOH}$ group) except beta-alanine. Amino acids can be obtained by the hydrolysis of a protein or by organic synthesis. An essential amino acid is one which is required for growth and which cannot be synthesized by the body. Essential amino acids in the diet of man are

isoleucine	phenylalanine
leucine	threonine
lysine	tryptophan
methionine	valine

In addition, arginine and histidine are essential in the diet of the rat. Historically "essential amino acids" referred to those amino acids essential for the rat. Amino acids may be classified as neutral, acidic or basic by the ratio of acidic (carboxyl) groups to basic (amino) groups. See individual amino acids.

5-aminoacridine. See 9-aminoacridine

9-aminoacridine (5-aminoacridine) $\text{C}_{13}\text{H}_{10}\text{N}_2$.

Properties: Sulfur-yellow crystals; m. p. 241°C ; moderately strong base. Freely soluble in alcohol; slightly soluble in chloroform, toluene, pyridine, soluble in acetone

Use: Medicine.

9-aminoacridine hydrochloride $\text{C}_{13}\text{H}_{10}\text{N}_2\cdot\text{HCl}$

Properties: Pale-yellow crystalline powder, odorless; bitter taste; stable to light, does not stain tissues; soluble in water (1:300).

Use: Medicine (topical antiseptic).

aminoamylene glycol. See 2-amino-2-ethyl-1,3-propanediol.

ortho-aminoanisoole. See ortho-anisidine.

para-aminoanisoole. See para-anisidine.

aminoanthraquinone $\text{C}_6\text{H}_4(\text{CO})_2\text{C}_6\text{H}_3\text{NH}_2$ (tricyclic) (a) 1-amino; (b) 2-amino.

Properties: (a) Red, iridescent needles.

(b) Red or orange-brown needles. Soluble in alcohol, chloroform, benzene, and acetone; insoluble in water.

Constants: M. p. (a) 252°C ; (b) 302°C ; b. p. sublime (both a and b)

Derivation: By reduction of nitroanthraquinones, or by the substitution of the amino radical direct for the sulfonic acids.

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden barrels.

Use: Dye intermediates.

Shipping regulations: None *

4-aminoantipyrine (4-amino-1,5-dimethyl-2-phenyl-3-pyrazolone; 1,5-dimethyl-2-phenyl-4-aminopyrazolone) $\text{C}_{11}\text{H}_{13}\text{N}_3\text{O}$.

Properties: M. p. $107\text{--}109^\circ\text{C}$.

Uses: Medicine; analytical reagent.

2-amino-4-arsenosphenol hydrochloride

(oxophenarsine hydrochloride)

$\text{C}_6\text{H}_3(\text{AsO})(\text{OH})\text{NH}_2\cdot\text{HCl}$.

Properties: A white or nearly white hygroscopic powder; soluble in water, solution of alkali hydroxides and carbonates and in dilute mineral acids. Solutions darken on exposure to air.

Derivation: Reduction of the arsonic acid derivative. It is usually marketed with buffering agents and suitable substances to make its solution physiologically compatible with human blood

Grade: N. F. XI.

Use: Medicine.

para-aminoazobenzene (aniline yellow, phenylazoaniline) $\text{C}_6\text{H}_5\text{NNC}_6\text{H}_4\text{NH}_2$.

Properties: Yellow to tan crystals. Soluble in alcohol and ether, slightly soluble in water

Constants: M. p. $126\text{--}128^\circ\text{C}$, b. p. above 360°C

Derivation: (a) Diazoaminobenzene when heated with aniline hydrochloride yields aminoazobenzene. The aniline hydrochloride acts as a catalyst and does not enter into the reaction. (b) Diazotization of a solution of aniline and aniline hydrochloride with hydrochloric acid and insufficient sodium nitrite to make the diazo compound.

Method of purification: Crystallization.

Grades: Technical.

Containers: Barrels; kegs, fiber containers.

Uses: Dyes (chrysoidine dyes, induline dyes, solid yellow and acid yellow dyes), coloring spirit varnishes (hydrochloride).

Shipping regulations: None. *

aminoazobenzenedisulfonic acid

$\text{C}_6\text{H}_4(\text{SO}_3\text{H})\text{NNC}_6\text{H}_3\text{NH}_2(\text{SO}_3\text{H})$.

Properties: Bright, violet needles. Soluble in hot water, and alcohol; insoluble in ether.

Derivation: By heating either aminoazobenzene hydrochloride or aminobenzene-mono-

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

sulfonic acid with fuming sulfuric acid.
 Grades: Technical.
 Uses: Synthesis of dyes; wool dyeing.

para-aminoazobenzene hydrochloride (aminoazobenzene salt) $C_6H_5NNC_6H_4NH_2 \cdot HCl$.
 Properties: Steel-blue crystals. Soluble in alcohol; slightly soluble in water.
 Derivation: By passing dry hydrogen chloride gas into a solution of aminoazobenzene.
 Method of purification: Crystallization.
 Grades: Technical.
 Containers: Barrels; kegs.
 Uses: Dyes; coloring lacquers, intermediate.
 Shipping regulations: None *

aminoazobenzenemonosulfonic acid

Properties: Yellowish-white, microscopic needles. Barely soluble in water; almost insoluble in alcohol, ether and chloroform.
 Derivation: By sulfonating aminoazobenzene.
 Grades: Technical.
 Use: Dyestuff manufacture.

aminoazobenzene-beta-naphthol (Sudan III, benzene-azo-para-benzene-azo-beta-naphthol) $C_6H_5NNC_6H_4NNC_{10}H_6OH$.

Properties: Brown powder, m. p. $195^\circ C$, insoluble in water, soluble in alcohol and oils.

Derivation: By heating aminoazobenzene and beta-naphthol

Method of purification: Crystallization from alcohol.

Grades: Technical.

Containers: Tins, glass bottles.

Uses: Coloring oils red, biological stain

aminoazobenzene salt. See para-aminoazobenzene hydrochloride

ortho-aminoazotoluene (2-amino-5-azotoluene, tolazotoluidine) $CH_3C_6H_4N_2C_6H_3NH_2CH_3$.

Properties: Reddish-brown to yellow crystals; soluble in alcohol, ether, oils, and fats, slightly soluble in water.

Constants: M. p. given variously from $99-117^\circ C$.

Derivation: From ortho-toluidine by treatment with nitrite and hydrochloric acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Kegs and barrels.

Uses: Dyes, medicine.

Shipping regulations: None *

aminoazotoluene hydrochloride

Properties: White crystals, soluble in water, alcohol, and ether

Derivation: By the interaction of aminoazotoluene and dry hydrogen chloride gas.

Method of purification: Crystallization.

Grades: Technical

Containers: Barrels; kegs.

Uses: Organic synthesis.

Shipping regulations: None. *

6-para-(para-aminobenzamido)benzamido-1-naphthol-3-sulfonic acid

Properties: Gray paste containing approx

35% solids.

Grade: Technical.

Use: Intermediate.

aminobenzene. See aniline.

para-aminobenzenearsonic acid. See arsanilic acid.

2-amino-para-benzenedisulfonic acid (aniline-2,5-disulfonic acid) $C_6H_3NH_2(SO_3H)_2 \cdot 4H_2O$.

Properties: Crystals; very soluble in water and alcohol.

Derivation: Boiling sodium salt of 4-chloro-3-nitrobenzene sulfonate with sodium sulfite, resulting in formation of sodium 2-nitrobenzene disulfonate, which is reduced with iron and acetic acid to aniline-2,5-disulfonic acid.

Use: Intermediate.

4-amino-meta-benzenedisulfonic acid (aniline-2,4-disulfonic acid) $C_6H_3NH_2(SO_3H)_2 \cdot 2H_2O$.

Properties: Needles decomposing when heated over $120^\circ C$; very soluble in water and alcohol.

Derivation: By heating sulfanilic acid with fuming sulfuric acid at $170-180^\circ C$.

Use: Dye intermediate.

para-aminobenzenesulfonamide. See sulfanilamide.

meta-aminobenzenesulfonic acid. See metanilic acid.

para-aminobenzenesulfonic acid. See sulfanilic acid.

meta-aminobenzoic acid $C_6H_4NH_2CO_2H$.

Properties: Yellowish or reddish crystals; sublimes easily; sweet taste. Slightly soluble in water, alcohol, and ether.

Constants: Sp. gr. 1.51 ($4^\circ C$); m. p. $173^\circ C$ to $174^\circ C$.

Derivation: By the reduction of meta-nitrobenzoic acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden kegs; fiber containers; multiwall paper sacks.

Use: Dye intermediate.

Shipping regulations: None. *

ortho-aminobenzoic acid. See anthranilic acid

para-aminobenzoic acid (PABA) $NH_2C_6H_4CO_2H$.

Required by many organisms as a vitamin for growth; is active in neutralizing the antibacteriostatic effect of some sulfamide drugs. Deficiency symptoms are achromotrichia in rats and a failure of growth in chicks.

Properties: Light buff odorless crystals; white when pure; discolors on exposure to light and air, m p $186-187^\circ C$ Sparingly soluble in cold water and dilute hydrochloric acid, slightly soluble in ether, benzene, chloroform, soluble in hot water, ethyl acetate, glacial acetic acid, warm glycerol; freely soluble in solutions of alkali hydroxides or carbonates, insoluble in petroleum ether. Unstable to ferric salts and oxidizing agents.

Derivation: Synthetic product from reduction

*See "I. C. C. Shipping Regulations," page xlii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

of para-nitrobenzoic acid. Commercially available as the calcium, potassium, and sodium salts.

Food source: Widely distributed in nature.

Yeast is an especially good source.

* Grades: Technical, N. F. XI.

Containers: Bottles; 25-, 100-lb drums.

Uses: Dyes and pharmaceuticals; nutrition.

Shipping regulations: None.*

meta-aminobenzotrifluoride $\text{CF}_3\text{C}_6\text{H}_4\text{NH}_2$.

Properties: Colorless to oily yellow liquid

Grade: Technical (88% min); purified (98% min).

Use: Pharmaceutical intermediate.

para-aminobenzoyldiethylaminoethanol base.

See procaine base

para-aminobenzoyldiethylaminoethanol hydrochloride. See procaine hydrochloride.

para-aminobenzoyldiethylaminoethanol nitrate.

See procaine nitrate.

ortho-aminobenzoylformic acid. See isatin.

N-(para-aminobenzoyl)glycine. See para-aminohippuric acid.

ortho-aminobiphenyl (ortho-phenylaniline, ortho-biphenylamine) $\text{C}_6\text{H}_5\text{C}_6\text{H}_4\text{NH}_2$.

Properties: Colorless or purplish crystals; m. p. 49.3°C; b. p. 299°C, slightly soluble in water.

Derivation: Reduction of ortho-nitrobiphenyl

Grades: Technical.

Containers: 475-lb drums; tank cars.

Uses: Intermediate for organic synthesis (carbazole); resins; synthetic rubbers, solvent.

Caution: Toxic. Avoid breathing vapors and skin contact.

2-amino-1-butanol $\text{CH}_3\text{CH}_2\text{CHNH}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid, sp. gr. 0.944 at 20/20°C; m. p. -2°C; b. p. (760 mm) 178°C, (10 mm) 79-80°C; vapor pressure 0.5 mm at 20°C (est'd), flash point 164°F; wt 7.85 lbs/gal (20°C), pH (0.1M aqueous solution) 11.11, refractive index 1.453 at 20°C. Completely miscible in water at 20°C, soluble in alcohols; corrosive to copper, brass, aluminum.

Containers: 1-gal cans, 5- and 55-gal drums.

Uses: Emulsifying agent (in soap form) for oils; fats, and waxes; absorbent for acidic gases; chemical synthesis.

Caution! Slightly toxic; mildly alkaline, avoid repeated skin contact.

aminobutylene glycol. See 2-amino-2-methyl-1,3-propanediol.

alpha-aminocaproic acid. See norleucine.

aminocaproic lactam. See caprolactam.

meta-aminochlorobenzene. See meta-chloroaniline.

ortho-aminochlorobenzene. See ortho-chloroaniline.

para-aminochlorobenzene. See para-chloroaniline.

2-amino-4-chlorophenol (para-chloro-ortho-

aminophenol) $\text{C}_6\text{H}_3\text{OHNH}_2\text{Cl}$.

Properties: Light brown crystals; m. p. 138°C (decomposes). Soluble in dilute mineral acid or dilute alkaline solution.

Derivation: Reduction of para-chloro-ortho-nitrophenol.

Method of purification: Recrystallization.

Containers: Fiber drums.

Grade: 96% pure (min.).

Use: Intermediate.

Shipping regulations: None.*

2-amino-4-chlorotoluene [5-chloro-2-methylaniline ($\text{NH}_2=1$); 4-chloro-ortho-toluidine ($\text{CH}_3=1$)] $\text{ClNH}_2\text{C}_6\text{H}_3\text{CH}_3$.

Properties: Off-white solid or light brown oil which tends to darken on storage; m. p. 20-22°C.

Grade: Fused.

Containers: Barrels; 40-gal steel drums.

Use: Intermediate.

2-amino-6-chlorotoluene [6-chloro-ortho-toluidine ($\text{CH}_3=1$), 3-chloro-2-methylaniline ($\text{NH}_2=1$)] $\text{ClNH}_2\text{C}_6\text{H}_3\text{CH}_3$.

Properties: Liquid; m. p. 0-2°C.

Grade: Technical.

Container: Drums.

Use: Intermediate.

4-amino-2-chlorotoluene [2-chloro-para-toluidine ($\text{CH}_3=1$); 3-chloro-4-methylaniline ($\text{NH}_2=1$)] $\text{ClNH}_2\text{C}_6\text{H}_3\text{CH}_3$.

Properties: Liquid; m. p. 21-24°C.

Grade: Technical.

Container: Drums.

Use: Intermediate.

meta-amino-para-cresol methyl ether. See cresidine.

aminocyclohexane. See cyclohexylamine.

L-amino dehydrogenase. See amino oxidase.

para-aminodiethylaniline (N,N-diethyl-para-phenylene diamine, diethylaminoaniline) $(\text{C}_2\text{H}_5)_2\text{NC}_6\text{H}_4\text{NH}_2$.

Properties: Liquid, b. p. 260-2°C; insoluble in water, soluble in alcohol and ether

Derivation: Treatment of diethylaniline with nitrous acid and subsequent reduction.

Use: Dye intermediate.

para-aminodiethylaniline hydrochloride

$\text{C}_{10}\text{H}_{16}\text{N}_2 \cdot \text{HCl}$.

Properties: Colorless needles; soluble in water, alcohol; insoluble in ether.

Containers: 1-, 5-lb bottles; 25-, 50-, 100-lb drums.

Use: Color photography.

2-amino-4,6-dihydroxypteridine. See xanthopterin.

3-amino-7-dimethylamino-2-methylphenazothionium chloride. See tolonium chloride.

para-aminodimethylaniline (dimethylaminoaniline; dimethyl-para-phenylenediamine) $(\text{CH}_3)_2\text{NC}_6\text{H}_4\text{NH}_2$.

Properties: Colorless, asbestos-like, long needles; stable in air when pure. If impure, the crystals liquefy. Soluble in water, alcohol and benzene.

Constants: M. p. 41°C; b. p. 257°C.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: By reduction of para-nitrosodimethylaniline with zinc dust and hydrochloric acid. The aminodimethylaniline is not isolated, but the solution is worked up. Method of purification: Recrystallization from mixture of benzene and ligroin.

Grades: Technical.

Containers: Kegs; 1- and 5-lb glass bottles; special metal cans or drums.

Uses: Base for production of methylene blue; photo-developer; reagent for detection of hydrogen sulfide, reagent for cellulose; organic synthesis; reagent for certain bacteria.

Shipping regulations: None.*

aminodimethylanilinethiosulfonic acid

Properties: Prismatic crystals. Soluble in hot water; less so in cold water.

Constants: M. p. 193-204° (decomposes).

Derivation: From para-nitrosodimethylaniline by reacting with sodium thiosulfate and weak acids.

Grades: Technical.

Use: Synthesis of dyestuffs.

aminodimethylbenzene. See xylidine.

1-amino-2,3-dimethylbenzene. See 2,3-xylidine.

1-amino-2,4-dimethylbenzene. See 2,4-xylidine.

1-amino-2,5-dimethylbenzene. See 2,5-xylidine.

1-amino-2,6-dimethylbenzene. See 2,6-xylidine.

4-amino-1,5-dimethyl-2-phenyl-3-pyrazolone. See 4-aminoantipyrene.

2-amino-4,6-dimethylpyridine $(\text{CH}_3)_2\text{C}_5\text{H}_2\text{NNH}_2$

Properties: B. p. 235.3°C; freezing point 65.2-68.5°C. Soluble in water.

Derivation: Prepared from 2-aminopyridine.

Grade: 95% (minimum).

Use: Organic intermediate.

2-amino-4,6-dinitrophenol. See picramic acid.

para-aminodiphenylamine (N-phenyl-para-phenylene diamine) $\text{NH}_2\text{C}_6\text{H}_4\text{NHC}_6\text{H}_5$

Properties: Colorless needles; m. p. 75°C, slightly soluble in water; soluble in absolute alcohol and ether.

Derivation: Reduction of the coupling product of diazotized sulfanilic acid and diphenylamine.

Grade: Technical.

Containers: Drums.

Use: Dye intermediate.

para-aminodiphenylamine hydrochloride

Properties: Green powder; soluble in hot water, hot alcohol; insoluble in ether.

1,4,2-aminodiphenylaminesulfonic acid

(2-aniline-5-aminobenzenesulfonic acid)

Properties: Needle-like crystals. Barely soluble in water.

Derivation: From para-nitrodiphenylamine-

ortho-sulfonic acid by reduction with iron and hydrochloric acid.

Grades: Technical.

Use: Synthesis of dyestuffs.

amino dithioformic acid. See dithiocarbamic acid.

aminoethane. See ethylamine.

2-aminoethanesulfonic acid. See taurine.

2-aminoethanethiol. See cysteamine.

1-aminoethanol. See aldehyde ammonia.

2-aminoethanol. See ethanolamine.

alpha-(1-aminoethyl) benzyl alcohol hydrochloride. See phenylpropanolamine hydrochloride.

aminoethylethanolamine. See hydroxyethyl-ethylene diamine.

4-aminoethylglyoxaline. See histamine.

beta-aminoethylisothiuronium bromide

hydrobromide (AET) $\text{C}_3\text{H}_7\text{N}_3\text{S} \cdot 2\text{HBr}$

Properties: Crystals; hygroscopic; m. p. 194-195°C.

Derivation: Thiourea is refluxed with 2-bromoethylamine hydrobromide in isopropanol.

Use: Suggested as a prophylactic in radiation sickness; enzyme activator; free radical detoxifier.

para-beta-aminoethylphenol. See tyramine.

N-aminoethylpiperazine

$\text{H}_2\text{NC}_2\text{H}_4\text{NCH}_2\text{CH}_2\text{NHCH}_2\text{CH}_2$. High boiling triamine combining a primary, secondary and tertiary amine in one molecule.

Properties: Liquid; sp. gr. 0.9837, b. p. 222.0°C; flash point 200.0°F; freezing point 17.6°C. Soluble in water.

Containers: 55-gal drums; tank cars.

Uses: Epoxy curing agent; intermediate for pharmaceuticals, anthelmintics, surface active agents, synthetic fibers.

2-amino-2-ethyl-1,3-propanediol (amino-amyleneglycol) $\text{CH}_2\text{OH}(\text{C}_2\text{H}_5)_2\text{NH}_2\text{CH}_2\text{OH}$

Properties: Colorless liquid, white crystalline solid. Completely miscible in water at 20°C. Corrosive to copper, brass, aluminum.

Constants: Sp. gr. 1.099 at 20°C/20°C; b. p. (10 mm) 152-153°C; m. p. 37.5-38.5°C; wt. 9.15 lbs/gal (20°C), refractive index 1.490 at 20°C, flash point 166°F; pH (0.1M aqueous solution) 10.82.

Containers: 5- and 55-gal drums.

Uses: Emulsifying agent (in soap form) for oils, fats, and waxes; absorbent for acidic gases; chemical synthesis.

Caution! Slightly toxic, mildly alkaline; avoid repeated skin contact.

2-aminoethylsulfuric acid $\text{NH}_2\text{CH}_2\text{CH}_2\text{OSO}_3\text{H}$

Properties: White noncorrosive crystalline powder; m. p. 274-280°C; sinters at 274°C and darkens without complete melting at 280°C, sp. gr. 1.782, bulk density 1.007 g/cc. Soluble in water; insoluble in most organic solvents; pH of 1% aqueous solution 4.0 (20°C), 5% aqueous solution 3.3 (39°C).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Use: Organic synthesis of ethyleneimine and various other compounds.

4-aminofolic acid. See aminopterin.

aminoform. See hexamethylenetetramine.

amino-G acid. See 2-naphthylamine-6,8-disulfonic acid.

alpha-aminoglutaric acid. See glutamic acid.

alpha-aminoglutaric acid hydrochloride. See glutamic acid hydrochloride.

aminoglutethimide [alpha-(para-aminophenyl)-alpha-ethylglutarimide]. Amino analog of glutethimide.

Use: Medicine.

amino-4-guanidovaleric acid. See arginine.

2-aminoheptane (1-methylhexylamine; tuaminoheptane) $\text{CH}_3(\text{CH}_2)_4\text{CH}(\text{NH}_2)\text{CH}_3$.

Properties: Volatile, colorless to pale yellow liquid; amine odor. Boiling range 138.5-142.5°C, refractive index 1.4150-1.4200 (n_D²⁵); sp. gr. 0.7600-0.7625 (25/25°C). Freely soluble in alcohol, benzene, chloroform, and ether; slightly soluble in water; pH (1% solution) 11.45.

Use: Medicine

para-aminohippuric acid [N-(para-aminobenzoyl) glycine; PAHA] $\text{NH}_2\text{C}_6\text{H}_4\text{CONHCH}_2\text{COOH}$.

Properties: White, crystalline powder. Discolors on exposure to light. Slightly soluble in water, alcohol, and most organic solvents. Very soluble in dilute hydrochloric acid and alkalis. Forms a water soluble sodium salt. M.p. 197-199°C.

Grade: N. F. XI.

Uses: Medical diagnostic reagent, intermediate.

aminohydroxybenzoic acids. See aminosalicic acids.

alpha-amino-beta-hydroxybutyric acid. See threonine.

alpha-amino-beta-para-hydroxyphenylpropionic acid. See tyrosine.

alpha-amino-beta-hydroxypropionic acid. See serine.

alpha-amino-beta-imidazolepropionic acid. See histidine.

dl-alpha-aminoisobutyric acid (2-amino-2-methylpropanoic acid) $(\text{CH}_3)_2\text{C}(\text{NH}_2)\text{COOH}$.

Properties: White crystals; sweetish taste. M.p. 335°C, sublimes; freely soluble in water; insoluble in alcohol and ether.

Derivation: (a) Treatment of acetone with ammonium cyanide; (b) by heating dimethylhydantoin with hydrochloric acid.

alpha-aminoisocaproic acid. See leucine.

alpha-aminoisovaleric acid. See valine.

D-4-amino-3-isoxazolidone (cycloserine; oxamycin) $\text{C}_5\text{H}_6\text{N}_2\text{O}_2$ or $\text{NHCOCH}(\text{NH}_2)\text{CH}_2\text{O}$.

A soluble, crystalline, broad spectrum antibiotic; highly stable in alkaline solutions; somewhat unstable in neutral or acid

solutions.

Derivation: (a) Submerged aerobic fermentation; (b) synthesis from serine.

Grade: N. N. D.

Use: Medicine.

amino-J acid. See 2-naphthylamine-5,7-disulfonic acid.

aminomercuric chloride. See mercury, ammoniated.

para-(4-amino-3-methoxyphenylazo) benzene-sulfonic acid $\text{H}_2\text{NC}_6\text{H}_3(\text{OCH}_3)\text{NNC}_6\text{H}_4\text{SO}_3\text{H}$.

Properties: Maroon paste containing approximately 38% solids.

Grade: Technical.

Use: Intermediate.

para-aminomethylbenzenesulfonamide hydrochloride. See maphenide hydrochloride.

1-alpha-(aminomethyl)-3,4-dihydroxybenzyl alcohol. See levarterenol.

4-amino-4'-methylidiphenylamine-2-sulfonic acid (aminotoluidinobenzene sulfonic acid) $\text{CH}_3\text{C}_6\text{H}_4\text{NHC}_6\text{H}_3\text{NH}_2\text{SO}_3\text{H}$.

Properties: Light to dark gray paste with characteristic odor.

Use: Intermediate.

6-amino-3-methyl-1-(2-methylallyl)uracil $\text{C}_9\text{H}_{13}\text{N}_3\text{O}_2$.

Properties: White crystalline powder; odorless with mild, slightly bitter taste; m.p. 170-176°C. Slightly soluble in water, with increasing solubility as water is heated; freely soluble in alcohol; insoluble in ether.

Grade: N. F. XI.

Use: Medicine.

2-amino-3-methylpentanoic acid. See isoleucine.

2-amino-2-methyl-1,3-propanediol (AMPD, aminobutylene glycol; butanediolamine) $\text{CH}_2\text{OHC}(\text{CH}_3)\text{NH}_2\text{CH}_2\text{OH}$. Corrosive to copper, brass, aluminum.

Properties: White crystalline solid. Solubility in water: 250 g/100 cc at 20°C, also soluble in alcohol.

Constants: M.p. 109-111°C, b.p. (10 mm) 151-152°C, pH (0.1M aqueous soln) 10.78.

Containers: 1-, 5-, 51-gal fiberpaks.

Uses: Emulsifying agent (in soap form) for oils, fats, and waxes; absorbent for acidic gases; chemical synthesis; cosmetics.

Caution: Slightly toxic; mildly alkaline; avoid repeated skin contact.

2-amino-2-methylpropanoic acid. See dl-alpha-aminoisobutyric acid.

2-amino-2-methyl-1-propanol (isobutanolamine; AMP) $\text{CH}_3\text{C}(\text{CH}_3)\text{NH}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid, or white crystalline solid. Completely miscible in water at 20°C.

Constants: Sp. gr. 0.934 at 20/20°C; b.p. (760 mm) 165°C, (10 mm) 67.4°C; m.p. 30-31°C; vapor pressure 1 mm at 20°C (est'd); flash point 153°F; wt. 7.76 lbs per gal (20°C), refractive index 1.449 at 20°C; pH (0.1M aqueous solution) 11.27.

Containers: 5- and 55-gal drums. May

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

solidify in drum in cool weather.

Uses: Emulsifying agent (in soap form) for oils, fats, and waxes; absorbent for acidic gases; chemical synthesis.

Caution: Slightly toxic; mildly alkaline; avoid repeated skin contact.

2-amino-3-methylpyridine

$N:CNH_2CH_2CHCH:CH$

Properties: B. p. 221.1°C; freezing point 29.5-33.3°C; soluble in water.

Derivation: From 2-aminopyridine.

Grade: 98% (minimum).

Use: Intermediate.

2-amino-4-methylpyridine (2-amino-4-picoline) $N:CNH_2CH:CCCH_2CH$

Properties: Crystals; b. p. 230.9°C (760 mm), 115-117°C (11 mm); freezing point 96-99.0°C. Sublimes on slow heating;

soluble in water, lower alcohols, dimethylformamide, coal tar bases; slightly soluble in petroleum ether, aliphatic hydrocarbons.

Derivation: Prepared from 2-aminopyridine.

Grade: 95% (minimum).

Uses: Intermediate; medicine.

2-amino-5-methylpyridine

$N:CNH_2CH:CHCCH_3CH$

Properties: B. p. 227.1°C; freezing point 76.6°C; soluble in water.

Derivation: Prepared from 2-aminopyridine.

Grade: 95% (minimum).

Use: Intermediate.

2-amino-6-methylpyridine

$N:CNH_2CH:CHCH:CCCH_3$

Properties: B. p. 214.4°C; freezing point 43.7°C; soluble in water.

Derivation: Prepared from 2-aminopyridine.

Use: Intermediate.

alpha-amino-beta-methylvaleric acid. See isoleucine.

alpha-amino-gamma-methylvaleric acid. See leucine.

3-amino-1,5-naphthalenedisulfonic acid.

Preferred name for 2-naphthylamine-4,8-disulfonic acid.

6-amino-1,3-naphthalenedisulfonic acid.

Preferred name for 2-naphthylamine-5,7-disulfonic acid.

7-amino-1,3-naphthalenedisulfonic acid.

Preferred name for 2-naphthylamine-6,8-disulfonic acid.

2-amino-1-naphthalenesulfonic acid. Preferred name for 2-naphthylamine-1-sulfonic acid.

4-amino-1-naphthalenesulfonic acid. See naphthionic acid.

5-amino-1-naphthalenesulfonic acid. Preferred name for 1-naphthylamine-5-sulfonic acid.

5-amino-2-naphthalenesulfonic acid. Preferred name for 1-naphthylamine-6-sulfonic acid.

6-amino-2-naphthalenesulfonic acid. Preferred name for 2-naphthylamine-6-sulfonic acid.

8-amino-1-naphthalenesulfonic acid. Preferred name for 1-naphthylamine-8-sulfonic acid.

8-amino-2-naphthalenesulfonic acid. Preferred name for 1-naphthylamine-7-sulfonic acid.

8-amino-1,3,6-naphthalenetrisulfonic acid. Preferred name for 1-naphthylamine-3,6,8-trisulfonic acid.

1-amino-2-naphthol-3,6-disulfonic acid.

$C_{10}H_4NH_2OH(SO_3H)_2$.

Properties: Needles. Soluble in water.

Derivation: By the action of hydrochloric acid and stannous chloride upon 1-benzene-azo-2-naphthol-3,6-disulfonic acid.

Grades: Technical.

Containers: Wooden barrels; fiber containers.

Use: Photography (in the form of the sodium salt as a developer).

1-amino-8-naphthol-2,4-disulfonic acid.

See 8-amino-1-naphthol-5,7-disulfonic acid.

1-amino-8-naphthol-3,5-disulfonic acid

(B acid; 8-amino-1-naphthol-4,6-disulfonic acid) $C_{10}H_4NH_2OH(SO_3H)_2$.

Derivation: By sulfonating 1-amino-8-naphthol-3-sulfonic acid.

Grades: Technical.

Containers: Wooden barrels.

Use: Dye intermediate.

1-amino-8-naphthol-3,6-disulfonic acid

(H acid; 8-amino-1-naphthol-3,6-disulfonic acid) $C_{10}H_4NH_2OH(SO_3H)_2$.

Properties: Gray powder. Soluble in water, alcohol and ether.

Derivation: From alpha-naphthylamine trisulfonic acid by soda fusion.

Method of purification: Crystallization.

Grades: Technical, 80%, 85%.

Containers: 300-, 385-lb wooden barrels.

Use: Dye intermediate.

Shipping regulations: None. *

1-amino-8-naphthol-4,6-disulfonic acid

(K acid; 8-amino-1-naphthol-3,5-disulfonic acid) $C_{10}H_4NH_2OH(SO_3H)_2$.

Derivation: By soda fusion of a naphthylamine trisulfonic acid.

Grades: Technical.

Containers: Wooden barrels.

Use: Dye intermediate.

2-amino-8-naphthol-3,6-disulfonic acid

(2R acid; RR acid; 7-amino-1-naphthol-3,6-disulfonic acid) $C_{10}H_4NH_2OH(SO_3H)_2$.

Properties: Soluble in water.

Derivation: By soda fusion of a naphthylamine trisulfonic acid.

Grades: Technical.

Containers: Wooden barrels.

Use: Dye intermediate.

7-amino-1-naphthol-3,6-disulfonic acid.

Preferred name for 2-amino-8-naphthol-3,6-disulfonic acid.

8-amino-1-naphthol-3,5-disulfonic acid.

Preferred name for 1-amino-8-naphthol-4,6-disulfonic acid.

8-amino-1-naphthol-3,6-disulfonic acid*

Preferred name for 1-amino-8-naphthol-3,6-disulfonic acid.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

8-amino-1-naphthol-4,6-disulfonic acid.

Preferred name for 1-amino-8-naphthol-3,5-disulfonic acid.

8-amino-1-naphthol-5,7-disulfonic acid

(Chicago acid; SS acid; 1-amino-8-naphthol-2,4-disulfonic acid)

$C_{10}H_7NH_2OH(SO_3H)_2$.

Properties: Gray paste; white when pure.

Soluble in water and sodium hydroxide solution.

Derivation: Fusion of 1,8-naphthosultam-2,4-disulfonic acid with caustic potash.

Method of purification: Recrystallization from water.

Grade: Technical.

Containers: Wooden barrels.

Use: Dye intermediate.

Shipping regulations: None.*

1-amino-2-naphthol-4-sulfonic acid

(1,2,4 acid) $C_{10}H_7NH_2OHSO_3H$.

Properties: Pinkish-white to gray needles.

Soluble in hot water; almost insoluble in cold water.

Derivation: Beta-naphthol is changed to the 1-nitroso-beta-naphthol which is treated with sodium bisulfite. Upon acidification the free sulfurous acid effects simultaneous reduction and sulfonation.

Method of purification: By washing the crude acid paste with water.

Grades: Technical.

Containers: Glass bottles; 500- to 800-lb wooden barrels.

Uses: Aniline dyes; analysis (determination of phosphates and calcium).

Shipping regulations: None.*

1-amino-2-naphthol-6-sulfonic acid

$C_{10}H_7NH_2OHSO_3H$.

Properties: Needles or prisms. Slightly soluble in hot water, alcohol; insoluble in ether.

Derivation: By reducing 1,2,6-nitrosenaphtholsulfonic acid.

Grades: Technical.

Uses: Photography (making sodium salt used as a developer); dye intermediate.

1-amino-2-naphthol-6-sulfonic acid, sodium salt. See eikonogen.**1-amino-5-naphthol-7-sulfonic acid**

(M acid; 5-amino-1-naphthol-3-sulfonic acid) $C_{10}H_7NH_2OHSO_3H$.

Properties: Gray needles. Slightly soluble in cold water; soluble in hot water and alcohol.

Grades: Technical.

Containers: Wooden barrels.

Use: Dye intermediate.

1-amino-8-naphthol-4-sulfonic acid

(S acid; 8-amino-1-naphthol-5-sulfonic acid) $C_{10}H_7NH_2OHSO_3H$.

Properties: Gray; white when pure. Slightly soluble in water; insoluble in alcohol and ether.

Derivation: Fusion of 1-naphthylamine-4,8-disulfonic acid with caustic soda.

Method of purification: Precipitation from a dilute solution of its sodium salt.

Grades: Technical.

Containers: Wooden barrels.

Use: Dye intermediate.

Shipping regulations: None.*

1-amino-8-naphthol-5-sulfonic acid

$C_{10}H_7NH_2OHSO_3H$.

Properties: Small needles; slightly soluble in water.

Derivation: Fusion of 1-naphthylamine-5,8-disulfonic acid with caustic soda.

Grades: Technical.

Containers: Wooden barrels.

Use: Dye intermediate.

2-amino-1-naphthol-4-sulfonic acid

$C_{10}H_7NH_2OHSO_3H$.

Properties: Needles; white; insoluble in water, alcohol, ether, benzene.

Derivation: By heating 2-nitroso-1-naphthol with sodium sulfite.

Grades: Technical.

Containers: Wooden barrels.

Use: Dye intermediate.

2-amino-3-naphthol-6-sulfonic acid

(R acid) $C_{10}H_7NH_2OHSO_3H$.

Properties: Needles; slightly soluble in water.

Derivation: Fusion of 2-naphthylamine-3,6-disulfonic acid with caustic soda.

Grades: Technical.

Containers: Wooden barrels.

Use: Dyes.

2-amino-5-naphthol-7-sulfonic acid

(J acid; 6-amino-1-naphthol-3-sulfonic acid) $C_{10}H_7NH_2OHSO_3H$.

Properties: Gray; white when pure. Soluble in hot water; sparingly soluble in cold water.

Derivation: Fusion of beta-naphthylamine-5,7-disulfonic acid with caustic.

Method of purification: Recrystallization from hot water.

Grades: Technical.

Containers: Wooden barrels.

Use: Dyes.

2-amino-5-naphthol-7-sulfonic acid, sodium salt

$C_{10}H_7NH_2OHSO_3Na$.

Properties: Gray to brown paste with characteristic odor.

Grade: 50% (minimum).

Use: Dye intermediate.

2-amino-8-naphthol-6-sulfonic acid. See 7-amino-1-naphthol-3-sulfonic acid.**5-amino-1-naphthol-3-sulfonic acid.** Preferred name for 1-amino-5-naphthol-7-sulfonic acid.**6-amino-1-naphthol-3-sulfonic acid.** Preferred name for 2-amino-5-naphthol-7-sulfonic acid.**7-amino-1-naphthol-3-sulfonic acid (gamma acid; 2-amino-8-naphthol-6-sulfonic acid)**

$C_{10}H_7NH_2OHSO_3H$.

Properties: White crystals. Soluble in alcohol and ether; very slightly soluble in water.

Derivation: By heating caustic soda and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

2-naphthylamine-6,8-disulfonic acid in an autoclave.

Method of purification: Crystallization.

Grades: Technical.

Containers: 50-, 100-lb kegs; 200-, 300-lb barrels.

Use: Azo dye intermediate.

Shipping regulations: None.*

8-amino-1-naphthol-5-sulfonic acid. Preferred name for 1-amino-8-naphthol-4-sulfonic acid.

2-amino-5-nitrothiazole $C_3H_3N_3O_2S$.

Properties: Greenish yellow to orange-yellow fluffy powder; slightly bitter taste. Decomposes $202^\circ C$; very sparingly soluble in water; soluble in dilute acids.

Use: Veterinary medicine.

amino oxidase (L-amino acid oxidase; D-amino acid oxidase; L-amino dehydrogenase).

An enzyme which catalyzes the deamination of amino acids by dehydrogenation to keto acids and ammonia. Two types are recognized, acting on the D- and L-amino acids. Recent emphasis has been on characterization of the D-amino oxidase, which is known to contain a flavin as coenzyme. Both types are found in animal tissue, especially in liver and kidney, as well as in snake venom and certain bacteria.

2-amino-6-oxypurine. See guanine.

aminopentamide sulfate (4-dimethylamino-2,2-diphenylvaleramide sulfate)

$H_2NOCC(C_6H_5)_2CH_2CH(CH_3)N(CH_3)_2 \cdot \frac{1}{2} H_2SO_4$.

Properties: White, odorless, crystalline powder. Freely soluble in alcohol and water; pH range of 2.5% solution is 1.3-2.2.

Grade: N.N.D.

Use: Medicine.

1-aminopentane. See n-amylamine.

aminophenacetin acetate. See phenocoll acetate.

aminophenacetin hydrochloride. See phenocoll hydrochloride.

2-aminophenetole. See ortho-phenetidine.

4-aminophenetole. See para-phenetidine.

meta-aminophenol (meta-hydroxyaniline)

$C_6H_4NH_2OH$.

Properties: White crystals; m. p. $122^\circ C$; soluble in water, alcohol, and ether.

Derivation: Fusion of meta-sulfanilic acid with caustic soda and subsequent extraction of the melt with ether.

Method of purification: Recrystallization.

Containers: Drums.

Uses: Dye intermediate; intermediate for para-amino-salicylic acid.

ortho-aminophenol (ortho-hydroxyaniline)

$C_6H_4NH_2OH$.

Properties: White crystals; turn brown with age; m. p. $170^\circ C$; sublimes on further heating. Slightly soluble in water, alcohol, benzene; freely soluble in ether.

Derivation: By reduction of ortho-nitrophenol mixed with aqueous ammonia by

means of a stream of hydrogen sulfide.

Method of purification: Recrystallization.

Grades: Technical.

Containers: 1- and 5-lb glass bottles; fiber cans and drums.

Uses: Dyeing furs and hair; dye intermediate for azo and sulfur dyes.

para-aminophenol (para-hydroxyaniline)

$C_6H_4NH_2OH$.

Properties: White or reddish yellow crystals; turn violet on exposure to light; m. p. $184^\circ C$ with decomposition; soluble in water and alcohol.

Derivation: (a) By reduction of para-nitrophenol with iron filings and hydrochloric acid. (b) By electrolytic reduction of nitrobenzene in concentrated sulfuric acid and treatment with an alkali to free the base.

Method of purification: Recrystallization.

Grades: Technical; photographic.

Containers: Glass bottles; 100-lb wooden barrels; 100-lb net fiber drums.

Uses: Dyeing textiles, hair, furs, feathers; photographic developer; pharmaceuticals; antioxidants; oil additives.

4-amino-1-phenol-2,6-disulfonic acid

$C_6H_2OHNH_2(SO_3H)_2$.

Properties: Fine needles. Soluble in water; slightly soluble in alcohol; insoluble in ether.

Derivation: By the action of sulfur dioxide on para-nitrophenol.

Grades: Technical.

Containers: Wooden barrels.

Uses: Dyes.

ortho-aminophenol hydrochloride $C_6H_7NO \cdot HCl$.

Properties: White crystals changing to gray on exposure to light; m. p. $208-210^\circ C$; soluble in alcohol and water.

Uses: Dyeing fur and hair; dye intermediate.

para-aminophenol hydrochloride $C_6H_7NO \cdot HCl$.

Properties: Light-brown to white needles; m. p. $306^\circ C$ with decomposition. Soluble in water and alcohol.

Derivation: By neutralizing para-aminophenol with hydrochloric acid.

Method of purification: Recrystallization.

Grades: Technical; photographic.

Containers: Glass bottles; 100-lbs net fiber drums.

Uses: Dyes; photographic chemicals.

Shipping regulations: None.*

aminophenolsulfonic acid III. See 3-amino-1-phenol-4-sulfonic acid.

aminophenolsulfonic acid IV. See 3-amino-1-phenol-6-sulfonic acid.

2-amino-1-phenol-4-sulfonic acid (ortho-aminophenol-para-sulfonic acid)

$C_6H_3OHNH_2SO_3H$.

Properties: Brown crystals. Fairly soluble in hot water; very soluble in alkaline solution. No melting point. Decomposes on heating.

Derivation: (a) Sulfonation and nitration of chlorobenzene followed by hydrolysis to phenol with caustic soda with subsequent

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

reduction by sodium sulfide. (b) Sulfonation of ortho-aminophenol. (c) Sulfonation of phenol followed by nitration and reduction.

Method of purification: Recrystallization.

Grades: Technical, 97% crystals; 10% solution in sodium sulfide.

Containers: 100-lb kegs; 250-lb wooden barrels.

Use: Intermediate for Schultz dyes Nos. 154, 155, 156, and 157.

Shipping regulations: None.*

3-amino-1-phenol-4-sulfonic acid (amino-phenolsulfonic acid III) $C_6H_3OHNH_2SO_3H$.

Properties: Needles or plates. Slightly soluble in cold water (sodium salt more so).

Derivation: By heating together (in a water bath) concentrated sulfuric acid and meta-aminophenol-disulfonic acid.

Grades: Technical.

Containers: Wooden barrels.

Use: Dyes.

3-amino-1-phenol-6-sulfonic acid (amino-phenolsulfonic acid IV) $C_6H_3OHNH_2SO_3H$.

Properties: Needles or plates. Soluble in water.

Derivation: (a) By soda fusion of aniline disulfonic acid; (b) by sulfonating metanilic acid.

Grades: Technical.

Containers: Wooden barrels.

Use: Dyes.

ortho-aminophenol-para-sulfonic acid. See 2-amino-1-phenol-4-sulfonic acid.

para-aminophenylarsonic acid. See arsanilic acid.

1-amino-2-phenylethane. See beta-phenylethylamine.

alpha-(para-aminophenyl)-alpha-ethylglutaramide. See aminogluthetamide.

ortho-aminophenylglyoxalic lactime. See isatin.

para-aminophenylmercaptoacetic acid $NH_2C_6H_4SCH_2CO_2H$.

Properties: M. p. 186-187°C; insoluble in water, alcohol, benzene, chloroform, soluble in aqueous acid or alkali solutions.

Uses: Synthetic intermediate for dyes and pharmaceuticals.

2-(para-aminophenyl)-6-methylbenzothiazole. See dehydrothio-para-toluidine.

meta-aminophenyl methyl carbinol $NH_2C_6H_4CH(OH)CH_3$.

Properties: Solid, sp. gr. 1.12 (density, g/ml); b. p. 217.3°C (100 mm); freezing point 66.4°C; soluble in water.

Uses: Carrier for dyeing synthetic fibers; intermediate for perfume chemicals and pharmaceuticals.

1-(meta-aminophenyl)-3-methyl-5-pyrazolone $NH_2C_6H_4NNC(CH_3)CH_2CO$.

Properties: Light tan paste containing approximately 45% solids.

Grade: Technical.

Use: Intermediate.

alpha-amino-beta-phenylpropionic acid. See phenylalanine.

aminophylline (theophylline ethylenediamine)

$C_{14}H_{24}N_{10}O_4 \cdot xH_2O$. Contains 78 to 83.5%

anhydrous theophylline; 12.8 to 14.1% ethylenediamine.

Properties: White or slightly yellowish granules or powder with slight ammoniacal odor and a bitter taste. Soluble in water; insoluble in alcohol and ether.

Solutions are alkaline to litmus.

Grade: U. S. P. XVI.

Containers: Bottles; 25-, 100-lb drums.

Use: Medicine.

aminopicolines. See aminomethylpyridines.

amino plastics. See amino resins.

2-aminopropane. See isopropylamine.

2-aminopropanoic acid. See alanine.

3-aminopropanoic acid. See beta-alanine.

2-amino-1-propanol (2-aminopropyl alcohol;

beta-propanolamine) $CH_3CH(NH_2)CH_2OH$.

Properties: Colorless to pale yellow liquid. Both l and dl forms are available. dl-form: fishy odor; boils at 173-176°C; freely soluble in water, alcohol, ether. l-form: refractive index 1.4480-1.4495 at 25°C; distillation range about 114°C at 100 mm.

3-aminopropanol (propanolamine)

$H_2NCH_2CH_2CH_2OH$.

Properties: Colorless liquid; m. p. 12.4°C; b. p. 184-186°C (760 mm), 168°C (500 mm); flash point (Tag open cup) 175°F; sp. gr. 0.9786 (30°C). Miscible with alcohol, water, acetone and chloroform.

Grade: 99% pure.

Uses: Organic intermediate.

alpha-aminopropionic acid. See alanine.

beta-aminopropionic acid. See beta-alanine.

2-aminopropyl alcohol. See 2-amino-1-propanol.

N-aminopropyl morpholine

$CH_2CH_2OCH_2CH_2NC_3H_7NH_2$.

Properties: Sp. gr. 0.9872 (20/20°C); b. p. 224.5°C, f. p. 220°F; freezing point -15°C; soluble in water.

Use: Fiber synthesis.

para-(2-aminopropyl) phenol. See hydroxy-amphetamine.

para-(2-aminopropyl) phenol hydrobromide. See hydroxyamphetamine hydrobromide.

aminopropyltriethoxysilane.

Properties: Liquid; b. p. 217°C; sp. gr. 0.94 (25°C).

Uses: Sizing of glass fibers for making laminates.

aminopterin (4-aminofolic acid; aminopteroyl-glutamic acid) $C_{19}H_{20}N_8O_5 \cdot 2H_2O$. Differs slightly in structure from folic acid (q. v.) and antagonizes the utilization of folic acid by the body.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Occurs as clusters of yellow needles which are soluble in aqueous sodium hydroxide solutions.

Grades: The sodium salt (aminopterin sodium) is listed in N. N. D.

Uses: Medicine; rodenticide.

6-aminopurine. See adenine.

2-aminopyridine (alpha-pyridylamine)

$C_5H_4NNH_2$.

Properties: White leaflets or large, colorless crystals; freezing point $58.1^\circ C$; b. p. $210.6^\circ C$; soluble in water, alcohol, benzene, ether, hot petroleum ether.

Use: Intermediate for antihistamines, other drugs and organics.

3-aminopyridine (beta-pyridylamine)

$C_5H_4NNH_2$.

Properties: White crystals; m. p. $64^\circ C$; b. p. $250-252^\circ C$; soluble in water, alcohol, benzene, ether.

Use: Intermediate in preparation of drugs and dyestuffs.

4-aminopyridine $C_5H_4NNH_2$.

Properties: Crystals; m. p. $158.9^\circ C$; b. p. $273.5^\circ C$; soluble in water.

Derivation: From 2-aminopyridine.

Grade: 95% (minimum).

Use: Intermediate.

aminopyrine (dimethylaminoantipyrene; amidopyrine) $C_{13}H_{17}N_3O$. 4-Dimethylamino-2,3-dimethyl-1-phenyl-3-pyrazolin-5-one.

Properties: Colorless crystalline powder, almost tasteless, odorless; m. p. $107-109^\circ C$. Moderately soluble in water; soluble in alcohol, chloroform, ether.

Derivation: By reducing isonitrosoantipyrene with zinc and methylating with methyl iodide.

Containers: 25-, 100-lb drums.

Use: Medicine.

Shipping regulations: None.*

amino resins (amino plastics). A large class of thermosetting resins made by the reaction of an amine with an aldehyde. The only aldehyde in commercial use is formaldehyde, and the most important amines are urea and melamine. These resins are used in molding, adhesives, laminating, textile finishes, protective coatings, and paper manufacture. Less important applications include leather treatment, binders for fabrics, and foundry sands, graphite resistors, plaster of paris fortification, foam structures and ion exchange resins. In general the resins are hard and brittle and are used with fillers.

In commercial practice the reaction between the amine and formaldehyde is carried only part way to completion by the resin manufacturer, and then heat, with or without a catalyst, is used in the final applications to cause thermosetting, i. e., the formation of the hard infusible resin. Many variations of these resins arise by changing the proportions of amine to form-

aldehyde and by having solvents or chemically reactive materials present during resin formation.

Aniline and thiourea resins are no longer of importance. Ethylene urea resins are of increasing importance for textile finishing.

4-aminosalicylic acid (PASA; PAS; para-aminosalicylic acid; 4-amino-2-hydroxybenzoic acid) $NH_2C_6H_3(OH)COOH$.

Properties: White or nearly white bulky powder. Odorless or has slight acetous odor. M. p. $150-151^\circ C$ (dec). Affected by light and air. Soluble in sodium bicarbonate and phosphoric acid; somewhat soluble in alcohol; slightly soluble in ether or acetone; practically insoluble in benzene and water; pH (saturated aqueous solution) 3.0-3.7.

Derivation: From meta-aminophenol and potassium bicarbonate solution under pressure.

Grade: U. S. P. XVI.

Containers: Drums.

Use: Medicine.

5-aminosalicylic acid (meta-aminosalicylic acid; 5-amino-2-hydroxybenzoic acid) $NH_2C_6H_3(OH)COOH$.

Properties: White crystals; sometimes pinkish; m. p. $260-280^\circ C$ with decomposition; soluble in hot water or alcohol.

Derivation: (a) From the corresponding nitrosalicylic acid by reduction. (b) By reducing the azo dye, benzeneazosalicylic acid.

Method of purification: Recrystallization from water.

Grades: Technical.

Containers: Drums.

Uses: Dyes; intermediates; manufacture of transfer paper.

Shipping regulations: None.*

5-aminosalicylic acid hydrochloride

$C_6H_3COOH(OH)NH_2 \cdot HCl$.

Properties: Grayish-white crystals. Soluble in water, alcohol and ether.

Derivation: By the reduction of nitrosalicylic acid with zinc and hydrochloric acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles; tins.

Uses: Medicine; manufacture of transfer paper.

Shipping regulations: None.*

meta-aminosalicylic acid. See 5-aminosalicylic acid.

para-aminosalicylic acid. See 4-aminosalicylic acid.

alpha-aminosuccinamic acid. See asparagine.

aminosuccinic acid. See aspartic acid.

2-aminothiazole (2-thiazylamine) $C_3H_4N_2S$.

Properties: Light yellow crystals; m. p. $90^\circ C$; distills at 3 mm without decomposition.

Slightly soluble in cold water, alcohol and ether; soluble in hot water and dilute mineral acids.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: Chlorination of vinyl acetate and condensation with thiourea.

Use: Intermediate in synthesis of sulfathiazole.

alpha-amino-beta-thiolpropionic acid. See cysteine.

aminothiurea. See thiosemicarbazide.

aminotoluene. See meta-, ortho-, or para-toluidine. See also benzylamine.

4-amino-meta-toluenesulfonic acid ($\text{SO}_3\text{H}=1$). See ortho-toluidine-metasulfonic acid ($\text{CH}_3=1$).

5-amino-ortho-toluenesulfonic acid ($\text{SO}_3\text{H}=1$). See para-toluidine-ortho-sulfonic acid ($\text{CH}_3=1$).

aminotoluidinobenzene sulfonic acid. See 4-amino-4'-methyldiphenylamine-2-sulfonic acid.

aminotrate phosphate. See trolnitrate phosphate.

"Aminotriazole." ⁵⁷ A proprietary grade of 3-amino-1,2,4-triazole sold as a weed killer. Particularly effective for control of noxious perennial weeds, defoliation, and plant growth inhibition.

Properties: White crystalline solid; m.p. 150-153°C; soluble in water; slightly soluble in ethanol; insoluble in ether or acetone.

Uses: As a weed killer, defoliant, and plant growth inhibitor. Particularly effective for control of perennial weeds such as poison ivy, poison oak, Canada thistle, quack grass, and aquatic weeds. Also effective as a defoliant for cotton and other plants with additional advantage of inhibiting regrowth of new foliage.

3-(3-amino-2,4,6-triiodophenyl)-2-ethyl propanoic acid. See iopanoic acid.

aminourea hydrochloride. See semicarbazide hydrochloride.

"Aminox." ²⁴⁸ Trademark for a low-temperature reaction product of diphenylamine and acetone.

Properties: A light-tan powder; sp. gr. 1.13; m.p. 85-95°C; soluble in acetone, benzol, and ethylene dichloride, insoluble in water and gasoline.

Use: Antioxidant for light-colored rubber stocks; tire carcass, inner tubes, footwear, heels, soles, proofing sundries, and wire insulation.

aminoxylene. See xylydine.

aminoxylol. See xylydine.

"Amite." ⁶⁷ Trademark for copper-titanium alloys in cast or wrought forms.

"Amizyme." ¹¹⁴ Trade name for a series of enzyme preparations, high in dextrinizing or starch-liquefying properties. Available in tablet, powdered or liquid form.

Derivation: Produced by growing pure microbial cultures on select media.

Uses: Conversion of starch; used in paper

coatings, adhesives, and textile sizes.

Shipping regulations: None.*

"Ammate." ²⁸ Trademark for non-selective herbicide (weed and brush killer) based on ammonium sulfamate. Supplied in 95% dry crystalline formulations and also in aqueous solution.

Containers: Tank car lots; 40-lb drums and 60-lb bags.

Use: For control of poison ivy and woody plants.

ammelide. A compound related to melamine; $\text{H}_2\text{NCNC}(\text{OH})\text{NC}(\text{OH})\text{N}.$

ammeline. A compound related to melamine; $\text{H}_2\text{NCNC}(\text{NH}_2)\text{NC}(\text{OH})\text{N}.$

ammeline resins. Stated to be ceramic-like materials subliming at about 1700°F. Made by action of phosphorus pentoxide on ammelide or melamine.

ammines. Coordination compounds formed by the union of ammonia with a metallic substance, in such a way that the nitrogen atoms are linked directly to the metal. See cobaltammines and coordination compound. Note the distinction from amines, in which the nitrogen is attached directly to the carbon atom.

ammonia NH_3 . This term is properly applied only to the pure gas or compressed or cooled liquid of the indicated composition, but the term is also regularly used for solutions of this material in water, i.e., aqua ammonia. The following discussion relates to the pure substance NH_3 .

Properties: Colorless gas with characteristic pungent odor; lighter than air; b.p. (colorless liquid) -33.5°C, freezing point -77.7°C, easily liquefied by pressure alone. Vapor pressure of liquid is 8.5 atm at 20°C; sp. volume (70°F) 22.7 cu ft/lb; sp. gr. of liquid 0.77 (0°C), 0.6819 (at b.p.); very soluble in water, alcohol, and ether.

Derivation: Formerly almost entirely as a byproduct of the destructive distillation of coal, but most ammonia is now produced by direct combination of nitrogen and hydrogen gases. (See ammonia synthesis.)

Grades: Commercial 99.5%; refrigerant 99.97%.

Containers: 50-, 100-, 150-lb steel cylinders; 50,000-lb tank cars; tank trucks.

Uses: Refrigeration, fertilizer, as ingredient of mixtures or applied directly in liquid form; chemical manufacture, e.g., nitric acid, or as neutralizing agent, etc.; in rubber vulcanization; water treatment; nitriding of steel, oil refining; extracting certain metals from ores; solvent and reaction medium in organic synthesis; yeast nutrient; sulfite paper pulp process; explosives; pesticide; rocket fuel. Cracked into its constituent gases, it is a protective atmosphere for bright annealing, and a source of hydrogen; also used in powder metallurgy and brazing.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Warning! Hazardous liquid and gas under pressure. Liquid causes burns. Gas extremely irritating. MCA warning label. Shipping regulations: Nonflammable gas. Green gas label.*

ammonia alum. See aluminum-ammonium sulfate.

ammonia, anhydrous. Ammonia that is free of water, i. e., the pure dry gas NH_3 , but much more frequently the pure dry liquid ammonia of commerce. See ammonia.

ammonia, aqua. See ammonium hydroxide.

ammoniac (ammoniac gum).

Properties: Irregular, rounded tears; peculiar odor; sweetish-bitter, somewhat acrid taste; sp. gr. 1.207; partly soluble in water (forming emulsions) and alcohol. **Constituents:** Resin, volatile oil, salicylic acid, gum.

Derivation: Gum resins from stems of perennial herb, *Dorema ammoniacum*.

Occurrence: Persia, northern India and southern Siberia.

Grades: Technical.

Containers: Bags.

Uses: Medicine; as ingredient of porcelain cements; perfumes.

Shipping regulations: None.*

ammoniacal liquor. See ammonia liquor.

ammoniac gum. See ammoniac.

ammonia, household. Name applied in trade to dilute ammonium hydroxide frequently containing small amounts of various detergent additives.

ammonia, liquid. Ammonia (NH_3) is regularly handled in commerce and industry in the form of a liquid, kept under relatively low pressure in steel cylinders or tanks. See ammonia.

ammonia liquor (gas liquor; ammoniacal liquor).

Derivation: A condensed watery solution obtained in the destructive distillation of a bituminous coal in gas or coke manufacture, composed of ammonia and ammonium compounds, and containing hydrogen sulfide and cyanogen.

Uses: Production of anhydrous ammonia, aqua ammonia (ammonium hydroxide), ammonium sulfate and other ammonium salts; as a source of ammonia in the Solvay process for producing soda ash.

Grades: Technical.

Containers: Tank cars.

Shipping regulations: None.*

ammonia-soda process. See Solvay process.

ammonia solution, U.S.P. XVI. Specifications covering two concentrations of aqueous ammonium hydroxide solutions. Diluted ammonia solution contains not less than 9 g or more than 10 g of ammonia (NH_3) per 100 ml. Strong ammonia solution contains not less than 27% or more than 30% by weight of ammonia (NH_3). See ammonium hydroxide.

ammonia synthesis. The direct combination of nitrogen and hydrogen gases at high temperature and pressure in the presence of a catalyst to produce ammonia. Pressures range up to 1000 atmospheres and temperatures up to 700°C, so that special chromium alloy steels and reaction vessel designs are required. The hydrogen is often obtained by reaction of natural gas with steam at high temperature. Hydrogen is also obtained by the water gas process, or by oxidation of natural gas to carbon monoxide and hydrogen, or, recently, as a by-product of certain petroleum refinery processes. Nitrogen is usually supplied by mixing enough air with the hydrogen stream so that after combustion all oxygen is removed and hydrogen and nitrogen are left in proper proportions.

The carbon monoxide usually present is converted to dioxide by reaction with steam over an iron oxide catalyst. The carbon dioxide is then absorbed in water under pressure or in a 20% solution of ethan-^{ol}amine, which can be continuously regenerated. Various special means are used for removing traces of carbon monoxide since it is a catalyst poison. The original operating process was the Haber process, but a variety of methods have since been developed for obtaining nitrogen and hydrogen, purifying them, and operating the catalytic conversion unit. These are now mostly of historic interest only, but include Haber-Bosch, Claude, Casale, Fauser and Mont Ceniz (q. v.).

ammoniated mercury chloride. See mercury, ammoniated.

ammoniated mercury nitrate. See mercurous nitrate, ammoniated.

ammoniated ruthenium oxychloride. See ruthenium red.

ammoniated superphosphate. Fertilizer produced by mixing ammonia with superphosphate in the ratio of 5 parts to 100.

ammonia water. A solution of the gas ammonia (NH_3) in water, also known as ammonium hydroxide (q. v.).

ammonio-cupric sulfate. See copper sulfate ammoniate.

ammonio-ferric oxalate. See ferric-ammonium oxalate.

ammonio-ferric sulfate. See ferric-ammonium sulfate.

ammonio-formaldehyde. See hexamethylene-tetramine.

ammonium acetate $\text{NH}_4(\text{C}_2\text{H}_3\text{O}_2)$.

Properties: White, deliquescent, crystalline mass. Soluble in water, alcohol.

Constants: M.p. 114°C; sp. gr. 1.073.

Derivation: By the interaction of glacial acetic acid and ammonia gas.

Method of purification: Crystallization.

Grades: Technical; C. P.

Containers: Drums.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Uses: Reagent in analytical chemistry; drugs; textile dyeing; preserving meats; foam rubbers; vinyl plastics; explosives.
Shipping regulations: None.*

ammonium acid camphorate. See ammonium camphorate.

ammonium acid carbonate. See ammonium bicarbonate.

ammonium acid fluoride. See ammonium bifluoride.

ammonium acid phosphate. See ammonium phosphate, monobasic.

ammonium alum. See aluminum ammonium sulfate.

ammonium-aluminum chloride. See aluminum-ammonium chloride.

ammonium arsenate $(\text{NH}_4)_2\text{HAsO}_4$.

Properties: White crystals or powder efflorescing in air with loss of ammonia; sp. gr. 1.99; poisonous! Soluble in water; decomposes in hot water.

Derivation: Interaction of arsenic acid with ammonia.

Grades: C. P.

Containers: 1-lb bottles.

Use: Medicine.

Shipping regulations: Class B poison. Poison label.*

ammonium atreolate.

Properties: Black, syrupy liquid. Bitter taste. Soluble in water and alcohol; miscible with lard, glycerin, petrolatum and wool fat; insoluble in chloroform.

Derivation: Aqueous solution which contains the ammonia salts of a mixture of organic acids. These organic acids are obtained by the action of sulfuric acid on certain petroleum distillates.

Use: Medicine.

ammonium benzenesulfonate (ammonium sulfonate) $\text{C}_6\text{H}_5\text{SO}_3\text{NH}_4$. An ashless sulfonate, marketed as a 35% solution in kerosene.

ammonium benzoate $\text{C}_6\text{H}_5\text{COONH}_4$.

Properties: White crystals or powder.

Soluble in water, alcohol and glycerol.

Constants: Decomposes at 198°C ; sp. gr. 1.260; sublimes at 160°C .

Derivation: By the action of ammonium hydroxide on benzoic acid with subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Bottles; fiber drums.

Uses: Medicine; food-preservative; latex and adhesive.

Shipping regulations: None.*

ammonium baborate. See ammonium borate.

ammonium bicamphorate. See ammonium camphorate.

ammonium bicarbonate (ammonium acid carbonate; ammonium hydrogen carbonate) NH_4HCO_3 .

Properties: White crystals. Soluble in

water; insoluble in alcohol.

Constants: Sp. gr. 1.586; m. p. decomposes at 36° to 60°C .

Derivation: By heating ammonium hydroxide with an excess of carbon dioxide, and evaporation.

Method of purification: Recrystallization.

Impurities: Ammonium carbonate.

Grades: Technical; C. P.; food grade.

Containers: 100-lb drums; carloads.

Uses: Production of ammonium salts; dyes; substitute for yeast in baking; ingredient of fire extinguishing compounds; pharmaceuticals; degreasing textiles; inflater for rubber.

Shipping regulations: None.*

ammonium bichromate. See ammonium dichromate.

ammonium bifluoride (ammonium acid fluoride) $(\text{NH}_4)\text{FHF}$.

Properties: White crystals, deliquescent;

sp. gr. 1.211, decomposed by heat; poisonous, soluble in cold water and alcohol; decomposes in hot water.

Derivation: Action of ammonium hydroxide on hydrofluoric acid with subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Drums.

Uses: Ceramics; chemical reagent; etching glass (white acid), sterilizer for brewery, dairy and other equipment; electroplating; processing beryllium.

Shipping regulations: None.*

ammonium binoxalate $(\text{NH}_4)\text{HC}_2\text{O}_4 \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals. Soluble in water.

Constants: Sp. gr. 1.556; decomposes on heating.

Derivation: Action of ammonium hydroxide on oxalic acid with subsequent crystallization.

Grades: Technical, pure.

Containers: Glass bottles; 25-, 100-lb drums.

Uses: Analytical chemistry, removing ink stains from fabrics.

Shipping regulations: None.*

ammonium biphosphate. See ammonium phosphate, monobasic.

ammonium bisulfate NH_4HSO_4 .

Properties: White crystals, deliquescent; sp. gr. 1.78; decomposes at 120°C .

Soluble in water; forms strongly acid solution.

Grades: C. P.

Containers: 1-, 5-lb bottles.

Use: Medicine.

Shipping regulations: None.*

ammonium bisulfide. See ammonium sulfide.

ammonium bisulfite NH_4HSO_3 .

Properties: White crystals easily decomposed by heat. Soluble in water and alcohol.

Grades: C. P.; 45-47% solution.

Containers: 1-, 5-lb bottles; tanks.

Use: Medicine; preservative.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ammonium bitartrate (acid ammonium tartrate) $(\text{NH}_4)\text{HC}_4\text{H}_4\text{O}_6$.

Properties: White crystals. Soluble in water, acids and alkalies; insoluble in alcohol.

Constants: Sp. gr. 1.636.

Derivation: By the action of ammonium hydroxide on tartaric acid.

Method of purification: Crystallization.

Grades: Technical; C. P.

Containers: 1-lb bottles; barrels; multi-wall paper sacks.

Use: Baking powder.

Shipping regulations: None.*

ammonium borate (ammonium baborate) $\text{NH}_4\text{HB}_4\text{O}_7 \cdot 3\text{H}_2\text{O}$.

Properties: Colorless crystals; efflorescent with loss of ammonia. Soluble in water.

Constants: Sp. gr. 2.38-2.95.

Derivation: By the action of ammonium hydroxide on boric acid with subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical; C. P.

Containers: Glass bottles; 100-lb drums.

Uses: Medicine; fireproofing compounds; electrical condensers.

Shipping regulations: None.*

ammonium bromide NH_4Br .

Properties: Colorless, odorless crystals or a yellowish white crystalline powder; soluble in water and alcohol; somewhat hygroscopic.

Constants: Sp. gr. 2.43; m. p., sublimes.

Derivation: Action of hydrobromic acid on ammonium hydroxide with subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical; pure; C. P.; N. F. XI.

Containers: 25-, 50-, 150-lb drums; 400-lb barrels.

Uses: Precipitating silver salts for photographic plates; medicine (for its bromide ion); analytical chemistry; process engraving; lithographic work; textile finishing; and fire retardant.

Shipping regulations: None.*

ammonium-cadmium bromide. See cadmium-ammonium bromide.

ammonium camphorate (ammonium bicamphorate; ammonium acid camphorate) $\text{NH}_4\text{HC}_{10}\text{H}_{14}\text{O} \cdot 3\text{H}_2\text{O}$.

Properties: White crystalline powder.

Soluble in water.

Use: Medicine.

Shipping regulations: None.*

ammonium carbamate $\text{NH}_4\text{CO}_2\text{NH}_2$.

Properties: White, crystalline rhombic powder; exceedingly volatile; the "anhydride" of ammonium carbonate; forms urea on heating. Soluble in water and alcohol.

Derivation: By the interaction of dry ammonia gas and carbon dioxide. Is recovered from gas liquor with ammonia and ammonium carbonate.

Grades: Technical.

Containers: Iron drums.

Use: Fertilizer.

Shipping regulations: None.*

ammonium carbazotate. See ammonium picrate.

ammonium carbonate (crystal ammonia; ammonium sesquicarbonate; hartshorn). A mixture of ammonium acid carbonate and ammonium carbamate, $(\text{NH}_4)\text{HCO}_3 \cdot (\text{NH}_4)(\text{NH}_2)\text{CO}_2$.

Properties: Colorless crystal plates or white powder; unstable in air, being converted into the bicarbonate. Strong odor of ammonia, sharp ammoniacal taste. Soluble in water; decomposes in hot water, yielding ammonia and carbon dioxide.

Derivation: Ammonium salts are heated with calcium carbonate.

Method of purification: Sublimation.

Grades: Technical; lumps; cubes; powder; C. P.; U. S. P. XVI.

Containers: Bottles; 5-, 10-, 25-, 100-lb kegs; 250-, 375-, 500-lb barrels; drums.

Uses: Ammonium salts; medicine; baking powders; smelling salts; rubber manufacture; manufacture of casein colors, casein glues and other adhesives; tanning; cleansing powders; fire extinguishing compounds; pharmaceuticals; textiles (mordant, washing fabrics); fermentation accelerator in wine manufacture; also, organic chemicals, ceramics, in washing wool.

Shipping regulations: None.*

ammonium-cesium bromide. See cesium ammonium bromide.

ammonium-cesium-rubidium bromide. See cesium-rubidium-ammonium bromide.

ammonium chloride (sal ammoniac; ammonium muriate) NH_4Cl .

Properties: White crystals; cool, saline taste; somewhat hygroscopic. Soluble in water and glycerol; slightly soluble in alcohol.

Constants: Sublimes 350°C; sp. gr. 1.54.

Derivation: (a) As a by-product of the ammonia-soda process (see soda ash and sodium bicarbonate); (b) reaction of ammonium sulfate and sodium chloride solutions.

Method of purification: Crystallization.

Grades: Technical (lumps or granulated); C. P.; U. S. P. XVI.

Containers: Barrels; multiwall paper sacks.

Uses: Dry batteries; mordant (dyeing and printing); soldering flux; manufacture of various ammonia compounds, etc.; dyes; fertilizer; tanning; manufacture of rust cement for pipe joints; pickling agent in zinc coating and tinning; electroplating; candle manufacture; washing powders; snow treatment; resins and adhesives of urea-formaldehyde; medicine.

Shipping regulations: None.*

ammonium chloroplatinate. See platinum-ammonium chloride.

ammonium chloroplatinite. See platinum-ammonium chloride.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ammonium chromate $(\text{NH}_4)_2\text{CrO}_4$.

Properties: Yellow crystals; soluble in cold water; insoluble in alcohol.

Constants: Sp. gr. 1.866; m. p., decomposes.

Derivation: By the addition of ammonium hydroxide to a solution of ammonium bichromate; recovery by crystallization.

Method of purification: Recrystallization.

Impurities: Dichromates.

Grades: Technical; C. P.

Containers: 1-, 5-lb bottles; barrels; boxes.

Uses: Mordant in dyeing; photography (sensitizer for gelatin coatings); reagent in analytical chemistry; catalyst; corrosion inhibitor.

Shipping regulations: None.*

ammonium chrome alum. See chromium ammonium sulfate.

ammonium-chromium sulfate. See chromium-ammonium sulfate.

ammonium citrate, dibasic $(\text{NH}_4)_2\text{HC}_6\text{H}_5\text{O}_7$.

Properties: White granules; soluble in water; very slightly soluble in alcohol.

Preparation: From citric acid by partial neutralization.

Grades: Pure; reagent.

Containers: Bottles; fiber drums; kegs; barrels.

Uses: Pharmaceuticals; rustproofing; cotton printing; plasticizer; analytically in determination of phosphate in fertilizer.

Shipping regulations: None.*

ammonium-cobalt sulfate. See cobaltous ammonium sulfate.

ammonium-copper chloride. See copper-ammonium chloride.

ammonium-cupric chloride. See copper-ammonium chloride.

ammonium decaborate. See ammonium pentaborate.

ammonium dichromate (ammonium bichromate) $(\text{NH}_4)_2\text{Cr}_2\text{O}_7$.

Properties: Orange needles, soluble in water; insoluble in alcohol. May react explosively with certain organic compounds.

Constants: Sp. gr. 2.152 (25°C); m. p., decomposes with slight heating.

Derivation: Action of chromic acid on ammonium hydroxide with subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical; C. P.

Containers: Various bottles and cartons; drums; multiwall paper sacks.

Uses: Mordant for dyeing; manufacturing of alizarin; chrome alum; smokeless sporting powders; oil purification; pickling; candle wicks; leather tanning; synthetic perfumes; photography; process engraving; lithographic work; chromic oxide; pyrotechnics.

Warning: Flammable; harmful dust may cause rash or external ulcers. MCA warning label.

Shipping regulations: Flammable solid.

Yellow label.*

ammonium dimethyldithiocarbamate

$(\text{CH}_3)_2\text{NCS}_2\text{NH}_4$.

Grades: 42% solution in water.

Containers: 5-gal cans, 55-gal drums.

Use: Fungicide.

ammonium ethyl phosphate solution.

Properties: Water-white to yellow-tinged liquid of ammoniacal odor; sp. gr. 1.23 at 25°C; wt/gal 10.37 lbs; pH (75% soln) 7.0-7.2; viscosity (25°C), 60 cps.

Chemical constitution: 67% monoethyl ammonium phosphate; 33% diethyl ammonium phosphate. In thin film is liquid at relative humidities above 40%; not stable to heat; when subjected to elevated temperatures for any length of time as a solution or while on any article, will liberate ammonia with a reduction in pH; at temperatures below 15°C crystals will form in the solution and will dissolve with a rise in temperature or on dilution.

Standard Grade: 75% solution in water.

Chief constituents: Mixture of mono- and diethyl ammonium phosphates.

Containers: 500-lb drums.

Use: Flameproofing agent for paper, textiles, wood and other combustible materials.

ammonium fluoride NH_4F .

Properties: White crystals; sp. gr. 1.31; decomposed by heat; soluble in cold water. Poisonous!

Derivation: Interaction of ammonium hydroxide and hydrofluoric acid with subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical; C. P.

Containers: 1-lb waxed bottles; 250-lb barrels.

Uses: Fluorides; analytical chemistry; in agriculture for improving sandy soils; antiseptic in brewing; etching glass; textile mordant; wood preservation.

Shipping regulations: None.*

ammonium fluosilicate (ammonium silicofluoride; cryptohalite) $(\text{NH}_4)_2\text{SiF}_6$.

Properties: White, crystalline powder; sp. gr. 2.01; soluble in alcohol and water.

Containers: Drums.

Uses: Laundry sour; moth proofing; disinfectant in brewing industry; glass etching; light metal casting; electroplating.

ammonium gluconate $\text{NH}_4\text{C}_6\text{H}_{11}\text{O}_7$.

Properties: White powder; soluble in water; insoluble in alcohol.

Constants: Optical rotation +11.6° (in water).

Preparation: From gluconic acid by neutralization with ammonia.

Grades: Pure; technical.

Containers: Bottles; fiber drums; kegs; barrels.

Use: In foods as an emulsifying agent for cheese and salad dressings.

ammonium hexanitratocerate. See ceric ammonium nitrate.

ammonium hydrate. See ammonium hydroxide.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

ammonium hydrogen carbonate. See ammonium bicarbonate.

ammonium hydrosulfide. See ammonium sulfide.

ammonium hydroxide (ammonia solution; aqua ammonia; ammonium hydrate) NH_4OH .

Properties: Colorless liquid; strong characteristic odor. Concentrations of solutions range up to about 30% ammonia.

Derivation: Ammonia gas is dissolved in water.

Grades: Technical; C. P.; 16°; 20°; 26°; U. S. P. XVI (strong and diluted).

Containers: 1-, 4-lb bottles; 5-, 10-gal carboys; 55-, 110-gal drums; 8,000-gal tank cars.

Uses: Textiles; manufacture of rayon, rubber, fertilizers; refrigeration; plastics (condensation agent for resins, accelerator in phenol condensation process); photography (development of latent images); pharmaceutical (smelling salts, aromatic spirits of ammonia, various preparations); ammonia soaps; lubricants; fireproofing wood; ink manufacture; explosives; ceramics; ammonium compounds; saponifying fats and oils; organic synthesis; detergent.

Warning: Liquid causes burns; vapor extremely irritating. MCA warning label.

Shipping regulations: None.*

ammonium hypophosphite $\text{NH}_4\text{H}_2\text{PO}_2$.

Properties: Colorless crystals or white powder; decomposes when heated, with evolution of phosphine which ignites spontaneously. Soluble in water and alcohol.

Derivation: Neutralizing hypophosphorous acid with ammonium hydroxide.

Grade: 98% pure.

Use: Medicine.

Shipping regulations: None.*

ammonium hyposulfite. See ammonium thiosulfate.

ammonium ichthosulfonate. See ichthammol.

ammonium iodide NH_4I .

Properties: White crystals or white granular powder; soluble in water or alcohol.

Constants: Sp. gr. 2.56; m. p., sublimes with decomposition.

Derivation: Action of ammonium hydroxide on hydriodic acid with subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical; C. P.

Containers: 1-oz, $\frac{1}{4}$ -, 1-, 5-, 7-lb bottles; 25-lb jars.

Uses: Iodides; medicine; photography.

Caution: Store away from light.

Shipping regulations: None.*

ammonium-iron tartrate. See ferric-ammonium tartrate.

ammonium lactate $\text{NH}_4\text{C}_3\text{H}_5\text{O}_3$.

Properties: Colorless to yellowish syrupy liquid. Slight odor of ammonia. Decomposes when hot. Sp. gr. 1.19-1.21 (15°C). Soluble in water and alcohol.

Grades: Technical.

Containers: 1-, 5-lb bottles.

Uses: Electroplating, and in leather tanning and finishing.

ammonium laurate, anhydrous $\text{C}_{11}\text{H}_{23}\text{COONH}_4$.

Properties: Tan colored, wax-like material, free from ammonia odor. Soluble in ethyl alcohol, methyl alcohol, cottonseed oil, and mineral oil. Soluble (hot) in naphtha, toluene, and vegetable oil.

Constants: Sp. gr. (25°C) 0.88; pH (5% dispersion) 7.6-7.8; m. p. 42-56°C; neut. value 120-125.

Grades: Technical.

Containers: 1-gal cans (7lbs); 5-gal cans (45 lbs); 55-gal drums (360 lbs).

Use: Emulsifying agent for the production of oil-in-water emulsions with a high oil content; cosmetics.

ammonium lignin sulfonate. See lignin sulfonates.

ammonium linoleate ($\text{C}_{17}\text{H}_{33}\text{COONH}_4$).

Properties: Yellow-colored paste with an ammoniacal odor. Soluble in water, ethyl alcohol, methyl alcohol. Emulsifies in naphtha, toluene, mineral oil, and vegetable oil.

Constants: Sp. gr. 1.1; pH (5% dispersion) 9.5-9.8; total solids 82%.

Grades: Technical, 80%.

Containers: 1-, 5-, 55-gal drums.

Uses: Emulsifying agent for oils, waxes, and hydrocarbon solvents for industrial purposes; surface tension reducer; detergent; water-repellent finishes.

ammonium-magnesium sulfate. See magnesium-ammonium sulfate.

ammonium metavanadate (ammonium vanadate) NH_4VO_3 .

Properties: White crystals; insoluble in saturated ammonium chloride solution; slightly soluble in cold water.

Constants: Sp. gr. 2.326; m. p., breaks up at 210°C.

Derivation: Alkali solutions of V_2O_5 and precipitation with ammonium chloride.

Method of purification: Recrystallization.

Grades: Technical; C. P.

Containers: Technical: compressed paper drums; C. P.: glass bottles.

Uses: Raw material for catalyst as V_2O_5 ; dyes; varnishes; drier for paints and inks; photography.

ammonium molybdate (molybdic acid 85%)

$(\text{NH}_4)_6\text{Mo}_7\text{O}_{24} \cdot 4\text{H}_2\text{O}$. The reagent grade contains 85% MoO_3 .

Properties: White crystalline powder; soluble in water; insoluble in alcohol.

Constants: Sp. gr. 2.38-2.95; m. p. decomposes.

Derivation: Dissolving molybdenum trioxide in aqueous ammonia.

Method of purification: Recrystallization.

Grades: Technical; C. P.; reagent (molybdic acid 85%, A. C. S.).

Containers: Glass bottles; boxes; drums; barrels.

Uses: Analytical reagent; pigments; catalyst

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

for dehydrogenation and desulfurization in petroleum and coal technology; production of molybdenum metal; sources of molybdate ions.

Shipping regulations: None.*

ammonium muriate. See ammonium chloride.

ammonium-nickel chloride. See nickel-ammonium chloride.

ammonium-nickel sulfate. See nickel-ammonium sulfate.

ammonium nitrate (Norway saltpeter) NH_4NO_3 .

Properties: Colorless crystals; explosive! but not readily detonated. Soluble in water, alcohol, and alkalis.

Constants: Sp. gr. 1.725; m.p. 169.6°C, b.p., decomposes at 210°C.

Derivation: By the action of ammonia vapor on nitric acid.

Method of purification: Crystallization.

Grades: Usually expressed in percent of nitrogen, as 20.5% N; 33.5% N. FGAN is a fertilizer grade, prilled and usually coated with kieselguhr.

Containers: Bags; carloads.

Uses: Fertilizer; explosives; pyrotechnics; weedicides and insecticides, manufacture of nitrous oxide; absorbent for nitrogen oxides; ingredient of freezing mixtures; oxidizer in solid rocket propellants; nutrient for antibiotics and yeast, catalyst.

Fire hazard: Dangerous. Has been the cause of large serious explosions.

Shipping regulations: Oxidizing material. Yellow label. Very special packaging regulations.*

ammonium nitroso-beta-phenyl hydroxylamine. See cupferron.

ammonium oleate (approximately) $\text{C}_{17}\text{H}_{33}\text{COONH}_4$. An ammonium soap.

Properties: Yellow to brownish, ointment-like mass, ammonia odor; decomposes on heating. Soluble in water and alcohol.

Containers: Barrels.

Uses: Emulsifying agent; cosmetics.

ammonium oxalate $(\text{NH}_4)_2\text{C}_2\text{O}_4 \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals; poisonous! soluble in water. Sp. gr. 1.502; decomposed by heat.

Derivation: Interaction of ammonium hydroxide and oxalic acid and subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical; pure; C. P.

Containers: 200-, 250-lb drums.

Uses: Analytical chemistry; safety explosives; manufacture of oxalates; rust and scale removal from metals.

Shipping regulations: None.*

ammonium paratungstate. See ammonium tungstate.

ammonium pentaborate (ammonium decaborate) $(\text{NH}_4)_2\text{B}_{10}\text{O}_{16} \cdot 8\text{H}_2\text{O}$.

Properties: Crystals; soluble in water.

Containers: 100-lb bags.

Use: Intermediate for boron chemicals; as a "control" in atomic submarines.

ammonium perchlorate (AP; APC) NH_4ClO_4 .

Properties: White crystals; explosive! Soluble in water. 'Sp. gr. 1.95; m.p., decomposes on heating.

Derivation: By the interaction of ammonium hydroxide and perchloric acid or from sodium chlorate. Recovery by crystallization.

Method of purification: Recrystallization.

Grades: Technical; C. P.

Containers: Glass bottles; drums.

Uses: Explosives; pyrotechnics; analytical chemistry; etching and engraving agent; as oxidizer in solid propellants.

Fire hazard! Dangerous; oxidizing material; may explode in a fire.

Shipping regulations: Oxidizing material. Yellow label.*

ammonium permanganate.

Shipping regulations: Oxidizing material.

Yellow label.*

ammonium persulfate $(\text{NH}_4)_2\text{S}_2\text{O}_8$.

Properties: White crystals; strong oxidizing agent; soluble in water. Sp. gr. 1.98; m.p., decomposes.

Derivation: Electrolysis of a concentrated solution of ammonium sulfate. Recovered by crystallization.

Method of purification: Recrystallization.

Grades: Technical; pure; C. P.

Containers: Bottles, drums.

Uses: Oxidizing agent, bleaching agent; photography; oxidizing copper; electroplating; manufacture of other persulfates; deodorizing and bleaching oils; aniline dyes; preserving food; depolarizer in batteries; washing infected yeast.

Caution! Strong oxidizing agent.

ammonium phosphate. See ammonium phosphate, dibasic, ammonium phosphate, hemibasic; ammonium phosphate, monobasic.

ammonium phosphate, dibasic (ammonium phosphate, secondary; diammonium hydrogen phosphate; diammonium phosphate) $(\text{NH}_4)_2\text{HPO}_4$.

Properties: White crystals or powder; sp. gr. 1.619; mildly alkaline in reaction; soluble in water; insoluble in alcohol.

Derivation: Interaction of ammonium hydroxide and phosphoric acid in proper proportions.

Method of purification: Recrystallization.

Grades: Technical; C. P.; dentifrice grade; highly purified, for phosphors.

Containers: 1-, 5-lb bottles; 200-lb bags; 350-lb barrels; drums.

Uses: Medicine (ingredient in compound syrups); in the impregnation of wood, paper, and textiles to render them nonflammable; to prevent afterglow in matches, and smoking of candlewicks; fertilizer; in plant nutrient solutions; manufacture of yeast, vinegar, yeast foods, and bread improvers; flux for soldering tin, copper, brass, zinc, purifying sugar; in ammoniated dentifrices; to make halophosphate phosphors.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ammonium phosphate, hemibasic

Properties: White crystalline material; somewhat hygroscopic. Strongly acid in reaction. Soluble in water.

Containers: Barrels and kegs with moisture-proof liners; 100-lb bags.

Uses: Nutrient for truck gardens; yeast food; buffer for adjustment of pH values; metal cleaning.

ammonium phosphate, monobasic (ammonium acid phosphate; ammonium biphosphate; ammonium phosphate, primary)

Properties: Brilliant, white crystals or powder. Mildly acid in reaction. Moderately soluble in water; sp. gr. 1.803.

Derivation: Interaction of phosphoric acid and ammonia in proper proportions.

Grades: Technical; C. P.

Containers: Barrels; kegs; multiwall paper sacks.

Uses: Fertilizer; in the impregnation of wood, paper, and textiles to render them nonflammable; to prevent afterglow in matches, and smoking of candlewicks; in plant nutrient solutions, manufacture of yeast, vinegar, yeast foods, and bread improvers, medicine.

ammonium phosphate, primary. See ammonium phosphate, monobasic.**ammonium phosphate, secondary.** See ammonium phosphate, dibasic.**ammonium phosphite (neutral ammonium phosphite) $(\text{NH}_4)_2\text{HPO}_3 \cdot \text{H}_2\text{O}$.**

Properties: Colorless, crystalline mass. Hygroscopic; keep tightly closed. Soluble in water.

Grades: Technical.

Use: Chemical (reducing agent).

ammonium phosphite, neutral. See ammonium phosphite.**ammonium phosphomolybdate**

Properties: Yellow crystalline powder, soluble in alkali; insoluble in alcohol and acids, very slightly soluble in water.

Derivation: By the interaction of ammonium molybdate and phosphoric and nitric acids.

Method of purification: Crystallization.

Grades: Technical, C. P.

Containers: Tins, glass bottles.

Use: Reagent for alkaloids.

Shipping regulations: None.*

ammonium phosphotungstate (ammonium phosphowolframate)

Properties: White powder. Soluble in alkali, insoluble in acid; slightly soluble in water.

Derivation: By the interaction of ammonium tungstate, ammonium phosphate and nitric acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles; tins.

Use: Chemical reagent.

Shipping regulations: None.*

ammonium phosphowolframate. See ammonium phosphotungstate.**ammonium picrate (ammonium carbazotate; ammonium picronitrate) $\text{C}_6\text{H}_2(\text{NO}_2)_3\text{ONH}_4$.**

Properties: Yellow crystals; highly explosive! Sp. gr. 1.72; m. p., decomposes; soluble in water and alcohol.

Derivation: By the action of ammonium hydroxide on picric acid with subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Wooden kegs or boxes free from metal nails or screws.

Use: Explosives; medicine.

Fire hazard: Dangerous; easily exploded by heat or shock.

Shipping regulations: Explosive, class A. High explosive label.*

ammonium picronitrate. See ammonium picrate.**ammonium polysulfide $(\text{NH}_4)_2\text{S}_x$.**

Properties: Known only in solution; yellow, unstable, having hydrogen sulfide odor; decomposed by acids with deposition of sulfur; poisonous.

Derivation: Passing hydrogen sulfide into 28% ammonium hydroxide and dissolving an excess of sulfur in the resulting solution.

Uses: Analytical reagent; insecticide spray.

ammonium reineckate. See reinecke salt.**ammonium rhodanide.** See ammonium thiocyanate.**ammonium ricinoleate $(\text{C}_{17}\text{H}_{32}\text{OHCOONH}_4)$.**

Properties: White paste.

Grades: Technical.

Uses: Detergent, emulsifying agent.

ammonium salicylate $\text{C}_6\text{H}_4\text{OHCOONH}_4$.

Properties: Colorless crystals and white powder with pink tinge; odorless; stable in dry air, but affected by light. Soluble in water and alcohol.

Derivation: By the action of ammonium hydroxide on salicylic acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: 5-, 25-lb cartons; 25-, 50-, 100-lb drums, 200-lb barrels.

Use: Medicine.

Shipping regulations: None.*

ammonium salts. The salts formed on direct union of ammonia or neutralization of ammonium hydroxide with acids. They are in general white salts and soluble in water. Usually decomposed by heat into ammonia and the corresponding acid, which may also be decomposed. All ammonium salts liberate ammonia (NH_3) when heated with a strong base, e. g., sodium hydroxide or calcium hydroxide.

ammonium selenate $(\text{NH}_4)_2\text{SeO}_4$.

Properties: Colorless crystals; sp. gr.

2.194; soluble in water; insoluble in alcohol.

Use: Mothproofing agent.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ammonium selenite $(\text{NH}_4)_2\text{SeO}_3 \cdot \text{H}_2\text{O}$.

Properties: Colorless or slightly reddish crystals. **Caution!** Keep away from dust or light! Soluble in water.

Grades: Technical.

Uses: Analysis (test for alkaloids); glass industry (red glass).

ammonium sesquicarbonate. See ammonium carbonate.**ammonium silicofluoride.** See ammonium fluosilicate.

ammonium soaps. Product resulting from the reaction of an appropriate fatty acid with ammonium hydroxide. The resulting soaps have an appreciable vapor pressure of ammonia and decompose on continual exposure leaving the fatty acid residue. Usually not sold as detergents but find application in the manufacture of toilet preparations and emulsions.

ammonium-sodium sulfate. See sodium-ammonium sulfate.**ammonium stearate** $\text{C}_{17}\text{H}_{35}\text{COONH}_4$.

Properties: Tan colored, wax-like solid, free from ammonia odor. Dispensable in hot water. Soluble (hot) in toluene; partially soluble (hot) in butyl acetate and ethyl alcohol.

Constants: Sp. gr. (22°C) 0.89; pH (3% dispersion) 7.6; m. p. 73-75°C; neutralization value 70-80.

Grades: Available as anhydrous solid or as paste.

Containers: 1-gal can (7 1/2 lbs.); 5-gal can (45 lbs); 55-gal drum (360 lbs).

Uses: In the manufacture of vanishing creams, brushless shaving creams, and other cosmetic products. Integral waterproofing of cements, concrete, stucco, etc.

ammonium sulfamate $\text{NH}_4\text{OSO}_2\text{NH}_2$.

Properties: White crystalline solid, m. p. 130°C, decomposes at 160°C; acidified solutions, when enclosed and heated, may explode. Soluble in water.

Derivation: Hydrolysis of the reaction product obtained when urea is treated with fuming sulfuric acid.

Grades: Technical, C. P.

Containers: 50- and 100-lb fiber drums; 350-lb wooden barrels.

Uses: Flameproofing agent for textiles and certain grades of paper; weed killer; electroplating; generation of nitrous oxide gas.

ammonium sulfate $(\text{NH}_4)_2\text{SO}_4$.

Properties: Brownish-gray to white crystals according to degree of purity. Soluble in water; insoluble in alcohol and acetone.

Sp. gr. 1.77; m. p. 513°C with decomposition.

Derivation: (a) The ammoniacal vapors from the destructive distillation of coal are led into sulfuric acid, followed by crystallization and drying. This forms the crude ammonium sulfate of commerce. (b) Ammonia derived from atmospheric

nitrogen by fixation is neutralized with sulfuric acid. (c) Ammonia and carbon dioxide are passed into a slurry of gypsum, converting the latter to insoluble calcium carbonate and a solution of ammonium sulfate, which is filtered and crystallized. The ammonia is sometimes obtained from refinery wastes or natural gas. (d) European process uses sulfurous gases (from smelters and roasters) absorbed in organic base like xylidine. This is oxidized by air and decomposed by ammonia.

Method of purifying: Recrystallization or sublimation.

Grades: Commercial; technical; C. P.; enzyme grade (no heavy metals).

Containers: 1-, 5-lb bottles; 25-lb boxes; 100-lb kegs; 200-lb bags; 300-, 400-lb barrels; carload; multiwall paper sacks.

Uses: Fertilizer; water treatment; fermentation; charging electric batteries; soldering liquids; galvanizing iron; candle manufacture, fireproofing compositions; viscose rayon; tanning.

Shipping regulations: None.*

ammonium sulfide $(\text{NH}_4)_2\text{S}$. The true sulfide is stable only in the absence of moisture and below 0°C. The ammonium sulfide of commerce is largely ammonium bisulfide or hydrosulfide, NH_4HS .

Properties: Yellow crystals. Soluble in water, alcohol, and alkalies. M. p., decomposes.

Derivation: By the interaction of ammonium hydroxide and hydrogen sulfide.

Method of purification: Crystallization.

Grades: Technical, C. P.; liquid, 40-44%.

Containers: Iron drums; tins; glass bottles; tanks.

Uses: Textile industry; photography (developers); coloring brasses, bronzes; iron control in soda ash production.

Shipping regulations: None.*

ammonium sulfite $(\text{NH}_4)_2\text{SO}_3 \cdot \text{H}_2\text{O}$.

Properties: Colorless crystals; acrid, sulfurous taste. Hygroscopic; sublimes at 150°C with decomposition, soluble in water. **Caution!** Keep well stoppered! Sp. gr. 1.41.

Containers: Multiwall paper sacks; 25-, 100-, 175-lb drums.

Grades: Technical; C. P.

Uses: Chemical (intermediates, reducing agent); medicine; permanent wave solutions; photography.

ammonium sulfocyanate. See ammonium thiocyanate.**ammonium sulfocyanide.** See ammonium thiocyanate.**ammonium sulfoichthyolate.** See ichthammol.**ammonium sulfonate.** See ammonium benzene-sulfonate.**ammonium sulfuricinoleate.**

Properties: Yellow liquid; soluble in alcohol.

Grades: Technical.

Containers: 400-lb barrels.

Use: Medicine; furniture polish.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers" page v.

ammonium tartrate $(\text{NH}_4)_2\text{C}_4\text{H}_4\text{O}_6$.

Properties: White crystals; soluble in water and alcohol. Sp. gr. 1.601; decomposes on heating.

Derivation: By the action of tartaric acid on ammonium hydroxide with subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical; C. P.

Containers: 1-lb bottles; barrels; boxes.

Uses: Textile industry; medicine.

Shipping regulations: None.*

ammonium tetrathiocyanodiammonio-chromate.

See Reinecke salt.

ammonium thiocyanate (ammonium sulfocyanide; ammonium rhodanide; ammonium thiocyanate) NH_4SCN .

Properties: Colorless, deliquescent crystals; soluble in water, alcohol, acetone, and ammonia.

Constants: Sp. gr. 1.3057; m. p. 149.6°C, decomposes at 170°C.

Derivation: By boiling an aqueous solution of ammonium cyanide with sulfur or polysulfides, or by the reaction of ammonia and carbon disulfide.

Method of purification: Crystallization.

Grades: Technical; C. P.; 50-60% solution.

Containers: 50-, 100-lb bags; plastic-lined kegs; drums; solution in tank cars.

Uses: Analytical chemistry; chemicals (thiourea, guanidine sulfocyanate); fertilizers; photography; ingredient of freezing solutions, especially liquid rocket propellants; coating zinc grayish-black; textiles; weed killer and defoliant; adhesives; curing resins; pickling iron and steel; electroplating; temporary soil sterilizer; polymerization catalyst; separator of zirconium and hafnium, of gold and iron.

Shipping regulations: None.*

ammonium thioglycolate $\text{HSCH}_2\text{COONH}_4$.

Containers: 55-gal drums, commercial grade.

Use: Hair-waving formulations.

ammonium thiosulfate (ammonium hyposulfite) $(\text{NH}_4)_2\text{S}_2\text{O}_3$.

Properties: White crystals, decomposed by heat; very soluble in water; pH of 60% solution 6.5-7.0.

Impurities: Ammonium sulfite, 1.0% max; heavy metals, trace.

Grades: Pure crystals (97%); 60% photographic solution.

Containers: 1-, 5-lb bottles; drums.

Uses: Photographic fixing agent; analytical reagent; fungicide; reducing agent; brightener in silver plating baths; cleaning compounds for zinc-base die-cast metals; hair waving formulas; fog screens.

Shipping regulations: None.*

ammonium tungstate (ammonium wolframate; ammonium paratungstate)

$(\text{NH}_4)_6\text{W}_7\text{O}_{24} \cdot 6\text{H}_2\text{O}$.

Properties: White crystals; soluble in water; insoluble in alcohol.

Derivation: Interaction of ammonium hydroxide and tungstic acid with subsequent

crystallization.

Method of purification: Recrystallization.

Grades: Technical; C. P.

Containers: Wooden kegs.

Uses: Preparation of ammonium phosphotungstate and other tungsten compounds.

Shipping regulations: None.*

ammonium-uranium carbonate. See uranyl ammonium carbonate.**ammonium-uranium fluoride.** See uranium-ammonium fluoride.**ammonium valerate** (ammonium valerianate; acid ammonium valerate)

$\text{NH}_4\text{C}_5\text{H}_9\text{O}_2 \cdot 2\text{HC}_5\text{H}_9\text{O}_2$.

Properties: Colorless, very deliquescent crystals; pungent unpleasant odor (as of valeric acid); sharp, sweet taste; acid reaction. Keep well stoppered! Soluble in water, alcohol, and ether. When saturated aqueous solution is diluted with 5 vols. of water, free valeric acid separates out in an oily liquid.

Derivation: Interaction of ammonium hydroxide and valeric acid with subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical.

Containers: 1-, 5-lb glass bottles.

Uses: Medicine; imitation butter flavors.

Shipping regulations: None.*

ammonium valerianate. See ammonium valerate.**ammonium vanadate.** See ammonium metavanadate.**ammonium wolframate.** See ammonium tungstate.**ammonium-zinc sulfate.** See zinc-ammonium sulfate.**ammonium zirconifluoride.** See zirconium-ammonium fluoride.**ammonium zirconyl carbonate solution**

$(\text{NH}_4)_3\text{ZrOH}(\text{CO}_3)_3 \cdot 2\text{H}_2\text{O}$, in water.

Properties: A clear solution; sp. gr. 1.238 (24°C). Stable up to about 60°C; decomposes in dilute acids, alkalis.

Containers: 500-lb drums.

Uses: Ingredient in water repellents for textiles and leather; catalyst; pharmaceutical preparations; ingredient in latex emulsion paints; preparation of zirconium metal and alloys; dyestuff industry.

"Ammonyx 27," ³²⁸ Trade name for tallow trimethyl ammonium chloride.

Uses: Germicide; de-emulsifier for foam rubber production.

"Ammonyx" 2194. ³²⁸ Trade name for ditallow dimethyl ammonium methyl sulfate, 75% active paste. Used as a softener.**amobarbital** (5-ethyl-5-isoamylbarbituric acid) $\text{C}_{11}\text{H}_{19}\text{N}_2\text{O}_3$.

Properties: White, crystalline powder; odorless with bitter taste. M. p. 156-158°C; solutions are acid to litmus. Very slightly soluble in water; soluble in alcohol,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ether, chloroform, and in solutions of fixed alkali hydroxides and carbonates.

Grade: U. S. P. XVI.

Use: Medicine.

amobarbital sodium $C_{11}H_{17}N_2NaO_3$. The sodium salt of amobarbital.

Properties: White, friable, granular powder; odorless with bitter taste; hygroscopic.

Solutions are alkaline to litmus and phenolphthalein. Very soluble in water; soluble in alcohol; practically insoluble in ether and chloroform.

Grade: U. S. P. XVI.

Use: Medicine.

amodiaquine hydrochloride

$ClC_6H_3NNHC_6H_3(OH)CH_2N(C_2H_5)_2 \cdot 2HCl \cdot 2H_2O$.

A synthetic antimalarial agent; 7-chloro-4-(3'-diethylaminomethyl-4'-hydroxyanilino)quinoline dihydrochloride dihydrate.

Properties: Yellow, odorless, bitter, crystalline solid. M. p. 150-160°C (dec).

Soluble in water; sparingly soluble in alcohol; very slightly soluble in benzene, chloroform, and ether; pH (1% solution) 4.0-4.8.

Grade: U. S. P. XVI.

Use: Medicine.

amolane hydrochloride $C_{20}H_{23}NO_2 \cdot HCl$.

[3-(beta-Diethylaminoethyl)-3-phenyl-2-benzofuranone hydrochloride]

Properties: Crystals; m. p. 152-153°C; soluble in water.

Grade: N. N. D.

Use: Medicine.

amorphous. Noncrystalline, having no determinable form or crystalline structure, e. g., glass.

amosite. A variety of asbestos, and of the mineral anthophyllite, containing a minimum of magnesium. Resistant to heat and used in insulation and filters.

AMP.

1. Abbreviation for 2-amino-2-methyl-1-propanol.
2. Abbreviation for adenosine monophosphate. See adenylic acid.

A5MP. Abbreviation for adenosine-5-monophosphoric acid. See adenylic acid (muscle adenylic acid).

"Ampco." ⁴⁰⁷ Trademark for a series of aluminum-iron-copper alloys containing 6-15% aluminum, 1.5-5.25% iron, balance copper. Available as sand, shell and centrifugal castings, extrusions, forgings, rolled sheet and plate, welding electrodes and filler rod. Resistant to fatigue, corrosion, erosion, wear and cavitation-pitting. Used for brushings, bearings, gears, slides, etc.

"Ampco-Bráz." ⁴⁰⁷ Trademark for a series of copper-zinc alloy filler rod for brazing and braze-welding with the oxyacetylene processes.

"Ampcoflex." ⁴¹ Trade name for synthetic-resin, normal-impact rigid sheet and also

pipe and fittings of Type I unplasticized polyvinyl chloride used to fabricate structures where optimum corrosion resistance is desired.

"Ampcolite." ⁴¹ Trade name for synthetic-resin, high-impact pipe and fittings of the styrene copolymer type used to handle normal corrosive fluids.

"Ampcoloy." ⁴⁰⁷ Trademark for a series of industrial copper alloys including low iron-aluminum bronzes, nickel-aluminum bronzes, tin bronzes, manganese bronzes, leaded bronzes, beryllium coppers and high conductivity alloys.

"Ampco-Trode." ⁴⁰⁷ Trademark for a series of aluminum-bronze, arc-welding electrodes and filler rod, containing 9.0-15.0% aluminum, 1.0-5.0% iron, balance copper, for joining like or dissimilar metals and overlying surfaces resistant to wear, corrosion, erosion and cavitation-pitting.

AMPD. Abbreviation for 2-amino-2-methyl-1,3-propanediol.

ampere-second. See coulomb.

"Amphedroxyn Hydrochloride." ¹⁰⁰ Trademark for methamphetamine hydrochloride (q. v.).

amphetamine (1-phenyl-2-aminopropane; methylphenethylamine) $C_6H_5CH_2CH(NH_2)CH_3$. Properties: Colorless, volatile liquid; characteristic strong odor and slightly burning taste; b. p. 200-203°C (dec); soluble in alcohol and ether; slightly soluble in water.

Derivation: By synthesis.

Grades: Dextro-, dextrolevo-.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

amphetamine phosphate, dibasic (1-phenyl-2-aminopropane phosphate) $(C_6H_5N)_2 \cdot H_3PO_4$. Both the racemic and dextro-forms are used.

Properties: White, odorless crystalline powder, with a slightly bitter taste; soluble in water; slightly soluble in alcohol; insoluble in ether; pH (solution 1 in 20) 7-8.5, specific rotation of dextro-salt (25°C) +20 to +23°.

Grades: N. F. XI (racemic or dl-; dextro-).

Containers: Glass bottles (dextro-); drums (racemic).

Use: Medicine.

amphetamine phosphate, monobasic (1-phenyl-2-aminopropane phosphate) $C_6H_5N \cdot H_3PO_4$. Both the racemic and dextro-forms are used.

Properties: White, odorless crystalline powder with bitter taste; sinters at 150°; becomes amorphous with further heating; decomposes at 300°C. Soluble in water (dextro- is less soluble than the racemic), slightly soluble in alcohol; practically insoluble in benzene, chloroform, and ether; pH (10% solution) about 4.6. Specific rotation of dextro-salt (25°C) +15 to +19°.

Grade: N. F. XI (racemic or dl-; dextro-).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: Glass bottles (dextro-); drums (racemic).

Use: Medicine.

amphetamine sulfate (1-phenyl-2-aminopropane sulfate)

$(C_9H_{11}N)_2 \cdot H_2SO_4$. Both the racemic and dextro- forms are used.

Properties: White, odorless powder; bitter taste; soluble in water; slightly soluble in alcohol; insoluble in ether. Specific rotation of dextro-salt (25°C) +20 to +23.5°; pH of solutions 5 to 6.

Derivation: By synthesis.

Grades: U. S. P. XVI (racemic or *dl* -; dextro-).

Containers: Glass bottles (dextro-); drums (racemic).

Use: Medicine.

Shipping regulations: None. *

amphibole asbestos. See asbestos.

amphiboles. A group of silicate minerals with similar physical properties, chemical composition and atomic structure. The group is characterized by the presence of hydroxyl, by a silica:oxygen ratio of 4:11, and by a fibrous or prismatic cleavage. Amphiboles are common in igneous and metamorphic rocks. The commercially useful members of the group are:

anthophyllite $(Mg, Fe)_7(Si_4O_{11})_2(OH)_2$

tremolite $Ca_2Mg_5(Si_4O_{11})_2(OH)_2$

actinolite $Ca_2(Mg, Fe)_5(Si_4O_{11})_2(OH)_2$

crocidolite $Na_2Fe_3(Si_4O_{11})_2(OH)_2$.

Uses: As asbestos minerals.

amphoteric. An amphoteric compound has the capacity of behaving either as an acid or base; thus aluminum hydroxide neutralizes acids with the formation of aluminum salts: $Al(OH)_3 + 3HCl = AlCl_3 + 3H_2O$, and also dissolves in strongly basic solutions to form aluminates: $Al(OH)_3 + 3NaOH = Na_3AlO_3 + 3H_2O$.

amphotericin B. A polyene antifungal antibiotic.

Properties: Pale yellow semicrystalline powder; m. p., gradual decomposition above 170°C. Insoluble in water; slightly soluble in methanol, propylene glycol, dimethylformamide and dimethylacetamide; somewhat more soluble in dimethylsulfoxide.

Derivation: Produced by fermentation with *Streptomyces nodosus*. Commercially available as a desoxycholate complex.

Grade: N. N. D.

Use: Medicine.

"Amplus Improved." ²⁹⁹ Trademark for a preparation containing d-amphetamine, hydroxyzine hydrochloride, vitamins and minerals designed to assist in the reduction of weight.

"Amprol." ¹²³ Trademark for amprolium for use as a coccidiostat.

amprotropine phosphate (phosphate of the d, l-tropic acid ester of 3-diethylamino-2,2-dimethyl-1-propanol) $C_{18}H_{29}NO_5 \cdot H_3PO_4$.

Properties: Bitter crystals. M. p. 142-

144°C. Soluble in water, slightly soluble in alcohol.

Use: Antispasmodic.

"Amprozime." ⁷⁸ Trademark for a series of enzyme products of bacterial origin used for desizing textiles and removal of blood and albuminous stains prior to dry cleaning, for removal of gelatin from used x-ray and photographic film, and in the manufacture of glue and various adhesives.

"Ampvar." ⁴¹ Trade name for synthetic-resin metal conditioner of the vinyl-phosphoric acid-zinc chromate type used to prepare metal surfaces for the application of corrosion-proof coatings.

"Amsulf." ⁶⁷ Trademark for copper-sulfur alloy castings in the form of wirebars, cakes, billets and the like.

"Amūno." ¹²³ Trademark for a mothproofing compound.

amydracaine hydrochloride $C_{16}H_{26}N_2O_2 \cdot HCl$. 2-Benzoxo-2-dimethylaminomethyl-1-dimethylaminobutane hydrochloride.

Properties: Colorless, hygroscopic crystals; bitter taste. Decomposes about 170°C; soluble in water, alcohol and chloroform; insoluble in ether.

Use: Medicine.

amygdala amara. See almond, bitter.

amygdala amara oil. See almond oil, bitter.

amygdala dulcis. See almond, sweet.

amygdalase. See emulsin.

amygdalic acid. See mandelic acid.

amygdalin (mandelonitrile beta-gentiobioside; amygdaloside) $C_{20}H_{27}CHCNOC_{12}H_{21}O_{10}$. A glycoside found in bitter almonds.

Properties: White crystals; bitter taste. Anhydrous form m. p. 214-216°; soluble in water and alcohol, insoluble in ether.

Use: Medicine.

amygdaloside. See amygdalin.

amygdophenine (mandelyl-para-phenetidine; phenetidine amygdalate)

$C_6H_4OC_2H_5NHCCHOHC_6H_5$.

Properties: Light, crystalline, grayish-white powder. Difficultly soluble in water. Constants: M. p. 140.5°C.

Derivation: By the action of mandelic acid upon para-phenetidine in the presence of dehydrating agents.

Use: Medicine.

Shipping regulations: None. *

amyl. The five-carbon aliphatic radical C_5H_{11} -, also known as pentyl. Eight isomeric arrangements (exclusive of optical isomers) are possible. In addition to this theoretical source of confusion, the amyl compounds occur (as in fusel oil), or are formed (as from the petroleum pentanes) as mixtures of several isomers, and since their boiling points are close and their other properties similar, it is neither easy nor usually necessary to purify them. As used in this

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

dictionary, amyl means a mixture of isomers, unless a specific isomer is designated. Several entries are under isoamyl. See also amyl alcohols.

amyl acetate (amylacetic ester; banana oil; pear oil) $\text{CH}_3\text{COOC}_5\text{H}_{11}$. Commercial amyl acetate is a mixture of isomers, the composition and properties depending upon the grade and derivation. The principal isomers are isoamyl, normal-, and secondary-amyl acetates (q. v.).

Derivation: Esterification of amyl alcohol (often fusel oil) with acetic acid and a small amount of sulfuric acid as catalyst.

Method of purification: Rectification.

Grades: Commercial (85-88%), flash point 63-70°F; high test (85-88%), flash point 84°F; technical (90-95%), flash point 79°F; pure (95-99%), flash point 77°F; special antibiotic grade. Amyl acetate is also sold by original source, as from fusel oil, pentane, or Oxo process.

Containers: 1-gal bottles; 1-, 5-, 30-, 54-gal drums; tank cars.

Uses: Solvent for lacquers and paints; extraction of penicillin; manufacture of photographic film, waterproofing compounds, artificial leather, artificial pearls; flavoring agent; printing and finishing textile fabrics.

Fire hazard: Keep lights and fire away.

MCA warning label.

Shipping regulations: Flammable liquid.

Red label (not required for highest grade).*

n-amyl acetate $\text{CH}_3\text{COOCH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_3$.

Properties: Colorless liquid; b. p. 148.4°C; m. p. -70.8°C; sp. gr. (20/20°C) 0.879; wt/gal (20°C) 7.22 lbs; flash point (closed cup) 77°F. Very slightly soluble in water; miscible with alcohol and ether.

Derivation: Esterification of n-amyl alcohol with acetic acid.

Containers and Uses: See amyl acetate.

Fire hazard: Keep lights and fire away.

MCA warning label.

Shipping regulations: Flammable liquid.

Red label.*

sec-amyl acetate $\text{CH}_3\text{CO}_2\text{C}_5\text{H}_{11}$.

Properties: Colorless liquid.

Typical specifications: Distillation range 123-145°C; odor mild, nonresidual; purity, ester content as amyl acetate, 85-88%; sp. gr. 0.862-0.866 (20/20°C); flash point 89°F (approximate); wt/gal (20°C) 7.19 lbs (approximate).

Derivation: Esterification of sec-amyl alcohol and acetic acid.

Grades: Technical.

Containers: 1-gal cans; 5-, 55-gal steel drums; tank cars.

Uses: Solvent for nitrocellulose and ethyl cellulose; airplane dopes; artificial leather; celluloid products; cements; coated paper; lacquers; lacquer thinners; leather finishes; linoleum; nail enamels; patent leather; plastic wood; textile sizing and printing compounds; washable wallpaper.

Fire hazard: Combustible but not flammable—flash point over 80°F; use with ade-

quate ventilation.

Shipping regulations: Requires no red caution label.

amylacetic ester. See amyl acetate.

amyl alcohol (amyl hydrate). Eight isomers of amyl alcohol, $\text{C}_5\text{H}_{11}\text{OH}$, are possible (exclusive of several optical isomers) and six are offered commercially. In addition, definite mixtures of the isomers are sold under a variety of names (unfortunately some of them identical with the names of the pure isomers) as well as fusel oil (q. v.), a natural fermentation product. For descriptive data on the pure isomers, see

- (1) n-amyl alcohol, primary
 $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{OH}$
- (2) 2-methyl-1-butanol (active amyl alcohol, from fusel oil)
 $\text{CH}_3\text{CH}_2\text{CH}(\text{CH}_3)\text{CH}_2\text{OH}$
- (3) isoamyl alcohol, primary
 $(\text{CH}_3)_2\text{CHCH}_2\text{CH}_2\text{OH}$
- (4) 2-pentanol
 $\text{CH}_3\text{CH}_2\text{CH}_2\text{CHOHCH}_3$
- (5) 3-pentanol
 $\text{CH}_3\text{CH}_2\text{CHOHCH}_2\text{CH}_3$
- (6) tert-amyl alcohol
 $(\text{CH}_3)_3\text{COHCH}_2\text{CH}_3$.

The other two isomers, not described in detail, are

- (7) sec-isoamyl alcohol
 $(\text{CH}_3)_2\text{CHCHOHCH}_3$
- (8) 2,2-dimethyl-1-propanol
 $(\text{CH}_3)_3\text{CCH}_2\text{OH}$.

(1), (2), (3) and (8) are primary alcohols, (4), (5) and (7) are secondary alcohols, and (6) is a tertiary alcohol. (1), (4) and (5) are normal, and (2), (3), (6), (7) and (8) are branched chain compounds. (2), (4) and (7) are asymmetric, and have optically active forms.

amyl alcohol, fermentation. See fusel oil.

amyl alcohol, primary. A mixture of primary amyl alcohols made from normal butenes by the Oxo process is sold under this name. It consists of 60% 1-pentanol, 35% 2-methyl-1-butanol, and 5% 3-methyl-1-butanol. Used as a solvent.

n-amyl alcohol, primary (1-pentanol; n-butyl carbinol) $\text{CH}_3(\text{CH}_2)_4\text{OH}$.

Properties: Colorless liquid; mild odor; b. p. 137.8°C; freezing point -78.9°C; sp. gr. (20/20°C) 0.8240; wt/gal (20°C) 6.9 lbs; flash point (open cup) 135°F. Slightly soluble in water; miscible with alcohol and ether.

Derivation: Fractional distillation of the mixed alcohols resulting from the chlorination and alkaline hydrolysis of pentane.

Grades: Technical; C. P.

Containers: 55-gal drums; tank cars.

Uses: Raw material for certain pharmaceutical preparations; organic synthesis.

Shipping regulations: None.*

amyl alcohol, primary, active. See 2-methyl-1-butanol. Ordinary active amyl alcohol.

n-sec-amyl alcohol. See 2-, and 3-pentanol.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

sec-amyl alcohol, active. See 2-pentanol.

tert-amyl alcohol (dimethyl ethyl carbinol; 2-methyl-2-butanol; amylene hydrate; tert-pentanol) $(\text{CH}_3)_2\text{COHCH}_2\text{CH}_3$.

Properties: Colorless liquid having a camphoraceous odor and burning taste; sp. gr. 0.81 (20/20°C); freezing point -11.9°C ; b. p. 101.8°C ; refractive index 1.4052 (20°C); wt/gal 6.76 lbs; flash point (open cup) 70°F . Slightly soluble in water; miscible with alcohol and ether; solutions neutral to litmus.

Derivation: Fractional distillation of the mixed alcohols resulting from the chlorination and alkaline hydrolysis of pentanes.

Grades: Technical; C. P.; U. S. P. XVI.

Containers: 1-gal can (approximate net contents 6.5 lbs); 5-gal can (approximate net contents 34 lbs); 55-gal drum (approximate net contents 350 lbs).

Uses: Solvent; flotation agent; organic synthesis; medicine.

Shipping regulations: Flammable liquid. Red label.*

amyl aldehyde. See n-valeraldehyde.

n-amylamine (pentylamine; 1-aminopentane) $\text{C}_5\text{H}_{11}\text{NH}_2$.

Properties: Liquid; sp. gr. 0.75 (20/20°C); m. p. -55.0°C ; b. p. 104.4°C ; flash point 40°F . Soluble in water, alcohol and ether.

Derivation: From the reaction of ammonia and amyl chloride, which gives a mixture of mono-, di-, and triamyl amines.

Grade: Technical.

Containers: 5-gal cans; 55-gal drums, tank cars.

Uses: Chemical intermediate; dyestuffs; rubber chemicals; insecticides; synthetic detergents; flotation agents; corrosion inhibitors; solvent, gasoline additive; pharmaceuticals.

Shipping regulations: Flammable liquid. Red label.*

amylase. A class of enzymes which convert starch into sugars. Fungal and bacterial amylases, from specific fungi and bacteria, have been suggested for commercial fermentation processes. See also amylopsin, diastase, and ptyalin.

Uses: Textile desizing; conversion of starch to glucose sugar in syrups (especially corn syrups); in baking to improve crumb softness and add shelf life (other baking advantages); in dry cleaning to attack food spots and similar stains.

amyl benzoate. See isoamyl benzoate.

amyl butyrate. See isoamyl butyrate.

tert-amyl carbamate (amylene carbamate) $\text{C}_2\text{H}_5\text{C}(\text{CH}_3)_2\text{CO}_2\text{NH}_2$.

Properties: White crystals with camphor odor. M. p. $83-86^\circ\text{C}$; soluble in alcohol and ether; slightly soluble in water.

Use: Medicine.

amyl carbinol. See 1-hexanol.

n-amyl chloride (1-chloropentane) $\text{CH}_3(\text{CH}_2)_4\text{CH}_2\text{Cl}$.

Properties: Colorless liquid. B. p. 107.8°C ; freezing point -99°C ; sp. gr. 0.883 (20/4°C); refractive index n_D 1.4128; flash point 54°F . Miscible with alcohol and ether; insoluble in water.

Derivation: (a) Distillation of amyl alcohol with salt and sulfuric acid; (b) addition of hydrogen chloride to alpha-amylene.

Grades: Technical.

Use: Chemical intermediate.

Shipping regulations: Flammable liquid. Red label.*

amyl chlorides, mixed. $\text{C}_5\text{H}_{11}\text{Cl}$.

Properties: Colorless liquid; sp. gr. (20°C) 0.88; 95% distills between 85° and 109°C ; wt/gal 7.33 lbs; refractive index (20°C) 1.406; water solubility negligible; water azeotrope at $77-82^\circ\text{C}$, 90% $\text{C}_5\text{H}_{11}\text{Cl}$ (approximate); miscible with alcohol and ether.

Constituents: 1-chloropentane, b. p. 107.8°C ; 2-chloropentane, b. p. 96.7°C ; 3-chloropentane, b. p. 97.3°C ; 1-chloro-2-methylbutane, b. p. 99.9°C ; 1-chloro-3-methylbutane, b. p. 98.8°C ; 3-chloro-2-methylbutane, b. p. 93.0°C ; and 2-chloro-2-methylbutane, b. p. 86.0°C .

Derivation: Vapor phase chlorination of mixed normal pentane and isopentane.

Containers: Drums; tank cars.

Use: Synthesis of other amyl compounds; solvent; rotogravure ink vehicles; rubber cements; soil fumigation.

Fire hazard: Flash point (open cup) 34°F .

Shipping regulations: Flammable liquid. Red label.*

alpha-amyl cinnamic aldehyde (jasmine aldehyde; "Buxine") $\text{C}_6\text{H}_5\text{CH}_2\text{C}(\text{CHO})\text{C}_5\text{H}_{11}$.

Properties: Clear, yellow, oily liquid. Jasmine-like odor. Aldehyde content 98-100%. Soluble in 4 volumes of 80% alcohol. Constants: Sp. gr. 0.962 to 0.966; refractive index 1.551 to 1.557.

Method of purification: Distillation.

Grades: Technical.

Containers: Glass bottles; demijohns; tin cans; aluminum containers; tin-lined or stainless steel drums.

Use: Perfumery, particularly for jasmine notes.

Shipping regulations: None.*

alpha-n-amylene (1-pentene; propylethylene) $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}=\text{CH}_2$.

Properties: Colorless liquid. Soluble in alcohol; insoluble in water.

Constants: B. p. 30°C ; m. p. -165°C ; refractive index (20°C) 1.3714; sp. gr. 0.6410 (20°C).

Derivation: Natural gasoline.

Grades: Technical.

Uses: Organic synthesis; blending agent for high octane motor fuel.

beta-n-amylene (sym-methylethylethylene; 2-pentene) $\text{CH}_3\text{CH}_2\text{CH}=\text{CHCH}_3$. Properties below are for the trans-isomer.

Properties: Colorless liquid. Flammable. Soluble in alcohol; insoluble in water.

Constants: B. p. 36.4°C ; m. p. -139°C ; sp. gr. 0.6482 (20°C); refractive index

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

1.3793 (20°C).

Derivation: Natural gasoline.

Grades: Technical.

Use: Organic synthesis.

amylene carbamate. See tert-amyl carbamate.

amylene dichlorides. See dichloropentane.

amylene hydrate. See tert-amyl alcohol.

amylenes, mixed C_5H_{10} . A mixture of several different amylenes. The chief constituents are sym-methylethylene (beta-n-amylenes) and trimethylethylene (3-methyl-2-butene). Small proportions of unsym-methylethylene and propylethylene (alpha-n-amylenes) are also present. Pentane may be present in the limits set by the specifications.

Typical specifications: Color, water-white, sp. gr. 0.66 (20°C); pentane content less than 5.0%; sulfur content none; initial b.p. not below 32°C; not less than 90% boils below 45°C; final b.p. not above 60°C; wt/gal 5.50 lbs.

Containers: 1-gal can (approximate net contents 5 lbs); 5-gal can (approximate net contents 27 lbs); 55-gal drum (approximate net contents 282 lbs); tank car capacity (approximate net contents 8,000 gals).

Use: Organic synthesis.

Fire hazard: Flash point below 80°F.

Shipping regulations: Flammable liquid.

Red label.*

amyl ether (amyl oxide; diethyl ether) ($C_5H_{11}O$). A mixture principally of normal- and iso-amyl ethers.

Properties: Yellowish liquid; unpleasant odor. Soluble in alcohol and ether; insoluble in water.

Typical specifications: Sp. gr. 0.78-0.81; flash point (open cup) 135°F; solidification point below -75°C; refractive index (20°C) 1.42; water azeotrope (96-98°C) 41% amyl ether (approx.); initial b.p. not below 165°C; not less than 95% boils below 200°C; final b.p. not above 210°C; wt/gal 6.61 lbs.

Derivation: By distilling a mixture of amyl alcohol and amyl chloride.

Grades: Technical.

Containers: 1-, 5-gal cans; 55-gal drums.

Use: Solvent.

amyl formate $HCOOC_5H_{11}$.

Properties: Anhydrous, colorless liquid composed of a mixture of isomeric amyl formates with the isoamyl formate in predominance. Plum-like odor. Less odoriferous and more energetic solvent than amyl acetate. It also has both a lower boiling point and a greater speed of evaporation. Miscible with oils, hydrocarbons, alcohols, ketones.

Constants: Sp. gr. 0.880 to 0.885; b.p. 123.5°C; flash point 80°F

Grades: Technical.

Uses: Solvent for cellulose esters, resins; solvent mixtures; films and coatings; celluloid substitutes; perfume for leather.

Shipping regulations: Flammable liquid.

Red label.*

n-amyl furoate (amyl pyromucate)

$C_4H_7OCO_2C_5H_{11}$.

Properties: Colorless oil, decomposes on standing.

Constants: Sp. gr. 1.0335 (20/4°C); b.p. 233°C. Insoluble in water; soluble in alcohol.

Derivation: By the usual esterification methods from furoic acid.

Uses: Perfumes; lacquers.

amyl hydrate. See amyl alcohol.

amyl hydride. See pentane.

amyl hydrosulfide. See amyl mercaptan.

"Amyliq." ¹⁷³ Trademark for a bacterial amylase preparation which permits conversion of starch to form superior sizings, coatings and adhesives from starch for use in the paper trade.

amyl laurate $C_{11}H_{23}COOC_5H_{11}$.

Properties: Sp. gr. at 20°C, 0.860; boiling range 290-330°C; color, very light straw; odor, faintly alcoholic. Flash point 300°F

Uses: Plasticizer and solvent.

amyl mercaptan (amyl hydrosulfide; amyl sulfhydrate, pentanethiol) $C_5H_{11}SH$. A mixture of isomers having an extremely noticeable odor.

Typical specifications: Water-white to light yellow liquid; sp. gr. (20°C) 0.83-0.84; mercaptan content at least 90.0%; initial b.p. not below 104.0°C; not less than 95% boils below 125°C; final b.p. not above 130°C; wt/gal 6.99 lbs; refractive index (20°C) 1.4406. Flash point 65°F (open cup).

Derivation: Mixing amyl bromide and potassium hydrosulfide in alcohol.

Containers: 1-, 5-gal cans; 55-gal drums.

Uses: Synthesis of organic sulfur compounds; chief constituent of odorant used in gas lines to locate leaks.

Shipping regulations: Flammable liquid.

Red label.*

tert-amyl mercaptan ($CH_3)_2CSH(C_2H_5)$, (2-Methyl-2-butanethiol).

Properties: Boiling range 95-119°C; sp. gr. 0.828 (60/60°F); refractive index 1.438 (20/D); flash point -1°C.

Grades: 95%.

Containers: Bottles and drums.

Use: Odorant.

Shipping regulations: Flammable liquid.

Red label.*

amyl naphthalene $C_{10}H_7C_5H_{11}$.

Properties: Liquid; sp. gr. (20°C) 0.965; refractive index (20°C) 1.573; vapor pressure (20°C) < 0.01 mm; b.p. 279-330°C; m.p. -60°C; flash point, 124°C; insoluble in water.

Use: Plasticizer.

amyl nitrate (mixed isomers) $C_5H_{11}NO_3$.

Properties: Sp. gr. at 20°C, 0.990; boiling range 145-156°C; color, water-white; odor, ethereal. Flash point 118°F.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

amyl nitrates, primary. See "Ethyl," Diesel Ignition Improver.

amyl nitrite (isoamyl nitrite)

Properties: A clear, yellowish liquid, of peculiar ethereal, fruity odor and pungent, aromatic taste. It is volatile even at low temperatures and is flammable. Soluble in alcohol; almost insoluble in water.

Constants: Sp. gr. 0.865-0.875 at 25°C; b.p. 96-99°C.

Derivation: By the interaction of amyl alcohol and nitrous acid.

Grades: U. S. P. XVI (95% min); technical.

Containers: Dark amber glass bottles.

Uses: Medicine; perfumes; diazonium compounds.

Fire hazard: Dangerous. Mixture with air explodes if ignited.

Shipping regulations: Flammable liquid. Red label.*

amylodextrin. See soluble starch.

amyloid. Used to refer to various gelatinous and filmlike or parchment-like materials resulting from the action of sulfuric acid and water on cellulose or starch.

amyl oleate $\text{C}_{17}\text{H}_{33}\text{COOC}_5\text{H}_{11}$.

Properties: Sp. gr. at 20°C, 0.862; boiling range 200 to 240°C at 20 mm; light straw color; faint alcoholic odor. Flash point 366°F.

Uses: Solvent and plasticizer.

Shipping regulations: None.*

"Amylon." ⁵³ Trade name for a high-amylose starch derived from high-amylose corn.

amyopectin. The outer, almost insoluble portion of starch granules. It is a hexosan, a polymer of glucose, and is a branched molecule of many glucose units. It stains violet with iodine and forms a paste with water.

amyllopsin (animal diastase). The starch-digesting enzyme of pancreatic juice, the most powerful enzyme of the digestive tract. It is an amylase which converts starches through the soluble-starch stage to various dextrans and maltose. It acts in neutral, slightly acid and slightly alkaline environments with an optimum pH of 6.3-7.2. It requires the presence of certain negative ions for activation.

Use: Biochemical research.

amylose. The inner, relatively soluble portion of starch granules. Amylose is a hexosan, a polymer of glucose, and consists of long straight chains of glucose units joined by a 1,4-glycosidic linkage. It stains blue with iodine.

amyl oxide. See amyl ether.

ortho-sec-amyl phenol $\text{C}_5\text{H}_{11}\text{C}_6\text{H}_4\text{OH}$.

Typical specification: Clear, straw-colored solid; sp. gr. (30/30°C) 0.955-0.971, initial b.p. not below 235.0°C; final b.p. not above 250.0°C; wt/gal 8.0 lbs; very slightly soluble in water; soluble in oil and

organic solvents. Flash point (open cup) 200°F.

Containers: 1-gal cans; 5-, 55-gal drums; tank cars.

Uses: Dispersing and mixing agent for paint, pastes; antiskinning agent for paint, varnish and oleoresinous enamels; organic synthesis.

ortho-tert-amyl phenol $(\text{CH}_3)_2\text{C}_2\text{H}_5\text{CC}_6\text{H}_4\text{OH}$.

Typical specifications: Pale yellow liquid, sp. gr. (30°C) 0.96-0.97; initial b.p. not below 233°C; final b.p. not above 245°C; wt/gal 8.12 lbs; slightly soluble in water; soluble in oil and organic solvents. Flash point (open cup) 219°F.

Containers: 1-gal cans; 5-, 55-gal drums.

Uses: Dispersing and mixing agent for paint, pastes, antiskinning agent for paint, varnish and oleoresinous enamels; organic synthesis.

para-tert-amyl phenol $(\text{CH}_3)_2\text{C}_2\text{H}_5\text{CC}_6\text{H}_4\text{OH}$.

Properties: White crystals; irritating to skin, handle with care; m.p. 93°C; b.p. 265-267°C (138°C at 15 mm); slightly soluble in water; soluble in alcohol and ether.

Containers: Drums.

Uses: Manufacture of oil-soluble resins; plasticizer; germicide; fumigant; organic synthesis.

para-tert-amylphenyl acetate $\text{C}_5\text{H}_{11}\text{C}_6\text{H}_4\text{OOCCH}_3$.

Properties: Sp. gr. (20°C) 0.996; boiling range 253-272°C; color, water-white; odor, fruity. Flash point 240°F.

Uses: Perfumes; flavorings.

Shipping regulations: None.*

amyl propionate $\text{CH}_3\text{CH}_2\text{COOC}_5\text{H}_{11}$. Probably the isoamyl isomer.

Properties: Colorless, high-boiling, liquid; apple-like odor; sp. gr. (20/20°C) 0.869-0.873; wt/gal (20°C) 7.25 lbs (approximate); distillation range 135-175°C; miscible with most organic solvents.

Derivation: By reacting fusel oil (amyl alcohol) with propionic acid in the presence of sulfuric acid as a catalyst, followed by neutralization, drying and distillation.

Grades: Technical.

Containers: 1-gal cans; 5-, 55-gal steel drums.

Uses: Perfumes; lacquers; flavors.

Shipping regulations: None.*

amyl pyromucate. See n-amyl furoate.

amyl salicylate. See isoamyl salicylate.

amyl stearate $\text{CH}_3(\text{CH}_2)_{16}\text{COOC}_5\text{H}_{11}$.

Properties: Liquid; sp. gr. (20°C) 0.860; boiling range 230-270°C at 30 mm; color, light straw; odor, faintly alcoholic; flash point 368°F.

Uses: Solvent and plasticizer.

Shipping regulations: None.*

amyl sulfhydrate. See amyl mercaptan.

amyl sulfide. See diamyl sulfide.

amyltrichlorosilane $\text{C}_5\text{H}_{11}\text{SiCl}_3$. A mixture of isomers.

Properties: Colorless to yellow liquid. B.p.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

168°C; sp. gr. 1.137 (25/25°C); refractive index n_D^{20} 1.4152; flash point (Cleveland open cup) 145°F. Readily hydrolyzed by moisture with the liberation of hydrochloric acid.

- * Derivation: By Grignard reaction of silicon tetrachloride and amylmagnesium chloride.
- Grades: Technical.
- Containers: 1-, 4-, 9-lb bottles; drums.
- Use: Intermediate for silicones.
- Shipping regulations: Corrosive liquid.
- White label.*

amylum. See starch.

amyl valerate. See isoamyl valerate.

amyl valgrianate. See isoamyl valerate.

amyris oil. See sandalwood oil, West Indies.

"**Amytal.**" ¹⁰⁰ Trademark for amobarbital, U. S. P.

"**Amytal Sodium.**" ¹⁰⁰ Trademark for amobarbital sodium, U. S. P.

"**Amzirc.**" ⁶⁷ Trademark for zirconium-containing copper-base alloys.

anabasine (neonicotine; 2-(3-pyridyl)piperidine) $C_{10}H_{14}N_2$. A naturally occurring alkaloid. Properties: Colorless liquid; darkens on exposure to air. B. p. 105°C, freezing point 9°C; sp. gr. 1.046 (20/20°C), refractive index n_D^{20} 1.5430. Miscible with water; soluble in alcohol and ether.

Derivation: (a) Extraction from *Anabasis aphylla* and *Nicotiana glauca*; (b) synthetic. Use: Insecticide.

anacardium gum. See cashew gum.

"**Anaesthesin.**" ¹⁶² Trademark for ethyl para-aminobenzoate.

analcime. See analcite.

analcite (analcime) $Na_2O \cdot Al_2O_3 \cdot 4SiO_2 \cdot 2H_2O$.

A mineral; one of the zeolites (q. v.).

Properties: Colorless, white; sometimes greenish-grayish, yellowish or reddish white; hardness 5-5.5; sp. gr. 2.22-2.29.

Occurrence: Europe; United States: Nova Scotia.

analogs, structural. See antimetabolites.

anatase (octahedrite). A natural crystallized form of titanium dioxide (q. v.).

"**Anattene.**" ³⁴² Trademark for annatto derivatives prepared for use in coloring food-stuffs, i. e., cheeses, oranges.

"**Anavenol.**" ²⁰⁷ Trademark of a solution containing 20% w/v beta-naphthoxyethanol and 5% w/v thialbarbitone used as veterinary anesthetic. See "Kernithal."

anchusa. See alkanna.

anchusin. See alkanna.

andalusite Al_2SiO_5 . A natural silicate of aluminum.

Properties: Gray, greenish, reddish, or bluish in color. Streak white or uncolored. Luster vitreous.

Constants: Sp. gr. 3.1-3.2; hardness, 7-7.5.

Occurrence: Massachusetts, Connecticut, California, Nevada; U. S. S. R.; Switzerland; Spain; South Africa; Australia.

Uses: Gem stones; a constituent of sillimanite refractories; spark plug insulators; laboratory ware; superrefractories.

"**Andok.**" ⁵¹ Trademark for a high quality grease for lubricating antifriction bearings. Correct grades, easily applied by hand or gun, are available for various speed and temperature conditions.

androgen. A general term for male sex hormones. These hormones cause the development of the secondary male sex characteristics such as the deepening of the voice and the growth of facial hair. The androgenic hormones are steroids and are synthesized in the body by the testis, the cortex of the adrenal gland, and, to slight extent, by the ovary. The international unit (I. U.) is the androgenic activity of 0.1 mg androsterone (q. v.).

Use: Medicine.

androsterone. $C_{19}H_{30}O_2$. An androgenic steroid; metabolic product of testosterone (q. v.). The international unit (I. U.) of androgenic activity is defined as 0.1 mg androsterone. Properties: Crystalline solid; m. p. 185-185.5°C; sublimes in high vacuum; dextrorotatory in solution; not precipitated by digitonin; practically insoluble in water; soluble in most organic solvents.

Derivation: Isolation from male urine; synthesis from cholesterol.

Use: Medicine; biochemical research.

"**Anectine.**" ³⁰¹ Trademark for succinylcholine chloride (diacetylcholine chloride), used in anesthesia and electroshock therapy.

anemonin (pulsatilla camphor) $C_{10}H_6O_4$.

Properties: Yellowish-white crystals; m. p. 157-158°C, insoluble in water; soluble in hot alcohol.

Derivation: Separation from the volatile oil of pulsatilla.

Use: Medicine.

Shipping regulations: None.*

anesthesia ether. See ether.

"**Anesthesin.**" ³ Trademark for ethyl-para-aminobenzoate (q. v.).

anethole (anise camphor; para-methoxy-propenylbenzene; para-propenylanisole) $CH_3CH=CHC_6H_4OCH_3$.

Properties: White crystals with sweet taste; tending to melt to liquid at warm room temperature; odor characteristic of oil of anise, suggestive of licorice. Affected by light. Soluble in 8 volumes of 80% alcohol, 1 volume of 90% alcohol. Almost immiscible with water.

Constants: Sp. gr. 0.983-0.987; refractive index 1.557-1.561; optical rotation, 0.08°; m. p. 22-23°C; distillation range 234-237°C.

Derivation: By crystallization from anise or fennel oils; synthetically from para-cresol.

Method of purification: Rectification.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Grades: U.S.P. XVI; technical. *

Containers: Glass bottles; demijohns; tin cans; aluminum containers; stainless steel drums. *

Uses: Perfumes, particularly for dentifrices; flavors; synthesis of anisic aldehyde; for licorice candies; color photography (sensitizer in color-bleaching process); in microscopy.

Shipping regulations: None. *

anethum (dill; dill seed).

Derivation: Fruit of garden dill, *Anethum graveolens*.

Occurrence: Asia Minor and Europe; cultivated in United States.

Grades: Technical.

Containers: Bags.

Uses: Medicine (aromatic); condiment.

Shipping regulations: None. *

anethum oil. See dill oil.

angelica (garden angelica). Root and seed of the biennial herb, genus *Angelica*.

Occurrence: Europe; Asia; eastern United States.

Grades: Technical.

Containers: Bags; bales.

Uses: Medicine (aromatic); candy; food ingredient; source of angelica root oil; rectification of alcohol and distilled liquors.

Shipping regulations: None. *

angelica root oil, European.

Properties: Essential oil. A limpid liquid, colorless when freshly distilled, becoming yellowish to brownish on exposure to light and air. Strong aromatic odor; spicy taste. Soluble in 0.5-6 vols. and more of 90% alcohol (sometimes with slight turbidity).

Chief known constituents: Phellandrene; valeric acid.

Constants: Sp. gr. 0.853-0.918; optical rotation $+16^{\circ}$ to $+41^{\circ}$; refractive index 1.477-1.488; acid value to 3.8; ester value 12-37, after distillation 51-75.

Derivation: Distilled from the roots of *Angelica archangelica*.

Uses: Medicine; preparation of liqueurs; perfumery.

Shipping regulations: None. *

angelica root oil Japanese.

Properties: Essential oil. Odor suggestive of musk. Odor is stronger and more persistent than that of European oil.

Constants: Sp. gr. 0.905-0.908 (15°C); optical rotation $-1^{\circ}40'$; refractive index 1.49110; acid value 10.6; ester value 40.

Derivation: Distilled from the root of either *Angelica refracta*, Fr. Schmidt or *Angelica anomala*, Lall.

Use: Medicine.

Shipping regulations: None. *

angelica seed oil.

Properties: Pale yellow essential oil; darkens with age; resembles in odor the oil from the root, but is much finer.

Chief known constituents: Phellandrene; valeric acid.

Constants: Sp. gr. 0.851-0.890; optical

rotation $+11^{\circ}$ to $+13^{\circ}30'$; refractive index 1.486-1.489; acid value up to 2.9; ester value 13-30. Soluble in 5-9 vols. of 90% alcohol (occasionally with opalescence and turbidity).

Derivation: Distilled from the seeds of *Angelica archangelica*.

Uses: Medicine; preparation of liqueurs; perfumery.

Shipping regulations: None. *

angelic acid (2-methyl-2-butenic acid; alpha-methyl-crotonic acid) $\text{CH}_3\text{CH}(\text{C}(\text{CH}_3)\text{COOH})$. The cis isomer of tiglic acid.

Properties: Colorless needles or prismatic crystals; spicy odor. Soluble in alcohol, ether, and hot water.

Constants: Sp. gr. 0.9539 ($76/4^{\circ}\text{C}$); m. p. 45°C ; b. p. 185°C ; refractive index $n_{\text{D}}^{20} 1.4434$.

Derivation: From the root of *Angelica archangelica* or from the oil of *Anthemis nobilis* by distillation.

Method of purification: Crystallization. *

Grades: Technical.

Containers: Tins.

Uses: Medicine; flavoring extracts.

Shipping regulations: None. *

angel red. See iron oxide reds.

angiotensin (angiotonin; hypertensin). A peptide found in the blood, important in its effect on blood pressure. Both a decapeptide and an octapeptide are known. Their amino acid sequences, and hence the complete structures, have been decided.

angiotonin. See angiotensin.

anglesite PbSO_4 . A natural lead sulfate.

Properties: White, gray, yellow, blue or green in color; luster, adamantine to vitreous; slowly soluble in nitric acid.

Derivation: Contains 73.6% PbO . Formed by the oxidation of galena (q. v.) and found wherever exposed deposits of galena occur.

Constants: Sp. gr. 6.12-6.39; hardness 3. Occurrence: United States; Canada; Mexico; Chile; Europe; Australia; Siberia.

Use: An ore of lead.

See also lead sulfate.

angostura (carony bark; cusparia bark).

Bark of tree, *Galipea officinalis* or *G. cusparia*.

Occurrence: Northern South America and West Indies.

Containers: Bags.

Use: Medicine (aromatic bitter).

Shipping regulations: None. *

angostura bark oil.

Properties: Light yellow-colored essential oil becoming darker on exposure to the air; aromatic odor and taste. Soluble in 9 vols. of 90% alcohol (with turbidity).

Chief known constituents: Galipol; cadinene; galipine; pinene.

Constants: Sp. gr. 0.928-0.96 (15°C); optical rotation $-7^{\circ}30'$ to -50° ; refractive index 1.50744; acid value 1.8; ester value 5.5, after acetylation 35.7.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: Distilled from the bark of *Galipea cusparia*, St. Hil.

Uses: Medicine; preparation of liqueurs and bitters.

-Shipping regulations: None.*

angstrom. A unit of length almost one one-hundred-millionth (10^{-8}) centimeter. The angstrom (abbreviated A.) is now defined in terms of the wave length of the red line of cadmium (6438.4696 A.).

anhaline. See hordenine.

anhalonidine $C_{12}H_{17}NO_3$ (7,8-dimethoxy-8-hydroxy-1-methyl-1-,2,3,4-tetrahydroisoquinoline). An alkaloid.

Properties: White crystals; poisonous! M. p. 160°C ; soluble in water, alcohol, and chloroform; slightly soluble in ether.

Derivation: By extraction from mescal buttons.

Method of purification: Crystallization.

Grades: Technical.

Containers: Tins; glass bottles.

Use: Medicine.

Shipping regulations: None.*

anhalonine $C_{12}H_{15}NO_3$. An alkaloid.

Properties: White crystals; poisonous!

Soluble in alcohol, ether, water and chloroform.

Constants: M. p. 85°C ; b. p. 140°C (0.02 mm); specific rotation (methanol solution) -63.8° (25°C).

Derivation: By extraction and subsequent crystallization from seed of mescal buttons.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Tins; glass bottles.

Use: Medicine.

Shipping regulations: None.*

"**Anhydrex**,"¹⁶⁰ Trademark for a proprietary product. Wires or cables with moisture-resistant insulation; suitable for submarine installation; excellent aging properties; low mechanical water absorption; high electrical stability on soaking in water.

anhydrite CaSO_4 . A natural calcium sulfate usually occurring as compact granular masses of white, gray-bluish or brick-red color and resembling marble in appearance; luster, pearly to vitreous. Found mostly as layers in gypsum and halite deposits. Differs from gypsum in hardness and lack of hydration.

Properties of powdered anhydrite: Hygroscopic, tasteless, odorless free-flowing powder; density 65.0 lbs/cu ft.

Occurrence: United States: Nova Scotia; Europe.

Containers: 5-ply asphalt laminated bags, 100-lbs net; carloads.

Uses: Substitute for gypsum in the manufacture of cement; sometimes employed in agriculture as land plaster; ornamental stone; drying agent; insecticide fillers, manufacture of refrigerant gases.

anhydroecgonine (ecgonidine) $C_9H_{13}NO_2$. An alkaloid.

Properties: White crystals; poisonous!

Soluble in water and alcohol.

Constants: M. p. (dl-isomer) $226-230^{\circ}\text{C}$, with decomposition; (l-isomer) 235°C , with decomposition.

Derivation: Obtained from ecgonine.

Method of purification: Crystallization.

Grades: Technical.

Containers: Tins; glass bottles.

Use: Medicine.

Shipping regulations: None.*

anhydroecgonine hydrochloride

$C_9H_{13}NO_2 \cdot \text{HCl}$.

Properties: White crystals; poisonous!

Soluble in water and alcohol.

Constants: M. p. $240-241^{\circ}\text{C}$.

Derivation: By the action of hydrochloric acid on anhydroecgonine.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

anhydro-formaldehyde-para-toluidine. See formaldehyde-para-toluidine.

anhydroglucose. Term applied to the unit of molecular structure of cellulose

$-\text{OCHCH}(\text{CH}_2\text{OH})\text{OCHCH}(\text{OH})\text{CHOH}$

and differing from the composition of glucose by abstraction of the elements of water. The term is also applied to material of essentially the same composition, resulting from oxidation of cellulose by agents such as nitrogen dioxide.

anhydroglucuronic acid. Oxidation product of cellulose, when NO_2 is used as the oxidizing agent. See cellulose, oxidized.

anhydrohydroxyprogesterone. See ethisterone.

"**Anhydrol**,"²¹⁴ Trademark for a proprietary gasoline-free solvent composed of 100 gal S. D. 1 ethanol denatured with 10 gal isopropanol (90%) and 1 gal methyl isobutyl ketone.

Properties of anhydrous grade: B. p. (760 mm) $75-80.5^{\circ}\text{C}$, sp. gr. 0.7895-0.7935 ($20/20^{\circ}\text{C}$), lb/gal 6.6 (20°C); flash point 54°F

Grades: Anhydrous and 190 proof.

Containers: 1-gal can; 5- and 55-gal drums; tank cars up to 10,000 gals.

Uses: Solvent in manufacture of printing inks, textile dyestuff solutions, wick deodorants, window cleaners, synthetic detergents, aircraft de-icing fluids, and as a solvent in the photographic industry.

Shipping regulations: Flammable liquid. Red label.*

"**Anhydroprene**,"¹⁶⁰ Trademark for a proprietary product. A wire or cable insulated with "Anhydrex" moisture-resistant insulation and protected with a thin neoprene jacket having high tear and abrasion resistance. Suitable for use underground in ducts, in conduit or racked on walls.

anhydrous aluminum chloride. See aluminum chloride.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

anhydrous borax. Borax glass. See sodium borate.

anhydrous salt. A dry salt; one which does not contain water either adsorbed on its surface or combined as water of crystallization.

"Anhydrox." ²³⁶ Brand name for a compound to prevent or overcome anhydrite or gypsum contamination in drilling mud, by pretreatment of the mud to remove calcium and sulfate ions.

"A" Nickel. ²⁸⁵ Trademark for wrought commercially pure nickel. An "electronic grade" is used in vacuum tubes and similar electronic applications. Low Carbon "A" nickel has a maximum carbon content of 0.02%. Used for applications where the temperature exceeds 600°F and for deep drawing.

anileridine hydrochloride $C_{22}H_{28}N_2O_2 \cdot 2HCl$
Ethyl 1-(4-aminophenethyl)-4-phenylisonipicotate dihydrochloride.

Properties: Crystals; decomposition 280-287°C; freely soluble in water; soluble in alcohol, methanol.

Grade: N. N. D.

Use: Medicine.

anileridine phosphate $C_{22}H_{28}N_2O_2 \cdot H_3PO_4$
Ethyl 1-(4-aminophenethyl)-4-phenylisonipicotate phosphate.

Grade: N. N. D.

Use: Medicine.

aniline (aniline oil; phenylamine; aminobenzene) $C_6H_5NH_2$. One of the most important of the organic bases; the parent substance for many dyes and drugs.

Properties: Colorless oily liquid; characteristic odor and taste; rapidly becomes brown on exposure to air and light; poisonous! Soluble in alcohol, ether, and benzene; slightly soluble in water.

Constants: Sp. gr. 1.0235; m. p. -6.2°C; b. p. 184.4°C; wt/gal (20°C) 8.52 lbs; refractive index $n_{20/D}$ 1.5863; flash point (open cup) 195°F.

Derivation: (a) Reduction of nitrobenzene with iron filings or borings and 30% hydrochloric acid as catalyst; aniline is recovered by distillation. (b) Reaction of chlorobenzene and aqueous ammonia in the presence of cuprous oxide catalyst at 200°C and 800 psi. (c) By catalytic vapor-phase reduction of nitrobenzene with hydrogen.

Grades: Commercial; C. P.

Containers: 1-lb bottles; 40-, 85-, 500-, 900-lb drums; 60,000-lb tank cars.

Uses (in approximate order of volume):

Rubber accelerators and anti-oxidants; dyes and intermediates; veterinary pharmaceuticals; drugs; photographic chemicals (hydroquinone); explosives; rocket fuel; petroleum refining.

Caution: Rapidly absorbed through skin; liquid and vapor hazardous. MCA warning label.

Shipping regulations: Class B poison.

Poison label.*

aniline acetate (phenylamine acetate)

$C_6H_5NH_2 \cdot CH_3COOH$.

Properties: Colorless liquid; becomes dark, with age; on standing or heating is converted gradually to acetanilide; sp. gr. 1.070-1.072; miscible with water and alcohol.

Derivation: Combination of acetic acid and aniline.

Grades: Technical.

Use: Organic synthesis.

2-aniline-5-aminobenzenesulfonic acid. See 1,4,2-aminodiphenylamine-sulfonic acid.

aniline black. A black color developed on cotton and other textiles from a bath containing aniline hydrochloride, an oxidizing agent (usually chromic acid) and a catalyzer (usually a vanadium or copper salt).

aniline chloride. See aniline hydrochloride.

aniline, N, N-dimethyl. See N, N-dimethylaniline.

aniline-2,4-disulfonic acid. See 4-amino-metabenzenedisulfonic acid.

aniline-2,5-disulfonic acid. See 2-amino-para-benzenedisulfonic acid.

aniline dyes. A large class of synthetic dyes made from intermediates based upon, or made from, aniline.

aniline-formaldehyde resins. See amino resins.

aniline hydrochloride (aniline salt; aniline chloride) $C_6H_5NH_2 \cdot HCl$.

Properties: White crystals; commercial article frequently greenish in appearance, darkens in light and air. Soluble in water, alcohol, and ether.

Constants: Sp. gr. 1.2215; m. p. 198°C; b. p. 245°C.

Derivation: (a) By passing a current of dry hydrochloric acid gas into an ethereal solution of aniline; (b) neutralizing aniline at 100°C with concentrated hydrochloric acid and subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical; C. P.

Containers: 1-, 5-lb bottles; 180-, 225-lb barrels; drums.

Uses: Dyes; intermediates; dyeing and printing aniline black.

Shipping regulations: None.*

aniline inks. Fast-drying printing inks used on kraft paper, cotton fabric, cellophane, polyethylene, etc. The name arises from the fact that original inks for this purpose were solutions of coal tar dyes in organic solvents. Modern inks usually employ pigments rather than dyes and are of two types: spirit inks, containing organic solvent as the vehicle, and emulsion inks, in which water is the main vehicle.

1-aniline-2-methylantraquinone

$C_{16}H_{11}NH_2 \cdot C_{14}H_9O_2$.

Properties: Chocolate-brown to deep-red crystals. Soluble in sulfuric acid and organic solvents such as alcohol, nitroben-

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

zene, and mono- and dichlorobenzenes.

Constants: Melts above 200°C.

Derivation: From 1-chloro-2-methylantraquinone and aniline in the presence of catalysts of copper salts and acid-binding agents like sodium carbonate, etc.

Method of purification: Crystallization from high boiling organic solvents such as nitrobenzene or from the halogenated benzenes.

Grades: Technical.

Containers: Wooden barrels.

Use: Dyes.

Shipping regulations: None.*

aniline resins. A type of amino resins (q. v.).

aniline salt. See aniline hydrochloride.

para-anilinesulfonic acid. See sulfanilic acid.

aniline yellow. See para-aminoazobenzene.

6-anilino-1-naphthol-3-sulfonic acid. Preferred name for phenyl-2-amino-5-naphthol-7-sulfonic acid.

7-anilino-1-naphthol-3-sulfonic acid.

Preferred name for phenyl-2-amino-8-naphthol-6-sulfonic acid.

anilino-phenol. See para-hydroxydiphenylamine.

anilipyrine. See anilpyrine.

anilpyrine (anilipyrine).

Properties: White, crystalline powder; m. p. 75°C; soluble in water.

Derivation: By fusing antipyrine with acetanilid.

Use: Medicine.

animal black. Forms of more or less pure and finely divided carbon made by calcination of animal bones or ivory. Used as pigments, decolorizing, purifying and refining agents. Bone black, drop black and ivory black are varieties of animal black.

animal cellulose. See tunicine.

animal char. See animal charcoal.

animal charcoal (animal char). Same as animal black.

animal diastase. See amylopsin.

animal oil. See bone oil.

animal starch. See glycogen.

animal tankage. See tankage.

animé (animi). Any of several resins but especially soft copal. Sometimes applied specifically to Zanzibar gum (q. v.), a variety of copal.

animi. A variation of animé.

anion. An ion having a negative charge; anions in a liquid subjected to electric potential collect at the positive pole or anode. Examples are hydroxide, OH⁻; carbonate, CO₃⁼; phosphate, PO₄⁼.

anion exchange. See ion exchange.

anionic detergents. See detergents, synthetic.

ortho-anisaldehyde (ortho-methoxybenzaldehyde; ortho-anisic aldehyde)
C₆H₄(OCH₃)CHO.

Properties: White to light tan solid; burned, slightly phenolic odor; b. p. 238°C; m. p. (2 crystalline forms) 38-39°C and 3°C; sp. gr. (liquid) 1.1274 (25/25°C); (solid) 1.258 (25/25°C); refractive index (n_D 20) 1.5608; flash point 244°F; slightly soluble in water.

Grade: 95% (min.).

Containers: 1-lb bottles; 1- and 5-gal cans; 55-gal drums.

Use: Intermediate.

para-anisaldehyde (aubepine; para-anisic aldehyde; para-methoxybenzaldehyde)
C₆H₄(OCH₃)CHO.

Properties: Colorless to pale yellow liquid, having odor of hawthorn. Soluble in 5 volumes of 50% alcohol.

Constants: Sp. gr. 1.119-1.122; refractive index 1.570-1.572; m. p. 0°C; b. p. 248°C; refractive index (n_D 13) 1.5764.

Derivation: Obtained from anethole or anisole by oxidation.

Method of purification: Distillation.

Grades: Liquid and crystals, latter being the disulfite compound.

Containers: Glass bottles; demijohns; stainless steel or tin-lined drums.

Uses: Perfumery, intermediate for anti-histamines.

Shipping regulations: None.*

anise (anise seed). Fruit of *Pimpinella anisum*.

Occurrence: Western Asia, Egypt; cultivated in southern Europe, India and North America.

Grades: Spanish; Mexican; Syrian.

Containers: Bags.

Uses: Manufacture of anise oil; condiment; flavor; medicine.

Shipping regulations: None.*

anise alcohol. See anisic alcohol.

anise camphor. See anethole.

aniseed oil. See anise oil.

anise oil (anise seed oil; aniseed oil).

Properties: A colorless, thick liquid having the identifying characteristic of solidifying to a crystalline mass at about 15°C.

Characteristic odor; very sweet taste.

Soluble in 1.5 to 3 vols. of 90% alcohol.

Chief constituents: Anethole (90%); methylchavicol; anise ketone; acetaldehyde.

Constants: Sp. gr. 0.978-0.988; optical rotation -2° to +1°; n_D(20°C) 1.5530-1.5600.

Derivation: By distillation of the seeds of *Pimpinella anisum* or *Illicium verum*.

Grades: U.S.P. XVI; Chinese; Russian.

Uses: As a source of anethole; medicine; when terpene-free, in perfumery; and to flavor liqueurs.

Shipping regulations: None.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

anise seed. See anise.

anise-seed oil. See anise oil.

anisic acid (para-methoxybenzoic acid)

Properties: White crystals or powder; sp. gr. 1.385 (4°C); m. p. 184°C; b. p. 275-280°C; soluble in alcohol and ether; almost insoluble in water.

Derivation: Oxidation of anethole.

Containers: 100-lb drums.

Use: Medicine; repellent and ovicide.

anisic alcohol (anisyl alcohol; anise alcohol; para-methoxybenzyl alcohol)

Properties: Colorless liquid, having a floral odor suggesting hawthorn. Soluble in 1 volume of 50% alcohol.

Constants: Sp. gr. 1.111-1.114; congealing point 24°; refractive index 1.541-1.545; boiling range 255-265°.

Derivation: Obtained from anisic aldehyde, by reduction.

Method of purification: Distillation.

Containers: Glass bottles; demijohns; tin cans; aluminum containers; tin-lined or stainless steel drums.

Use: In perfumery, for light floral odors.

Shipping regulations: None.*

anisic aldehyde. See anisaldehyde.

ortho-anisidine (ortho-methoxyaniline; ortho-aminoanisole) $\text{CH}_3\text{OC}_6\text{H}_4\text{NH}_2$.

Properties: Reddish or yellowish colored oil, becomes brownish on exposure to air, volatile with steam; sp. gr. 1.097 (20°C); b. p. 225°C; m. p. 5°C; soluble in dilute mineral acid, alcohol, and ether; insoluble in water.

Derivation: (a) Reduction of ortho-nitroanisole with tin (or iron) and hydrochloric acid; (b) heating ortho-aminophenol with potassium methyl sulfate.

Method of purification: Steam distillation.

Grades: 99% (1% maximum moisture).

Containers: 55-, 110-gal drums; tank cars.

Use: Intermediate for azo dyes and for guaiacol.

Warning! Hazardous liquid and vapor; absorbed through skin. MCA warning label!

Shipping regulations: None.*

para-anisidine (para-methoxyaniline; para-aminoanisole) $\text{CH}_3\text{OC}_6\text{H}_4\text{NH}_2$.

Properties: Fused, crystalline mass; crystallizing point 57.2°C min; sp. gr. 1.089 (55/55°C); b. p. 242°C; soluble in hot water, alcohol, and ether.

Derivation: (a) Reduction of para-nitroanisole with iron filings and hydrochloric acid; (b) methylation of para-aminophenol.

Grades: Technical.

Containers: 500-, 800-lb drums.

Uses: As a component of various azo dye-stuffs and as an intermediate in chemical synthesis.

Warning! Hazardous solid. Absorbed through skin. MCA warning label.

Shipping regulations: None.*

anisindione (2-para-anisyl-1,3-indandione)

Properties: Pale yellow crystals; m. p. 156-157°C.

Use: Medicine.

anisoin $\text{CH}_3\text{OC}_6\text{H}_4\text{COCH(OH)C}_6\text{H}_4\text{OCH}_3$.

Properties: White to yellow powder; sweet, cinnamon-like odor; m. p. 111-113°C.

anisole (methylphenyl ether; methoxybenzene)

Properties: Colorless liquid; agreeable, aromatic odor; soluble in alcohol and ether; insoluble in water.

Constants: Sp. gr. 0.999 (15/15°C); m. p. -37.8°C; b. p. 155°C; refractive index (n_D 20/D) 1.5150-1.5170.

Derivation: From sodium phenate and methyl chloride; heating phenol with methyl alcohol.

Containers: 5-lb tins; 60-lb cases; drums.

Uses: Solvent; perfumery; vermicide; intermediate.

anisoyl chloride $\text{CH}_3\text{OC}_6\text{H}_4\text{COCl}$.

Properties: Clear crystals or amber colored liquid. M. p. 22°; b. p. 262-263°. Soluble in acetone and benzene; decomposed by water or alcohol.

Containers: 500-lb drums.

Uses: Intermediate for dyes and medicines.

Shipping regulations: Corrosive liquid.

White label.*

anisyl acetate (para-methoxybenzyl acetate)

Properties: Colorless liquid, having a lilac-type odor. Soluble in 4 vols. of 60% alcohol.

Constants: Sp. gr. 1.104-1.107; refractive index 1.514-1.516.

Derivation: Reaction of anisic alcohol with acetic anhydride, using sulphocamphoric acid as catalyst.

Method of purification: Distillation.

Grades: Technical.

Containers: Glass bottles; demijohns; tin cans; aluminum containers; stainless steel or tin-lined drums.

Use: Perfumery.

Shipping regulations: None.*

anisyl alcohol. See anisic alcohol.

anisyl formate (para-methoxybenzyl formate)

Properties: Colorless liquid, with floral-lilac odor. Soluble in 5.5 vols. of 70% alcohol.

Constants: Sp. gr. 1.139-1.141; refractive index 1.522-1.524.

Method of purification: Distillation.

Grades: Technical.

Containers: Glass bottles; demijohns; tin cans; aluminum containers; stainless steel or tin-lined drums.

Use: Perfumery.

Shipping regulations: None.*

annatto (annotta; arnotta; bixin; butter color).

Vegetable dyestuff containing coloring principle called bixin.

Properties: Soluble in alcohol, ether, and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

oils.

Derivation: From the seeds of *Bixa orellana*.

Occurrence: South America; West Indies; India.

Grades: Spanish; Brazilian; French; technical.

Containers: 100-lb boxes.

Uses: Coloring foodstuffs (dairy products); dyeing orange yellow on cotton and silk (not fast); coloring wood stains and varnishes.

annealing. The process of maintaining a material such as glass or metal at a specified range of temperature for a specified period of time, also the process of gradually cooling such a material at a predetermined rate. The objective is to remove strains resulting from previous operations, and thereby to eliminate brittleness and to give a tougher, stronger and more enduring material.

annotta. See annatto.

"Ano." ³⁰⁷ Brand name of a line of dyestuffs used for the coloring of anodized aluminum.

anode. The positive terminal of an electrical source to which electrons and negatively charged ions travel. See also cathode.

anode mud. Residue obtained from the bottom of a copper or other plating bath. In the electrolytic refining of copper the anode mud contains the relatively inert metals platinum, silver and gold and is usually collected and treated for the recovery of these metals and other rare elements.

anodizing. The production of a protective oxide film on aluminum or other light metals by passing a high voltage electric current through a bath in which the metal is suspended. The metal serves as the anode. The bath usually contains sulfuric, chromic, or oxalic acid.

anona oil. See ylang-ylang oil.

anorthosite. A rock consisting principally of soda-lime feldspar, with minor quantities of iron-magnesium silicates and other minerals.

Occurrence: Wyoming, Colorado, New York; Labrador.

Use: A possible low grade ore of aluminum, successfully used in pilot plant recovery operations.

"Anozinc." ²⁸⁸ Trademark for chemical compounds and compositions for use in anodizing metals, both in dry form and in the form of aqueous solutions.

ANPO. Abbreviation for alpha-naphthylphenyl-oxazole (q.v.).

"Ansol" M. ¹⁹² Proprietary product. Said to be substantially anhydrous denatured alcohol to which has been added small amounts of ester and hydrocarbons.

Properties: Water-white; flammable. Keep lights and fire away.

Constants: Acidity, free acid as acetic, not more than 0.02%; distillation range, below

70°C, none; below 80°C, not less than 90%; above 90°C, none. Mild, non-residual odor; sp. gr. 0.796-0.800 at 20/20°C; flash point 52°F (approx.); water solubility (25°C) 100 cc solvent dissolves 44 cc water.

Grades: Technical.

Containers: 1-gal cans; 36,000-lb (gross) drum cars; 6,000- and 8,000-gal tank cars.

Uses: Solvent for many resins not soluble in regular alcohol; solvent for alcohol-soluble nitrocellulose; antiblushing agent; substitute for alcohol and (less) high-boiling solvents; airplane dopes; artificial leather dopes; Bakelite cements; celluloid products; celluloid softeners; cleaning compounds; coated paper; lacquers; lacquer thinners; leather dopes; linoleum; nitrocellulose cements; resin solutions; spirit varnishes; textile finishes.

Fire hazard: Flammable - flash point under 80°F.

Shipping regulations: Flammable liquid.

Red label.*

"Ansol" PR. ¹⁹² Proprietary product. Said to be compounded from anhydrous denatured alcohol, esters, and hydrocarbons. It contains a considerably larger percentage of esters than "Ansol" M.

Constants: Flash point 54°F (approx.).

Dilution ratio (nitrocellulose solution method): with toluol 3.7, with petroleum naphtha 1.1. Water solubility (25°C): 100 cc solvent dissolves 61.5 cc water. Mild, nonresidual odor; sp. gr. 0.841-0.846 (20/20°C).

Grades: Technical.

Containers: 1-gal cans; 5-gal drums to 36,000-lb (gross) drum cars; 6,000- and 8,000-gal tank cars.

Uses: Solvent for nitrocellulose and resins; airplane dopes; artificial leather; celluloid; celluloid softener; cleaning fluids; coated transparent paper; coated wall paper; decalcomanias; lacquers; leather dopes; linoleum, nitrocellulose cements; nitrocellulose solution; oilcloth; paint removers; plastic wood; ribbons; spirit varnishes.

Fire hazard: Flammable - flash point under 80°F.

Shipping regulations: Flammable liquid.

Red label.*

"Ansolyzen" Tartrate. ²⁴ Trademark for pentolinium tartrate [pentamethylene-1,5-bis(1'-methylpyrrolidinium bitartrate)]. Use: Medicine.

"Anstac-2M." ²³⁸ Trade name for an anti-static and cleaning agent for plastics, such as methyl methacrylates, vinyls, and polystyrenes.

Containers: 1-qt bottles, 1-, 5-gal drums.

Uses: In aircraft, sign, novelty, electrical, photographic, optical, and other industries.

"Antaron FC-34." ³⁰⁷ Trademark for a high foaming, water soluble, amphoteric surfactant with soap-like qualities; a complex fatty amido compound; 40% active.

Properties: Amber, viscous liquid; soluble in water; aqueous solutions are stable to

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

strong alkalies and acids, hard water and high concentrations of electrolytes.

Uses: Fulfilling agent and detergent for woolen and worsted fabrics, effective under neutral, acid and alkaline conditions; recommended for use in bubble baths, detergents, in soaps for dedusting purposes.

"Antarox G-100,"³⁰⁷ Trademark for a non-ionic surfactant which has cationic properties in acid media and is nonionic in alkaline systems, an alkyl polyoxyethylene glycol amide; 100% active.

Properties: Dark brown, viscous liquid; soluble in water, ethanol, ethylene glycol, insoluble in mineral oil, stable in 10% sulfuric acid; stable to alkali.

Uses: Viscose spin bath additive, preventing accumulation of sludge in pipe lines, reels, etc.; prevents clogging of the spinnerets; in manufacture of cellophane, prevents deposits forming on extrusion slits and rollers which cause surface scratches; in the steel industry, used to obtain cleaner sheets in the final wash of the reduced sheet during the cold reduction process.

antazoline hydrochloride $C_{17}H_{19}N_3 \cdot HCl$.
2-(N-benzylanilinomethyl)-2-imidazoline hydrochloride, or
 $C_6H_5CH_2N(C_6H_5)CH_2C_3H_5N_2 \cdot HCl$.

Properties: White, odorless crystalline powder with bitter taste. M.p. 237-241° (dec). Sparingly soluble in alcohol and water; practically insoluble in benzene and ether.

Use: Medicine.

antazoline phosphate $C_{17}H_{19}N_3 \cdot H_3PO_4$, or
 $C_6H_5CH_2N(C_6H_5)CH_2C_3H_5N_2 \cdot H_3PO_4$.

Properties: White, odorless crystalline powder with bitter taste. M.p. 194-198° (dec). Soluble in water, sparingly soluble in methanol; practically insoluble in benzene and ether, pH (2% solution) about 4.5
Grade: N.F. XI.

Use: Medicine.

"Ant-B-Gon,"²⁵³ Brand name for an ant bait containing sodium arsenite.

"Antepar,"³⁰¹ Trademark for piperazine citrate, an anthelmintic.

anthemidis oil. See chamomile oil, Roman.

anthion. See potassium persulfate.

"Anthomine,"³⁰⁰ Trademark for a dyeing assistant primarily for use in wool dyeing to eliminate tippiness, achieve uniformity, and impart softness and antistatic properties.

anthophyllite $(Mg, Fe)_7Si_8O_{22}(OH)_2$. A natural magnesium-iron silicate, usually occurring in metamorphic rocks, a member of the amphibole group (q. v.).

Properties: Gray to various shades of green or brown. Streak uncolored or gray. Luster vitreous to pearly. Sp. gr. 2.85-3.2; hardness 5.5-6.

Occurrence: North Carolina, New York, Pennsylvania, Massachusetts; Greenland; Norway.

Uses: Asbestos filters and paint filler.

anthracene (anthracin; green oil) $C_{14}H_{10}$.
A tricyclic hydrocarbon.

Properties: Colorless crystals with blue fluorescence. Soluble in alcohol and ether; insoluble in water.

Constants: Sp. gr. 1.25 (27/4°C); m. p. 217°C; b. p. 340°C.

Derivation: (a) By salting out from crude anthracene oil, and draining. The crude salts are purified by pressing and finally, by the use of various solvents, phenanthrene and carbazole are removed; (b) by distilling crude anthracene oil with alkali carbonate in iron retorts, the distillate containing only anthracene and phenanthrene. The latter is removed by carbon disulfide.

Method of purification: By sublimation with superheated steam, or by crystallization from benzene followed by sublimation; for very pure crystals, by zone melting of solid anthracene.

Impurities: Phenanthrene, carbazole and chrysene.

Grades: Commercial (90 to 95%), pure crystals.

Containers: 300-lb bags, 100-, 600-lb drums; casks.

Uses: Dyes, alizarin; phenanthrene; carbazole, anthraquinone; calico printing; also as component of smoke screens; as scintillation counter crystals.

anthracene oil. A coal-tar fraction boiling in the range 270-360°C, used as a source of anthracene and similar aromatics. It is also used as a wood preservative.

anthracin. See anthracene.

anthracite (hard coal) A variety of coal containing 86-98% fixed carbon, and usually with a brilliant luster and conchoidal fracture. It burns with a short blue flame and gives off little smoke or odor.

Occurrence: Pennsylvania, Virginia; U.S.S.R.; Europe; Korea.

Uses: Household fuel; industrial fuel; metallurgy; manufacture of producer gas and water gas.

anthragallic acid. See anthragallol.

anthragallol (1,2,3-trihydroxyanthraquinone, anthragallic acid) $C_{14}H_8(OH)_3O_2$.

Properties: Brown powder. Soluble in alcohol, ether, glacial acetic acid; slightly soluble in water and chloroform.

Constants: Sublimes at 290°C; m. p. 312-313°C.

Derivation: Obtained as a product of the reaction of benzoic, gallic, and sulfuric acids.

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden kegs.

Use: Dyeing.

Shipping regulations: None.*

"Anthragen,"³⁰⁷ Trademark for a line of lake colors. Used for printing inks, wall-paper, coated paper, paint, rubber, and organic plastics.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

"Anthralan." ³⁰⁷ Trademark of proprietary line of acid dyestuffs. Used on wool.

anthralin (1,8,9-anthracinol, 1,8-dihydroxy-anthranol) $C_{14}H_{10}O_3$.

* Properties: Odorless, tasteless, crystalline, yellowish brown powder. M. p. 176-181°C. Filtrate from water suspension is neutral to litmus. Soluble in chloroform, acetone, benzene, and in solutions of alkali hydroxide; slightly soluble in alcohol, ether, and glacial acetic acid; insoluble in water.

Derivation: By catalytic reduction of 1,8-dihydroxyanthraquinone with hydrogen at high pressure.

Grade: U. S. P. XVI (95%).

Use: Medicine.

anthranilamide $C_6H_4CO(NH_2)_2$.

Properties: Tan crystalline powder; m. p. 108°C.

Grade: 98% (min).

anthranilic acid (ortho-aminobenzoic acid) $C_6H_4(NH_2)(CO_2H)$.

Properties: Yellowish crystals; sweetish taste; soluble in hot water, alcohol, and ether.

Constants: M. p. 144-146°C. Sublimes.

Derivation: By the treatment of phthalimide with an alkaline hypobromite solution.

Method of purification: Crystallization.

Grades: Technical (95-98%); 99% or better.

Containers: 10-, 25-lb tins (in cases); 100-, 175-, 225-lb barrels, 50-, 100-, 150-lb drums.

Uses: Manufacture of dyes, drugs, perfumes and pharmaceuticals.

Shipping regulations: None.*

anthranol (9-hydroxyanthracene) $C_{14}H_9OH$.

Properties: Crystals, m. p. 120°C; soluble in organic solvents with a blue fluorescence. Changes in solution to anthrone.

Use: Dyes.

anthranone. See anthrone.

"Anthrapole." ³⁰⁰ Trademark for a group of dye carriers or assistants, for use in dyeing polyester fibers and blends. Active ingredients are aromatic esters, chlorinated hydrocarbons and phenol derivatives. Emulsifying agents are incorporated.

anthrapurpurin (1,2,7-trihydroxyanthraquinone; isopurpurin; purpurin red) $C_{14}H_5O_2(OH)_3$.

Properties: Orange-yellow, crystalline needles. Soluble in alcohol and alkalies, slightly soluble in ether and hot water; very slightly soluble in chloroform and benzene.

Constants: M. p. 369°C; b. p. 462°C.

Derivation: By fusion of anthraquinone-1-sulfonic acid with caustic soda and potassium chlorate; the melt is run into hot water and the anthrapurpurin precipitated by hydrochloric acid.

Grades: Technical; pure.

Containers: Kegs; wooden barrels.

Uses: Dyeing; organic synthesis.

Shipping regulations: None.*

anthraquinone $C_6H_4(CO)_2C_6H_4$.

Properties: Yellow needles. Soluble in alcohol, ether, and acetone; insoluble in water.

Constants: Sp. gr. 1.419-1.438; m. p. 286°C; b. p. 379-381°C; flash point (closed cup) 365°F.

Derivation: (a) By oxidizing anthracene with alkali bichromate, or electrolytically; (b) heating phthalic anhydride and benzene in the presence of aluminum chloride and dehydrating the product; (c) by direct oxidation of naphthalene in a fixed bed catalytic converter.

Method of purification: Sublimation.

Grades: Sublimed; 30% paste (sold on 100% basis), electrical, 99.5%.

Containers: Bags; drums.

Uses: Intermediate for dyes and organics; organic inhibitor; bird repellent for seeds.

Shipping regulations: None.*

anthraquinone-1,5-and-1,8-disulfonic acids

(rho acid, chi acid respectively) $C_{14}H_6O_8S_2$.

Properties: In their pure state, trace yellow to white. The technical variety is grayish-white. Soluble in water and strong sulfuric acid. The 1,8-isomer is much more soluble than the 1,5-isomer.

Constants: The 1,5-disulfonic acid melts with decomposition at 310-311°C. The 1,8-isomeric form melts with decomposition at 293-294°C.

Derivation: Anthraquinone is sulfonated with strong oleum in the presence of mercury or mercuric oxide to a mixture of the 1,5- and 1,8-disulfonic acids which are separated by fractional crystallization.

Method of purification: Fractional crystallization from strong sulfuric acid or in form of their alkali salts from either acid or alkaline solutions.

Grades: Technical.

Containers: Wooden barrels.

Use: Dyes.

Shipping regulations: None.*

anthraquinone dyes. Dyes whose molecular structure is based on anthraquinone ($C_6H_4(CO)_2C_6H_4$). The chromophore groups are $>C=O$ and $>C=C<$; the benzene ring structure is important in the development of color. Color index numbers range from 1027 to 1175. These dyes are acid or mordant dyes respectively when OH or HSO_3 groups are present. Those anthraquinone dyes that can be reduced to an alkaline soluble leuco (vat) derivative that has affinity for fibers, and which can be reoxidized to the dye, are known as anthraquinone vat dyes. They are largely used on cotton, rayon, and silk, and have excellent properties of color and fastness.

anthraquinone-2-sodium sulfonate (silver salt) $C_{14}H_7O_2SO_3Na \cdot H_2O$.

Properties: Silvery leaflets. Soluble in water; insoluble in alcohol and ether.

Derivation: From anthraquinone by sulfonating with an equal weight of 45-50% oleum and heating up to 160°C, diluting, neutralizing with caustic soda and evapora-

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ting to crystallization.

Method of purification: Crystallization from water.

Grades: Technical.

Containers: Wooden barrels.

Use: Dyes.

Shipping regulations: None.*

anthraquinonic acid. See alizarin.

anthrarobin (leuco-alizarin, 3,4-dihydroxy-anthranol; deoxylizarin) $C_{14}H_{10}O_3$.

Properties: Yellowish-brown to dark brown crystals; m. p. 208°; soluble in alcohol, chloroform and ether; slightly soluble in water.

Derivation: Reduction of alizarin with ammonia and zinc dust.

Uses: Medicine; substitute for chysarobin.

anthrarufin. See 1,5-dihydroxyanthraquinone.

anthrasol (colorless coal-tar). Thin, mobile, light yellow oil obtained from pitch by distillation and from coal tar by freeing it from bases by acid treatment.

1,8,9-anthratrilol. See anthralin.

anthraxylon. A constituent of coal, which originated from lignin and woody tissue. It is associated with the vitrain structure.

anthrone (anthranone; 9,10-dihydro-9-oxo-anthracene) $C_{14}H_{10}O$. The keto, more stable form of anthranol.

Properties: Colorless needles; m. p. 156°C; insoluble in water; soluble in alcohol, benzene, and hot sodium hydroxide.

Derivation: Reduction of anthraquinone with tin and hydrochloric acid.

Use: Rapid determination of sugar in body fluids, and of animal starch in liver tissue; general reagent for carbohydrates; organic synthesis.

antibiotic. A chemical substance produced by microorganisms that has the capacity, in dilute solutions, to inhibit the growth of other microorganisms or destroy them. Vuillemin, in 1889, first defined the words, antibiosis and antibiotic, as pertaining to the injurious effects of one organism upon another. These effects were later found to be due largely to the production of specific chemical substances. In 1942, Waksman designated these substances as antibiotics.

Antibiotics are produced by aerobic spore-forming (tyrothricin, bacitracin, polymyxin) and non-spore-forming bacteria (pyocyanase), by filamentous fungi (penicillin) and higher or mushroom fungi (polyporin, clitocybin) and by actinomycetes (actinomycin, streptomycin, chloramphenicol, tetracyclines). Antibiotic-like substances are produced by higher plants (quinine, emetine, tomatin) and animals (lysozyme).

More than 500 antibiotics are now known. Only about 20 of these have found extensive application in the treatment of infectious diseases in man and animals. Since the discovery of penicillin, the most important new antibiotics were found to be produced

by actinomycetes. The manufacture of antibiotics has now grown to a great pharmaceutical industry, sales amounting to more than a billion dollars annually in the United States alone.

The antibiotics differ greatly in their physical properties, chemical composition, antimicrobial activities (antibiotic spectrum), toxicity and usefulness as therapeutic agents. Some are active only upon bacteria, others upon fungi, still others upon bacteria and fungi; some are active on viruses, some on protozoa, and some are also active on neoplasms.

Antibiotics can now alleviate most bacterial infections. They are finding extensive applications in veterinary medicine and in the treatment of certain bacterial and fungus diseases of plants (fire blights of fruit trees and blights of beans, tomatoes, peppers, and tobacco). Antibiotics also possess certain growth-promoting properties and are being used extensively in the feeding of nonherbivorous animals. They also find application in the preservation of biological materials (bull semen, virus preparations).

antichlor. A term used in the bleaching, dyeing and wood pulp industries to designate any product which serves to neutralize and remove hypochlorite or free chlorine after the bleaching operations. For many years the trade considered the term as synonymous with sodium thiosulfate, but it may equally be applied to sodium disulfite or any other product used for the purpose.

anticoagulin. An inhibitor of the power of blood to coagulate.

anti-diuretic hormone. See vasopressin.

antienzyme. A substance present in the substrate which restricts or negates the catalytic activity of the enzyme on that substrate.

antifebrin. See acetanilide.

"Antifoam A." ¹⁴⁹ Trademark for a silicone defoamer used to prevent or suppress foams in a wide variety of aqueous and nonaqueous systems. Generally effective at concentrations in the range of 1 to 200 ppm. Physiologically harmless, it is permissible in food processing up to 10 parts per million. Also available as a water-dilutable emulsion.

anti-foam agents. See defoaming agents.

"Antifoams 60, 66 and SF-96." ²⁴⁵ Trade names for silicone emulsions and fluids designed for the prevention or suppression of foam in aqueous and nonaqueous systems.

Uses: "Antifoam 60" is recommended for use in aqueous systems and makes possible the increases of capacity in kettles by its anti-foaming action. Used in adhesive manufacture, pulp and paper manufacture and coating, textile finishing, fermentation processes and metal reclaiming. "Antifoam 66" is used in non-aqueous systems to eliminate foaming in cooking of phenolic

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

resins, antibiotic fermentation, resin polymerization, esterification of vegetable oils, and the manufacture of paints and printing inks. "Antifoam SF-96" is used for defoaming of high-detergency motor oils, petroleum crudes, and other applications where the presence of silica is objectionable.

"Antifoams" C-1 and HP. ¹⁰⁰ C-1 is a light-colored, water soluble liquid; HP a dry, powdered, water dispersible blend containing organic dispersing agents and sodium sulfite.

Containers: C-1: 5-gal cans and 55-gal drums. HP: 60 and 180-lb net wt fiber drums.

Uses: Foaming and carryover control in steam boilers. Improves steam purity; disperses sludge; minimizes blowdown.

"Anti-Fume S Solution." ²⁸ A durable protective agent for inhibiting the fading of dyed acetate by atmospheric gases.

antiglobulin. An agent used to coagulate globulin.

antigorite. A variety of serpentine asbestos characterized by thin lamellar or plate-like structure.

antihistamines. Synthetic substances whose presence in minute amounts prevents or counteracts the action of excess histamine formed in body tissues as the result of allergic reactions, or of other circumstances. These compounds are usually complex amines of various types, and also have other physiological effects and medical uses. For examples, see chlorpheniramine maleate, dimenhydrinate, diphenhydramine hydrochloride, pheniramine maleate, pyrilamine maleate, thonzylamine hydrochloride, tripeleminamine hydrochloride.

antiknock compounds. Substances added to gasoline to prevent explosive combustion in the engine (knocking). The most familiar and widely used of these is tetraethyl lead, $Pb(C_2H_5)_4$. The term antiknock compound is sometimes incorrectly used as though restricted to this one compound or to closely similar compounds.

antiknock gasoline. Gasoline having a high knock rating (octane number, q. v.) due to presence of tetraethyl lead, benzene, or branched chain hydrocarbons.

"Antilac." ¹⁶⁵ Trademark for liquid antimony lactate containing 15% available antimony oxide. Completely soluble in cold water. Recommended as a replacement for technical tartar emetic. See also "Mordantine."

antimatter. See antiparticle.

antimetabolites. Substances structurally analogous to essential metabolites (any such as nucleic acid, proteins, enzymes, etc., essential to the synthesis of new cell substance in a plant or animal organism) which interfere with or prevent growth of

an organism, or simply cause it to starve. The sulfa drugs and antibiotics probably work in this way.

antimonial glass. See antimony glass.

antimonial lead alloys (hard lead). Lead containing from about 6 to 28% antimony. Common grades are as follows: (a) 15% antimony; resistant to sulfuric acid; used in type metal; (b) national stock pile specification; 10.7-11.3% antimony; (c) battery grids; 5-11% antimony; (d) battery terminals; 4% antimony; (e) cable sheaths; 1% antimony.

antimonic. The variation of the name antimony used for compounds in which the antimony has a valence of five, as antimony pentachloride, pentasulfide, etc.

antimonic acid. See antimony pentoxide.

antimonic anhydride. See antimony pentoxide.

antimonine. See antimony lactate.

antimonite. See stibnite.

antimonious. See antimonous.

antimonous (antimonious). The variation of the name antimony used for compounds in which the antimony has a valence of three, as in antimony tribromide, antimony trichloride, antimony trioxide, antimony trisulfide

antimony Sb. Element of atomic number 51 of group V of the periodic system. The symbol Sb comes from the Latin name stibium. Under the name regulus of antimony or antimony regulus, it was one of the earliest known elements. Two forms are known, the ordinary stable metallic form (beta), and an unstable yellow variety (alpha), which can be obtained during the electrolysis of antimony trichloride. As the alpha antimony is deposited on the electrode, it forms a solid solution in the antimony chloride. When this solution is scratched or heated, metallic antimony and clouds of antimony chloride form instantaneously, giving rise to the designation "explosive antimony."

Properties (beta or stable metallic form):

Silver white, lustrous, hard, brittle metal. Sp. gr. 6.68, m.p. 630°C; b.p. 1380°C, hardness 3-3.5. Soluble in hot concentrated sulfuric acid. Insoluble in dilute acids.

Not acted upon by air at room temperature.

Ores: Stibnite, antimony ochre, valentinite, livingstonite, and jamesonite are most common. Mexico, Bolivia, Yugoslavia, China, Algeria, and South Africa are major producers.

Derivation: Roasting stibnite in air to remove sulfur and obtain the oxide. This is then mixed with carbon and heated. U. S. production includes much antimony recovered as a by-product from antimony-bearing lead and silver ores.

Grades: Technical; lump; ground; powdered. Purity usually 99.0-99.9%; high purity (impurities less than 10 ppm).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Containers:** 224-lb cases; 55-lb bars or pigs.
- Uses:** For hardening lead, particularly in lead storage batteries and cable sheaths; bearing metal, type metal, pewter, Britannia metal, and in making antimony compounds.
- See also antimony black.
- antimony 124.** Radioactive antimony of mass number 124.
- Properties:** Half-life, 60 days; radiation, beta and gamma.
- Uses:** As a tracer (q. v.) especially in solid state studies, and marker of interfaces between products in pipe lines; the gamma ray has the proper energy to eject neutrons from beryllium. Convenient portable neutron sources, which may be reactivated in a nuclear reactor, are made by such an irradiation of an antimony pellet encased in a beryllium shell.
- Shipping regulations:** Class D poison, radioactive material. Red label.*
- antimony arsenate.**
- Properties:** Heavy, white powder. Poisonous! Insoluble in alcohol, water.
- Derivation:** By precipitating a solution of tartar emetic with arsenic. Consists approximately of 40% Sb_2O_3 , 20% As_2O_3 and H_2O .
- Grades:** Technical.
- Use:** Medicine.
- Shipping regulations:** Poison, Class B. Poison label.*
- antimony arsenite.**
- Properties:** Fine, white powder. Insoluble in alcohol, water or dilute acids. Soluble in solutions of alkali hydroxides. Poisonous!
- Derivation:** Mixture of equal parts of arsenic trioxide and antimony trioxide.
- Grades:** Technical.
- Use:** Medicine.
- Shipping regulations:** Poison, Class B. Poison label.*
- antimony black.** Metallic antimony in the form of a fine powder produced by electrolysis or chemical action on an antimony salt solution. Used as a bronzing pigment for metals and plaster casts. The term antimony black is also used to refer to antimony sulfide.
- antimony bloom.** See antimony trioxide.
- antimony blue.** See antimony yellow.
- antimony bromide.** See antimony tribromide.
- antimony, butter.** See antimony trichloride.
- antimony, caustic.** See antimony trichloride.
- antimony chloride.** See antimony trichloride.
- antimony chloride, basic.** See antimony oxychloride.
- antimony fluoride.** See antimony trifluoride.
- antimony glance.** See stibnite.
- antimony glass** (vitreous antimony; antimonial glass). A vitrified product of variable composition obtained by partial roasting and subsequent fusion of antimony trisulfide. Transparent dark ruby-red mass.
- Use:** For tinting glass and porcelain yellow. Now seldom used.
- antimony gray.** See stibnite.
- antimony iodide.** See antimony triiodide.
- antimonyl.** The radical or group SbO , which occurs commonly in formulas of antimony compounds. Thus, SbOCl is often named antimonyl chloride, and numerous other antimony compounds are sometimes named in a similar manner.
- antimony lactate** (antimonine) $\text{Sb}(\text{C}_3\text{H}_5\text{O}_3)_3$.
- Properties:** Tan-colored mass. Soluble in water.
- Derivation:** By the interaction of antimony hydroxide and lactic acid.
- Grades:** Technical.
- Containers:** 500-lb barrels.
- Uses:** Mordant; textile industry.
- Shipping regulations:** None.*
- antimonyl chloride.** See antimony oxychloride.
- antimony needles.** See antimony trisulfide.
- antimony orange.** See antimony trisulfide.
- antimony oxide.** See antimony trioxide.
- antimony oxychloride** (algaroth powder; antimony chloride, basic; antimonyl chloride) SbOCl .
- Properties:** White crystalline powder; m. p. 170°C (decomposes); soluble in hydrochloric acid and alkali tartrate solutions; insoluble in alcohol, ether, and water.
- Derivation:** By the interaction of water and antimony chloride.
- Method of purification:** Crystallization.
- Grades:** Technical; C. P.
- Containers:** Wooden kegs.
- Uses:** Antimony salts; smoke-producing substance; medicine; flame proofing textiles.
- Shipping regulations:** None.*
- antimony pentachloride** (antimony perchloride) SbCl_5 .
- Properties:** Reddish-yellow, oily liquid. Offensive odor. Hygroscopic. Caustic! Fumes in moist air. Solidifies by absorption of moisture. Decomposed by excess water into hydrochloric acid and antimony pentoxide. Soluble in an aqueous solution of tartaric acid, in hydrochloric acid, and chloroform.
- Constants:** M. p. 2.8°C ; sp. gr. 2.34; b. p. 92°C (30 mm).
- Derivation:** Action of chlorine on antimony powder.
- Containers:** 15-gal drums.
- Uses:** Analysis (testing for alkaloids and cesium); dyeing; intermediates; as chlorine carrier in organic chlorinations.
- Shipping regulations:** Corrosive liquid. White label.*
- antimony pentafluoride** SbF_5 .
- Properties:** Liquid; sp. gr. 2.99 (23°C);

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

m. p. 7°C; b. p. 149.5°C; hydrolyzed by water; soluble in potassium fluoride.

Derivation: Antimony pentachloride and anhydrous hydrogen fluoride.

Use: Catalyst and/or source of fluorine in fluorination reactions.

Shipping regulations: Corrosive liquid. White label.*

antimony pentasulfide (antimony red; antimony persulfide; antimony sulfide golden) Sb_2S_5 . Properties: Orange yellow powder; odorless; insoluble in water; soluble in concentrated HCl with evolution of hydrogen sulfide; soluble in alkali.

Uses: Red pigment for oil or water color; vulcanizing and coloring rubber.

antimony pentoxide (antimonic anhydride; antimonic acid; stibic anhydride) Sb_2O_5 . Properties: White or yellowish powder; sp. gr. 5.6; m. p. 450°C; loses oxygen above 300°C; insoluble in water; soluble in strong bases forming antimonates; insoluble in acids except concentrated hydrochloric.

Derivation: Action of concentrated nitric acid on the metal or the trioxide.

Use: Preparation of antimonates and other antimony compounds.

antimony perchloride. See antimony pentachloride.

antimony persulfide. See antimony pentasulfide.

antimony pigment (white). See antimony white.

antimony potassium tartrate (tartar emetic; potassium antimonyl tartrate; tartarated antimony) $\text{K}(\text{SbO})\text{C}_4\text{H}_4\text{O}_6 \cdot \frac{1}{2} \text{H}_2\text{O}$.

Properties: Transparent, odorless crystals, efflorescing on exposure to air, or white powder; sweetish, metallic taste, poisonous! Sp. gr. 2.6; at 100°C loses all its water. Soluble in water, glycerol; insoluble in alcohol. Aqueous solution is slightly acid.

Derivation: By heating antimony trioxide with a solution of potassium bitartrate and subsequent crystallization.

Grades: Technical; crystals; powdered. C. P.; U. S. P. XVI.

Containers: 25-, 50-, 100-, 250-lb drums; 425-, 625-lb barrels.

Warning! May be fatal if swallowed. MCA warning label.

Uses: Textile and leather mordant; medicine (emetic); perfumery; insecticide.

Shipping regulations: None.*

antimony red. See antimony pentasulfide.

antimony regulus. See antimony.

antimony salt (deHaens salt). Mixture of antimony trifluoride and either sodium fluoride or ammonium sulfate.

Properties: White crystals; soluble in water; poisonous!

Grades: Technical; crystalline.

Use: Dyeing and printing textiles.

antimony sodiate.

See sodium antimonate.

antimony sodium tartrate (sodium antimonyl tartrate) $\text{Na}(\text{SbO})\text{C}_4\text{H}_4\text{O}_6$.

Properties: Hygroscopic white crystals or powder; sweet taste. Soluble in water; insoluble in alcohol.

Derivation: By interaction of antimony trioxide and sodium acid tartrate.

Use: Medicine (emetic).

antimony sodium thioglycollate

$\text{C}_4\text{H}_4\text{O}_4\text{NaS}_2\text{Sb}$.

Properties: White or pink powder; odorless or with a faint mercaptan odor; freely soluble in water; insoluble in alcohol.

Grades: Technical.

Use: Medicine.

antimony sulfate (antimony trisulfate)

$\text{Sb}_2(\text{SO}_4)_3$.

Properties: White powder or lumps. Deliquescent. Poisonous! Decomposes in water. Sp. gr. 3.62 (4°C).

Derivation: By the action of sulfuric acid on antimony trioxide and subsequent crystallization.

Grades: C. P.; technical.

Use: Explosives.

antimony sulfide. See antimony trisulfide and antimony pentasulfide.

antimony sulfide golden. See antimony pentasulfide.

antimony sulfuret. See antimony trisulfide.

antimony tribromide (antimony bromide)

SbBr_3 .

Properties: Yellow, deliquescent, crystalline mass. Poisonous! Soluble in carbon disulfide, hydrobromic acid, hydrochloric acid, ammonia. Decomposed by water.

Constants: Sp. gr. 4.148; m. p. 96.6°C; b. p. 280°C.

Grades: Technical.

Containers: Glass bottles.

Uses: Analytical chemistry; mordant; staining iron and copper articles; manufacturing antimony salts.

antimony trichloride (antimonous chloride;

antimony chloride; butter of antimony; caustic antimony; mineral butter) SbCl_3 .

Properties: Colorless, transparent, crystalline mass. Very hygroscopic. Fumes slightly in air. Corrosive! Soluble in alcohol, benzene, carbon disulfide, chloroform, ether, acetone, acids; with water forms antimony oxychloride. Butter of antimony is a clear strongly caustic liquid with an acid reaction. Poisonous!

Constants: Sp. gr. 3.14; b. p. 223.5°C; m. p. 73.2°C.

Derivation: By the interaction of chlorine and antimony or by dissolving antimony sulfide in hydrochloric acid.

Grades: Technical; C. P.

Containers: Crystals: bottles; pails. Liquid: bottles; jugs; demijohns; carboys.

Uses: Antimony salts; bronzing iron; mordant; manufacturing lakes; coloring zinc black; catalyst in organic synthesis; pharmaceuticals (drug, manufacture of

*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

tartar emetic); fireproofing textiles.
Danger! Causes severe burns; vapor hazardous. MCA warning label.

antimony trifluoride (antimony fluoride)
 SbF_3 .

Properties: White to gray crystals, hygroscopic. M.p. 292°C ; sp. gr. 4.58; soluble in water. **Poisonous!**

Uses: Porcelain; pottery; dyeing.

antimony triiodide (antimony iodide) SbI_3 .

Properties: Red crystals. Volatile at high temperatures. Decomposed by water. **Poisonous!** Soluble in carbon disulfide, hydrochloric acid, and solution of potassium iodide; insoluble in alcohol and chloroform, decomposes in water with precipitation of oxyiodide.

Constants: Sp. gr. 4.768; m.p. 167°C ; b.p. 401°C .

Derivation: Action of iodine on antimony.

Use: Medicine.

antimony trioxide (antimony white; flowers of antimony; antimony bloom) Sb_2O_3 .

Properties: White, odorless, crystalline powder. Sp. gr. 5.67; m.p. 655°C . Insoluble in water; soluble in concentrated hydrochloric and sulfuric acids, strong alkalis; amphoteric.

Derivation: Burning antimony in air; adding ammonium hydroxide to antimony chloride; acidifying a solution of an antimonite.

Grades: Technical; C.P.

Containers: 50-, 100-lb bags; 500-lb barrels.

Uses: Opacifying white enamels; flameproofing and flame-retardant for textiles, tentage, paper, plastics and paints; paint pigments; glass manufacture; infrared transparent glass; mordant; medicine.

antimony trisulfate. See antimony sulfate.

antimony trisulfide (sulfuret of antimony; antimony orange; black antimony; antimony needles; antimony sulfide) Sb_2S_3 .

Properties: (a) Black crystals; (b) orange-red crystals. Insoluble in water; soluble in concentrated hydrochloric acid, and sulfide solutions.

Constants: Sp. gr. 4.562; m.p. 546°C .

Derivation: (a) Occurs in nature as black crystalline stibnite (q.v.). (b) As precipitated from solutions of salts of antimony, the trisulfide is an orange-red precipitate, which is filtered, dried and ground. See also antimony vermilion.

Grades: Technical.

Containers: 250-, 350-, 500-lb barrels; bags.

Uses: Pigment; antimony salts; pyrotechnics; matches; percussion pellets for cartridges; ruby glass; refining gold from silver and copper; metallic antimony; veterinary surgery; rubber pigment; fireproofing fabrics and paper.

Shipping regulations: None.*

antimony vermilion. A red trisulfide of antimony formed by the action of hydrogen sulfide on an antimony salt solution. Used as a pigment.

antimony violet. See antimony yellow.

antimony white (antimony pigment, white). A durable paint pigment especially valuable as a flame retardant. Formed in flues and dust chambers of antimony roasting furnaces. It is antimony trioxide.

antimony yellow.

1. A pigment produced by slow oxidation of antimony sulfide. Various shades, (as antimony blue, antimony violet) are obtained by admixture of metal oxides or other mineral compounds.

2. Synonym for lead antimonate.

antimycin A ($\text{C}_{25}\text{H}_{40}\text{O}_9\text{N}_2$). An antibiotic substance said to have strong fungicidal properties.

Properties: Crystals. M.p. $139-140^\circ\text{C}$; soluble in alcohol, ether, acetone, and chloroform; slightly soluble in benzene, carbon tetrachloride, and petroleum ether; insoluble in water.

Derivation: From *Streptomyces*.

Use: Active against a large group of fungi, but in general not against bacteria; suggested as insecticide and miticide.

antioxidant. Any of a class of compounds added to vulcanized rubber, gasoline, natural fats and oils, soaps, and other substances to retard oxidation, deterioration, and rancidity. Rubber antioxidants are commonly of an aromatic amine type, such as di-beta-naphthyl-para-phenylenediamine and phenyl-beta-naphthylamine, and are added in quantities approximately 1%. Many of the antioxidants used in food products, petroleum oils, as well as rubber, are substituted phenolic compounds. Some examples are: butylated hydroxyanisole, di-tert-butyl-para-cresol, and propyl gallate. Food antioxidants are effective in very low concentrations (not more than 0.01% in animal fats) and not only retard rancidity but protect the nutritional value by minimizing the breakdown of vitamins and essential fatty acids. Sequestering agents, such as citric and phosphoric acids, are frequently employed in antioxidant mixtures to nullify the harmful effect of traces of metallic impurities.

"Antioxidant No. 29."²⁸ Di-tert-butyl-para-cresol. A colorless to pale yellow crystalline solid or finely divided solid. Bulk density, untapped, 0.61 g/cc; sp. gr. 1.04. **Containers:** 100-lb fiber drums.

Uses: To retard gum formation and TEL precipitation in motor and aviation gasolines and to inhibit the oxidation of turbine and electrical oils. Soluble in most gasolines at concentrations up to 40%. Concentration required 5 to 40 lbs/1000 bbls.

"Antioxidant 425."⁵⁷ A proprietary name for 2,2'-methylene-bis(4-ethyl-6-tertiary-butylphenol). A powerful antioxidant for use in white and light colored rubber products where no discoloration or staining can be tolerated.

"Antioxidant 2246."⁵⁷ Brand name for 2,2'-methylenebis (4-methyl-6-tert-butyl-

* See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

phenol).

Properties: Colorless, crystalline solid; m. p. 131.2°C; sp. gr. 1.074 (30°C); soluble in acetone, benzene, chloroform, dioxane, ethanol, ethyl acetate. Insoluble in water.

Uses: Oxidation inhibitor for use in rubber, polyethylene, waxes, etc. Polymerization inhibitor in chemical processes.

"Antioxidant B." ²⁴³ Trade name for a proprietary antioxidant and antiskinning agent.

Properties: Water-white to pale straw liquid, containing 100% active ingredient; sp. gr. 0.921; flash point 69°C, Cleveland open cup; slight odor.

Containers: 15- and 55-gal specially lined drums.

Uses: Antiskinning agent for paint, enamel, varnish, pigment dispersions, ink, baking finishes, and hot dip and hot spray compositions.

"Antioxidant D." ²⁴³ Trade name for a proprietary antioxidant and antiskinning agent.

Properties: Off-white powder containing 4.7% inert material to impart free flowing properties; melting point (dried) 86°C; flash point 234°F; slight odor; soluble to various degrees in V.M.&P. naphtha, turpentine, toluene, mineral spirits, tung oil, and linseed oil.

Containers: 10-, 100- and 250-lb drums.

Uses: Antiskinning agent for paint, enamel, varnish, pigment dispersions, ink, baking finishes, and hot dip and hot spray compositions.

antiozidants. See antiozonants.

antiozonants (antiozidants). Substances used to reverse or prevent the severe oxidizing action of ozone. Their most common use is to prevent the harmful action of the ozone in the air on rubbers, both natural and synthetic. Among antiozonant materials used are petroleum waxes, both amorphous and microcrystalline, secondary aromatic amines such as N,N-diphenylpara-phenylenediamine, quinoline, and furane derivatives.

antiparticle (antimatter). Modern theories of physics, particularly the symmetry laws, assume that for each kind of particle of which matter is made an antiparticle exists. This idea is of most importance in relation to fundamental particles (q. v.). The most important property of the antiparticle is that it will, on collision with its symmetric particle, be annihilated along with its partner and give rise to radiant energy. If a given particle has electromagnetic properties such as charge and magnetic moment, the antiparticle has the same magnitudes of these properties, but reversed in sign. The antiparticle always has the same mass as its symmetry partner, but the two will differ in the kinds and probabilities of the reactions they can undergo.

antipyonin. Neutral sodium tetraborate, used

medicinally.

antipyrrine (phenazone; phenyldimethylisopyrazolone). $C_{11}H_{12}N_2O$.

Properties: Colorless crystals; fine white crystalline powder; odorless; slightly bitter taste; sp. gr. 1.19; m. p. 110-113°C; b. p. 319°C; soluble in water, alcohol, and chloroform, slightly soluble in ether.

Derivation: By the condensation of methyl-

phenylhydrazine and ethyl acetoacetate.

Method of purification: Crystallization.

Grades: Technical; N. F. XI.

Containers: 25-, 100-, 200-, 250-lb drums; barrels.

Uses: Medicine; an analytical reagent for nitrous acid, nitric acid, and iodine number.

Shipping regulations: None. *

antipyrrine acetylsalicylate $C_{11}H_{12}N_2OC_6H_4(COOH)COCH_3$. Not to be confused with antipyrrine salicylate.

Properties: White crystalline powder; acetous odor. Soluble in alcohol and warm water; sparingly soluble in cold water.

Constants: M. p. 63-65°C.

Derivation: Combination of antipyrrine and acetylsalicylic acid.

Use: Medicine.

Shipping regulations: None. *

antipyrrine amygdalate. See antipyrrine mandelate.

antipyrrine chloral hydrate. See chloral hydrate antipyrrine.

antipyrrine mandelate (antipyrrine amygdalate) $C_{11}H_{12}N_2OC_6H_5CHOHCOOH$.

Properties: White powder. Soluble in water, alcohol, and ether.

Constants: Fusing point 52-53°C.

Use: Medicine.

antipyrrine salicylate

$C_{11}H_{12}N_2O \cdot C_6H_4(COOH)OCH_2COOH$.

Antipyrrine ortho-(carboxymethoxy) benzoate. Not to be confused with antipyrrine acetylsalicylate.

Properties: Crystals with bitter, acid taste. M. p. 149-150°C; soluble in alcohol; slightly soluble in water.

Derivation: An equimolar mixture of antipyrrine and ortho-(carboxymethoxy)benzoic acid.

Use: Medicine.

antipyrrine salicylate $C_{11}H_{12}N_2O \cdot C_6H_4COOH(OH)$.

Properties: White, coarse, crystalline powder, odorless, tasteless, sometimes causes vomiting. Soluble in alcohol and benzene.

Constants: M. p. 91.5°C.

Derivation: By the action of salicylic acid upon antipyrrine, either at 100°C or in solution.

Containers: Drums; barrels.

Use: Medicine.

Shipping regulations: None. *

antiseptics. Substances applied to humans or animals which inhibit or stop the growth of microorganisms without necessarily destroying them. Such substances may

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

also often be used as disinfectants, which are applied to inanimate objects, but concentrations and other conditions are different. Some substances, commonly used as antiseptics are: alcohol; boric acid and borates; certain dyes, as acriflavine; certain essential oil derivatives, as menthol; hydrogen peroxide; hypochlorites; iodine; mercuric chloride; and phenol. Many of these are corrosive and poisonous and should be used with great caution. Among the newer antiseptics are hexachlorophene and some quaternary ammonium compounds.

See also disinfectants; sanitizers.

antistatic agents. Materials which reduce static electrical charges on textiles, wax polishes, resins, and paper products. Such charges are often built up by friction and cause difficulty in handling as well as creating a fire hazard. The antistat allows the charge to leak off, usually by retaining enough moisture to provide good electrical conduction by way of molecularly held water. Most textile antistats are non-durable (will wash out), but durable agents are available. The field is largely given over to trademarked items. High molecular weight fatty alcohols and medium-sized polymers have been mentioned.

"**Antistine.**" ³⁰⁵ Trademark for antazoline, an antihistaminic drug. Available as the hydrochloride or phosphate.

"**Antivert.**" ²⁹⁹ Trademark for a combination drug containing meclizine hydrochloride and nicotinic acid; used in medicine.

antlerite $\text{Cu}_3(\text{OH})_4\text{SO}_4$. A natural basic sulfate of copper. Found in the oxidized portions of copper deposits.

Properties: Color green, hardness 3.5-4, sp. gr. 3.9; luster vitreous.

Occurrence: Chile.

Use: An ore of copper.

ant oil, artificial. See furfural.

"**Antox.**" ²⁸ Trademark for rubber antioxidant made from condensation product of butyraldehyde-aniline.

Properties: Amber liquid.

Containers: Drums (275 lbs net).

Use: To improve the aging and service life of rubber and synthetic rubber.

"**Antrenyl.**" ³⁰⁵ Trademark for oxyphenonium bromide (q. v.).

"**Antron.**" ²⁸ Trademark for a trilobal multifilament nylon for textile fibers in the form of continuous filament yarns.

"**Antrycide.**" ²⁰⁷ Trademark for quinapyramine sulfate [4-amino-6-(2'-amino-6'-methyl-4'-pyrimidylamino)-2-methylquinoline 1,1'-dimetho(methylsulfate)]. White crystalline powder for veterinary medicine.

"**Antrypol.**" ²⁰⁷ Trademark for suramin (the symmetrical urea of the sodium salt of meta-benzoyl-meta-amino-para-methyl-

benzoyl-1-aminonaphthalene-4,6,8-trisulfonic acid.

Use: Medicine.

ants, artificial oil of. See furfural.

ANTU. Abbreviation for alpha-naphthylthiourea.

Antwerp blue. Applied loosely to any of a number of varieties of iron blue pigments, usually containing considerable extender such as alumina.

AP. Abbreviation for ammonium perchlorate.

"**AP 30.**" ²³³ Trademark for an anionic flocculant.

APAP. Abbreviation for acetyl-para-aminophenol. See para-acetylaminophenol.

"**Asapol W-1345.**" ⁷⁸ Trademark for a completely sulfonated ester of a high molecular weight alcohol.

Properties: Clear oil, soluble in water, having penetrating, suspending, leveling, and softening properties.

Uses: Textile operations, such as desizing, kier boiling, pasting dyestuffs, dyeing, soaping, dispersion of acetate printing colors, etc.

apatite $\text{Ca}_5(\text{F}, \text{Cl}, \text{OH})(\text{PO}_4)_3$. A natural calcium phosphate usually containing fluorine; sometimes with chlorine, hydroxyl, or carbonate substituting for part or all of the fluorine. The corresponding minerals are known as fluorapatite, chlorapatite, hydroxyapatite, carbapatite. May contain magnesium, manganese, or iron. Collophanite is a finely divided crystalline variety which makes up the bulk of phosphate rock.

Properties: Color variable; sp. gr. 3.1-3.2; hardness 5, luster vitreous to greasy; frequently in hexagonal crystals.

Occurrence: Maine, New Hampshire, Virginia, Massachusetts, New York, Connecticut, Pennsylvania, New Jersey, North Carolina, California; U.S.S.R.; Canada, Europe.

Uses. Source of phosphorus and phosphoric acid, manufacture of fertilizers; gems.

APC. Abbreviation for ammonium perchlorate.

"**APCO.**" ²⁰⁰ Trademark for a series of petroleum solvents including "Petrolene," "Troluol," mineral spirits, etc., as well as the following:

"Deodorized APCO 125":

Properties: Water-white; initial boiling point 326°F, 95% distills at 395°F; sp. gr. 0.774 (60°F); flash point (TCC) 118°F; neutral odor, nonresidual.

Uses: In odorless brushing enamels; fly spray and polish manufacture; some dry cleaning units; and in degreasing, extraction and cleaning operations.

"APCO 140":

Properties: Water-white; initial boiling point 363°F, 95% distills at 403°F; sp. gr. 0.795 (60°F); flash point (TCC) 140°F; mild, nonresidual odor.

Use: In dry cleaning industry.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- "Deodorized APCO 140":
 Properties: Water-white; neutral odor; boiling range 366-405°F; sp. gr. 0.781 (60°F); wt/gal 6.50 lbs (60°F); flash point 140°F.
 Containers: Drums; tank cars; tank wagons.
 Uses: Dry cleaning solvent; thinner for low odor brushing enamels.
- "APCO 360":
 Properties: Water-white; boiling range 310-353°F; sp. gr. 0.779 (60°F); wt/gal 6.49 lbs (60°F); flash point 102°F.
 Containers: Drums; tank cars; tank wagons.
 Uses: Paint, varnish and enamel thinner; metal cleaning and degreasing.
- "APCO 467":
 Properties: Water-white; initial boiling point 410°F; 95% distills at 465-470°F; sp. gr. 0.809 (60°F); flash point (TCC) 175°F; mild nonresidual odor.
 Uses: In flat wall paint, polish; insecticides, degreasing operations; and as a coolant in milling magnesium and other metals.
- "Deodorized APCO 467":
 Properties: Approximately the same as "APCO 467" except for the neutral odor.
 Uses: In paint; varnish, insecticides, polishes; cleaners, and inks.
- "Apco Wood Treating and Weed Treating Solvent":
 Trade name for a petroleum distillate.
 Properties: Straw color; boiling range 425-635°F; wt/gal 7.39 lbs (60°F); flash point, open cup, 245°F.
 Containers: Tank cars.
- "Apco Inkol No. 0." ²⁰⁰ Trademark for a petroleum solvent.
 Properties: Light color, boiling range 470-505°F; sp. gr. 0.824 (60°F); flash point 240°F (open cup).
 Use: Solvent for heat set and flash dry printing inks.
- "Apcolene." ²⁰⁰ Trademark for a petroleum solvent.
 Properties: Water-white; initial boiling point 195-204°F, 95% distills at 236-248°F; sp. gr. 0.739 (60°F); flash point (TCC) 25°F; mild, nonresidual odor.
 Use: Preservative wash for lithographic blankets, rubber rolls, and rubber printing plates.
 Shipping regulations: Flammable liquid. Red label. *
- "Apco seal." ²⁰⁰ Trademark for a chemical dispersion of a tough and resilient asphalt and mineral filler.
 Properties: Flash point (P.M. closed cup) 119°F; thermal conductivity or K factor 1.26; density of material before application 1.05; density of cured coating 0.96; remains flexible at low temperatures and does not flow at high temperatures.
 Uses: Weather proofing or corrosion resistant coating; heat or sound insulating coating.
- "Apco thinner." ²⁰⁰ Trademark for a petroleum solvent.
 Properties: Water-white; initial boiling point 240-248°F; 95% distills at 278-288°F; sp. gr. 0.763 (60°F); flash point (TCC) 52°F; mild, nonresidual odor.
 Use: In paints; varnishes; enamels; roto ink; and for degreasing hides.
 Shipping regulations: Flammable liquid. Red label. *
- aphrodine. See yohimbine.
- "Aphrosol." ²⁰⁶ Brand name for a proprietary foaming agent used for fire fighting and for the production of foamed cements and aerated concrete.
- API. Abbreviation for American Petroleum Institute.
- "Apiezon." ⁴³¹ Trademark for a line of hydrocarbon oils, greases and waxes that are produced by molecular distillation and characterized by very low vapor pressures and good thermal stability. Vapor pressures of various grades range from 10^{-5} to 10^{-11} mm Hg at room temperature. Some of these materials are liquids at room temperature, others have melting points up to 125°C. Used as lubricants and seals in high vacuum equipment and operations.
- apiol (parsley camphor; 1-allyl-2,5-dimethoxy-3,4-methylenedioxybenzene) $C_{12}H_{14}O_4$. Dimethoxymethylene ether of allyltetrahydroxybenzene.
 Properties: White, crystalline solid with faint parsley odor; m. p. 29.5°C; b. p. 294°C; refractive index $n_{20/D}$ 1.536-1.538; soluble in alcohol, ether, and fixed oils; insoluble in water.
 Derivation: Separation from the volatile oil of parsley.
 Use: Medicine.
 Shipping regulations: None. *
- aplite. A fine-grained variety of granite consisting mostly of quartz and feldspar.
 Occurrence: Virginia.
 Use: Source of alumina for glass, pottery, porcelain and enamel-ware.
- apo-. A prefix denoting formation from, or relationship to, another compound.
- APO. See tris(1-aziridinyl)phosphine oxide.
- apoptropine $C_{17}H_{21}NO_2$.
 Properties: White crystalline, poisonous alkaloid! Soluble in alcohol, ether, benzene, chloroform, and dilute acids; slightly soluble in water.
 Constants: M. p. 60-62°C.
 Derivation: Obtained from atropine by dehydration.
 Method of purification: Crystallization.
 Grades: Technical.
 Containers: Cans; glass bottles.
 Use: Medicine.
 Shipping regulations: None. *
- apoptropine hydrochloride $C_{17}H_{21}NO_2 \cdot HCl$.
 Properties: Colorless crystals; poisonous! Soluble in water and alcohol; slightly soluble in ether.
 Constants: M. p. 239°C.
 Derivation: By the action of hydrochloric acid

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

on apotropine.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

apocodeine $C_{18}H_{19}NO_2$.

Properties: White crystalline, poisonous alkaloid! M. p. 124°C with decomposition. Soluble in alcohol and ether; very slightly soluble in water.

Derivation: Obtained from codeine by fusion with oxalic or metaphosphoric acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Tins; glass bottles.

Use: Medicine.

Shipping regulations: None.*

apocynum (Canadian hemp; American Indian hemp; Indian physic; black Indian hemp; dogbane).

Derivation: Dried rhizome and roots of

Apocynum cannabinum.

Occurrence: United States.

Grades: Technical.

Containers: Sacks.

Use: Medicine.

Shipping regulations: None.*

apomorphine $C_{17}H_{17}NO_2$.

Properties: White crystalline alkaloid; poisonous! Oxidizes rapidly in air and becomes green. Decomposes 195°C . Soluble in alcohol, acetone, chloroform; slightly soluble in water, benzene, and ether.

Derivation: From morphine by extraction of one molecule of water.

Method of purification: Crystallization.

Containers: 15-grain vials, $\frac{1}{8}$ -, 1-oz bottles; 5-oz tins.

Use: Medicine.

Shipping regulations: None.*

apomorphine hydrochloride

$C_{17}H_{17}NO_2 \cdot HCl \cdot \frac{1}{2}H_2O$.

Properties: White crystalline alkaloid; poisonous! Bitter taste, turns green on exposure to light and air; odorless. Soluble in water and alcohol; slightly soluble in chloroform and ether.

Constants: M. p. $200-210^{\circ}\text{C}$.

Derivation: Obtained by the action of hydrochloric acid on apomorphine.

Method of purification: Crystallization.

Grades: U. S. P. XVI.

Containers: 15-grain vials; $\frac{1}{8}$ -, 1-oz bottles; 5-oz tins.

Use: Medicine.

Shipping regulations: None.*

apparent density. See density.

apple acid. See malic acid.

apple essence. See isoamyl valerate.

apple oil. See isoamyl valerate.

apple, Peru. See stramonium.

"App-L-Set." ²³³ Brand name for a proprietary product. Plant growth control agent to

prevent preharvest drop of certain fruits.

"Appramine." ⁴² Proprietary product. Cationic fatty amides.

Properties: Light yellow paste; disperses readily in water at temperatures above 60°C .

Containers: 44-gal fiber container.

Use: Durable softening agent for all types of textile fibers.

"Appretole." ⁴² Proprietary product. Anionic fatty amide dispersion.

Properties: Cream colored paste; disperses readily in water above 60°C .

Containers: 55-gal steel drums.

Use: Softener for cotton and rayon textile fabrics. Effects are durable to washing and dry cleaning; does not affect light fastness of dyestuffs.

approx. Abbreviation for approximate or approximately.

"Apresoline." ³⁰⁵ Trademark for hydralazine hydrochloride, used in medicine.

apricot kernel oil. See persic oil.

aprobarbital. See 5-allyl-5-isopropylbarbituric acid.

aprobarbital sodium. See 5-allyl-5-isopropylbarbituric sodium.

"APW." ²⁴⁴ Proprietary compound consisting of a balanced blend of buffered alkalies and a surface active agent.

Properties: Soluble in water; total Na_2O content 39.9%; per cent of total Na_2O in active form 24.0%; per cent of total Na_2O in inactive form 15.9%; white, granular dedusted mechanical mix.

Containers: 5-lb cans (9/case); 10-lb cans (4/case); 125-lb plywood drum; 325-lb wooden barrel.

Shipping regulations: None.*

aqua. Water.

aqua ammonia. See ammonium hydroxide.

"Aquablak." ¹³³ Trademark for carbon black and bone black aqueous dispersions used in latex paints, latex compounding, paper coatings, leather finishing, etc.

Containers: 50-, 300- and 500-lb drums; available in many types, including:

"Aquablak" B: All-purpose utility black; anionic type.

"Aquablak" K: All-purpose utility black; non-anionic type.

"Aquablak" M: Blue-tone gray black for tinting.

"Aquablak" 15: Special black for electrical conductivity.

"Aquablak" 41: Jet4-black.

"Aquadag." ⁴⁶ Trademark for a concentrated colloidal dispersion of pure electric-furnace graphite in water.

Properties: Paste consistency; solids content 22%; average particle size 0.5 micron; max. particle size 4 microns; sp. gr. 1.121; b. p. 100°C ; completely miscible with water.

Uses: General industrial applications

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

including metalworking operations at elevated temperatures, conductive films in electrical and electronic applications, dry-film lubrication, impregnation, and graphic-arts opaquing, meets U. S. Army Specification 2-130.

"Aquadow." ²³³ Trademark for an aqueous ammonia solution used for fertilizing purposes.

aqua fortis. See nitric acid.

"Aqualgel." ²³⁶ Brand name for a proprietary product. A gel-forming colloidal bentonite clay used in drilling muds.

"Aqualin." ¹²⁵ Trademark for an herbicide which is a formulation containing 85% acrolein as the principal constituent for the control of submersed and floating weeds and algae in irrigation canals, ditches, drains, ponds and other bodies of water. Properties: Colorless, lachrymatory liquid that is highly volatile; b. p. 52°C, miscible in lower alcohols, ether, hydrocarbons, acetone, and benzene, moderately soluble in water at 68°F, may polymerize with violence under some conditions!

Containers: 16-gauge unlined steel drum containing 370 lbs.

Danger: Extremely flammable and irritating vapor and liquid. Poisonous by inhalation, skin contact or swallowing.

Shipping regulations: Flammable liquid. Red label. *

aquamarine. See beryl.

"Aquaness." ⁸⁹ Trademark for chemicals used in oil production and refining.

"Aqualpel." ²⁶⁶ Trade name for alkylketene dimers used as paper size and for treatment of textiles.

"Aqua Phos Kil 6." ⁵⁵ Trademark for insecticide used on fruits, vegetables, cotton. Active ingredient, 61% parathion (q. v.).

"Aquaprint." ²⁹³ Trademark for a resin-bonded pigment color for printing on textiles. The vehicle, an oil-in-water emulsion, contains a water-insoluble binder which adheres to the fibers and anchors the color permanently to the cloth.

aqua regia (nitrohydrochloric acid, nitromuriatic acid, chloronitrous acid; chloroazotic acid; chlorazotic acid).

Derivation: A mixture of nitric and hydrochloric acids, usually one part of nitric acid and three or four parts of hydrochloric acid.

Properties: Fuming yellow, corrosive, suffocating, volatile liquid.

Grades: Technical.

Containers: Glass bottles.

Uses: Metallurgy, testing metals; dissolving metals (platinum, gold, etc.).

Fire hazard: Dangerous. *

Shipping regulations: Corrosive liquid.

White label. Legal label name: nitrohydrochloric acid. *

"Aquaresin." ⁷³ Brand name for proprietary

product; glycol bori-borate.

Properties: Water-white viscous liquid which is nondrying. Odorless. Soluble in water, methyl alcohol, glycerine, and diethylene glycol; insoluble in ethyl alcohol and toluene. Sp. gr. (25°C) 1.375; pH (5% dispersion) 8.0.

Containers: 1-gal cans (11 lbs); 5-gal cans (55 lbs); 55-gal drums (625 lbs).

Uses: Textile lubricant and softener; softener or plasticizer for glues, gelatine, gums; adhesive for cellophane, glassine; sealing joints in systems carrying oils, hydrocarbons; fire retardant for treating paper, leather, textiles; prevention of caking in pigments in water suspensions.

"Aquaresin" G. B. ⁷³ Brand name for proprietary product, modified glyceryl borate.

Properties: Water-white viscous liquid.

Will not crystallize at any dilution. Odorless, noncorrosive, nontoxic. Soluble in water, methyl alcohol, glycerine, and diethylene glycol. Insoluble in ethyl alcohol, toluene, mineral spirits, mineral oil, vegetable oil.

Containers: 1-gal cans (11 lbs); 5-gal cans (55 lbs); 55-gal drums (675 lbs).

Uses: Textile lubricant and softener; flexibilizer, softener, or plasticizer for glues, gelatine, gums. Cosmetic preparations, astringent lotions; adhesive for cellophane, glassine; sealing joints in systems carrying oils, hydrocarbons; fire retardant for treating paper, leather, textiles.

"Aquarex." ²⁸ Trademark for a line of rubber latex stabilizers and mold lubricants.

Available as:

"Aquarex" D. Sodium salts of sulfate monoesters of a mixture of higher fatty alcohols consisting chiefly of the lauryl and myristyl derivatives of the type RSO_4Na . White powder, sp. gr. 1.33.

Uses: To improve the stability of latex mixtures and to prevent coagulation due to mechanical friction, in water solution as a mold lubricant.

Containers: 100-lb drums.

"Aquarex" G Surface Active Agent Water solution of sodium alkyl sulfonate of the type RSO_3Na . Clear amber liquid; sp. gr. 1.09.

Use: In emulsion polymerization of synthetic elastomers and resins.

Containers: 425-lb drums.

"Aquarex" L Mold Release Agent. Ammonium salts of alkyl acid phosphates of the type $\text{RHPO}_3\text{ONH}_4$. Amber viscous paste; sp. gr. 1.01.

Use: As a corrosion inhibiting mold lubricant.

Containers: 400-lb drums.

"Aquarex" MDL Surface Active Agent or Mold Release Agent. Water paste of sodium salts of sulfate monoesters of a mixture of higher fatty alcohols consisting chiefly of the lauryl and myristyl derivatives. Amber paste; sp. gr. 1.08.

Uses: A stabilizing and wetting agent for latex mixtures; in water solution as a mold lubricant.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Containers: 375-lb drums.
- "Aquarex" ME Surface Active or Mold Release Agent. Sodium salts of sulfate mono-esters of a mixture of higher fatty alcohols consisting chiefly of the lauryl and myristyl derivatives. Creamy white powder; sp. gr. 1.06.
- Use: A stabilizing and wetting agent for latex mixtures and in water solution as a mold lubricant.
- Containers: 150-lb drums.
- "Aquarex" NS Surface Active Agent. Water solution of C-cetyl-betaine $(\text{CH}_3)_3\text{N}^+\text{CH}(\text{C}_{16}\text{H}_{33})\text{COO}^-$. Brown slightly cloudy liquid; sp. gr. 1.05.
- Use: As a stabilizer for latex mixtures. Due to its amphoteric properties, it functions as a stabilizer in both acid and alkaline dispersions.
- Containers: 450-lb drums.
- "Aquarex" SMO Surface Active Agent. 33% water solution of mono-sodium salt of sulfated methyl oleate $\text{CH}_3(\text{CH}_2)_6\text{CH}(\text{SO}_3\text{Na})(\text{CH}_2)_7\text{COOCH}_3$. Reddish amber liquid; sp. gr. 1.08.
- Use: A surface conditioning agent for rubber latex and neoprene latex mixtures.
- Containers: 450-lb drums.
- "Aquarex" WAQ Surface Active or Mold Release Agent. A water solution of the sodium salts of the sulfate mono-esters of a mixture of higher fatty alcohols consisting chiefly of the lauryl and myristyl derivatives (see "Aquarex" D). Amber viscous liquid; sp. gr. 1.04.
- Use: A stabilizing and wetting agent for latex mixtures; diluted, as a mold lubricant.
- Containers: 400-lb drums.
- "Aquarol." ³⁰⁰ Trademark for water repellents of the wax-multivalent metal salt type for textiles. Non-durable or renewable.
- "AquaSol." ⁵⁷ Trademark for a highly sulfonated castor oil.
- "Aquatar." ³²³ Trademark for a coal tar emulsion maintenance coating.
- "Aquazinc." ³⁵⁴ Trade name for an aqueous dispersion of zinc stearate containing a wetting agent and designed to replace powdered zinc stearate for many applications in order to eliminate the dust, fire hazard, and other difficulties encountered with the dry material. It will volatilize at or below 100°C.
- Uses: In manufacture of butyl rubber, neoprene adhesives, various types of rubber latex and molded goods.
- Ar. Symbol for argon; official since 1957.
- "A.R." ³²⁹ Trademark for chemical products for laboratory and industrial use which are specially produced and controlled to meet critical purity and uniformity requirements.
- arabic gum.** A commercial term for acacia gum, the dried gummy exudate from the stems of *Acacia Senegal* or related African species of *Acacia*.
- Properties: Thin flakes, powder, granules or angular fragments; color white to yellowish white, almost odorless, and have a mucilaginous taste. Completely soluble in hot and cold water, yielding a viscous solution of mucilage; insoluble in alcohol. The aqueous solution is acid to litmus.
- Grades: U.S.P. XVI; a great many varieties named according to color and source, as Senegal, Kordofan, Morocco, Cape, Aden, suakin, white Senaar. See also wattle gum, an Australian variety.
- Containers: Bags; multiwall paper sacks; barrels.
- Uses: Pharmaceuticals; adhesives; inks; textile printing; cosmetics; food preparation; in general, as a thickening agent and colloidal stabilizer.
- Shipping regulations: None.*
- arabinose** (pectinose; pectin sugar; gum sugar) $\text{C}_5\text{H}_{10}\text{O}_5$.
- Properties: White crystals. Three varieties (optical isomers) are known but differ very slightly in most properties. Soluble in water and glycerine; insoluble in alcohol and ether. M.p. 158.5°C; sp. gr. 1.585 (20/4°C).
- Derivation: (a) From calcium dextrogluconate and hydrogen peroxide; (b) by boiling vegetable gum with dilute sulfuric acid.
- Method of purification: Crystallization.
- Grades: Technical.
- Containers: Glass bottles.
- Uses: Medicine; as a culture medium.
- Commercially available as D- and L-arabinose.
- "Aracar." ⁵¹ Trademark for railroad car journal oils for both plain and roller bearings. Having good viscosity index, they permit operation over wide temperature ranges without waste grab or hot boxes.
- arachic acid.** See arachidic acid.
- arachic alcohol.** See arachidyl alcohol.
- arachidic acid** (arachic acid; eicosanoic acid) $\text{CH}_3(\text{CH}_2)_{18}\text{COOH}$. A widely distributed but minor component of the fats of peanut oils and related plant species.
- Properties: Shining, white, crystalline leaflets. Soluble in ether; slightly soluble in alcohol; insoluble in water. M.p. 75.4°C; sp. gr. 0.8240 (100/4°C); b.p. 205°C (1 mm), 328°C (760 mm) (decomposes); refractive index 1.4250 (100°C).
- Derivation: From peanut oil.
- Grades: Technical; 99%.
- Containers: Glass bottles; 50-lb bags.
- Uses: Organic synthesis; lubricating greases, waxes, and plastics.
- Shipping regulations: None.*
- arachidonic acid** $\text{CH}_3(\text{CH}_2)_4(\text{CH}:\text{CHCH}_2)_4(\text{CH}_2)_2\text{COOH}$. A C_{20} unsaturated fatty acid. It is considered essential for good health.
- Properties: Liquid; m.p. -49.5°C; iodine value 333.50.
- Source: Liver; brain; lecithin.
- Use: Medicine; biochemical research.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

arachidyl alcohol (1-eicosanol; arachic alcohol) $\text{CH}_3(\text{CH}_2)_{18}\text{CH}_2\text{OH}$. A long-chain saturated fatty alcohol, much like stearyl alcohol.

Properties: M.p. 71°C ; b.p. 220°C (3 mm).

Derivation: Reduction of arachidic acid.

Uses: Lubricants, rubber, plastics, textiles.

arachidyl behenyl amine RNH_2 , in which R equals principally the saturated straight chain radicals $\text{C}_{20}\text{H}_{41}$ - and $\text{C}_{22}\text{H}_{43}$ -.

Properties: White solid; soluble in most organic solvents.

Suggested uses: Surface active agents; ore flotation; corrosion inhibitor; intermediate for bactericides, detergents, lube oil additives, etc.

arachin (arachine). A protein from peanut, a globulin containing the following amino acids in representable amounts: arginine, histidine, lysine, cystine. A yellow green syrup. Soluble in water and alcohol; insoluble in ether.

arachine. See arachin.

arachis oil. See peanut.

aragonite CaCO_3 . A natural carbonate of calcium with the same formula as calcite (q. v.) but differing in stability, hardness, specific gravity, and other properties.

Properties: Colorless, white, yellow, various other pale colors; hardness, 3.5-4; sp. gr. 2.9-3. May show luminescence. Occurs in crystals, pisolites, the pearly layer of shells, and in flos ferri (a colloidal variety with siderite).

Occurrence: United States and Europe.

"Aralen" Phosphate. ¹⁶² Trademark for chloroquin phosphate.

aralia (American spikenard; spikenard; spignet; pettymorrel; spice berry) Dried rhizome and roots of perennial herb, *Aralia racemosa*.

Occurrence: Northeastern United States.

Grades: N. F. XI

Use: Medicine.

"Aramite." ²⁴⁸ Trademark for 2-(para-tert-butylphenoxy) isopropyl 2-chloroethyl sulfite $(\text{CH}_3)_3\text{CC}_6\text{H}_4\text{OCH}_2\text{CH}(\text{CH}_3)\text{OSOOC}_2\text{H}_4\text{Cl}$

Properties: Clear light colored oil; sp. gr. 1.148-1.152 (20°C), b. p. 175°C (0.1 mm), very soluble in common organic solvents; insoluble in water; non-corrosive.

Grades: Technical (90% min.); wettable powder; emulsifiable concentrates; dusts.

Uses: As an acaricide on a wide variety of non-edible crops and ornamentals.

Hazards: Harmful if absorbed through the skin or ingested. Do not get in eyes; avoid contact with skin or clothing; store in cool, dry place.

"Aranox." ²⁴⁸ Trademark for para-(para-tolyl-sulfonylamido)-diphenylamine, $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_2\text{NHC}_6\text{H}_4\text{NHC}_6\text{H}_5$.

Properties: Grey powder; sp. gr. 1.32; m. p. 135°C min; soluble in acetone, benzol and ethylene dichloride; insoluble in gasoline

and cold water; slightly soluble in hot water or hot alkaline solutions which extract it from thin rubber sheets after considerable exposure.

Uses: Antioxidant for balloon fabrics, proofing, clothing and light-colored sundries.

"Aranthol." ⁹ Trademark for methamocetol (2-methyl-amino-6-hydroxy-6-methyl-heptane) employed in medicine as the mucate and hydrochloride salts.

"Arapen." ⁵¹ Trademark for high quality lime-base greases of greenish black color developed for all types of pressure gun fittings. Made with a high viscosity base oil, they adhere sufficiently to reciprocating parts so they will not be thrown off.

araroba (goa powder). A brownish-yellow odorless powder obtained from cavities in the trunk of the Brazilian tree, *Andira araroba*; it is the source of chrysarobin.

"Arasan." ²⁸ Trademark for seed disinfectants based on thiram (tetramethyl thiuram disulfide). Formulated for dry applications and with wetting and sticking agents for slurry. Also formulated with thiram plus methoxychlor.

Use: For the treatment of corn, sorghums, peanuts, soybeans, and vegetable seeds.

"Arazate." ²⁴⁸ Trademark for zinc dibenzyl dithiocarbamate, $\text{Zn}[\text{SCSN}(\text{C}_6\text{H}_5)_2]_2$.

Properties: White powder; sp. gr. 1.41; melting range 165 - 175°C ; moderately soluble in benzol and ethylene dichloride; insoluble in acetone, gasoline, and water.

Uses: Accelerator for latex, dispersions, and cements.

arbor vitae. See thuja.

arbor vitae oil. See thuja oil.

arbutin (ursin, hydroquinone glucose; arbutoside) $\text{C}_{12}\text{H}_{16}\text{O}_7 \cdot \text{H}_2\text{O}$.

Properties: Long colorless silky needles with bitter taste; m. p. 195 - 200° (anhydrous); loses water about 70°C ; soluble in water and alcohol; insoluble in ether, chloroform, and carbon disulfide

Derivation: A glucoside found in the leaves of the cranberry and blueberry and in the roots, trunks and leaves of most pear species. Pure arbutin has also been prepared synthetically from acetobromoglucose and hydroquinone in presence of alkali.

Use: Medicine

arbutoside. See arbutin.

archil. See orchil.

"Arctic Crystal" Soap. ⁸⁶ Trademark for neutral sodium soap, 42°C titer. Available in flakes or granules.

Uses: Detergent; fulling; kier-boiling; scouring; soaping.

"Arctic Syntex." ⁸⁶ Trademark for a series of detergents. Available as:

"Arctic Syntex" 036; polyoxyethylated nonylphenol, 100% active.

"Arctic Syntex" HD; alkylarylsulfonate built

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

with polyphosphates.

"Arctic Syntex" M Beads; alkylarylsulfonate plus polyphosphates.

"Arctic Syntex" M Liquid; modified alkylarylsulfonate (22% active ingredient).

Uses: Emulsifying agents; kier-boiling; wetting; dispensant; scouring; acid ful-ling; dyeing and carbonizing assistant.

"Arcturus Red." ¹⁴¹ Trade name for azo red pigments derived from beta-naphthol. Properties: Yellow shade of red; very transparent, fair resistance to light, good resistance to heat; non-bleeding in water and organic solvents.

Uses: Printing inks, especially flexographic inks for foil printing, rubber, plastics.

"Ardil." ²⁰⁶ Trademark for a brand of regenerated protein fiber derived from groundnuts (peanuts).

arecaine (arecaine; 1,2,5,6-tetrahydro-1-methylnicotinic acid) $C_7H_{11}O_2N \cdot H_2O$. An alkaloid derived from betel nuts (Areca catechu).

Properties: White crystals, optically inactive; decomposes 232° when anhydrous; freely soluble in water; slightly soluble in organic solvents.

arecaine methyl ester. See arecoline.

arecaine. See arecaine.

areca nut (betel nut, Pinang). Fruit of Areca catechu. The seeds are hard and heavy, round-conical, depressed at the base, externally brown, mottled with fawn spots. The fresh seeds have a faint cheese-like odor; the powder has an astringent, slightly bitter taste.

Occurrence: East Indies.

Grades: Technical; N. F. XI (dispensed as powder).

Containers: Bags; barrels.

Uses: Medicine; chewed by the natives (mixed with lime) for its stimulating effect.

Shipping regulations: None.*

arecolidine $C_8H_{13}O_2N$. An alkaloid derived from betel nuts (Areca catechu). Isomeric with arecoline.

Properties: White crystals; hygroscopic; m. p. $105^\circ C$; sublimes $110^\circ C$; soluble in water, alcohol, acetone, ether.

arecoline (arecaine methyl ester; methyl 1,2,5,6-tetrahydro-1-methylnicotinate; methyl arecainate) $C_8H_{13}O_2N$. Alkaloid obtained from Areca catechu or betel nut. Properties: Colorless, odorless, oily liquid; strongly alkaline; optically inactive; b. p. $209^\circ C$; sp. gr. 2.02; soluble in water, alcohol, chloroform, ether; volatile with steam.

Use: Medicine.

arecoline hydrobromide $C_8H_{13}NO_2 \cdot HBr$.

Properties: White crystals or white crystalline powder; odorless; bitter taste; optically inactive; affected by light. Soluble in water and alcohol. M. p. $170-175^\circ C$.

Derivation: By the action of hydrobromic acid on arecoline.

Method of purification: Crystallization.

Containers: Vials; bottles; tins.

Grades: Technical; N. F. XI.

Use: Medicine.

Shipping regulations: None.*

"Areskap." ⁵⁸ Trademark for sodium butyl-ortho-phenylphenolsulfonate in liquid (250-lb barrels) or dry powder form (115-lb drums).

Uses: Wetting, penetrating and spreading agent for insecticides, embalming fluids.

"Aresket." ⁵⁸ Trademark for sodium butyl-biphenylsulfonate in dry powder form.

Containers: 115-lb drums.

Uses: Wetting, penetrating, and spreading agent.

"Aresklene." ⁵⁸ Trademark for disodium dibutyl-ortho-phenylphenoldisulfonate.

"Arfonad" Camphorsulfonate. ¹⁹⁰ Trademark for a brand of trimethaphan camphorsulfonate (q. v.).

argentic. Adjective meaning divalent silver, as in argentic fluoride, AgF_2 . The monovalent term is argentous, as AgF .

argentite (silver glance) Ag_2S . Lead-gray to black or blackish-gray mineral, streak same color, metallic luster. A natural silver sulfide. Found both primary and as a product of secondary enrichment. Contains 87.1% silver. Differs from other soft black minerals in cutting like wax. Soluble in nitric acid.

Constants: Sp. gr. 7.2-7.36; hardness 2-2.5.

Occurrence: Nevada, Colorado, Montana; Mexico; Chile; Germany; Canada.

Use: An important ore of silver.

argentous. See argentic.

argentum. The Latin name for silver, hence the symbol Ag in chemical nomenclature.

argilla. See kaolin.

argillaceous hematite (ironstone clay). A variety of natural ferric oxide containing an appreciable portion of clay or sand as impurity. A hard brown to deep red mineral, with submetallic to nonmetallic luster and a red streak. See hematite, red.

argillaceous limestone. A limestone with appreciable clay as impurity. Certain varieties are useful as raw material for cement manufacture and are called cement rock (q. v.).

arginase. An enzyme producing ornithine and urea by splitting arginine. It is found in liver.

Use: Biochemical research.

arginine (guanidine aminovaleric acid; amino-4-guanidovaleic acid)

$NHC(NH_2)NH(CH_2)_3CH(NH_2)COOH$. An essential amino acid for rats, occurring naturally in the L(+) form.

* Properties: Prisms from water containing 2 molecules of H_2O , anhydrous plates from alcohol solution; dehydrates at $105^\circ C$;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

decomposes at 244°C; sparingly soluble in alcohol; insoluble in ether.

Derivation: Widely found in animal and plant proteins. It is precipitated as the flavinate from gelatin hydrolysate in industry.

Containers: Drums.

Uses: Biochemical research; medicine; pharmaceuticals.

arginine hydrochloride

$\text{NHC}(\text{NH}_2)\text{NH}(\text{CH}_2)_3\text{CH}(\text{NH}_2)\text{COOH} \cdot \text{HCl}$.

Properties: Platelets and prisms; sinters at 218°C, solidifies again at 225°C, decomposes at 235°C. Soluble in water; slightly soluble in hot alcohol.

Grade: N.N.D.

Use: Medicine.

"Argo." ³⁰ Trademark for a brand of chemical products made from corn.

argols. A by-product of the wine industry containing crude potassium acid tartrate (cream of tartar). It consists of a crystalline crust found on the sides of wine vats in which the grape juice has fermented. White argol is the deposit of the white grape and red argol is the deposit of the red grape. Argols are similar to wine lees (q. v.) in their chemical nature, but are purer since they contain less sediment. They contain from about 50 to 85% of potassium acid tartrate and 6-12% calcium tartrate.

Containers: 1-, 5-lb cans; bags.

Uses: Manufacture of tartaric acid and tartrates; fertilizer ingredient; manufacture of malt vinegar; mordant in dyeing.

Shipping regulations: None.*

argon Ar. Element of atomic number 18, zero group of the periodic system. Occurs to the extent of 0.94% by volume in the atmosphere.

Properties: Colorless, inert, monatomic gas, does not combine chemically with any element; m. p. -189.3°C; b. p. -185.8°C; specific volume (70°F) 9.7 cu ft/lb. Slightly soluble in water.

Derivation: (a) By fractional distillation of liquid air. (b) By the treatment of atmospheric nitrogen with certain metals such as magnesium and calcium to form nitrides. (c) Recovery from natural gas oxidation bottoms stream in ammonia plant.

Method of purification: (a) Highly purified argon is obtained by passing the gas through a bed of titanium at 850°C. (b) Synthetic zeolite molecular sieves separate oxygen from argon to give high-purity gas.

Grades: Technical; highest purity (99.995%).

Containers: Steel cylinders (technical); hermetically sealed glass flasks (highest purity).

Uses (in approximate order of volume): Inert gas shield in arc welding; aircraft; electric lamps (also used with neon in "neon" lights); electronics; titanium and zirconium refining; flushing molten metals (particularly aluminum) to eliminate porosity in castings. Its use as an inert gas or atmosphere in miscellaneous applications is

growing as fast as new production can take care of the demand.

Shipping regulations: Nonflammable compressed gas. (Green gas label.*

"Aridex." ²⁸ Trademark for a line of non-durable water repellents for textiles, including both aqueous and solvent types.

"Aridye." ²⁹³ Trademark for a patented product and process for printing colors on textiles using permanent and insoluble pigments suspended in an organic vehicle, into which water is emulsified to give printing consistency. The vehicle contains a water-insoluble binder which adheres to the cloth and anchors the color permanently to the fibers.

"Ariperm." ³⁰⁰ Trademark for a gas-fading inhibitor for application to dyed acetate fabrics. Protects the dyes from fading due to acid gases in the atmosphere.

"Aristocort." ³¹⁵ Trademark for triamcinolone (q. v.).

aristoquin (diquinine carbonate; quinine carbonate) $\text{CO}(\text{OC}_{20}\text{H}_{23}\text{ON}_2)_2$.

Properties: White or pinkish, amorphous powder containing 96% quinine; tasteless; m. p. 189°C; decomposed by acids and alkalis with liberation of quinine. Soluble in alcohol, chloroform, glycerol and dilute acids; insoluble in water, ether.

Use: Medicine.

Shipping regulations: None.*

"Arizole." ²⁵² Trademark for a group of terpene products, including anethole U.S.P., anethole Technical, and sulfate pine oil. Used in perfumes, soaps, etc.

"Arko." ³⁰⁰ Trademark for a cationic finishing agent used to soften fabrics made from wool, acetate, rayon, and synthetic fibers.

"Arkolene." ³⁰⁰ Trademark for wetting agents of the alkylarylsulfonate type, sodium or ammonium salts. Used in acid carbonizing of wool and other wet processing of textiles where quick wetting or penetration is required.

"Arkolube." ³⁰⁰ Trademark for textile lubricating and softening agents, based on silicones, polyethylenes, and waxes. Used with textile resins to minimize loss of tear strength and abrasion resistance, and to improve sewability.

"Arko Stat-Ex." ³⁰⁰ Trademark for antistatic agent for use on synthetic fibers.

"Arkotan." ³⁰⁰ Trademark for a synthetic tanning agent for leather. Ammonium salt of a naphthalenesulfonic acid complex.

"Arlacel." ⁸⁹ Trademark for each of a series of non-ionic emulsifiers for use in cosmetics and pharmaceuticals. They are fatty acid partial esters of polyols or polyol anhydrides.

"Arlex." ⁸⁹ Trademark for non-crystallizing industrial humectant solution, containing

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

83% solids consisting of sorbitol and related polyhydric materials.

Use: For flexibilizing and moisture-conditioning in industrial applications, including tobacco, glue compositions, cellulose products, etc.

"Armacs." ¹⁵ Trademark for a group of amine acetate salts derived from primary amines, secondary amines and diamines. The alkyl groups range from C₈ to C₁₈ in chain length.

Containers: 55-gal non-returnable drums.

Uses: Anti-static agents on resin and plastic surfaces; bactericides; algicides; corrosion inhibitors in oil pipelines; mineral flotation; pigment dispersants; emulsifiers.

"Armalon." ²⁸ Trademark for TFE-fluoro-carbon fiber felt and also for TFE-fluoro-carbon resin coated glass fabrics, tapes, and laminates.

The felt is made in various thicknesses either as porous material or impregnated with TFE resin. The latter is used for gaskets, the plain felt for filter purposes.

The TFE coated fabrics, etc., are used for electrical insulation, for antistick and antifriction conveyor belts and covers in the food and packaging industries, for diaphragms and gaskets requiring unusual resistance to chemicals and to high and low temperatures.

"Armeens." ¹⁵ Trademark for a series of high molecular weight aliphatic amines, primary, secondary and tertiary.

Derivation: From natural fats and oils. Available in chain lengths ranging from C₈ to C₁₈ of 90% purity of a single homolog, and certain mixtures of these obtained from overall distilled coco, soya, tallow, etc., sources.

Grades: Technical and distilled.

Containers: 55-gal drums; 320-lb fiber drums for certain items.

Uses: As chemical intermediates for textile agents, flotation agents, asphalt additives, emulsifiers, wetting agents, rubber chemicals, metal working lubricants, plastics, fuel oil additives, motor oil additives, catalysts for polyurethane foams.

Armenian bole. See iron oxide reds.

"Armids." ¹⁵ Trademark for a class of high-melting, wax-like amides derived from fatty acids. They vary in form from material that can be flaked (like stearic acid) to a soft paste, and are soluble in ketones, esters, alcohol, turpentine, fatty acids, fats and mineral spirits, but insoluble in water.

Containers: Flaked and powdered products packed in 50-lb multiwall paper bags; lump products packed in 100-lb cloth bags.

Use: As antiblocking agents in plastic formulations; as emulsion additives; solvents; printing ink, antiscratch agents; dye solubilizers and in organic synthesis.

See also "Armowax."

"Armofos." ³³⁴ Trademark for sodium tri-

polyphosphate, anhydrous (sodium triphosphate; pentasodium triphosphate) Na₅P₃O₁₀.

Properties: White granules or powder; soluble in water; non-deliquescent; pH (1% solution) 9.7; improves the sudsing and detergent properties of soaps and synthetic detergents; prevents rust stains.

Grades: Technical; food processing.

Containers: 100-lb multiwall paper bags; bulk hopper cars.

Uses: Sequestering agent for iron, calcium and magnesium ions; soap builder; detergent mixtures; deflocculator in drilling muds; paper, ceramics and textiles.

armoracia radix (horse-radish root).

Occurrence: Cultivated everywhere.

Derivation: The fresh root of Cochlearia armoracia, containing volatile oil similar to oil of mustard.

armored concrete. See concrete.

"Armowax." ¹⁵ Trademark for a synthetic amide wax derived from fatty acids.

Properties: M p. 130°C; amide, 90%; color, FAC 35.

Uses: In wax mixtures, powder metal lubricant, and steel wire drawing.

See also "Armids."

Armstrong's acid. See naphthalene-1,5-disulfonic acid.

arnatto. See annatto.

Arnaudon's green. See chromic phosphate.

"Arneels." ¹⁵ Trademark for a series of high molecular weight aliphatic nitriles. Available in chain lengths ranging from C₈ to C₁₈ and certain naturally occurring mixtures of these.

Properties: Consistency ranges from liquids freezing at -36°C to solids melting at 40°C. Good thermal and chemical stability.

Containers: 55-gal non-returnable drums.

Uses: Excellent softening agents and plasticizers for nitrile type rubbers, vinyl plastics; dye solubilizers for inks; metal wetting agents.

"Arnel." ³⁵² Trademark for an acetate fiber made from cellulose triacetate. It has a higher melting point and is less soluble than cellulose acetate.

Properties: Staple or continuous filament.

Tensile strength (psi) 20,000-26,000;

elongation 22-28%; sp. gr. 1.3; moisture

regain 3.2%; m. p. approximately 300°C,

soluble in methylene chloride, glacial acetic acid, chloroform; swollen by acetone and trichloroethylene.

Uses: Knitted and woven fabrics for wearing apparel, alone and blended with other fibers; laundry pads; electrical insulation; laminated papers.

arnica flowers (mountain tobacco).

Derivation: Dried flowers and heads of Arnica montana.

Occurrence: Northern Europe; Asia; North America.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Grades: Technical; N. F. XI.

Containers: Sacks.

Use: Medicine.

Shipping regulations: None. *

arnica flowers oil.

Properties: Reddish-yellow to brown-colored essential oil; strong aromatic odor and taste. The consistency of the oil varies; sometimes it is a butter-like mass which melts between 20° and 30°C to a brownish liquid. Soluble in alcohol with great difficulty. Solutions in absolute alcohol are clear at first, later become turbid. Soluble in ether, benzene, chloroform.

Constants: Sp. gr. 0.8905-0.9029; acid value 62.6-127.3; ester value 22.7-32.2.

Derivation: By distillation of the flowers of *Arnica montana*, L.

Use: Medicine.

Shipping regulations: None. *

arnica root oil.

Properties: Light yellow-colored essential oil, darkens with age; pungent aromatic taste; radish odor.

Constants: Sp. gr. 0.982-1.00 at 15°C; optical rotation +0°25' to -2°; refractive index 1.507-1.508; acid value 4-10; ester value 60-100. Soluble in 7-12 volumes of 80% alcohol, occasionally with turbidity.

Derivation: From the dried root of *Arnica montana*, L.

Use: Medicine (liniments, etc.).

Shipping regulations: None. *

"Aroclor." ⁵⁸ Trademark for a series of polychlorinated polyphenyls available as liquids, resins, or solids.

Properties: Water-white mobile liquids and pale yellow viscous oils to light amber resins and opaque crystalline solids. Insoluble in water; thermoplastic; non-drying; stable on long heating at 150°C; electrically nonconducting; not affected by boiling with sodium hydroxide solution.

The light oils can be distilled at atmospheric pressure without appreciable decomposition. The viscous oils and resins distil readily under vacuum, are odorless and tasteless at ordinary temperatures, have adhesive properties; do not support combustion when heated alone above 360°C; are easily soluble in most common organic solvents and drying oils. Hard crystalline materials are, in general, less soluble.

Uses: In protective coatings; as plasticizers and extenders; as sealers in water-proofing compounds and putty; in asphaltic materials, printing inks, waxes, synthetic adhesives. Liquid "Aroclors" are used as dielectrics; hydraulic fluids; in thermostats; in cutting oils; as extreme pressure lubricants; as high temperature lubricants; as grinding fluids; and as a heat transfer medium. Solid "Aroclors" are used to impregnate carbon resistors, as sealers, or impregnating agents for electrical apparatus.

"Aroflo." ²⁸⁵ Proprietary brand name for a

carbon black having long flow properties. Properties: Sp. gr. 1.72; bulk density 12 lbs/cu ft; fluffy powder; color (Nigrometer) 84; particle diameter 27 millimicrons; oil absorption 85 lbs/100 lbs carbon black.

Containers: 25-lb bags and 50-lb cartons.

Uses: A new, long-flow carbon black for printing inks and paints, with low oil absorption, fast drying, a dense color and bluish undertone.

"Arogen" (GPF). ²⁸⁵ Proprietary brand name for a general purpose furnace carbon black.

Properties: Sp. gr. 1.77; free-flowing pellets; bulk density 26 lbs/cu ft; particle diameter 60 millimicrons; pH (approx.) 9.3; ash 0.50% max; 99.9% through 325 mesh screen; color (Nigrometer) 96.

Containers: 50-lb paper bags.

Uses: As a reinforcing ingredient for compounding in natural and most synthetic rubbers, contributing to abrasion resistance, good tensile and tear strength. As a black coloring agent in rubber, paper, plastics, paint and ink.

aromatic nucleus. The six-carbon ring characteristic of the molecules of all organic compounds of the benzene and related series, or the condensed six-carbon rings of naphthalene, anthracene, phenanthrene, etc.

aromatization. See hydroforming process.

"Aromex." ²⁸⁵ Proprietary name for a series of furnace carbon blacks; "Aromex HAF," "Aromex CF" and "Aromex ISAF."

Properties: Sp. gr. 1.77; free-flowing pellets; bulk density 26 lbs/cu ft; particle diameter 30 (HAF), 27 (CF) and 25 (ISAF) millimicrons; pH (approx.) 9.3 (HAF), 9.3 (CF) and 8.0 (ISAF); ash 0.75% max.; 99.9% through 325 mesh screen.

Containers: 50-lb paper bags or bulk.

Uses: As reinforcing ingredients for compounding in natural and most synthetic rubbers, contributing to abrasion resistance, good tensile and tear strength. As black coloring agents in rubber, paper, plastics, paint and ink. "Aromex CF" contributes electrical conducting properties to most rubber compounds. "Aromex ISAF" contributes abrasion resistance.

Arosorb process. Separation of benzene, toluene and xylenes from mixtures containing saturated naphthenic and aliphatic hydrocarbons, by selective adsorption on silica gel.

"Arothane." ²²¹ Trademark for a line of urethane resins.

"Arovel" (FEF). ²⁸⁵ Proprietary brand name for fast extrusion furnace carbon black.

Properties: Sp. gr. 1.77; free-flowing pellets; bulk density 26 lbs/cu ft; particle diameter 55 millimicrons; pH (approx.) 8.4; ash 0.50% max; 99.9% through 325 mesh screen; color (Nigrometer) 92-93.

Containers: 50-lb paper bags.

Uses: As a reinforcing ingredient in natural

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

and most synthetic rubbers, contributing to processing of unvulcanized compounds, and to abrasion resistance, tensile and tear strength; as a black coloring agent.

"Arox." ⁵¹ Trademark for specially compounded fluid lubricants for all air tools except those requiring hand-packing with grease. Used for both wet and dry operations and under all temperature conditions.

"Arquads." ¹⁵ Trademark for a series of quaternary ammonium salts containing one or more alkyl groups ranging in chain lengths from C_8 to C_{18} . These are water-soluble cationic surface chemicals. Certain oil-soluble and water-dispersible "Arquads" are also available.

Containers: Openhead lined drums.

Uses: Sanitizing and cleansing agents; dispersants for fillers in rubber compounding; emulsifying agents; germicides; textile softeners.

Arrhenius equation. An empirical expression relating to the increase of the rate of chemical reaction with rise in temperature. Mathematically:

$$\frac{d \ln k}{dT} = \frac{A}{RT^2}$$

in which k is the specific reaction velocity, T is the absolute temperature, A is a constant usually referred to as the energy of activation of the reaction and R is the gas law constant.

arrowroot. A starch obtained from the roots of several varieties of plants belonging to the genus *Maranta*.

Grades: Bermuda; St. Vincent; domestic.

Containers: Bags; barrels.

Uses: Food; sizing; laundry; adhesives; face powder; starches; baking and confectionery industries.

Shipping regulations: None.*

"Arrow TX" (EPC). ²⁸⁵ Proprietary brand name for a medium processing channel carbon black.

Properties: Sp. gr. 1.77; free-flowing pellets; bulk density 25 lbs/cu ft; particle diameter 27 millimicrons; pH 4.1-4.5; ash 0.05% max.; 99.9% through 325 mesh screen; color (Nigrometer) 84-85.

Containers: 50-lb paper bags or bulk.

Uses: As a reinforcing ingredient for compounding in natural and most synthetic rubbers, contributing to abrasion resistance, tensile and tear strength; as a black coloring agent in rubber, paper, plastics, paint and ink.

arrow wood. See eunonymus.

arsacetin (sodium acetylarsanilate; sodium para-acetylaminophenylarsenate)
 $CH_3CONHC_6H_4AsO(OH)ONa$.

Properties: White, crystalline powder; odorless, tasteless, free of arsenous or arsenic acid; solutions will admit of thorough sterilization. Poisonous! May produce optic atrophy! Soluble in cold, but more

so in warm water.

Use: Medicine.

arsanilic acid (atoxylic acid; para-amino-benzenearsonic acid; para-aminophenyl-arsonic acid; arsenic acid anilide)
 $C_6H_4NH_2 \cdot AsO(OH)_2$.

Properties: White, crystalline powder; practically odorless; poisonous! Soluble in hot water, amyl alcohol and alkaline carbonate solutions; slightly soluble in cold water, alcohol, and acetic acid; insoluble in acetone, benzene, chloroform, and ether. Constants: M. p. 232°C.

Derivation: By condensing aniline with arsenic acid, removing the excess of aniline by steam distillation in alkaline solution and setting the acid free by hydrochloric acid.

Method of purification: Conversion into the sodium salt, boiling with animal charcoal, crystallizing the sodium salt and setting the acid free by dilute hydrochloric acid.

Grades: Technical; pure.

Containers: Tins; glass bottles.

Uses: Arsanilates; starting-point for the manufacture of arsenical medicinal compounds, such as arsphenamine, etc.

arsenic *As*. Element of atomic number 33 of group V of the periodic system. (The word "arsenic" is also frequently used to refer to arsenic trioxide.)

Arsenic is a silver gray or tin-white brittle, crystalline metal that turns black in air. The black form is sometimes encountered as a powder (see arsenic, black). Arsenic also exists in an allotropic form that is a yellow powder (very poisonous!), or a brown or gray powder. Only the metallic form is of commercial importance.

Occurrence: The main commercial source is the flue dust of copper and lead smelters. Arsenic occurs as enargite, realgar, loellingite, arsenopyrite, and danaite (a cobalt-bearing iron arsenic sulfide). The native element is sometimes found. Other minerals are orpiment, mimetite, niccolite, scorodite, smaltite, and sperry-lite.

Properties (of metallic form): Sp. gr. 5.72, but commercial material ranges from 5.6-5.9; m. p. 814° (at 36 atm); sublimes at 615°C; appreciably volatile at 100°C; hardness 3.5 Mohs; insoluble in water; soluble in nitric acid.

Derivation: Arsenic trioxide is heated with charcoal.

Grades: Technical; refined 99%; crude 95-98%; high or electronic purity (impurities less than 10 ppm).

Containers: Bulk; 500-lb barrels; 100-lb casks.

Uses: Hardening lead shot; certain copper alloys (bronzes, speculum metal); lead base alloys for battery grids, bearings, cable sheaths, anodes; certain brasses for high temperature use; copper alloy boiler tubes; in medicine in the form of an amalgam; certain solders; diodes.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

End uses of arsenic and its compounds, in approximate order of volume: insecticides; weed killers; glass industry; crabgrass controls; cotton desiccants; feed additives; miscellaneous.

* Shipping regulations: Poison, class B. Poison label.*

beta-arsenic. See arsenic, black.

arsenic acid $\text{H}_3\text{AsO}_4 \cdot \frac{1}{2}\text{H}_2\text{O}$.

Properties: White, translucent crystals; poisonous! Soluble in water, alcohol, alkali, glycerin.

Constants: Sp. gr. 2-2.5; m.p. 35.5°C; b.p. loses water at 160°C.

Derivation: By digestion of arsenic with nitric acid.

Grades: Pure; technical; C. P.

Containers: Glass bottles; barrels.

Uses: Manufacture of arsenates, arsenical insecticides; rarely medicinally; glass making; wood treating process.

Shipping regulations: Poison, class B. Poison label.*

See also arsenic pentoxide.

"Arsenic Acid 75." ¹⁴⁷ Brand name for arsenic acid for cotton desiccation.

Containers: 5- and 30-gal drums.

arsenic acid anilide. See arsenic acid.

arsenical Babbitt. Bearing metal with up to 3% arsenic, but usually in the range 0.1 to 1.4%. The arsenic minimizes softening at higher temperatures, promotes fatigue strength. Such bearings are extensively used in automobile and diesel engines.

arsenical nickel. See niccolite.

arsenical pyrites. See arsenopyrite.

arsenicals, liquid. General term referring to solutions or mixtures containing arsenic compounds and intended for use as weed killers.

Warning! Poisonous. May be fatal if swallowed. MCA warning label.

Shipping regulations: Poison, class B. Poison label.*

arsenic anhydride. See arsenic pentoxide.

arsenic, black (beta-arsenic). A form of arsenic obtained by the sublimation of arsenic in a tube of hydrogen; sp. gr. 4.2 (20°C); insoluble in water; soluble in nitric acid, hot alcohol.

arsenic bromide. See arsenic tribromide.

arsenic, butter of. See arsenic trichloride.

arsenic chloride. See arsenic trichloride.

arsenic disulfide (red orpiment; arsenic monosulfide; ruby arsenic; realgar; red arsenic glass; red arsenic sulfide; red arsenic) As_2S_2 or AsS .

Properties: Orange-red powder; poisonous! Soluble in acids and alkalis; insoluble in water.

Constants: Sp. gr. 3.4-3.6; m.p. 307°C.

Derivation: By roasting arsenopyrite and iron

pyrites and sublimation.

Grades: Technical.

Containers: Steel drums.

Uses: Leather industry, depilatory agent; paint pigment; shot manufacture; pyrotechnics; calico dyeing and printing; rodenticide.

Shipping regulations: Poison, class B.

Poison label. Legal label name: arsenic sulfide.*

arsenic glass, red. See arsenic disulfide.

arsenic hydride. See arsine.

arsenic iodide (arsenous iodide; arsenious iodide; arsenic triiodide) AsI_3 .

Properties: Orange-red shining crystalline scales or powder; poisonous!; unstable in sunlight or moisture; sp. gr. 4.70 (25°C); m.p. 146°C; sublimes when heated slowly. Soluble in alcohol, ether, carbon disulfide, chloroform, and benzene; soluble in water with hydrolysis.

Derivation: By the direct union of arsenic and iodine.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Glass bottles.

Uses: Analytical chemistry; medicine.

Shipping regulations: Poison, class B. Poison label.*

arsenic monosulfide. See arsenic disulfide.

arsenic oxide. See arsenic trioxide; arsenic pentoxide.

arsenic pentasulfide As_2S_5 .

Properties: Yellow or orange powder.

Poisonous! Soluble in nitric acid and alkalis; insoluble in water; decomposes to sulfur and the trisulfide when heated.

Derivation: By the decomposition of sulfarsenates or by precipitating arsenic acid in a hydrochloric acid solution with hydrogen sulfide. It is filtered, then dried.

Grades: Technical.

Containers: Barrels; boxes.

Uses: Paint pigments; blue fire; Bengal lights.

Shipping regulations: Poison, class B. Poison label.*

arsenic pentoxide (arsenic oxide; arsenic anhydride; arsenic acid) As_2O_5 .

Properties: White, amorphous solid; deliquescent. Poisonous! Forms arsenic acid in water. Soluble in water, alcohol.

Constants: Sp. gr. 4.086; m.p. 315°C.

Derivation: By action of oxidizing agent such as nitric acid on arsenious oxide.

Grades: Various as to purity.

Containers: 400-lb drums; cartons; boxes; tins.

Uses: Arsenates; insecticides; dyeing and printing.

Shipping regulations: Poison, class B. Poison label.*

arsenic red. See arsenic disulfide.

arsenic, ruby. See arsenic disulfide.

arsenic sulfide, red. See arsenic disulfide.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

arsenic sulfide, yellow. See arsenic trisulfide; orpiment.

arsenic tersulfide. See arsenic trisulfide.

arsenic tribromide (arsenic bromide; arsenious bromide; arsenous bromide) AsBr_3 .

Properties: Yellowish-white hygroscopic crystals; poisonous! Sp. gr. 3.54 (25°C); m. p. 33°C; b. p. 221°C. Decomposed by water.

Derivation: By the direct union of arsenic and bromine.

Uses: Analytical chemistry; medicine.

Shipping regulations: Poison, class B.

Poison label. Legal label name: arsenic bromide.*

arsenic trichloride (arsenic chloride; arsenious chloride; arsenous chloride; butter of arsenic; caustic arsenic chloride; fuming liquid arsenic) AsCl_3 .

Properties: Colorless or pale yellow, oily liquid. Soluble in concentrated hydrochloric acid and most organic liquids; decomposed by water. Fumes in moist air. Poisonous!

Constants: B. p. 130.5°C; m. p. -18°C; sp. gr. 2.163 (14/4°C); flash point, none.

Derivation: (a) By action of chlorine on arsenic; (b) by distillation of arsenic trioxide with concentrated hydrochloric acid.

Grades: Technical.

Containers: Bottles; 20-, 55-gal drums.

Uses: Intermediate for organic arsenicals (pharmaceuticals, insecticides); poison gases; ceramics.

Shipping regulations: Poison, class B.

Poison label.*

arsenic triiodide. See arsenic iodide.

arsenic trioxide (arsenious acid; white arsenic; arsenious oxide; "arsenic," arsenous anhydride) As_2O_3 .

Properties: White amorphous, odorless, tasteless powder; poisonous! Slightly soluble in water; soluble in acids and alkalis; freely soluble in glycerin.

Constants: Sp. gr. 3.865; sublimes 193°C.

Derivation: By roasting arsenopyrite and recovery of the arsenic trioxide by sublimation.

Method of purification: Sublimation.

Grades: Technical; 99%; offgrade (96-99%); C. P.; N. F. XI; electronically pure.

Containers: 5-, 50-gal drums; barrels; carloads.

Uses: Manufacture of pigments, glass, shot and bullets; insecticides; rat poison; cattle dip; weed killer; hide preservative; medicine; manufacture of other arsenic compounds; ceramic enamels; aniline colors; mixed with soda ash for boiler compound; textile mordant; sterilizing agent in water purification; wood preservative.

Danger! May be fatal if swallowed. MCA warning label.

Shipping regulations: Poison, class B.

Poison label.*

arsenic trisulfide (arsenious sulfide; arsenous sulfide; arsenic tersulfide) As_2S_3 .

Properties: Yellow crystals or powder, changes to a red form at 170°C; sp. gr. 3.43; m. p. 300°C; insoluble in water and hydrochloric acid; dissolves in alkaline sulfide solutions and in nitric acid; poisonous!

Derivation: Occurs in nature as the mineral orpiment (q. v.). May be precipitated from arsenious acid solution by the action of hydrogen sulfide.

Grades: Technical.

Uses: Pigment; reducing agent; medicine; fibers to be used in fiber optics.

Shipping regulations: Poison, class B.

Poison label. Legal label name: arsenic sulfide.*

arsenic white. See arsenic trioxide.

arsenic yellow. See arsenic trisulfide (pigment); orpiment.

arsenious acid. See arsenic trioxide.

arsenious anhydride. See arsenic trioxide.

arsenious bromide. See arsenic tribromide.

arsenious chloride. See arsenic trichloride.

arsenious iodide. See arsenic iodide.

arsenious oxide. See arsenic trioxide.

arsenious sulfide. See arsenic trisulfide.

arseniuretted hydrogen. See arsine.

arsenobenzene. See arspenamine.

arsenopyrite (mispickel; arsenical pyrites) $\text{FeS}_2 \cdot \text{FeAs}_2$.

Properties: Silver-white to gray mineral with grayish-black streak and metallic luster. Found in mineral veins associated with ores of silver, lead, cobalt, tin, zinc. It sometimes is highly auriferous. Soluble in nitric acid. Sp. gr. 5.89 to 6.2; hardness 5.5 to 6.0.

Occurrence: United States (California, Alaska); Canada; Brazil; Australia; Bolivia; England; Germany.

Uses: Ore of arsenic and gold.

arsenous anhydride. See arsenic trioxide.

arsenous bromide. See arsenic tribromide.

arsenous chloride. See arsenic trichloride.

arsenous iodide. See arsenic iodide.

arsenous oxide. See arsenic trioxide.

arsenous sulfide. See arsenic trisulfide.

arsenous sulfide, yellow. See arsenic trisulfide.

arsine (arsenic hydride; arseniuretted hydrogen) AsH_3 .

Properties: Colorless gas; extremely poisonous! M. p. -113.5; b. p. -55°C; decomposes 230°C; soluble in water; slightly soluble in alcohol, alkalis.

Derivation: By the action of sulfuric acid on metallic zinc mixed with arsenic compounds.

Grades: Technical.

Containers: Steel cylinders.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Use: Organic synthesis; military poison gas.
Shipping regulations: Poison, class A.
Poison gas label: *

arsphenamine (3,3'-diamino-4,4'-dihydroxy-arsenobenzene dihydrochloride; arsenobenzene; 606; Ehrlich 606). Originally patented as "Salvarsan."

$\text{NH}_2(\text{OH})\text{C}_6\text{H}_3\text{AsAsC}_6\text{H}_3(\text{OH})\text{NH}_2 \cdot 2\text{HCl} \cdot 2\text{H}_2\text{O}$.
Properties: Light yellow, hygroscopic, poisonous powder; odorless or slight odor. Contains not less than 30% arsenic. Oxidized by exposure to air, it becomes more toxic and darker. Soluble in water, alcohol, glycerol and sodium hydroxide solution; slightly soluble in chloroform and ether.

Derivation: By reducing 3-nitro-4-hydroxyphenylarsonic acid with sodium hydrosulfite.

Containers: Ampules; sealed glass tubes.

Use: Medicine.

Shipping regulations: None. *

arsthinol $\text{C}_{11}\text{H}_{14}\text{NO}_3\text{S}_2\text{As}$ Cyclic 3-hydroxypropylene ester of 3-acetamido-4-hydroxydithiobenzenearsonous acid; 2-(3'-acetamido-4'-hydroxyphenyl)-1,3-dithia-2-arsacyclopentone-4-methanol.

Properties: White, odorless, microcrystalline powder; sparingly soluble in alcohol; very slightly soluble in water.

Grade: N. N. D.

Use: Medicine.

"Artane" Hydrochloride. ⁵⁷ Trademark for trihexphenidyl hydrochloride [3-(1-piperidyl)-1-phenyl-1-cyclohexyl-1-propanol hydrochloride] $\text{C}_{20}\text{H}_{31}\text{NO} \cdot \text{HCl}$.

Properties: White crystalline powder; m. p. 248-252°C; solubility less than 1 g/100 cc water at 25°C; slightly soluble in alcohol; pH (saturated aqueous solution) 6.3; decomposes 258.8°C.

Use: Medicine.

artemisla absinthium oil. See wormwood oil.

artemisla maritima. See worm-seed oil, Levant.

l-arterenol. See levarterenol.

"Artic." ²⁸ Trademark for refrigeration grade 99.5+ % pure methyl chloride.

Properties: Boiling range (95%) -24.6° to -23.6°C; wt/gal 7.68 lb at 20°C.

Containers: 100-lb cylinders; multiunit tank cars of 15 (1,300 lb each) tanks.

artificial cinnabar. See mercuric sulfide, red.

artificial gum. See dextrin.

artificial ivory. See ivory, artificial.

artificial malachite. See copper carbonate.

artificial oil of neroli. See methyl anthranilate.

aryl compounds Those whose molecules have the ring structure characteristic of benzene, naphthalene, phenanthrene, anthracene, etc., i. e., either the six-carbon ring of benzene or the condensed six-carbon rings of the other aromatic derivatives.

For example, an aryl radical might be phenyl, C_6H_5- ; benzyl, $\text{C}_6\text{H}_5\text{CH}_2-$; naphthylene, C_{10}H_8- ; etc.

As. Symbol for arsenic.

as-. Abbreviation for asymmetrical; same as uns- (q. v.).

"AS-15." ²⁹⁹ Trademark for an agricultural preparation containing streptomycin.

"ASA." ¹⁰⁰ Trademark for acetylsalicylic acid, U. S. P.

"ASA." ²⁴³ Trade name for a proprietary antiskinning agent.

Properties: Water-white to pale straw liquid, containing 100% active ingredient; sp. gr. (80°F) 0.908; flash point 66°C (Cleveland open cup).

Containers: 5-, 15-, and 55-gal specially lined drums.

Uses: Antiskinning agent for paint, enamel, varnish and ink.

asafetida (devil's dung; food of the gods). A soft brown gum resin obtained by incising the living roots of *Ferula fetida* and other species of *Ferula*.

Properties: Very obnoxious odor; bitter, acrid taste.

Occurrence: Native in Tibet; Persia; Turkistan.

Grades: Technical; lump; powdered.

Containers: Cans; barrels.

Uses: Medicine; proprietary remedies; condiment.

Shipping regulations: None. *

asafetida oil.

Properties: Colorless to yellow or brown essential oil. Disagreeable odor suggestive of onions or garlic. Soluble in alcohol, ether, chloroform, benzene.

Constants: Sp. gr. 0.915-0.993 at 15.5°C; optical rotation +10°58' to -17°3'; refractive index 1.4942-1.5259; sulfur content 8.9-31.4%.

Derivation: By distillation of gum asafetida.

asar. See asarum.

asarabacca oil. See asarum europeum oil.

asarum (Canada snake root; wild ginger; asar).

The dried rhizomes and roots of *Asarum canadense* or *Asarum europeum*, a low perennial herb.

Occurrence: Canada to North Carolina and Kansas.

Chief constituents: An acrid bitter resin and aromatic volatile oil. (See asarum oil).

Uses: Medicine; source of oil.

asarum canadense oil (Canada snake root oil; wild ginger oil; Canadian asarabacca oil).

Properties: Yellowish-brown volatile oil; agreeable, strong aromatic odor and taste; soluble in 70-80% alcohol.

Chief known constituents: Linalool; pinene; borneol; terpineol; geraniol; methyl eugenol.

Derivation: Distilled from the rhizome and roots of *Asarum canadense*.

*See "I. C. C. Shipping Regulations," page xiii. *

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Aseptoform" methyl, "Aseptoform" propyl, "Aseptoform" butyl.

"A. S. F." ²⁹⁹ Trademark for a preparation containing water-soluble vitamins; used in medicine.

ash. Mineral content of a product that remains after the product has been burned.

ash, causticized. See causticized ash

askarel. A generic descriptive name for synthetic nonflammable electrical insulating (dielectric) material which when decomposed by the electric arc evolves only non-explosive gases or gaseous mixtures. Examples are chlorinated aromatic derivatives, particularly pentachlorodiphenyl and trichlorobenzene, but also including pentachlorodiphenyl oxide, pentachlorophenylbenzoate, hexachlorodiphenylmethane, pentachlorodiphenyl ketone, and pentachloroethylbenzene.

Use: Nonflammable liquids for transformer insulation.

A. S. M. Abbreviation for American Society for Metals.

"**ASP.**" ⁹⁹ Trademark for aluminum silicate pigments; selected particle size, white crystals that have been process engineered to remove moisture, sand, mica, and water-soluble salts. These nonhygroscopic products are essentially inert and insoluble under normal use conditions. Certain grades are available with surface treatment or modifications for special properties in aqueous or organic systems.

Typical analysis (volatile free basis):

ASP (unmodified): SiO_2 , 45.4%; Al_2O_3 , 38.8%; Fe_2O_3 , 0.3%; TiO_2 , 1.5%; CaO , 0.1%; Na_2O , 0.1%; K_2O , trace, LOI, 13.8%

ASP 102, 106, 600 and 602 are used for rubber applications. They have very high whiteness and excellent extrusion properties. ASP 400 and 900, because of their "anti-penetration" characteristics, make effective blocking agents in adhesives for corrugated board, laminated fiber board, paper bag seams, paper tubes, cores, and proprietary adhesives

asparagic acid. See aspartic acid.

asparagine (alpha-aminosuccinamic acid; beta-asparagine; althein; aspartamic acid; aspartamide)
 $\text{NH}_2\text{COCH}_2\text{CH}(\text{NH}_2)\text{COOH}$. The beta amide of aspartic acid, a non-essential amino acid, existing in the D(+)- and L(-)-isomeric forms as well as the DL-racemic mixture. L(-)-asparagine is the most common form

Properties L(-)-asparagine monohydrate: White crystals; m.p. 234-235°C; acid to litmus; nearly insoluble in ethanol, methanol, ether, and benzene; soluble in acids and alkalis

Derivation: Occurs in most young plants, especially Leguminosae.

Uses: Biochemical research; preparation of

culture media; medicine.

beta-asparagine. See asparagine.

asparaginic acid. See aspartic acid.

aspartamic acid. See asparagine.

aspartamide. See asparagine.

aspartic acid (asparaginic acid; asparagic acid; aminosuccinic acid)
 $\text{COOHCH}_2\text{CH}(\text{NH}_2)\text{COOH}$. A naturally occurring nonessential amino acid. The common form is L(+)-aspartic acid.

Properties: Colorless crystals; soluble in water; insoluble in alcohol and ether; optically active:

DL-aspartic acid: M p. 278-280°C with decomposition; sp gr 1.663 (12/12°C)

L(+)-aspartic acid: M p 251°C

D(-)-aspartic acid: M p 269-271°C with decomposition; sp gr 1.6613

Source: Young sugar cane; sugar beet molasses

Derivation: Hydrolysis of protein; reaction of ammonia with diethyl fumarate

Uses: Biological and clinical studies; preparation of culture media; organic intermediate; dietary supplement.

Available commercially as D(-)- and L(+)-aspartic acid.

aspergillic acid $\text{C}_{12}\text{H}_{20}\text{N}_2\text{O}_2$. Dibutylhydroxypiperazone. An antibiotic substance from strains of *Aspergillus flavus*.

Properties: M. p. 97°C; insoluble in cold water; soluble in common organic solvents and dilute acids. Hydrochloride melts at 178°C and is soluble in water

asphalt (asphaltum; earth pitch; Trinidad pitch; Judean pitch, Jew's pitch; mineral pitch; petroleum asphalt) Black to dark-brown solid or semi-solid material which gradually liquefies when heated; its predominating constituents are bitumens, which occur in the solid or semi-solid form in nature, or are obtained by refining petroleum, or are combinations of the bitumens mentioned with each other or with petroleum or derivatives thereof

Properties: Black solid, with a dull luster; streak black to brown; solubility in carbon disulfide 69% (native), 99% (petroleum). Flash point 350°F (native), 450°F (petroleum).

Derivation: Found native, or obtained as a residue from the distillation of crude petroleum.

Occurrence: United States; Trinidad; Venezuela; Cuba; Canada; Europe

Containers: 1-gal friction top pails; 25- and 50-lb cans; 400-lb seamless drums; tank trucks; tank cars.

Uses: Paving, roofing, waterproofing material; paints; oil-base drilling muds; dielectrics; rubber blends; fungicides; fuel, including solid propellants for rockets.

Shipping regulations: None.*

See also asphaltite; bitumen; asphaltic pyrobitumen; rock asphalt; gilsonite.

asphalt, blown. See blown asphalt.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

asphalt, condensed. See blown asphalt.

asphalt, cut-back. A liquid petroleum product, produced by fluxing an asphaltic base with suitable distillates (A. S. T. M. definition).

Properties: Flash point (open cup) 100°F.

Solubility of residue from distillation in carbon tetrachloride 99.5%.

Use: Road surfaces

asphalt, emulsified. A suspension or emulsion of ordinary asphalt in water. Such emulsions have attained wide use because, unlike straight asphalt, they do not have to be heated to be applied. The suspended asphalt is spread on in the usual way; and after the water has evaporated, the asphalt hardens into a continuous mass.

Containers: Steel drums and tank cars or trucks

Uses: Highways; cement waterproofing; roofing compounds; and the like.

asphaltic pyrobitumen. A natural bitumen distinguished by infusibility and low solubility in carbon disulfide. Species include elaterite, wurzilite, albertite, impsomite, and pyrobituminous shales

asphaltite. A native bituminous mixture similar to asphalt, but more difficultly fusible, and less soluble in carbon disulfide. Materials coming under this classification are gilsonite, glance pitch, grahamite, Egyptian asphalt, and Syrian asphalt.

asphalt, liquid. See residual oils.

asphalt, oxidized. See blown asphalt

asphalt paint. Asphaltic base in a volatile solvent with or without drying oils, resins, fillers, and pigments

asphalt, sludge. See sludge asphalt.

asphalt, sulfurized. See sulfurized asphalts

asphaltum. See asphalt.

asphaltum oil. See residual oils

aspic oil. See lavender-spike oil.

aspidium (male fern; shield fern)

Derivation: Dried rhizome of *Dryopteris filixmas*

Occurrence: North America; northern Asia; Europe; northern Africa.

Grades: Technical; U. S. P. XVI.

Containers: Bags

Use: Medicine.

Shipping regulations: None.*

aspidosperma. See quebracho

aspidospermine $C_{22}H_{30}O_2N_2$. An alkaloid.

Properties: White to brownish-yellow crystalline alkaloid.

Constants: M.p. 208°C; b.p. 220°C

(1 to 2 mm); sublimes at 180°C under reduced pressure. Soluble in fats and fixed oils; sparingly soluble in absolute alcohol and ether. Its sulfate and hydrochloride are soluble in water.

Use: Medicine.

aspirin. See acetylsalicylic acid.

aspirin, soluble. The calcium, lithium, or sodium salts of aspirin.

assay. A method of analysis, or the results of an analysis, or the process of performing the analysis. Formerly applied to ores and metals, but now more generally used

association. A chemical reaction, generally caused by a weaker class of chemical bonding forces, but stronger than the forces that hold liquids and solids together, more specific and usually reversible. It may be between molecules of the same kind, for example the dimerization of acetic acid in nonaqueous solvents, or between molecules, or ions and molecules, of unlike kind, as is represented by the formation of ammonia complexes of many metal ions. The simple and the larger molecules are usually in equilibrium with one another with appreciable concentrations of each present. Polymerization is almost synonymous but usually refers to processes in which the larger molecules are not easily reconverted to the simpler form.

A-stage resin (resol). The first stage of condensation in the formation of phenol-formaldehyde and similar resins. At this stage the resin is fusible, i.e., it becomes fluid on heating, and is completely soluble in alcohol. Its molecules have not become cross-linked. This form of resin is used for laminating and impregnating paper and fabrics. On heating further, the resin is converted to the infusible, insoluble, thermoset cross-linked form. See B-stage resin (intermediate) and C-stage resin

astatine At. Element of atomic number 85, a member of the halogen family of elements (group VII). It is reported to occur naturally in very small quantities from the branched beta decay in the three naturally occurring radioactive decay series. Astatine is also formed by the alpha decay of francium and has been prepared synthetically by bombarding bismuth with alpha particles. Astatine 210 is the longest-lived isotope, having a half-life of 8.3 hours. Thus its properties are difficult to evaluate. Astatine, although more metallic than the other halogens, has halogen-like characteristics, being easily volatilized and easily reduced to the free element in solution. It is similar to iodine in that it is concentrated in the thyroid gland.

"Asterol" Dihydrochloride. ¹⁹⁰ Trademark for a brand of diamthazole dihydrochloride (q.v.), an antifungal agent.

asthma weed. See lobelia.

ASTM. Abbreviation for American Society for Testing Materials, a national technical society organized for "the promotion of knowledge of the materials of engineering, and the standardization of specifications and the methods of testing." The society

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

publishes standards for all types of engineering materials in its Book of ASTM Standards, which is frequently revised to keep it up to date

"Astol" A. ²⁰⁶ Brand name for a proprietary scouring and desizing agent consisting of a stable emulsion of trichloroethylene suitable for use on delicate materials

"Aston 123." ³²⁸ Trade name for a thermo-setting polyamine, 20% active
Use: Durable anti-static agent

"Astracel." ³⁰⁷ Fast dyes for printing acetate rayon.

"Astrol." ¹⁰⁷ A fast alizarine direct blue

asymmetry. A molecular arrangement in which a particular carbon atom is joined to four different groups See optical isomerism

At. Symbol for astatine

"Atabrine" Hydrochloride. ¹⁶² Trademark for the drug, quinacrine hydrochloride

atacamite $\text{Cu}_2\text{Cl}(\text{OH})_3$ Naturally occurring basic copper chloride

Properties: Color, various shades of green; luster, adamantine to vitreous; hardness 3-3.5, sp. gr. 3.75-3.94. Found in the oxidized portions of copper deposits

Occurrence: Chile; Bolivia, Mexico; Australia; Arizona

Use: A minor ore of copper.

atactic. A type of polymer molecule in which substituent groups or atoms are arranged randomly above and below the backbone chain of atoms, when the latter are arranged so as all to be in the same plane See polymer, stereospecific

"Atarax." ²⁹⁹ Trademark for hydroxyzine hydrochloride

"Ataraxoid." ²⁹⁹ Trademark for a combination drug containing prednisolone and hydroxyzine hydrochloride

ATE. Abbreviation for aluminum triethyl
See triethyl aluminum

"Atlas." ⁸⁹ Trademark for a series of polyester resins for use in reinforced plastics

"Atlacide." ¹⁴⁷ Brand name for a non-selective chlorate weed and grass killer
Containers: 100-lb drums

Use: As water spray or dry powder to destroy roots of undesirable vegetation

Atlas "A." ¹⁴⁷ Trademark for a sodium arsenite solution

Containers: 5-, 30- and 55-gal drums
Properties: Contains 4, 6, 8 or 9 1/2 lbs arsenic trioxide per gal; mixes readily in cold water; nonflammable and non-explosive; also available as a soluble powder (Atlas "A" SP); 5 lbs is equivalent to 1 gal Atlas "A" solution

Uses: For selective weed control in turf; tree or stump killer; potato vine killer prior to harvesting; controls certain submerged vegetation in ponds and lakes;

effective for control of subterranean termites

Atlas "D" Debarking Compound. ¹⁴⁷ Brand name for a sodium arsenite solution.
Containers: 2-gal cans; 5-, 30-, 55-gal drums

Use: Used during sap-flow season to obtain easy removal of bark from standing timber intended for pulpwood, fence posts and poles. Contains animal repellent

"Atlstavon." ⁴¹ Trade name for synthetic-resin sheet lining of the plasticized vinyl type used to protect steel tanks at temperatures up to 160°F without brick sheathing Outstanding resistance to oxidizing acids.

"Atlstatic 31." ⁴¹ Trade name for an asphaltic lining material used as a resilient membrane between concrete and acid brick sheathing

"Atlstatic 77." ⁴¹ Trade name for a cold-trowel, bituminous-based compound for joining sewer pipe.

"Atlas W. P. & C." ¹⁴⁷ Trademark for a non-corrosive, non-poisonous, non-vaporous, and odorless liquid for cleaning and preserving ships' decks
Containers: 5-gal drums

"Atlosol." ⁸⁹ Trademark for an emulsifier used with oil and water to make drilling fluids for oil production

"Atlox." ⁸⁹ Trademark for series of emulsifiers developed for use with agricultural pesticides.

ATM. Abbreviation for aluminum trimethyl
See trimethyl aluminum

"Atmos." ⁸⁹ Trademark for a series of mono- and diglyceride emulsifiers used in ice cream and frozen desserts

atmosphere.

1 Synonym for air (q. v.)

2 A unit of pressure equivalent to 760 mm mercury or 14.696 pounds per square inch absolute (psia)

"Atmul." ⁸⁹ Trademark for a series of mono- and diglyceride emulsifiers used in baked goods and other food products.

atom. The smallest particle of an element which retains the characteristic properties and behavior of the element, or the smallest particle of an element that can exist by itself or in combination with similar particles of the same or other elements

atomic bomb (A-bomb) An explosive device containing two or more masses of fissionable substances such as uranium-235 or plutonium, together with a mechanical means of uniting these masses suddenly. The size of the individual masses must be subcritical, i. e., less than the critical mass, but the combined mass is greater (super-critical) Immediately upon uniting the masses an extremely violent explosion occurs due to rapid uncontrolled release of

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

nuclear energy by fission of the U-235 or plutonium. This nuclear reaction is propagated into a chain reaction when a neutron from fission of one atom enters another atom and causes its fission, so that it releases energy and more neutrons, which continue the process. In a large mass few neutrons escape and the chain reaction becomes explosively rapid. It has been proposed that such explosive devices of great power may be used for peaceful purposes such as the clearing of underwater obstacles, or the release of petroleum from oil shales.

atomic energy. Misnomer for nuclear energy (q. v.).

atomic hydrogen welding. A term used to describe a method of welding in which hydrogen gas is passed through an arc between two tungsten electrodes. The arc breaks down the molecules to form atomic hydrogen. The recombination of the atoms to form molecules and the combustion of the molecular hydrogen in atmospheric oxygen produce a flame temperature of 4000-5000°C.

atomic number. The number of unit positive charges carried by the nucleus of an atom, or the number of external electrons outside the nucleus of an atom. With a few exceptions, it is the number of the element in the sequence obtained by arranging the elements in the order of increasing atomic weight.

atomic volume. The atomic weight of an element divided by its density

atomic weight. The weight of an atom of an element compared with the weight of an atom of the lighter isotope of oxygen taken as standard at 16. This is the definition of the so-called physical atomic weights, which differ very slightly from chemical atomic weights based on the normally occurring mixture of isotopes of oxygen.

atoxylic acid. See *arsanilic acid*.

ATP. Abbreviation for *adenosine triphosphate*.

"Atpet." ⁸⁹ Trademark for a series of emulsifiers used in conjunction with oil as corrosion inhibitors, solubilizers for production of soluble cutting oils, and water-block removal agents in oil well drilling.

atropamine. See *apoatropine*.

atropine (daturine) $C_{17}H_{23}NO_3$. An alkaloid obtained from species of *Atropa*, *Datura* or *Hyoscyamus*.

Properties: White crystals or white crystalline powder; extremely poisonous! optically inactive (but usually contains levorotatory hyoscyamine). Soluble in alcohol, ether, chloroform, and glycerol. Slightly soluble in water. M. p. 114-116°C.

Derivation: By extraction from *Datura stramonium*, or synthetically.

Grades: Technical; N F. XI

Containers: Glass bottles; tins.

Use: Medicine; antidote for nerve gases.

Shipping regulations: None. *

atropine methylbromide $C_{17}H_{23}NO_3 \cdot CH_3Br$.

Properties: White crystals; m. p. 222-223°C; very poisonous! Soluble in water and alcohol.

Use: Medicine.

atropine methylnitrate $C_{17}H_{23}NO_3 \cdot CH_3NO_3$.

Properties: White crystalline powder; odorless; m. p. 163°C; very poisonous! soluble in water and alcohol.

Use: Medicine.

atropine oleate. Soluble in benzene, chloroform, ether, and oils; insoluble in water.

Derivation: A 2% solution of atropine in equal parts of olive oil and oleic acid.

Use: Medicine.

atropine sulfate $(C_{17}H_{23}NO_3)_2H_2SO_4 \cdot H_2O$.

Intense poison!

Properties: White, odorless, crystalline powder, efflorescent in dry air; very poisonous! Soluble in water, alcohol, and glycerol; less soluble in chloroform and ether. M. p. given variously at 183-194°C. U. S. P. requires not less than 188°C.

Derivation: By interaction of a solution of atropine in ether and of sulfuric acid in strong alcohol.

Grades: U. S. P. XVI.

Containers: 1-oz bottles; 5- and 15-grain vials

Uses: Similar to those of atropine (q. v.).

"Attaclay." ⁹⁹ Trademark for a naturally absorbent material produced from the mineral *attapulgit*, a clay mined only in southwestern Georgia and northwestern Florida. Activated by specific thermal treatment and ground to fine particle size for use as versatile carriers, diluents, and conditioners for the formulation of insecticides, herbicides, fungicides and other agricultural dusts and wettable powders.

Typical analysis (volatile free basis):

SiO₂, 67.0%; Al₂O₃, 12.5%; MgO, 11.0%; Fe₂O₃, 4.0%; CaO, 2.5%; other, 3.0%.

Tamped bulk density 25-27 lbs/cu ft; sp. gr. 2.47.

"Attacote." ⁹⁹ Trademark for a fine particle size, sorptive *attapulgit* clay product recommended as an anti-caking, anti-agglomerating agent for conditioning ammonium nitrate and sulfate crystals, urea, granular fertilizers, etc

Properties: Tamped bulk density 18-22 lbs/cu ft; sp. gr. 2.47; average particle size 5-3 microns.

Attacote "C": A modified grade of Attacote that will meet a low specification for ammonia release.

"Attagel." ⁹⁹ Trademark for colloidal grades of *attapulgit* clay (hydrous magnesium aluminum silicate).

Properties: Tamped bulk density 19-21 lbs/cu ft (Attagel 20); 30-35 lbs/cu ft (Attagel 30). Sp. gr. 2.36; average particle size

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

0.12-0.14 microns.

Attagel 30: A pulverized colloidal form of attapulgis clay which disperses by the application of shear to produce thickening of aqueous systems.

Attagel 20: Similar except that it has been processed to obtain the best particle size distribution.

Uses: In thickening or gelling of organic or aqueous systems, suspending pigments or other solids in aqueous or organic systems, stabilizing emulsions, or for introducing thixotropic properties into organic or aqueous systems.

attapulgit ($\text{Mg, Al}_2\text{Si}_4\text{O}_{22}(\text{OH})_4 \cdot 4\text{H}_2\text{O}$). A clay mineral, the active ingredient in most fuller's earth (q. v.).

"Attapulgis" 150. ⁹⁹ Trademark for attapulgis drilling clay processed from attapulgit. Used in fresh, salt, gyp, or high temperature systems. For typical analysis, see "Attaclay."

attar of roses. See rose oil.

"Attasorb" LVM. ⁹⁹ Trademark for a complex hydrated magnesium aluminum silicate; an effective sorptive cleaner and polishing agent, emulsion stabilizer, and film strengthener. For typical analysis, see "Attaclay." Tamped bulk density 15-18 lbs/cu ft; pH 7.5-9.0.

Au. Symbol for gold.

aubepine. See para-anisaldehyde.

Auer metal. See pyrophoric alloy.

Auger effect. The phenomenon of the emission of electrons from atoms during de-excitation from energy levels from which x-rays are expected. When an electron is removed from an inner shell of an atom, the x-ray energy of the transition of outer electrons into the inner shells may be internally converted to the ejection of several of the more loosely bound electrons. These emitted electrons are called Auger electrons.

"Aura." ¹⁰⁸ Trademark for a powdered, chlorinated, alkaline polyphosphate detergent for mechanical washing of all tableware, including plastic and china-ware.

Containers: 125-, 350-lb drums.

"Auragreen." ³²⁹ Trademark for a special dye mixture used for control of brown-patch disease of turf grass. It has advantage as a grass dye.

auramine ($(\text{CH}_3)_2\text{NC}_6\text{H}_4(\text{C:NH})\text{C}_6\text{H}_4\text{N}(\text{CH}_3)_2 \cdot \text{HCl}$). Properties: Yellow flakes or powder; soluble in water, alcohol, and ether.

Uses: Yellow dye for paper, textiles, leather; also an antiseptic; fungicide.

aurantiin. See naringin.

"Aurantiol." ²²⁷ $\text{C}_{18}\text{H}_{27}\text{O}_3\text{N}$. Trademark for hydroxycitronellal-methyl anthranilate Schiff base (methyl N-3,7-dimethyl-7-hydroxyoctylidene-anthranilate).

Properties: Linden-orange flower odor; yellow honey-like viscous liquid; stable; refractive index (n_{20/D}) 1.5350-1.5460; flash point TCC 206°F. Clearly soluble in 2 parts of 70% alcohol, 1 part of 80% alcohol.

Occurrence: Not found in nature.

Uses: Floral scents.

"Aurasperse." ¹³⁴ Trade name for water dispersions of pigments for use in latex based paints.

aureolin. See Indian yellow.

"Aureomycin." ³¹⁵ Trademark for chlortetracycline (q. v.).

"Auric." ²⁸ Trademark for a hydrated ferric oxide brown pigment

auric bromide. See gold tribromide.

auric chloride. See gold chloride.

auric hydroxide. See gold hydroxide.

auric oxide. See gold oxide

auric trioxide. See gold oxide.

aurin ($\text{C}_6\text{H}_4\text{OH})_2\text{CC}_6\text{H}_4\text{O}$.

Properties: Reddish-brown pieces with greenish metallic luster; easily powdered; insoluble in water, benzene, and ether; soluble in alcohol

Uses: Indicator; dye intermediate.

Note: This material is often confused with para-rosolic acid, from which it differs only slightly in composition

auripigment. See orpiment.

"Aurofac." ⁵⁷ Trademark for a feed supplement based on chlortetracycline.

alpha-auromeraptoacetanilid. See aurothioglycanide

aurothioglucose (gold thioglucose) $\text{C}_6\text{H}_{11}\text{O}_5\text{SAu}$

Properties: Yellow to yellow-green powder; almost odorless and tasteless. Soluble in water (decomposes); insoluble in acetone, alcohol, chloroform, and ether; pH of 1% aqueous solution 6.3.

Derivation: Reaction of gold bromide with an aqueous solution of thioglucose and sulfur dioxide.

Grade: N. F. XI.

Use: Medicine.

aurothioglycanide (alpha-auromeraptoacetanilid) $\text{C}_6\text{H}_5\text{NHCOC}_6\text{H}_4\text{SAu}$.

Properties: Grayish-yellow powder. Insoluble in acids, bases, benzene, ether, chloroform, and water.

Grade: N. N. D.

Use: Medicine.

aurous bromide. See gold monobromide.

aurous iodide. See gold iodide.

aurous sodium thiosulfate. See gold-sodium thiosulfate.

austenite. A nonmagnetic solid solution of carbon or ferric carbide in gamma iron. Very unstable below its critical temperature, but may be obtained in high carbon

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

steels by rapid quenching from high temperatures. Addition of manganese and nickel lowers critical transition temperature and austenite may be obtained stable at room temperature in proper alloys. Characterized by a face-centered cubic lattice.

austenitic alloys (austenitic steels). Alloys of iron, chromium, nickel noted for their resistance to corrosion.

Australian bark. See wattle bark.

Australian black wattle gum. See wattle gum.

Australian fever bark. See alstonia.

Australian fever tree. See eucalyptus

Australian native quinine. See alstonia.

Austrian cinnabar. See chromè red.

"Autoset."⁶⁵ Trademark for urea-formaldehyde resin for use as a binder in the manufacture of particle board.

autumn crocus. See colchicum.

autunite (calcium uranite; lime uranite) $\text{Ca}(\text{UO}_2)_2(\text{PO}_4)_2 \cdot 10\text{H}_2\text{O}$. A natural hydrated phosphate of calcium and uranium, found in the oxidized zones of uranium deposits. Properties: Color, lemon yellow to sulfur yellow, sometimes pale greenish yellow; streak yellowish; one good cleavage; hardness 2.0-2.5; sp. gr. 3.1-3.2; fluorescent in ultraviolet light; radioactive. Occurrence: New York, North Carolina, New Mexico, South Dakota, Europe. Use: Minor ore of uranium.

auxenolic acid. See auxin.

auxentriolic acid. See auxin.

auxin.

1. General term for any of a group of natural and synthetic substances referred to as plant hormones which stimulate plant growth. The presence of auxins in plant cells contributes to the ability to bend toward the light. The natural materials are formed in the tips of growing plants, and in root tips, and on the shaded side of growing shoots. The materials occur in small amounts in numerous varieties of plant and animal matter. These are mostly ether-soluble carboxylic acids of the formula $\text{R}(\text{CH}_2)_x\text{COOH}$, where R is either aromatic or an unsaturated naphthenic group. Phenylpropionic acid, and 3-indoleacetic acid are well-known examples.

2. Specifically auxin A and auxin B are particular naturally occurring members of the above group with formulas $\text{C}_{18}\text{H}_{32}\text{O}_5$ and $\text{C}_{18}\text{H}_{30}\text{O}_4$. The former is also known as auxentriolic acid, and the latter as auxenolic acid. Heteroauxin (3-indoleacetic acid) is a related material.

auxochrome. A radical or group of atoms whose presence is essential in enabling a colored organic substance to be retained on fibers. The best examples are the

groups $-\text{COOH}$, $-\text{SO}_3\text{H}$, $-\text{OH}$ and $-\text{NH}_2$.

ava-ava. See kava.

aventurine. A form of native quartz (q. v.) spangled with scales of mica, hematite or other mineral; also a kind of glass containing gold-colored spangles of brass or similar material.

Use: In ornaments.

"Avertin."¹⁶² Trademark for tribromoethanol solution and amylene hydrate.

"Av-Formula."¹²³ Trademark for an animal feed supplement containing antibiotics and vitamins.

avgas. Abbreviation for aviation gasoline.

aviation gasoline. A fuel especially suited for aircraft use, in that it has high volatility, high octane rating, and good stability.

"Avicel."²⁶¹ Trademark for crystalline cellulose, a highly purified particulate form of cellulose; molecular weight 30,000-50,000; particle size 10-50 microns; density 1.55 (bulk density 0.3-0.8). Dispersible in water; swells in dilute alkali; insoluble in dilute acid, organic solvents, oils. No caloric value in foods. Forms stable gels with water, for calorie control in foods, and for pharmaceutical creams and lotions. Absorbs oil based and syrupy foods to form free flowing forms for dry mixes. Used in column chromatography, and as raw material for cellulose reactions.

"Avisun."⁴²⁹ Trade name for polypropylene resin; molecular weight 100,000-500,000; sp. gr. 0.90-0.92; m.p. 347°F. Available in several molding and film grades.

"Avitex."²⁸ Trademark for a group of textile softeners, lubricants, and antistatic agents. Included are both anionic and cationic types.

"Avitone."²⁸ Trademark for a line of chemical compounds that are used principally as softening, lubricating, and finishing agents for textiles, leather, and paper.

"Avlocor."²⁰⁷ Trademark for chloroquine phosphate [7-chloro-4-(4-diethylamino-1-methylbutylamino) quinoline diphosphate]. A synthetic drug.

"Avloprocil."²⁰⁷ Trademark for procaine penicillin G.

"Avlosulfon."²⁰⁷ Trademark for dapsone (di-aminodiphenylsulfone) used in medicine.

Avogadro, principle of (Avogadro's hypothesis) Equal volumes of different gases under the same conditions of temperature and pressure contain the same number of molecules. An alternative and sometimes more useful statement is that equal molecular quantities of different gases occupy the same volume at the same conditions of temperature and pressure.

"Avolin."¹⁸⁸ $\text{C}_6\text{H}_4(\text{COOCH}_3)_2$. Trademark for a special perfume grade of dimethyl phthalate. Free from odor; used as a diluent for perfume materials.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

axerophthol. Synonym for vitamin A₁. See vitamin A.

"Ayr-Trap."²⁰⁵ An air-entraining admixture for concrete to minimize capillary absorption of moisture and the disintegration caused by the freezing and thawing of such moisture.

azacyclonol hydrochloride (alpha, alpha-diphenyl-4-piperidinemethanol hydrochloride) (C₆H₅)₂COHC₅H₁₀N·HCl

Properties: Small white crystals or crystalline powder. Odorless, stable in air. M. p. 270-281°C (dec.). Slightly soluble in water, alcohol. Insoluble in chloroform, ether, acetone, hexane; pH of 1 in 200 solution 5-7.

Grade: N. F. XI.

Use: Medicine.

azapetine phosphate C₁₇H₁₇N·H₃PO₄. 6-Allyl-6,7-dihydro-5H-dibenz[c,e]-azepine phosphate.

Properties: M. p. 210-213°C Soluble in water.

Grade: N. N. D.

Use: Medicine.

azaserine C₅H₇N₃O₄. O-Diazoacetyl-L-serine. N₂CHCOOCH₂CH(NH₂)COOH. An antibiotic of importance in cancer research. It has had some success in inhibiting certain types of cancer in mice and rats. It was originally isolated from a *Streptomyces*, but is also prepared synthetically.

6-azauracil riboside. See 6-azauridine

6-azauridine (6-azauracil riboside; 6-azauridine-3,5(2H,4H)dione riboside)

Derivation: Microbiological fermentation.

Use: Suggested as treatment for cancer.

azelaic acid (nonanedioic acid; 1,7-heptanedicarboxylic acid) CO₂H(CH₂)₇CO₂H.

Properties: Yellowish to white crystalline powder; m. p. 106°C; b. p. 286.5°C at 100 mm; soluble in hot water, alcohol, and organic solvents.

Derivation: Oxidation of oleic acid by ozone

Grades: Technical

Containers: Bags; wooden barrels; kegs.

Uses: Organic synthesis; lacquers; production of hydrotropic salts; alkyl resins; polyamides; plasticizers; jet engine lubricants.

azelaoyl chloride ClOC(CH₂)₇COCl.

Properties: B. p. 125-130°C (3 mm). Slowly decomposes in cold water; soluble in hydrocarbons and ethers.

Use: Organic synthesis.

azeotrope. See azeotropic mixture.

azeotropic distillation. A type of distillation in which a substance is added to the mixture to be separated in order to form an azeotropic mixture with one or more of the constituents of the original mixture. The azeotrope or azeotropes thus formed will have boiling points different from the boiling points of the original mixture and will permit greater ease of separation.

azeotropic mixture (azeotrope). A liquid mixture of two or more substances which behaves like a single substance in that the vapor produced by partial evaporation of liquid has the same composition as the liquid. The constant boiling mixture exhibits either a maximum or minimum boiling point as compared with that of other mixtures of the same substances.

aziminobenzene. See 1,2,3-benzotriazole.

azine dyes. Dyes which are derived from phenazine (C₆H₄)₂N₂(C₆H₄) (tricyclic). The chromophore group may be >C=N-; but the cause of color is more probably due to the characteristic unsaturation of the benzene rings. The members of the group are quite varied in application. The "Nigrosines" (Color Index 864 and 865) and "Safranin" (Color Index 841) are examples of this group.

aziridine. See ethyleneimine.

"Azite" 900 Liquefier.⁵⁷ Trademark for a nonresinous nitrogenous chemical used in the paper industry primarily for the liquefaction of various coating adhesives.

azlon. Generic name for a manufactured fiber in which the fiber-forming substance is composed of any regenerated naturally occurring protein (Federal Trade Commission). Proteins from corn, peanuts and milk have been used. Azlon fiber has a soft "feel", blends well with other fibers, and is used, in general, like wool.

azobenzene (diphenyldiimide; benzeneazobenzene) C₆H₅N₂C₆H₅

Properties: Yellow or orange crystals; m. p. 68°C; b. p. 297°C; sp. gr. 1.203 (20/4°C); soluble in alcohol and ether; insoluble in water.

Derivation: By reducing nitrobenzene with sodium stannite

Method of purification: Crystallization

Grades: Technical

Containers: Wooden kegs or fiber containers.

Use: Manufacture of benzidine and induline dyes, rubber accelerators; fumigant.

Shipping regulations: None.*

azobenzene-para-sulfonic acid C₁₂H₁₀O₃N₂S.

Properties: Orange crystals; m. p. 129°C.

Uses: Intermediate and reagent chemicals.

"Azocel."⁸³ Trade name for a nonionic, stable solubilizer for diazotized, developed, naphthol, acid, and acetate dyes.

azodine (benzeneazonaphthylethylenediamine) C₁₈H₁₈N₄.

Properties: Red crystals; m. p. 107-108°C.

Use: Reagent for rapid determination of penicillin in blood, urine and other media.

azo dyes. Those that have the -N=N- group as a chromophore group in their molecular structure and are produced from amino compounds by the processes of diazotization and coupling. Over half of the commercial dyestuffs are in this general category. By varying the chemical composition

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

it is possible to produce acid, basic, direct, or mordant dyes. This general group is subdivided as monoazo, diazo, trisazo, and tetrazo according to the number of -N=N- groups in the molecule. Examples of these dyes are Chrysoidine Y, Bismarck Brown 2R and Direct Green B.

"Azo Fuchsine." ³⁰⁷ Brand name of proprietary line of acid dyestuffs, used on wool. Can also be used on certain kinds of paper and leather.

"Azoguard." ²⁰⁶ Brand name for a proprietary product. Increases the stability of diazo compounds and is a useful addition to printing pastes and padding liquors containing these products.

azoic dyes (azoics). Insoluble azo dyes made on or in the fiber, except direct dyes that are further developed on the fiber. Formerly called developed, ice, or ingrain colors.

"Azomel" A. ²⁰⁶ Brand name for a proprietary product used for pasting and dissolving the "Brenthols." Owing to its stability to hard water and metallic salts, it aids in the production of good rubbing fastness and is particularly recommended when machine dyeing with "Brenthols."

azophenylene. See phenazine

"Azo Phloxine." ³⁰⁷ Brand name for a proprietary line of acid dyestuffs, used on wool. Can also be used on certain kinds of paper and leather

"Azopol A." ²⁰⁶ Brand name of a proprietary product. An aqueous solution of an ethylene oxide condensate

Uses: In the developing bath for the production of azoic dyeing on cotton; it is employed as a stabilizer and as a dispersing agent, to give dyeings of improved rubbing fastness

"AzoSol." ³⁰⁷ Brand name for a proprietary line of dyestuffs; soluble in organic solvents.

Uses: For the coloring of spirit lacquers and spirit inks.

azosulfamide (disodium 2-(4'-sulfamylphenylazo)-7-acetamido-1-hydroxynaphthalene-3,6-disulfonate) $C_{18}H_{14}N_4Na_2O_{10}S_3$.

Properties: Dark red, odorless, tasteless powder. Soluble in water with an intense red color; practically insoluble in organic solvents.

Use: Medicine

azotic acid. See nitric acid.

azoxytoluidine. See diaminoazoxytoluene.

azulene $C_{16}H_{16}O$. The blue coloring matter of chamomile, wormwood and other essential oils. A terpene

Properties: Blue, oily liquid; b.p. 170°C; sp. gr. 0.987; insoluble in water.

azure A carbacrylic resin. See azuresin.

azure blue. See cobalt blue.

azuresin (azure A carbacrylic resin).

Properties: Moist, irregular, dark blue or purple granules. Slightly pungent odor.

Derivation: Carbacrylic cation-exchange resin, in reversible combination with 3-amino-7-dimethylaminophenazathionium chloride (azure A dye).

Grade: U. S. P. XVI.

Use: Medicine (diagnostic test)

azurite (copper carbonate, blue; hydrated basic copper carbonate; chessy copper; chessylite) $2CuCO_3 \cdot Cu(OH)_2$. Copper mineral, various shades of azure-blue in color, vitreous almost adamantine luster, light blue streak. Found as an alteration product of chalcopryrite and other sulfide ores of copper in the upper oxidized zones of mineral veins. Contains 69.2% CuO, 25.6% CO₂, balance water. Sp. gr. 3.77-3.83, hardness 3.5-4

Occurrence: United States; Australia; Europe; U. S. S. R.; Africa

Uses: Ore of copper, jewelry

azurmalachite. A blue and green mixture of the minerals azurite and malachite. Sometimes used as a gem.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

B

B. Symbol for boron.

Ba. Symbol for barium.

babassu oil. An oil expressed or extracted from a species of Brazilian palm nut (*Orbignya speciosa*).

Properties: Pale yellow when refined; sp. gr. 0.9240 (15°C); saponification value 246-251; iodine value 14.0-16.3; refractive index $n_{40/D}$ 1.4500

Use: It is similar in its properties and uses to coconut oil, being edible. The press cake and meal are used as stock feed, while the oil itself is chiefly used in food, soap, and cosmetic industries.

Babbitt, bearing metal. See Babbitt metal.

Babbitt metal (Babbitt, bearing metal). A group of soft alloys used widely for bearings. They have good bonding characteristics with the supporting metal, maintain oil films on their surface, and possess nonseizing, antifriction and bearing properties. Used as cast, machined or preformed bimetallic bearings in the form of a thin coating on a steel base. The main types are lead base Babbitt, lead silver base Babbitt, tin base Babbitt, cadmium base Babbitt, arsenical Babbitt, white metal bearing alloys. Named for Isaac Babbitt, the inventor.

Babcock test. A rapid test for butterfat in milk introduced by Stephen M. Babcock in 1890 and now in world-wide use in the dairy industry.

B acid. See 1-amino-8-naphthol-3,5-disulfonic acid.

bacitracin. An antibiotic, of polypeptide structure, produced by the metabolic processes of *Bacillus subtilis*. It is effective against many gram-positive bacteria, but is ineffective against most aerobic gram-negative bacteria.

Properties: White to pale buff, hygroscopic powder; odorless or with slight odor; bitter taste. Powder is stable to heat but solutions deteriorate at room temperature. Freely soluble in water; soluble in alcohol, methanol, and glacial acetic acid; insoluble in acetone, chloroform, and ether. Solutions are neutral or slightly acid to litmus.

Units: Defined by comparison with a U. S. P. reference standard.

Grade: U. S. P. XVI, having a potency of about 40 to 50 units per milligram.

Use: Medicine; feed supplement.

background counts. See counts.

bactericide. Any product that will kill bacteria; used especially in killing disease bacteria. Bactericides vary in their potency; thus many bactericides will kill ordinary germs, but may not be effective against anthrax or tetanus or other sporeforming bacteria which are particularly resistant. Germicide is a synonymous term.

bacteriophage. An organism introduced into the body for the purpose of killing bacteria. Synonymous with phagocyte.

bacteriostat. A substance which prevents or slows down the growth of bacteria. Examples are quaternary ammonium salts and hexachlorophene.

baddeleyite (brazilite) ZrO_2 . A natural zirconium oxide.

Properties: Color, black, brown, yellow, to colorless; streak white; luster submetallic to vitreous to greasy. M. p. 2500-2950°C. Highly resistant to chemicals. Sp. gr. 5.5-6.0.

Grades: Crude (53%, 73-75%); purified (98%).

Occurrence: Brazil; Ceylon.

Uses: In corrosion- and heat-resistant applications, such as furnace linings and muffles.

"Badger Liquid Soap." [®] Trademark for liquid potash soap (15% soap solution).

Uses: Detergent; degumming; soaping; wool and yarn scouring; fulling.

Badische acid. See 2-naphthylamine-8-sulfonic acid.

bagasse (megass). The crushed cane pulp left after the juice has been expressed from sugar canes.

Uses: The tough fiber is used in insulating buildings; fuel; fertilizer; building board; paper pulp.

Bahama white wood. See canella.

"Bake Aid." [®] Brand name for hydrated monocalcium phosphate.

Properties: White, free-flowing, crystalline powder. Purity complies with all Food and Drug laws.

Containers: 100-lb paper bags.

Use: "Rope" preventive in bread baking.

"Bakelite." [®] Trademark for a series of resins; see "Vinylite."

baker's sugar. See dextrose.

baking finish. A paint or varnish that requires baking at temperatures above 150°F for the

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

development of desired properties. (ASTM definition, ASTM D16-52).

baking powder, calcium acid sulfate. A baking powder containing sodium bicarbonate and mono-calcium phosphate.

baking powder, cream of tartar. A baking powder using as its ingredients sodium bicarbonate, tartaric acid and cream of tartar (potassium bitartrate).

baking powders. Powdered chemicals used as a substitute for yeast in baking for generating carbon dioxide gas in the dough. The components include sodium bicarbonate, one or more substances that become slightly acid when the powder is moistened, and starch to adjust the overall concentration of the active materials.

baking soda. See sodium bicarbonate.

"Bakthane." ²³ Trademark for an agricultural insecticide based on the microorganism *Bacillus thuringiensis* Berliner and supplied as a dust containing viable spores.

Use: Controls imported cabbage worms, cabbage loopers, artichoke plume moths, and tobacco hornworm on certain fruits, vegetables, and field crops.

BAL. Abbreviation for British Anti-Lewisite. See 2,3-dimercaptopropanol.

balas ruby. A variety of spinel used as a gem stone.

balata.

Properties: A rubber-like hydrocarbon polymer gum obtained from the latex of *Mimosa balata*, which grows wild in Central and South America. Balata is tough and water resistant but softens in hot water and cannot be vulcanized.

Grades: Ciudad Bolivar block, Manaos block; Surinam sheets; amber sheets.

Uses: Machinery belting, golf ball covers; packing; gaskets.

balatá, synthetic. A stereospecific rubber, consisting of the trans isomer of polyisoprene.

"Balco." ¹⁵⁵ Trademark for an alloy of 70% nickel and 30% iron.

Properties: Resistivity, 120 ohms per circular mil ft at 20°C; temperature coefficient of resistance, 0.0045 between 0-100°C; strongly magnetic; heat resistant below 1100°F.

Forms: Wire; insulated wire; ribbon.

Uses: Thermometer bulbs; applications which require high temperature coefficients of resistance.

ball clay. General term for those clays that possess good plasticity, strong bonding power, high refractoriness and which burn to a white or cream colored product. These clays are fine grained relatively pure hydrated aluminum silicate and usually are gray, tan or blue but may be nearly white or even black. Used as bonding and plasticizing agents, or chief ingredients of

whiteware, porcelains, stoneware, terracotta, glass refractories, graphite crucibles and porcelain enamels.

"Ball Powder." ⁴¹³ Trademark for a spherical granular smokeless powder.

Use: Propelling charge for small arms ammunition in military and sporting categories.

Containers: Metal cans, 12-16 oz. net weight; fiber drums 30 and 100 lbs. net weight.

Fire hazard: Dangerous.

Shipping regulations: Explosives. Red label.*

balm of Gilead (Mecca balsam). Resinous juice from twigs of the evergreen tree, *Commiphora opobalsamum*.

Properties: Color ranges from yellow to green, brownish-red; fragrant odor; insoluble in water; soluble in benzene, acetone, chloroform, carbon disulfide, ether, glacial acetic acid.

Occurrence: Shores of the Red Sea.

Uses: Perfumery; medicine.

balsa. A strong light-weight wood principally from the tree *Ochroma logopus* SW which grows in Central America. It is available in three weights: aero, max weight 9 lb/cu ft; flotation, max weight 18 lb/cu ft; "heavy," max weight 25 lb/cu ft.

Uses: In insulation, life preservers, protective packaging, airplane construction.

balsam. An aromatic, liquid, resinous substance exuding from a tree or shrub and consisting of a resin mixed with a volatile oil, usually with benzoic or cinnamic acids and their esters. For individual balsams see under their respective names; e.g., balsam copaiba. See copaiba resin.

balsam of fir. See Canada balsam.

"Bamadex." ⁵⁷ Trademark for dextro-amphetamine and meproamate.

banana liquid. See banana oil.

banana oil.

1. (banana liquid). A solution of nitrocellulose in amyl acetate or similar solvent, so termed because of the odor.

2. Synonym for amyl acetate.

B and R. Abbreviation for ball and ring, a method of determining the softening point of tars, pitches, and various thermoplastic materials, both natural and synthetic.

banewort. See belladonna.

"Banox." ¹⁰⁸ Trademark for a series of dry, powdered, phosphate-type corrosion inhibitors. No. 1 is artificially colored. No. 1-P and WT are colorless.

Containers: 135-lb fiber drums.

Uses: Refrigerator cars; refrigeration brine; cooling towers and small water systems.

"Banthine." ⁷⁰ Trademark for methantheline bromide (beta-diethylaminoethylxanthene-

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

9-carboxylate methobromide).

Use: Medicine.

BAP. Abbreviation for benzyl-para-amino-phenol.

"Barabond." ²³⁶ Brand name for southern type bentonite for use in foundry sands.

Useful where higher green strength and lower dry strength are desired than are obtained with Wyoming type bentonites.

Containers: Multiwall paper bags containing 100 lbs.

"Barafos." ²³⁶ Brand name for a proprietary product, a polyphosphate compound for the treatment of drilling mud to reduce viscosity and gel strength.

Containers: Asphalt laminated bag containing 100 lbs.

"Baragel." ²³⁶ Trademark for a compound of purified bentonite and an organic base; useful as an inorganic gelling agent for lubricating oils to prepare nonmelting greases of general usefulness.

Containers: 50-lb multiwall paper bags

"Baragel" ²⁴. ²³⁶ Trademark for compound similar to "Baragel." Particularly adapted for gelling oils of higher aromatic content.

"Barak." ²⁸ Trademark for dibutyl-ammonium oleate

Properties: Translucent, light brown liquid

Containers: Drums (175 lbs net)

Use: To activate accelerators and improve processing of rubber and synthetic rubber

barbaloin. See aloin

barbasco root. See cube root

Barberio's solution. An aqueous solution of sodium nitrite (1:2000)

Use: Analysis (testing for indican in urine)

barberite. A nonferrous alloy containing 88.5% copper, 5% nickel, 5% tin, 1.5% silicon. Sp gr 8.80; m.p. 1070°C. It offers good resistance to sulfuric acid in all dilutions up to 60%, sea water, moist sulfurous atmospheres, and mine waters.

barberry (jaundice berry; woodsour; sowberry, pepperidge bush; sour-spine) The bark, root bark and root are commercial products obtained from shrubs of *Berberis vulgaris*. The root contains berberine, oxycanthine and berbamine.

Containers: Bags.

Use: Source of its alkaloids.

barbital (diethylmalonylurea; diethylbarbituric acid) $C_8H_{12}N_2O_3$.

Properties: White crystals or powder; bitter taste; odorless; stable in air; m.p. 187-192°C; soluble in hot water, alcohol, ether, acetone, and ethyl acetate.

Derivation: By the interaction of diethyl ester of diethylmalonic acid and urea.

Grades: Technical; N. F. XI.

Containers: 1-, 5-lb tins; 25-, 100-lb drums.

Use: Medicine; stabilizer for hydrogen peroxide.

barbital sodium (barbital, soluble)

$C_8H_{11}N_2NaO_3$.

Properties: White powder, stable, odorless; bitter taste. Soluble in water (solution alkaline to litmus); slightly soluble in alcohol; insoluble in ether.

Grade: N. F. XI

Containers: 100-lb drums.

Use: Medicine.

barbital, soluble. See barbital sodium.

barbituric acid (malonylurea, pyrimidine-trione) $CO(NHCO)_2CH_2 \cdot 2H_2O$.

Properties: White crystals, efflorescent; odorless; m.p. 245°C with some decomposition; slightly soluble in water and alcohol; soluble in ether. Forms salts with metals.

Derivation: By condensing malonic acid ester with urea.

Grades: Technical.

Containers: 1-, 5-lb glass bottles; tins.

Uses: Preparation of pharmaceutical chemicals; plastics (condensation agent with furfural).

Shipping regulations: None.*

"Barden" Clay. ²⁸⁵ Proprietary brand name for a group of hydrous aluminum silicates (sedimentary kaolins) from South Carolina

Properties: Sp gr 2.60; bulk density, aerated, 18-20 lbs/cu ft, packed, 35-40 lbs/cu ft; creamy white; pH 4.5-5; air-floated; particle size 90% minus 2 microns.

Containers: 50-lb multiwall bags or bulk.

Uses: In pesticides as a carrier for dust bases and wettable powders, and as a secondary diluent in field strength dusts; in boxboard adhesives to impart high viscosity, provide solid glue lines, speed up setting, retard silica migration for smoother board and non-reactive printing surfaces; in flooring and tile adhesives as a filler and viscosity control agent; in fertilizers and prilled urea as an anti-caking agent; in roofing granules; putties; caulking compounds; linoleum.

"Bardol" Rubber Compounding Oil. ¹⁷⁵ Trademark for a coal-tar oil with high aromatic hydrocarbon content

Properties: Dark colored liquid; sp gr. 1.07-1.12 (25/25°C); distillation at 300°C, 60% max; low viscosity at 40°F.

Containers: 55-gal steel drums; tank trucks; tank cars.

Uses: In rubber compounding as a swelling agent for natural and synthetic elastomers; as a dispersing agent for blacks and mineral fillers; to improve tack in butyl rubber; and to impart low set, low heat build-up and high resilience

Caution: Avoid contact with skin and inhalation of vapors.

"Bardol" B Rubber Compounding Oil. ¹⁷⁵

Trademark for a refined coal-tar distillate

Properties: Pale yellow to straw-colored liquid; naphthalene-like odor; sp gr.

1.020-1.045 (15.5/15.5°C); distillation range, 230-300°C; non-toxic in normal usage.

Containers: 55-gal steel drums

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Uses:** Primary uses as a plasticizer, softener, and reclaiming oil; secondary uses as a reinforcer and tackifier. Pale color permits use in light colored stocks. This solvent-swelling type of softener markedly reduces viscosity of all elastomers and is especially suited for low hardness stocks made with "Thiokol" and neoprene-type elastomers.
- barite** (barytes; heavy spar; tiff) BaSO_4 .
Natural barium sulfate, the chief source of barium chemicals. Found as masses in sedimentary rocks, in metallic veins, and in residual clays.
Properties: Colorless, white, and various light shades; luster vitreous; one good cleavage.
Constants: Sp. gr. 4.5; hardness 3-3.5.
Occurrence: Arkansas, Missouri, Georgia, Tennessee, Nevada, California, Arizona; Germany; Canada; Brazil; England; U.S.S.R.
Grades and Uses:
(Crude) Unground, massive, product used for production of lithopone and barium chemicals.
(Ground barite) Sold in numerous sizes and degrees of purity. Used in oil well drilling mud; glass making; filler for paper, rubber, oilcloth, linoleum, etc; paint pigment and extender; x-ray apparatus; storage batteries; flux for smelting brass.
Containers: 50-, 100-lb bags; box cars.
Shipping regulations: None.*
- barite, artificial.** See barium sulfate.
- barite, synthetic.** See barium sulfate
- barium** Ba. Element of atomic number 56, of group II of the periodic system; one of the alkaline earth elements.
Properties: Silver-white, slightly lustrous, somewhat malleable metal. All barium salts except the sulfate are poisonous.
Soluble in acids; decomposes water.
Constants: Sp. gr. 3.78; m.p. 850°C.
Occurrence: In combination in nature in the form of barite (q.v.) and witherite (q.v.)
Derivation: Reduction of barium oxide by ferrosilicon in a vacuum at a high temperature.
Grades: Technical (not an article of commerce as yet).
Uses: Alloys; pyrotechnics.
Shipping regulations: None.*
- barium acetate** $\text{Ba}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot \text{H}_2\text{O}$.
Properties: White crystals; poisonous.
Soluble in water; insoluble in alcohol.
Constants: Sp. gr. 2.02; m.p. decomposes.
Derivation: Acetic acid is added to a solution of barium sulfide. The product is recovered by evaporation and subsequent crystallization.
Method of purification: Recrystallization.
Grades: Technical; C.P.
Containers: 1-, 5-lb bottles; 525-lb casks.
Uses: Chemical reagent; acetates; verdigris; textile mordant.
Shipping regulations: None.*
- barium aluminate** $3\text{BaO} \cdot \text{Al}_2\text{O}_3$.
Properties: Gray pulverized mass, soluble in water, acids.
Uses: Ceramics; water treatment.
- barium bichromate.** See barium dichromate.
- barium binoxide.** See barium peroxide.
- barium borotungstate** (barium borowolframite) $\text{Ba}_3[\text{B}(\text{W}_2\text{O}_7)_6]_2$.
Properties: Large, white crystals. Caution! Effloresces in air. Keep well stoppered! Soluble in water.
Use: Making borotungstates.
- barium borowolframite.** See barium borotungstate
- barium bromate** $\text{Ba}(\text{BrO}_3)_2 \cdot \text{H}_2\text{O}$.
Properties: White crystals or crystalline powder. Slightly soluble in water; insoluble in alcohol.
Constants: Sp. gr. 3.820; decomposes at 260°C.
Derivation: By passing bromine into a solution of barium hydroxide, barium bromide and barium bromate being formed which are separated by crystallization.
Method of purification: Recrystallization.
Grades: Pure; reagent.
Containers: Glass bottles; 25-lb tin boxes.
Use: Analytical reagent.
Fire hazard: Dangerous.
Shipping regulations: Oxidizing material.
Yellow label *
- barium bromide** $\text{BaBr}_2 \cdot 2\text{H}_2\text{O}$.
Properties: Colorless crystals; poisonous.
Soluble in water and in alcohol.
Constants: Sp. gr. 3.852; m.p. anhydrous BaBr_2 847°C
Derivation: By the interaction of barium sulfide and hydrobromic acid, with subsequent crystallization.
Method of purification: Recrystallization.
Grades: Technical; C.P.
Containers: 50-lb cases; glass bottles.
Use: Manufacturing bromides.
Shipping regulations: None.*
- barium carbonate** BaCO_3 .
Properties: White powder; found in nature as the mineral witherite; poisonous! Insoluble in water; soluble in acids (not in sulfuric acid).
Constants: Sp. gr. 4.275; m.p. 174°C at 90 atm.
Derivation: (a) Interaction of barium sulfide and soda ash solutions. (b) By passing a current of carbon dioxide gas through the solution of barium sulfide.
Grades: Technical; C.P.
Containers: Bags; drums; barrels.
Uses: Barium salts; rat poison; optical glass; flat wall paint; foundry core compounds; water purification; oil well drilling; ceramics (tile, terra cotta, porcelain); marble substitutes; dyes; enamels for ironware; steel carburizing; rubber; beet sugar; chemical reagent.
Shipping regulations: None.*
- barium chlorate** $\text{Ba}(\text{ClO}_3)_2 \cdot \text{H}_2\text{O}$.
Properties: Colorless prisms or white

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

powder; poisonous! Soluble in water.
 Constants: Sp. gr. 3.179; m. p. 414°C
 Derivation: Electrolysis of barium chloride.
 Method of purification: Crystallization
 • Grades: Technical; C. P.
 Containers: 1-lb bottles; 1-lb cans; drums
 Uses: Pyrotechnics; explosives; textile mordant; manufacture of other chlorates.
 Caution: Fire hazard; dangerous; oxidizing material; explosive when in contact with combustible material.
 Shipping regulations: Oxidizing material.
 Yellow label.*

barium chloride $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless flat crystals; poisonous! Soluble in water; insoluble in alcohol
 Constants: Sp. gr. 3.097; m. p. 960°C (anhydrous)
 Derivation: (a) By the action of hydrochloric acid on barium sulfide with subsequent crystallization (b) By treating witherite (natural barium carbonate) with hydrochloric acid. (c) By roasting crude barite with coal and calcium chloride. (d) By treating a solution of barium sulfide with calcium chloride.
 Method of purification: Recrystallization
 Grades: Technical (crystals or powdered) 99%; crystalline; powdered; C. P.
 Containers: 1-, 5-lb bottles; 200-lb bags; 400-lb barrels; 800-, 1000-lb casks; multiwall paper sacks; drums.
 Uses: Chemicals (artificial barium sulfate, other barium salts, photographic chemicals); in ceramics to precipitate soluble sulfates as insoluble sulfate of barium, color lakes; leather tanning and finishing; heat-treating ferrous metals; rat and vermin poisons; pigments; drug; purification of sugar juice; textiles (mordant, weighting, calico-printing); water softener; boiler compounds; chemical reagent; lube oil additives.
 Warning! May be fatal if swallowed
 MCA warning label.
 Shipping regulations: None.*

barium chromate (lemon chrome; ultramarine yellow; baryta yellow; Steinhilber yellow)
 BaCrO_4

Properties: Heavy, yellow, crystalline powder; poisonous! Soluble in acids; insoluble in water.
 Constants: Sp. gr. 4.498.
 Derivation: By the interaction of barium chloride and sodium chromate. The precipitate is washed, filtered and dried
 Grades: Technical; C. P.
 Containers: 1-lb bottles; wooden barrels; kegs; multiwall paper sacks
 Uses: Safety matches; pigment in paints, ceramics; see also chrome yellow.
 Shipping regulations: None.*

barium citrate $\text{Ba}_3(\text{C}_6\text{H}_5\text{O}_7)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Grayish white crystalline powder. Highly insoluble in water. Poisonous!
 Grades: Technical.
 Containers: 55-gal fiber drums (250 lbs net).
 Uses: Manufacture of barium compounds; stabilizer for latex paints.

barium cyanide $\text{Ba}(\text{CN})_2$.

Properties: White, crystalline powder; poisonous! Soluble in water and alcohol.
 Derivation: By the action of hydrocyanic acid on barium hydroxide with subsequent crystallization.
 Method of purification: Recrystallization.
 Grades: Technical.
 Containers: Steel barrels.
 Use: Metallurgy; electroplating.
 Shipping regulations: Poison, class B
 Poison label.*

barium cyanoplatinite. See platinum(ous) barium cyanide.

barium dichromate (barium bichromate)
 $\text{BaCr}_2\text{O}_7 \cdot 2\text{H}_2\text{O}$.

Properties: Poisonous! Brownish-red needles or crystalline masses. Soluble in acids, decomposed by water.

barium dioxide. See barium peroxide

barium diphenylamine sulfonate
 $(\text{C}_6\text{H}_5)_2\text{NHC}_6\text{H}_4\text{SO}_3\text{Ba}$.

Properties: White crystals, soluble in water
 Poisonous!
 Use: Indicator in oxidation-reduction titrations.

barium dithionate (barium hyposulfate)
 $\text{BaS}_2\text{O}_6 \cdot 2\text{H}_2\text{O}$

Properties: Colorless crystals. Soluble in water; slightly soluble in alcohol
 Poisonous!
 Constants: Sp. gr. 4.536.
 Derivation: By the action of manganese dithionate on barium hydroxide.

barium diuranate. See uranium-barium oxide.

barium ethylsulfate $\text{Ba}(\text{C}_2\text{H}_5\text{SO}_4)_2 \cdot 2\text{H}_2\text{O}$

Properties: Colorless crystals; poisonous!
 Soluble in water and alcohol
 Derivation: By the interaction of barium hydroxide and ethylsulfuric acid.
 Method of purification: Crystallization.
 Grades: Technical
 Containers: Tins
 Use: Organic preparations
 Shipping regulations: None.*

barium fluoride BaF_2 .

Properties: White powder; poisonous!
 Sparingly soluble in water
 Constants: Sp. gr. 4.828; m. p. 1280°C.
 Derivation: By the interaction of barium sulfide and hydrofluoric acid followed by crystallization.
 Grades: Technical; C. P.; single pure crystals.
 Containers: 1-, 5-lb bottles; wooden barrels.
 Uses: Enamels; embalming fluids; crystals for spectroscopy.
 Shipping regulations: None.*

barium fluosilicate (barium silicofluoride)
 BaSiF_6 .

Properties: White, crystalline powder.
 Insoluble in water
 Grades: Technical.
 Containers: 350-lb barrels.
 Uses: Ceramics; insecticide; insecticidal compositions
 Caution! May be fatal if swallowed. MCA label.

barium fructose diphosphate. See fructose diphosphates, calcium and barium salts.

barium glass. A glass in which barium oxide (BaO) replaces part of the calcium oxide of ordinary lime soda glass.

barium hydrate. See barium hydroxide.

barium hydrosulfide $\text{Ba}(\text{SH})_2$.

Properties: Yellow crystals. Caution! Keep well stoppered! Soluble in water.

barium hydroxide, octahydrate (barium hydrate; barium octahydrate; caustic baryta) $\text{Ba}(\text{OH})_2 \cdot 8\text{H}_2\text{O}$.

Properties: White powder or crystals; poisonous; absorbs carbon dioxide from air. Keep well stoppered! Soluble in water, alcohol and ether.

Constants: Sp. gr. 1.656; m. p. 78°C , losing its water of crystallization (m. p. anhydrous $\text{Ba}(\text{OH})_2$ 408°C).

Derivation: (a) By dissolving barium oxide in water with subsequent crystallization. (b) By precipitation from an aqueous solution of the sulfide by caustic soda (c) Prepared on a large scale by heating barium sulfide in earthenware retorts into which a current of moist carbonic acid is passed after which superheated steam is passed over the resulting heated carbonate.

Impurities: Iron and calcium in some commercial grades.

Method of purification: Recrystallization. Grades: Technical (crystals or anhydrous powder); C. P.; ACS reagent.

Containers: 1-, 5-lb bottles; 25-lb boxes; 100-lb kegs; 500-, 700-lb barrels; multi-wall paper sacks.

Uses: Organic preparations; barium salts; beet sugar industry (now largely replaced by strontium or lime); refining animal and vegetable oils; analytical chemistry.

Shipping regulations: None.*

barium hydroxide, monohydrate (barium monohydrate) $\text{Ba}(\text{OH})_2 \cdot \text{H}_2\text{O}$.

Properties: White powder. Poisonous!

Containers: 50-lb bags.

Uses: Manufacture of oil and grease additives; barium soaps and chemicals. Used in refining of beet sugar; as alkalinizing agent in water softening; sulfate removal agent in treatment of water and brine; in boiler scale removal; dehairing agent; catalyst in manufacture of phenol-formaldehyde resins; insecticide and fungicide; sulfate controlling agent in ceramics; purifying agent for caustic soda and as steel carbonizing agent.

barium hydroxide pentahydrate (barium pentahydrate) $\text{Ba}(\text{OH})_2 \cdot 5\text{H}_2\text{O}$.

Properties: Translucent free-flowing white flakes; density 65 lbs/cu ft (approx.).

Containers: 100-lb paper bags; 400-lb fiber drums.

Uses: Same as the octahydrate, above.

barium hypophosphite $\text{BaH}_2(\text{PO}_2)_2$.

Properties: White, crystalline powder; odorless; soluble in water; insoluble in alcohol. Poisonous! Used as a medicine.

barium hyposulfate. See barium dithionate.

barium hyposulfite. See barium thiosulfate.

barium iodate $\text{Ba}(\text{IO}_3)_2$.

Properties: White, crystalline powder.

Caution! Poisonous! Slightly soluble in water; insoluble in alcohol.

Constants: Sp. gr. 5.23; m. p., decomposes at 476°C .

Use: Medicine.

barium iodide $\text{BaI}_2 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless crystals; decomposes and reddens on exposure to air; poisonous!

Soluble in water; slightly soluble in alcohol.

Constants: Sp. gr. 5.150; m. p., loses $2\text{H}_2\text{O}$ and melts at 740°C .

Derivation: By the action of hydriodic acid on barium hydroxide or of barium carbonate on ferrous iodide solution.

Method of purification: Crystallization.

Grades: Technical; C. P.

Containers: 1-oz vials; $\frac{1}{4}$ -, 1-, 5-lb bottles.

Use: Preparation of other iodides.

Shipping regulations: None.*

barium manganate (manganese green; Cassel green) BaMnO_4 .

Properties: Emerald-green powder; poisonous! Insoluble in water; decomposed by acids

Constants: Sp. gr. 4.85.

Use: Paint pigment.

barium-mercury bromide. See mercuric-barium bromide.

barium-mercury iodide. See mercuric-barium iodide.

barium metaphosphate $\text{Ba}(\text{PO}_3)_2$.

Properties: White powder; slowly soluble in acids; insoluble in water.

Use: As a constituent of glasses, porcelains and enamels

barium molybdate BaMoO_4 .

Properties: White powder. Slightly soluble in acids, water.

Grades: Technical.

barium monohydrate. See barium hydroxide, monohydrate.

barium monosulfide. See barium sulfide

barium monoxide. See barium oxide.

barium nitrate $\text{Ba}(\text{NO}_3)_2$.

Properties: Lustrous, white crystals; poisonous! Soluble in water; insoluble in alcohol.

Constants: Sp. gr. 3.244; m. p. 575°C

Derivation: (a) By the action of nitric acid on barium carbonate, oxide or hydroxide and subsequent crystallization. (b) By adding sodium nitrate (Chile salt-peter) either to a solution of barium chloride or barium sulfide.

Method of purification: Recrystallization.

Grades: Technical; crystals; fused mass or powder; C. P.

Containers: 100-lb kegs; 500-lb barrels; *

800- to 900-lb casks; multiwall paper sacks; 550-lb drums.

Uses: Pyrotechnics (gives green light);

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

explosives; drug; chemicals (barium peroxide); ceramic glazes; rodenticide; vacuum tubes.

Warning: Contact with other material may cause fire; may be fatal if swallowed. MCA warning label.

Shipping regulations: Oxidizing material. Yellow label.*

barium nitrite $\text{Ba}(\text{NO}_2)_2 \cdot \text{H}_2\text{O}$.

Properties: White to yellowish, crystalline powder. Soluble in alcohol, water.

Constants: Sp. gr. 3.173; decomposed by heat.

Grades: Technical; C.P.

Uses: Diazotization.

barium octahydrate. See barium hydroxide, octahydrate.

barium oxalate $\text{BaC}_2\text{O}_4 \cdot \text{H}_2\text{O}$.

Properties: White crystalline powder. Sp. gr. 2.66 Insoluble in water; soluble in dilute nitric or hydrochloric acids.

Grades: Technical; reagent.

Use: Analytical reagent.

barium oxide (barium monoxide; barium protoxide; calcined baryta) BaO .

Properties: White to yellowish-white powder; absorbs carbon dioxide readily from air, keep well stoppered; poisonous! Soluble in acids; reacts violently with water to form the hydroxide

Constants: Sp. gr. 4.73-5.46; m.p. 1923°C.

Derivation: (a) Fusion of barium sulfate mixed with carbon in an electric furnace (b) Fluid bed reduction. (c) For special porous grade, low temperature reduction of pure barium carbonate.

Grades: Technical regular grind (208 lbs/cu. ft.); technical fine grind (175 lbs/cu. ft.); porous, carbide free; 97%.

Containers: Pails; drums; bulk unit loads.

Uses: Dehydrating agent; glass industry; other barium salts; in Europe for refining beet sugar.

Caution: May cause skin irritation.

Shipping regulations: None.*

barium pentahydrate. See barium hydroxide pentahydrate.

barium perchlorate $\text{Ba}(\text{ClO}_4)_2 \cdot 3\text{H}_2\text{O}$.

Properties: Colorless crystals; explosive if in contact with combustible materials. Soluble in alcohol and water.

Constants: Sp. gr. 2.74; m.p. 505°C.

Grades: Technical.

Use: Drying agent for gases

Shipping regulations: Oxidizing material. Yellow label.*

barium periodate $\text{Ba}_5(\text{IO}_6)_2$. White, insoluble powder which is decomposed by dilute sulfuric acid to form periodic acid and barium sulfate. It is prepared by heating barium iodate to redness.

barium permanganate $\text{Ba}(\text{MnO}_4)_2$

Properties: Brownish-violet crystals.

Soluble in water.

Grades: Technical.

Uses: Strong disinfectant; manufacture of

permanganates; strong oxidizing agent.

Shipping regulations: Oxidizing material.

Yellow label.*

barium peroxide (barium binoxide; barium dioxide; barium superoxide) BaO_2 or $\text{BaO}_2 \cdot 8\text{H}_2\text{O}$

Properties: Grayish-white powder; poisonous! Decomposes in water.

Constants: Sp. gr. 4.96; m.p. 450°C; decomposes 800°C.

Derivation: By heating the monoxide in a stream of oxygen or air.

Grades: Technical; reagent

Containers: 700-lb ret. steel drums; 75-lb lug-covered pails.

Uses: Manufacture of oxygen and hydrogen peroxide; bleaching (textiles and straw hat industry); tracer bullets; primer in combination with aluminum powder in aluminic thermic welding; oxygenated water.

Fire hazard: Dangerous; avoid contact with skin.

Shipping regulations: Oxidizing material. Yellow label.*

barium phosphate, secondary BaHPO_4

Properties: White powder. Soluble in nitric acid (dilute), hydrochloric acid (dilute); slightly soluble in water. Toxic.

Grades: Technical.

barium phosphite BaHPO_3 .

Properties: White powder Slightly soluble in water

Grades: Technical.

barium potassium chromate pigment (Pigment E) $\text{BaK}_2(\text{CrO}_4)_2$.

Properties: A pale yellow pigment. As compared with other chromate pigments, it has a particularly low chloride and sulfate content and forms stronger, more elastic paint films. Sp. gr. 3.65

Derivation: By a kiln reaction at 500°C between potassium dichromate and barium carbonate.

Uses: As a component of anticorrosive paints for use on iron, steel, and light metal alloys

barium protoxide. See barium oxide.

barium pyrophosphate $\text{Ba}_2\text{P}_2\text{O}_7$.

Properties: White powder; soluble in acids and ammonium salts; very slightly soluble in water.

barium rhodanide. See barium thiocyanate.

barium silicide BaSi_2 (variable).

Properties: Metallic, gray lumps Decomposed by moisture.

Uses: Deoxidizing and desulfurizing steel.

barium silicofluoride. See barium fluosilicate.

barium stannate $\text{BaSnO}_3 \cdot 3\text{H}_2\text{O}$.

Properties: A white crystalline powder, sparingly soluble in water, readily soluble in hydrochloric acid.

Use: In the production of special ceramic insulations requiring high dielectric properties.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

barium stearate $\text{Ba}(\text{C}_{18}\text{H}_{35}\text{O}_2)_2$.

Properties: White crystalline solid; insoluble in water or alcohol; m. p. 160°C ; sp. gr. 1.145.

Uses: Waterproofing agent; lubricant; packing for bearings; wax compounding; preparation of greases.

Containers: Cartons.

barium sulfate (barium sulfate precipitated; blanc fixe; barite, synthetic or artificial; heavy spar artificial; permanent white; terra ponderosa) BaSO_4 .

Properties: A fine, white, odorless, tasteless, bulky powder. Practically insoluble in water, organic solvents, and solutions of acids and alkalis; soluble in concentrated sulfuric acid; sp. gr. 4.25-4.5.

Derivation: (a) By treating a solution of a barium salt with sodium sulfate (salt cake). (b) By-product in manufacture of hydrogen peroxide. Barium peroxide is added to a 4% solution of sulfuric acid forming weak hydrogen peroxide and a barium sulfate precipitate. This is washed, dried, and marketed as blanc fixe. (c) Occurs in nature as the mineral barite.

Grades: Technical, dry, pulp, bleached, ground, floated, natural; C.P.; U.S.P. XVI; x-ray.

Containers: 1-, 5-lb bottles; 100-, 250-lb drums; wooden barrels; multiwall paper sacks.

Uses: Pigment for paints; filler and delustrant for textiles, rubber, linoleum, oilcloth, plastics, and lithograph inks; base for lake colors; indicator in x-ray photography; medicine.

Shipping regulations: None.*

See also barite, the natural product.

barium sulfate, precipitated. See barium sulfate**barium sulfide** (barium monosulfide; black ash) BaS .

Properties: Yellowish-green or gray powder or lumps; poisonous. Soluble in water, decomposes to the hydrosulfide.

Constants: Sp. gr. 4.25.

Derivation: Barium sulfate (crude barite) and coal are roasted in a furnace. The melt is lixiviated with hot water, filtered and evaporated.

Impurities: Iron, arsenic.

Grades: Technical.

Containers: 500-lb casks; multiwall paper sacks

Uses: Depilatory; barium salts including lithopone; vulcanizing; weighting gutta-percha; generating perfectly pure hydrogen sulfide for analytical purposes.

Shipping regulations: None.*

barium sulfite BaSO_3 .

Properties: White powder, decomposed by heat. Soluble in hydrochloric acid (dilute); insoluble in water.

Grades: Technical; C. P.

Uses: Analysis; paper

barium thiocyanate. See barium thiocyanate.**barium superoxide.** See barium peroxide.**barium thiocyanate** (barium sulfocyanide; barium rhodanide) $\text{Ba}(\text{SCN})_2 \cdot 2\text{H}_2\text{O}$.

Properties: White crystals; poisonous!

Soluble in water and in alcohol. Deliquescent.

Derivation: By heating barium hydroxide with ammonium thiocyanate and subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Iron drums.

Uses: For making aluminum or potassium thiocyanates; dyeing; photography.

Shipping regulations: None.*

barium thiosulfate (barium hyposulfite) $\text{BaS}_2\text{O}_3 \cdot \text{H}_2\text{O}$.

Properties: White, crystalline powder; slightly soluble in water. Insoluble in alcohol. Poisonous!

Constants: Sp. gr. 3.5; decomposed by heat.

Grades: Technical.

Uses: Explosives; luminous paints; matches; varnishes.

barium titanate BaTiO_3 . Widely used ferroelectric ceramic. Single crystals, either pure or doped with iron, are used in storage devices, dielectric amplifiers, and digital calculators.**barium tungstate** (barium wolframate; barium white; tungstate white; wolfram white) BaWO_4 .

Properties: White powder. Insoluble in water.

Constants: Sp. gr. 5.04.

Uses: Pigment; in x-ray photography for manufacture of intensifying and phosphorescent screens.

barium-uranium oxide. See uranium-barium oxide.**barium white.** See barium tungstate.**barium wolframate.** See barium tungstate.**barium zirconium silicate** BaZrSiO_3 , a complex of BaO , ZrO_2 , SiO_2 .

Properties: White compound. Density 118 lbs/cu ft; m. p. 2800°F ; insoluble in water, alkalies. Slightly soluble in acids; soluble in hydrofluoric acid.

Containers: 80-lb paper bags; 500-lb drums.

Uses: Production of electrical resistor ceramics; glaze opacifiers; stabilizer for colored ground coat enamels.

barm. See yeast.

barn. A unit of measurement, equal to 10^{-24} square centimeters, for the cross-section target area of the nucleus of an atom. The name arose from colloquial reference in the early stages of nuclear technology to a nucleus as being "as big as a barn."

"Barnesite." ⁸⁸ Trademark for a special rare earth for instrument lens polishing.

"Baroco." ²³⁶ Brand name for a high yield clay, compounded for the preparation of drilling

* See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

muds for use in formations containing moderate quantities of salt or other oil field electrolytes that may flocculate ordinary drilling muds. Used in preparation of starting muds or workover muds where weights of 9.0 lbs/gal (67 lbs/cu ft) are sufficient.

"Baroid." ²³⁶ Brand name for a weighting material manufactured from selected barytes (barium sulfate ore). "Baroid" is added to drilling muds to increase the unit weight of the mud, thus increasing the hydrostatic head on the formations being drilled in deep wells, to prevent the walls of the hole from caving.

barometric pressure. The pressure of the air at a particular point on or above the surface of the earth, due to the weight of the air above. At sea level this pressure is sufficient to support a column of mercury about 29.9 in. in height (760 mm). This is equivalent to a pressure of 14.7 psi or 1 atmosphere. These are average values that have been chosen as standards; thus 29.9 in. or 760 mm of mercury is referred to as standard or normal barometric pressure. The actual barometric pressure varies continually with changes in the weather, and the average value decreases about one inch for each 1000 feet of altitude, up to several thousand feet.

"Baron." ²³³ Weed-killing composition containing 2-(2,4,5-trichlorophenoxy) ethyl-2,2-dichloropropionate.

"Bar-O-Sil." ³⁰⁴ Trademark for a complex barium silicate vinyl stabilizer
Properties: Fine white powder; sp. gr. 2.7; refractive index 1.5.

Containers: Fiberboard drums containing 15 and 75 lbs.

Uses: A supplementary vinyl stabilizer used to control plating, hazing, crocking and dry hand in vinyl products

barrel syrup. See molasses.

barthrin. Synthetic analog of allethrin described as the 6-chloropiperonyl ester of chrysanthemum monocarboxylic acid. Used as insecticide with applications similar to allethrin and other analogs as furethrin, ethyethrin and cyclothrin. Accepted as generic name by Ent. Soc.

"Bartyls." ¹² Trademark for a series of compounded anti-skinning agents. A blend of chemical ingredients designed to retard film formations in storage and during the printing operation.

baryon. The name of a group of fundamental particles (q. v.) A baryon is a fundamental particle with a mass equal to or greater than the mass of a nucleon, and includes the nucleon and hyperons

baryta, calcined. See barium oxide.

baryta, caustic. See barium hydroxide.

baryta water. A solution of barium hydroxide.

baryta yellow. See barium chromate.

barytes. See barite.

"Basacryl." ⁴⁴⁰ Trademark for a series of cationic dyestuffs for the dyeing and printing of polyacrylonitrile fiber. Readily soluble in water.

basalt. A dense to glassy, dark-colored, basic volcanic rock composed essentially of soda-lime feldspar and pyroxene, with or without olivine and with accessory magnetite or ilmenite. An average of 198 analyses of typical basalts gave 49.06% SiO₂, 15.70% Al₂O₃, 5.38% Fe₂O₃, 6.37% FeO, 8.95% CaO, 6.17% MgO, 3.11% Na₂O, 1.52% K₂O, 1.36% TiO₂, 0.31% MnO, 0.45% P₂O₅, 1.62% H₂O. Interpretations of the term are rather indefinite and quarrymen sometimes include any dark-colored fine-grained rock under the term basalt or trap rock

Uses: Road building; paving blocks; building stone.

basanite. See Lydian stone.

base. In common everyday language, a base is any one of a large class of compounds having one or more of the following properties: bitter taste, slippery feeling in solution, ability to make litmus dye turn blue and to cause other indicator dyes to take on characteristic colors, ability to react with (neutralize) acids to form salts. Included are both hydroxides and oxides of metals. More specific definitions state that a base is a compound whose molecules yield hydroxyl ions (OH⁻) in water, or yield the negative ion of a solvent, or finally, that a base is any molecule or ion that can combine with protons or hydrogen ions, i. e., a proton acceptor

See also acid; alkali; neutralization.

"Basekote." ⁵¹ Trademark for light brown, firm-consistency lubricant used as a load-carrying medium on ship-launching ways. It is melted and applied hot to the groundways. On cooling, it forms a hard, tough, extremely adhesive coating.

base metals. Commonly used name for lead, zinc, etc., in contrast to gold and silver.

base oils. See blown oils

BASF process (formerly called Sachsse process). A process for producing acetylene by burning a mixture of low molecular weight hydrocarbons (as, natural gas) with oxygen to produce a 2700°F temperature. The combustion gases are quickly chilled by scrubbing with water, and the acetylene is separated by distillation and solvent extraction from ethylene, carbon monoxide, hydrogen and other reaction products.

basic. Term used to describe certain compounds to distinguish them because of their more alkaline nature as compared with other compounds of nearly the same name. In this book the term basic is usually ignored

in making the alphabetical arrangement. Thus basic beryllium carbonate will be found indexed as beryllium carbonate.

basic cinder. See basic slag.

basic dichromate. See bismuth chromate.

basic lining. A furnace lining containing basic oxides or compounds that decompose under furnace conditions to give basic oxides. The usual basic linings contain calcium and magnesium oxides or carbonates

"Basicol." ¹⁸⁸ Trademark for a series of essential oils intended as replacements for oils of lavender, geranium, lemon, pine, ylang ylang, neroli and orris root

basic oxides. An oxide which is a base or which forms a hydroxide when combined with water, and/or which will neutralize acidic substances. Basic oxides are all metallic oxides, but there is a great variation in the degree of basicity. Some basic oxides such as those of sodium, calcium and magnesium combine with water with vigor or with relative ease, and also neutralize all acidic substances rapidly and completely. The oxides of the heavy metals are only weakly basic, do not dissolve or react with water to any extent, and neutralize only the more strongly acidic substances. There is a gradual transition from basic to acidic oxides and certain oxides, as aluminum oxide, show both acidic and basic properties.

basic phosphate. See basic slag.

basic refractories. See basic lining.

basic salts. Compounds that belong both to the category of salts and that of bases because they have in their composition the radicals OH (hydroxide) or O (oxide) as well as the usual positive and negative radicals of normal salts. Among the best examples are bismuth subnitrate, often written BiONO_3 , and basic copper carbonate $\text{Cu}_2(\text{OH})_2\text{CO}_3$. Most basic salts are insoluble in water and many are of variable composition

basic slag (basic cinder; basic phosphate; Thomas metal; Thomas slag; Thomas phosphate; Belgian slag). A slag produced in the conversion of pig iron of high phosphorus content into steel. It contains a variable amount of tricalcium phosphate, calcium silicate, lime and oxides of iron, magnesium and manganese. Used as a fertilizer, being particularly valuable for grazing lands.

See also slag.

basil oils (sweet basil oil).

Properties: Essential oils of which there are two commercial varieties, viz., (a) ordinary sweet basil oil and (b) Réunion oil. Yellow color; odor is aromatic, penetrating, estragon-like (ordinary), camphor-like (Réunion). (a) Soluble in 1 to 2 vols. and more of 80% alcohol (sometimes opalescent or with separation of paraffin).

(b) Soluble in 2 to 3 vols. of 80% alcohol; (mostly) in 3 to 7 vols. of 80% alcohol (occasionally with separation of paraffin). Insoluble in water.

Chief known constituents: (a) Methyl chavicol; linalool; cineole. (b) Pinene, cineole, camphor and methyl chavicol

Constants: (a) Sp. gr. 0.904-0.930 (15°C); optical rotation -6° to -22° ; refractive index 1.481-1.495; acid value up to 3.5; ester value 1-12 (b) Sp. gr. 0.945-0.987 (15°C); optical rotation $+0^\circ 22'$ to $+12^\circ$; refractive index 1.51505-1.51753; acid value up to 3; ester value 9-22.

Derivation: From the leaves of several varieties of the sweet basil, *Ocimum basilicum*, L

Uses: Flavoring; medicine; perfumery.

Shipping regulations: None.*

bassora gum. A term applied collectively to a group of highly colored gums which are somewhat similar to tragacanth gum. A bassora gum of commercial importance is Indian gum (q. v.).

bassorin (tragacanthin; adraganthin). A slimy nonadhesive mucilaginous residue obtained when tragacanth gum is treated with water several times and filtered. In the presence of alkalis the whole of the gum dissolves.

bastard saffron. See carthamus.

bastnaesite $(\text{Ce}, \text{La})(\text{CO}_3)\text{F}$. A natural fluorocarbonate of the cerium group of rare earth metals.

Properties: Color wax-yellow to reddish brown; luster vitreous to greasy; hardness 4.0-4.5; sp. gr. 4.9-5.2.

Occurrence: California, Colorado, New Mexico; Sweden.

Use: Ore of the rare earths

bastose. A combination of cellulose and lignin occurring in jute fiber.

batch distillation. Distillation in which the entire sample of the material to be distilled, the charge, is placed in the still before the process is begun and product is withdrawn only from the condenser of the apparatus

batteries. See dry cell; storage battery.

battery acid (electrolyte acid) Sulfuric acid of strengths suitable for use in storage batteries. The product is water-white, odorless and practically free from iron.

Derivation: By diluting high-grade commercial sulfuric acid with distilled water to standard strengths.

Approximate freezing points of electrolyte:

Sp gr.	Charge of Battery	F. p., °F
1.100	Discharged	+18
1.150	Discharged	+5
1.165	Discharged	-0
1.180	Discharged	-6
1.200	Half charged	-23
1.225	Half charged	-30
1.250	Half charged	-61
1.280	Full charged	-96

Containers: 126- to 200-lb glass carboys;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

tank cars

Use: Storage batteries

Shipping regulations: Corrosive liquid

White label. *

Baumé (abbreviated as Bé) A term used to designate readings on an arbitrary scale of specific gravities devised by the French chemist Antoine Baumé and used by him in the graduation of hydrometers. The relations to specific gravity (at 60/60°F) are as follows:

°Bé = 145 — 145/sp. gr. for materials heavier than water

°Bé = 140/sp. gr. — 130 for materials lighter than water

bauxite. A natural aggregate of aluminum-bearing minerals, more or less impure, in which the aluminum occurs largely as hydrated oxides. It is usually formed by prolonged weathering of aluminous rocks. Contains 30-75% Al_2O_3 , 9-31% H_2O , 3-25% Fe_2O_3 , 2-9% SiO_2 , and 1-3% TiO_2

Properties: Color white, cream, yellow, brown, gray or red; streak variable; luster dull or earthy; sp gr 2-2.55, hardness 1-3; often in pisolitic concretions. Insoluble in water; decomposed by hydrochloric acid.

Occurrence: Arkansas, Alabama, Georgia, Virginia; British Guiana; Surinam; Haiti; France; U.S.S.R.; Hungary.

Uses: Most important ore of aluminum, aluminum chemicals; abrasives; cement; refractories; decolorizing and deodorizing agent; catalysts; filler in rubber, plastics, paints, cosmetics

bay.

bayberry. There is understandable confusion in popular usage among these terms and their derivatives, but official and traditional usage as to the botanical drugs is clear. Bay is the European laurel, *Laurus nobilis* (see laurus) and is used for laurel oil (sweet bay oil). Bayberry is the wax myrtle, *Myrica cerifera* (see myrica), and is used for bayberry wax. However, bayberry oil and bay oil (see myrica oil) are made from the berries and leaves, respectively, of *Pimenta racemosa*. Note that myrica is not a mistake for myrica.

bayberry oil.

Properties: Yellowish-brown essential oil, aromatic odor distinct from that of bay oil, phenol content 73%; other constituents are pinene, chavicol, citrol, eugenol; sp. gr 0.955-0.990 (15°C); optical rotation -7° 3'. Soluble in 1.5 vol of 70% alcohol; in 0.5 vol. and more of 80% alcohol

Derivation: By distillation of the berries of *Pimenta racemosa* (*Pimenta acris*). Note that this is not the same plant used for bayberry wax, but is identical with that used for bay oil

Containers: Tins; glass bottles.

Shipping regulations: None *

bayberry wax (myrtle wax)

Properties: Green wax; bitter taste; feeble odor; chief constituents: palmitin, palmitic

acid, myristin and lauric acid; sp. gr. 0.933 (15°C); saponification value 198-199; iodine value 68-80; solidifying point 25°C; partly soluble in alcohol.

Derivation: By boiling the berries of myrica. The wax on the berries melts and floats.

Grades: Technical

Containers: Boxes; bags.

Uses: Candles (for pleasant odor when

burned); soaps; leather polishing; medicine.

Shipping regulations: None. *

Bayer process. Process for making pure alumina from the crude ore bauxite. The main use of alumina is in the production of metallic aluminum.

Bauxite is mixed with hot concentrated sodium hydroxide, which dissolves the alumina and silica. The silica is precipitated and the dissolved alumina is separated from the solids, diluted, cooled and then is crystallized as aluminum hydroxide. The aluminum hydroxide is calcined to give alumina

"Bayer 21/199." See O, O-diethyl O-3-chloro-4-methyl-2-oxo-2H-1-benzopyran-7-yl-phosphorothioate

"Bayer 22555." See para-dimethylaminobenzenediazo sodium sulfonate

"Bayer 29493." See O, O-dimethyl O-(4-(methylthio)-meta-tolyl)phosphorothioate

Bayer's acid. See 2-naphthylamine-7-sulfonic acid; also crocein acid.

bayleaf oil. See myrcia oil.

bay oil. See myrcia oil

"Bayol." ⁵¹ Trademark for technical, colorless, "white," mineral oils of low viscosity. They are used primarily for textile fiber lubrication, in the preparation of cloth sizes, etc. "Bayol" 50 is best suited as a lubricant on synthetic fibers during twisting and weaving

bay rum. Properly, the distillate from a mixture of 200 lbs of dried bay leaves, 65 gals rum, 100 gals of water, a little salt. Now commonly substituted is a mixture of bay oil, orange-peel oil and oil of pimenta.

Uses: Aromatic shaving lotions; alcoholic rub

"Baytex." ¹⁸¹ Trademark for O, O-dimethyl O-(4-(methylthio)-meta-tolyl)phosphorothioate (q. v.).

"Baytown." ¹¹⁰ Brand name for styrene-butadiene rubber masterbatch which contains carbon black and sometimes processing and extending oils

BBO. See 2,5-dibiphenyloxazole.

BBP. Abbreviation for butyl benzyl phthalate.

BCWL. Abbreviation for basic carbonate white lead. See lead carbonate, basic.

Be. Symbol for beryllium.

Bé. Abbreviation for Baumé (q. v.).

"Beacon." ⁵¹ Trademark for low temperature,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

low-torque, bearing greases for aircraft control bearings and instrument bearings subjected to wide temperature variation.

"Beaconol." ³⁵⁴ A line of sulfonated fatty alcohols used as detergents, wetting agents, and dispersing agents in the paper, textile, paint, and rubber industries.

bean oil. See soybean oil.

bean oil, Chinese. See soybean oil.

bearberry bark. See cascara sagrada bark.

bearwood. See cascara sagrada bark.

bebeerine (d-bebeerine; l-bebeerine or curine) $C_{36}H_{58}N_2O_4$. An alkaloid. Two stereoisomers known; the levo form (curine) is related to curare.

Properties: White to yellowish-brown, amorphous powder; levo or alpha: m.p. 214°C; insoluble in water; soluble in acetone, chloroform, dilute acid; slightly soluble in alcohol; dextro or beta: m.p. 142-150°C; soluble in chloroform, benzene, acids; slightly soluble in alcohol.

Derivation: By extraction of the bark of *Nectandra rodia* (d-bebeerine) or *Pareira brava* (curine) and subsequent crystallization.

Method of purification: Recrystallization

Grades: Technical.

Containers: Tins; glass bottles.

Use: Medicine, in form of sulfate and other salts. The commercial sulfate is a mixture of alkaloids allied to bebeerine.

bebeerine hydrochloride.

Properties: Reddish-brown scales. Soluble in water and alcohol; m.p. 259°C.

Derivation: By the action of hydrochloric acid on bebeerine.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

"Becco." ⁵⁵ Trademark for a line of chemicals, especially active oxygen chemicals, such as hydrogen peroxide, peracetic acid, calcium peroxide, urea peroxide, etc.

"Beckacite." ³⁶ Modified phenolic and non-phenolic or maleic ester synthetic resins.

Physical properties: Color, different grades range from G to WG (U.S. Department of Agriculture rosin standards); acid number 15-20 in most instances, running as high as 130 in specialty types; melting range 176-310°F, capillary tube method.

Chemical properties: All grades soluble cold in acetates and coal-tar solvents, some requiring heat in the presence of turpentine and drying oils. Imparted resistance to abrasion, water, weather and other reagents, as well as drying speed vary according to type and grade.

Uses: Clear varnishes; oleoresinous enamels; clear and pigmented nitrocellulose lacquers; printing ink vehicles; etc.

"Beckamine." ³⁶ Urea-formaldehyde and

melamine resin solutions with water or various blends of toluene, n-butyl alcohol, xylene and ethyl alcohol as the volatile component.

Physical properties: Solids, 39% to 61%; color none; acid number -1 to +7; viscosity A to W (Gardner-Holdt).

Chemical properties: Most important properties imparted to surface coatings are greater hardness, better color and color retention and faster baking.

Uses: Clear and pigmented industrial finishes of the baking type; plywood bonding; agent for improving the wet strength of papers.

"Beckolin." ³⁶ Synthetic drying oils. Two grades available: Light and dark.

Physical properties: Nonvolatile, 100%; color 4-7 (Hellige-Klett); acid number 6-16; viscosity X to Y (Gardner-Holdt).

Chemical properties: Imparts faster drying, longer luster life and increased resistance to weathering.

Uses: Paint, varnish, and enamel products.

"Beckopol." ³⁶ A phenolated copal gum or reacted combination of a phenolic synthetic resin and Congo copal gum.

Physical properties: Color M to K (U.S. Department of Agriculture rosin standards); acid number 40-45; melting range 268-302°F.

Chemical properties: Soluble cold in acetates, coal-tar solvents and turpentine; soluble hot in drying oils. Imparts excellent resistance to weather, water and abrasion, high viscosity; unusual hardness, remarkable toughness and outstanding printproof properties.

Use: Exceptionally hard varnishes, principally of the rubbing and polishing types.

"Beckosol." ³⁶ Alkyd resins in solid and solution form. Over 50 different items representing 16 separate and distinct kinds of base resins of the following types: (1) Drying pure alkyds, (2) nondrying pure alkyds, (3) phenol-modified alkyds, (4) oil- and phenol-modified alkyds, and (5) non-phenolic alkyds.

Physical properties: Solids from 45-100% by weight; solvents mineral spirits, high solvent naphtha, V.M. & P. naphtha, xylene and toluene; oil length, short to extra-long; color 1L to 7 (Hellige-Klett standards); acid number 3-23; viscosity A to Z₂.

Chemical properties: Imparted properties (speed of drying, hardness, color and color retention, durability, etc.) vary with the different types, kinds and grades.

Uses: Paints; lacquers; enamels; industrial and architectural surface coatings of all kinds.

"Bedacryl." ²⁰⁶ Trademark for methacrylic ester polymers used in air drying or stoving lacquers showing no discoloration at high temperatures or yellowing in ultra-violet light.

"Bedafil." ²⁰⁶ Brand name of a proprietary leather filling agent.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- "Bedafin" 685.** ²⁰⁶ Brand name for a resin used as a plasticizer for "Bedafin" 2001 to produce more flexible finishes. Soluble in aqueous ammonia.
- "Bedafin" 2001.** ²⁰⁶ Brand name for an alternative to albumen for fixing pigments on fabrics. Soluble in ammonia and other alkalies, e.g., triethanolamine.
- "Bedafin" E and F.** ²⁰⁶ Brand name for transparent, colorless, thermoplastic resins, soluble in trichlorethylene and mixtures of toluene and methylated spirit. Applied from organic solvents they give stiff finishes with a firm handle. They can be applied with plasticizers to give flexible transparent effects.
- "Bedafin" 285X.** ²⁰⁶ Brand name for a solution of "Bedafin" 685 in xylene.
- "Bedesol."** ²⁰⁶ Brand name of a line of synthetic resins used in the paint, varnish and printing-ink industries.
- beechwood creosote.** See creosote, wood-tar.
- beerstone.** A deposit occurring during brewing operations on containers and consisting of calcium oxalate and organic material.
- "Bee-Sive."** ³⁰² Trademark for adhesive compositions containing synthetic polymers; used for bonding materials.
- beeswax** (cera flava; yellow wax) Wax from the honeycomb of the bee. Beeswax consists largely of myricyl palmitate, cerotic acid and some high-carbon paraffins.
Properties: Yellow to grayish brown solid with honey-like odor and faint characteristic taste. Sp. gr. 0.95, melting range 62-65°C; insoluble in water; slightly soluble in alcohol; soluble in chloroform, ether, and oils.
Derivation: From melting the honeycomb in hot water, straining, and cooling the mixture in molds.
Grades: Technical; crude; refined; N. F. XI
 For the white grade, see beeswax, bleached
Containers: Bags; 100-lb cartons
Uses: Furniture and floor waxes; adhesives; leather dressings; anatomical specimens, artificial fruit and flowers; transparent and wax paper; process engraving; lithographing; textile sizes and finishes; also uses listed under beeswax, bleached
- beeswax, bleached** (white wax, cera alba) Beeswax bleached by sunlight or oxidizing agents such as chromic acid, hydrogen peroxide, or ozone.
Properties: Yellowish-white solid, translucent in thin layers, nearly tasteless.
 Other properties are those of beeswax.
Grades: U S P. XVI
Containers: Bricks and slabs in 100-lb cartons.
Uses: Ointments; cosmetics; candles.
- "Beetle" Resins.** ⁵⁷ Trademark for a series of alkylated urea-formaldehyde condensation products supplied in solution in organic solvents. These resins are thermosetting types generally used with alkyd type resins in surface coatings baked in the range of 250-300°F for 15-60 minute time periods. Available in the following grades:
 212-9. Solids 60 wt %; 8.4 lb/gal; special solvent; color (Gardner) 1 max; viscosity (Gardner-Holdt, 25°C) Y-Z₂; hydrocarbon solvent tolerance 1500; acid number (solid resin) 1-4.
 216-8. Solids 60 wt %; 8.5 lb/gal; butanol-xylol solvent; color (Gardner) 1 max.; viscosity (Gardner-Holdt, 25°C) S-V; hydrocarbon solvent tolerance 350; acid number (solid resin) 0.5-2.0
 220-8. Solids 50 wt %; 8.3 lb/gal; butanol-xylol solvent; color (Gardner) 1 max; viscosity (Gardner-Holdt, 25°C) X-Z₁; hydrocarbon solvent tolerance 200; acid number (solid resin) 1-4.
 227-8. Solids 50 wt %; 8.3 lb/gal; butanol-xylol solvent; color (Gardner) 1 max; viscosity (Gardner-Holdt, 25°C) W-Z; hydrocarbon solvent tolerance 100; acid number (solid resin) 1-4.
 230-8. Solids 50 wt %; 8.3 lb/gal; butanol-xylol solvent; color (Gardner) 1 max; viscosity (Gardner-Holdt, 25°C) Q-T; hydrocarbon solvent tolerance 150; acid number (solid resin) 0.5-2.0
- beet molasses.** See molasses
- beet sugar.** Sugar (sucrose) from special types of beets by extraction with water, refining and evaporation. Chemically identical with cane sugar (C₁₂H₂₂O₁₁)
- behenic acid** (docosanoic acid) CH₃(CH₂)₂₀COOH
 A saturated fatty acid found as a minor component of the oils of the type of peanut and rapeseed
Properties: M p 80.0°C; b p 306°C (60 mm), 265°C (15 mm), sp gr 0.8221 (100/4°C); refractive index 1.4270 (100°C).
Derivation: Peanut oil; occurs in ben oil, hydrogenated mustard oil and rapeseed oil
Containers: 50-lb paper bags
Grades: Technical, 99%
Uses: Cosmetics; waxes; plasticizers; chemicals; stabilizers
- behenyl alcohol** (1-docosanol)
 CH₃(CH₂)₂₀CH₂OH A long chain, saturated fatty alcohol, much like stearyl alcohol
Typical specifications: Titer 62.6°C; boiling range 342-377°C
Impurities: -15% or more stearyl and arachidyl alcohols
Derivation: Reduction of behenic acid
Uses: Synthetic fibers; lubricants
- Belgian slag.** See basic slag
- belladonna** (deadly nightshade; death's herb; banewort; divale; poison black cherry)
 An herbaceous perennial bush (Atropa belladonna) of which the leaves and roots are used for their content of hyoscyamine and atropine
Occurrence: Southern and central Europe; Asia Minor; Algeria; cultivated in North America; England; France

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer.. See "List of Manufacturers," page v.

- Grades:** Belladonna leaf, U.S.P. XVI; belladonna root, N.F. XI.
Containers: Boxes; bales.
Shipping regulations: None. *
- bell metal.** An alloy used for casting bells. It is generally composed of about 80% copper and 20% tin. It often contains small amounts of lead and zinc. Sp. gr. 8.7; m.p. about 890°C.
- "Belro."** ²⁶⁶ Trademark for a dark, acidic, thermoplastic resin.
Uses: Adhesives; battery waxes, coatings; cleaning compounds.
- "Bemberg."** ²⁸⁷ Trademark for cuprammonium yarn, a continuous spun regenerated cellulose product. Spun in ranges from 40 to 1800 denier in straight yarns and 70 to 5200 denier in novelty yarns. Sp. gr. 1.5; 11% moisture regain; tenacity range 1.8 to 2.4 grams per denier
Uses: Triple sheers; linings; dress goods; sportswear; underwear; draperies; upholstery.
- "BEM Brand."** ²⁴¹ Brand name for mixed fertilizers.
- bemegride** (3,3-methylethylglutarimide; 3-ethyl-3-methylglutarimide; methetharimide) $C_8H_{13}NO_2$.
Properties: Platelets; m.p. 127°C. Sublimes at 100°C and 2 mm pressure. Soluble in water and acetone.
Grade: N.N.D.
Use: Medicine.
- "Bemul."** ³⁵⁴ Trademark for a nontoxic, practically odorless emulsifying agent
Properties: A pure white, edible glycerol monostearate in bead form; m.p. 58-59°C, completely dispersible in hot water; completely soluble in alcohols and hot hydrocarbons.
Uses: In the manufacture of pharmaceuticals, cosmetics, and foodstuffs; as a protective coating for edible hygroscopic powders, tablets, and crystals; as a pour-point depressant for lubricating oils; and in textile sizes; etc.
- benactyzine hydrochloride** (2-diethylaminoethyl benzilate hydrochloride)
 $(C_6H_5)_2COHCOO(CH_2)_2N(C_2H_5)_2 \cdot HCl$.
Grade: N.N.D.
Use: Medicine.
- "Benadryl" Hydrochloride.** ³³⁰ Trademark for diphenhydramine hydrochloride.
- "Ben-A-Gel."** ^{236, 304} Trademark for a highly beneficiated magnesium montmorillonite, used as a thickening agent.
Properties: Soft, milky-white powder; sp. gr. 2.4.
Containers: 10-, 25-, and 100-lb fiberboard drums.
Uses: Viscosity control and pigment suspension in aqueous systems in water-based paints and cosmetics. "Ben-A-Gel" requires high shear and is used primarily in industrial paints, cosmetics and pharmaceuticals. "Ben-A-Gel EW" is designed
- for use with low shear mixing equipment.
- bench gas.** See coal gas.
- bendroflumethiazide** 3-benzyl-3,4-dihydro-6-(trifluoromethyl)-2H-1,2,4-benzothiadiazine-7-sulfonamide, 1,1-dioxide.
Properties: White crystalline solid; faint rose-like odor; m.p. 216-218°C. Insoluble in water and acid; soluble in dilute alkali.
Grade: Pharmaceutical.
Use: Medicine.
- Benedict solution.** A water solution of sodium carbonate, copper sulfate and sodium citrate. The blue color changes to a red, orange, or yellow precipitate or suspension in the presence of a reducing sugar such as glucose, and is therefore used in testing for such materials, especially for urinalysis in the treatment of diabetes. See Fehling's solution.
- "Benemid."** ¹²³ Trademark for probenecid; used in medicine.
- Bengal gelatin.** See agar-agar.
- Bengal isinglass.** See agar-agar.
- Bengal lights.** A mixture of realgar or arsenic disulfide, synthetic, potassium nitrate and sulfur, used in pyrotechnics to make blue light.
- beni oil.** See sesame oil.
- benjamin gum.** See benzoin gum, Siam, and benzoin gum, Sumatra.
- benne oil.** See sesame oil.
- "Benodaine."** ¹²³ Trademark for piperoxan hydrochloride.
- ben oil.** A non-drying oil obtained from the seeds of *Moringa aptera*.
Uses: Food; lubricant for delicate machinery; perfumery; pharmaceuticals
- benoxinate hydrochloride**
 $CH_3(CH_2)_3OC_6H_5(NH_2)_2CO_2(CH_2)_2N(C_2H_5)_2 \cdot HCl$.
 beta-Diethylaminoethyl-4-amino-3-n-butoxybenzoate hydrochloride.
Properties: White, odorless, crystalline powder; salty taste. M.p. 157-160°C; stable to air, heat and light. Freely soluble in alcohol, chloroform, and water; insoluble in ether; pH (aqueous solution) 4.5-5.2.
Grade: U.S.P. XVI.
Use: Medicine.
- "Benthal" Alkyd Resin Intermediate.** ⁵⁸ Trademark for a material consisting of phthalic anhydride 4.5-5.5%, benzoic acid 94.5-95.5%; light yellow flakes; m.p. 118°C min; characteristic odor.
Containers: 200-lb net wt fiber drums.
Uses: In the resin industry, particularly in alkyds where it reduces the acid value, reduces viscosity, retards yellowing on baking at elevated temperatures and after bodying, improves stability and flow. *
- "Bentone."** ^{236, 304} Trademark for a group of thickening agents:
"Bentone" 18-C: Alkyl ammonium montmorillonite. Finely divided light-cream powder;

* See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

sp. gr. 1.85.

Uses: Thickening and suspension agent for polar liquids and liquid mixtures; allows pigment suspension without strong thickening action for aerosol paints.

"Bentone" 27: Organic derivative of a special montmorillonite; finely divided creamy-white powder; sp. gr. 1.7.

Uses: Thickening agent with efficient gelling action over a wide range of organic solvents and finishes; prevents hard settling of suspended pigments or heavy reactive particles, fillers or abrasives; prevents excessive penetration into porous surfaces; provides strong reinforcing action in non-volatile organic compositions.

"Bentone" 34: Dimethyldioctadecyl ammonium bentonite. Finely divided light cream powder; sp. gr. 1.80.

Uses: Gelling agent for a wide variety of organic liquids; permits production of lubricating greases from lubricating oils; used in paints to prevent pigment settling and improve film properties

"Bentone" 38: Organic derivative of a special montmorillonite. Finely divided creamy-white powder; sp. gr. 1.8.

Uses: Gellant for organic liquids of low and intermediate polarity; promotes particle suspension and penetration control for paints, varnishes, enamels, vinyl dispersions and epoxy and polyester resins.

bentonite (wilkenite; colloidal clay). A clay containing appreciable amounts of the clay mineral montmorillonite, and usually with the ability to swell greatly by absorption of water. Composed principally of aluminum and silicates, usually with some magnesium and iron.

Properties: Color, light yellow or green, cream, pink, gray to black; plastic. Earthy taste; insoluble in water, but swells when added to water. Insoluble in common organic solvents; pH of water suspension between 9 and 10. Some varieties are activated by acid treatment before use.

Occurrence: Wyoming, South Dakota, California, Mississippi, Texas, Arizona; Europe; U. S. S. R.; Canada.

Containers: Paper sacks; mesh bags; railroad cars.

Grades: Various, including U. S. P. XVI.

Uses: Metal casting, oil well drilling mud; decolorizing agent for oils, water, wine, and other products; filler and plasticizer for ceramics, refractories, rubber, soap, paper; for closing leaks in walls and dams; polishes, adhesives; to emulsify asphalts for roads.

"Bentox." ²⁵³ Brand name for a type of sulfur product used as insecticide dust.

"Benzahex." ¹⁴⁷ Trademark for dusts and sprays containing benzene hexachloride sometimes formulated with DDT and/or sulfur.

Containers: Dusts, 50-lb bags; sprays, 5-, 30-, 55-gal drums; spray powders, 4-, 50-lb bags.

Uses: For control of insects on cotton, corn,

certain other crops and livestock. Should not be used on potatoes, peas, beans (after pods are set) and other crops on which it may cause off flavor and/or odor.

benzalacetone. See benzylidene acetone.

benzal chloride. See benzyl dichloride.

benzaldehyde (benzoic aldehyde; synthetic oil of bitter almonds; benzoyl hydride; benzene carbonal) C_6H_5CHO

Properties: Colorless or yellowish, fragrant, strongly refractive, volatile oil with odor resembling oil of bitter almonds, and burning aromatic taste; miscible with alcohol, ether, fixed and volatile oils; soluble in water.

Constants: Sp. gr. 1.041-1.046; refractive index (20°C) 1.5440-1.5464; m. p. -26°C; solidifies -56°C; b. p. 179.9°C.

Derivation: (a) From benzene, carbon monoxide and hydrogen chloride in the presence of cuprous chloride or aluminum chloride; (b) air oxidation of toluene with uranium or molybdenum oxides as catalysts; (c) chlorination of toluene with subsequent hydrolysis by acid or alkali.

Impurities: Usually chlorine derivatives.

Method of purification: Rectification.

Grades: Technical; F. F. C. (meaning free from chlorine); N. F. XI. Note: The specifications, especially regarding impurities, vary considerably for the grades used for dye manufacture from those used in perfumery.

Containers: 25-, 50-lb tins; 100-lb carboys; 425-, 450-lb drums.

Uses: Organic synthesis, especially of dyes and dye intermediates; solvent for oils, resins, some cellulose ethers, cellulose acetate and nitrate; flavoring compounds; production of synthetic perfumes; manufacture of cinnamic acid, benzoic acid; toilet preparations and soaps; photographic chemicals; baking chemicals; and in medicine.

Shipping regulations: None.*

benzaldehyde green. See malachite green.

benzalkonium chloride. A mixture of alkyl dimethylbenzylammonium chlorides of general formula $C_6H_5CH_2N(CH_3)_2RCl$ in which R is a mixture of the alkyls from C_8H_{17} to $C_{18}H_{37}$. It is a typical quaternary ammonium salt

Properties: Occurs as a white or yellowish-white, amorphous powder or in gelatinous pieces. It has an aromatic odor and very bitter taste; very soluble in water, alcohol or acetone; almost insoluble in ether; slightly soluble in benzene. Water solutions foam strongly when shaken and are alkaline to litmus

Grade: U. S. P. XVI.

Uses: Cationic detergent; surface antiseptic; fungicide.

benzamide (benzoylamide) $C_6H_5CONH_2$.

Properties: Colorless crystals; m. p. 130°C; b. p. 288°C; sp. gr. 1.341. Soluble in hot water, hot benzene, alcohol, and ether

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: From benzoyl chloride and ammonia or ammonium carbonate.

Grades: Technical.

Uses: Organic synthesis. *

benzamine hydrochloride. See eucaine hydrochloride.

benzamine lactate. See eucaine lactate.

benzaminoacetic acid. See hippuric acid.

benzanilide (benzoylanilide; phenylbenzamide)
 $C_6H_5NH(COC_6H_5)$.

Properties: White to reddish crystals and powder, closely related to acetanilide, containing benzoyl in place of acetyl radical. Sp. gr. 1.306; m.p. 160-162°C. Soluble in alcohol; insoluble in water; slightly soluble in ether.

Derivation: From benzoic anhydride and aniline with caustic soda.

Method of purification: Crystallization.

Grades: Technical.

Containers: Kegs.

Uses: Medicine; intermediate in the synthesis of dyes, drugs and perfumes.

Shipping regulations: None. *

benzanthrone $C_{17}H_{10}O$, a four ring system.

Properties: Pale yellow needles; soluble in alcohol and other organic solvents. M.p. 170°C.

Derivation: (a) From anthranol and glycerol by condensation by means of sulfuric acid (anthranol is made from anthraquinone); (b) from anthracene in sulfuric acid solution by addition of glycerol and heating to 100-110°C until the anthracene disappears. The reaction mass is then diluted with water, salted out and purified.

Method of purification: Crystallization from toluene.

Grades: Technical.

Containers: Wooden barrels.

Use: Dyes.

Shipping regulations: None. *

benzathine penicillin G. See penicillin.

benzazimide. See 4-ketobenzotriazine.

benzazoline hydrochloride. See tolazoline hydrochloride.

"Benzedrine." ⁷¹ Trademark for racemic amphetamine sulfate. See amphetamine sulfate.

benzene (benzol) C_6H_6 .

Properties: Clear, colorless, flammable liquid of highly refractive nature; characteristic odor; vapors burn with a very smoky flame; narcotic and toxic; b.p. 80.1°C; m.p. 5.5°C; sp. gr. 0.8790 (20/4°C); wt/gal 7.32 lb; refractive index (n 20/D) 1.50110; flash point (closed cup) 12°F. Miscible with alcohol, ether, acetone, carbon tetrachloride, carbon disulfide, acetic acid; slightly soluble in water.

Derivation: (a) Illuminating gas and coke-oven gas are "scrubbed," by passing through oil which thus becomes saturated with benzene and toluene. The resulting oil is distilled; benzene and toluene are

recovered, and then separated by fractional distillation. (b) Coal-tar, after dehydration, is fractionally distilled yielding "light oil." On distilling this, the first runnings contain the crude benzene. This is successively washed with caustic soda, sulfuric acid and water, and again distilled. (c) Extraction from catalytic reforming streams in refining of petroleum. The last two methods are the more important.

Impurities: Toluene, xylene, tarry substances.

Grades: Crude; straw color; motor; industrial pure (2°C); nitration (1°C); thiophene-free.

Containers: 1-, 5-lb bottles; various sizes of tin cans; 55-, 110-gal drums; 8,000-10,000-gal tank cars.

Uses (in approximate order of volume):

Styrene; phenol; synthetic detergents; nylon intermediates; aniline; DDT; maleic anhydride; dichlorobenzene; benzene hexachloride; nitrobenzene; diphenyl; insecticides; fumigants; solvent and miscellaneous synthetic uses. Large amounts are produced from petroleum and used in motor fuels without separation from the hydrocarbon mixture.

Danger: Extremely flammable, vapor harmful, poison. MCA warning label.

Shipping regulations: Flammable liquid.

Red label *

benzene azimide. See 1,2,3-benzotriazole.

benzeneazobanilide. See diazoaminobenzene.

benzeneazobenzene. See azobenzene.

benzene-azo-para-benzene-azo-beta-naphthol. See aminoazobenzene-beta-naphthol.

benzeneazonaphthylamine. See yellow AB.

benzeneazonaphthylethylenediamine. See azodine.

benzene carbonal. See benzaldehyde.

benzenecarbothioic acid. See thiobenzoic acid.

benzene carboxylic acid. See benzoic acid.

benzene dibromide. See dibromobenzene.

benzene-ortho-dicarboxylic acid. See phthalic acid.

benzene-para-dicarboxylic acid. See terephthalic acid.

benzene hexachloride. Common and accepted designation for a commercial mixture of isomers of 1,2,3,4,5,6-hexachlorocyclohexane (q.v.) Used as an insecticide. See also purified gamma-isomer under lindane.

gamma-benzene hexachloride. See lindane.

benzenemonosulfonic acid. See benzenesulfonic acid.

benzenephosphinic acid (phenylphosphinic acid)
 $C_6H_5H_2PO_2$.

Properties: Colorless crystals; m.p. 82-84°C; sp. gr. 1.376 (29°C). Decomposes at 200°C. Stable in air.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Soluble in water, alcohol, acetone.
Slightly soluble in ether; insoluble in benzene, hexane, carbon tetrachloride.

Containers: 100-lb fiber drums.

Uses: Antioxidant; intermediate for metallic salt formation; accelerator for organic peroxide catalysts.

benzenephosphonic acid (phenylphosphonic acid) $C_6H_5H_2PO_3$.

Properties: Colorless crystals. M. p. $158^\circ C$, sp. gr. 1.475 ($4^\circ C$); decomposes at $275^\circ C$; soluble in water, alcohol, ether, acetone; insoluble in benzenes, hexane, carbon tetrachloride.

Containers: 100-lb fiber drums

Uses: Intermediate in anti-fouling paint agents; catalyst in organic reactions.

benzene phosphorus dichloride $C_6H_5PCl_2$.

Properties: Highly reactive colorless liquid. M. p. $-51^\circ C$; b. p. $224.6^\circ C$ (760 mm); sp. gr. 1.315 ($25^\circ C$); refractive index 1.5958 (n 25/D). Soluble in common inert organic solvents; fumes in air; hydrolyzes in water. Handle with caution.

Containers: 55-gal stainless steel drums

Uses: Organic synthesis, for derivation of plasticizers, polymers, antioxidants; oil additives.

benzene phosphorus oxydichloride $C_6H_5POCl_2$.

Properties: Reactive colorless liquid. M. p. $3.0^\circ C$, b. p. $258^\circ C$ (760 mm); sp. gr. 1.197 ($25^\circ C$); refractive index 1.5585 (n 25/D). Soluble in common inert organic solvents; hydrolyzes in water.

Containers: 55-gal nickel drums

Uses: Organic synthesis, for derivation of plasticizers, polymers, antioxidants, oil additives.

benzene ring. The six-carbon ring present in the molecular structure of benzene and in all the organic compounds derived from benzene by replacing the hydrogen atoms by other atoms or radicals.

benzene series. A series of compounds of hydrogen and carbon all having the general formula C_nH_{2n-6} with n never less than six, e. g., benzene C_6H_6 , toluene C_7H_8 , xylene C_8H_{10} .

benzenesulfonic acid (phenylsulfonic acid)

$C_6H_5SO_3H$

Properties: Fine, deliquescent needles or large plates; m. p. $65-66^\circ C$ when anhydrous; with 15 molecules water, m. p. is $43-44^\circ C$; soluble in water and alcohol; slightly soluble in benzene; insoluble in ether and carbon disulfide.

Derivation: By sulfonating benzene with fuming sulfuric acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Iron drums.

Uses: Making phenol; resorcinol; for other organic syntheses and as a catalyst.

Shipping regulations: None *

benzenylaminophenol $C_6H_5CNC_6H_4S$.

Properties: Yellow needles; pleasant odor of tea roses and geranium. Soluble in

alcohol, ether, carbon disulfide, and dilute hydrochloric acid; insoluble in water. M. p. $115^\circ C$; b. p. $360^\circ C$.

Method of purification: Crystallization.

Grades: Technical.

Containers: Tins.

Use: Perfumery.

Shipping regulations: None. *

benzenyl trichloride. See benzotrichloride.

benzestrol

$HOC_6H_4CH(C_2H_5)CH(C_2H_5)CH(CH_3)C_6H_4OH$. 4,4'-(1,2-Diethyl-3-methyltrimethylene) diphenol.

Properties: Odorless, white, crystalline powder. M. p. $161-163^\circ C$; readily soluble in acetone, alcohol, ether, methanol, and sodium hydroxide solution; soluble in vegetable oils; moderately soluble in glacial acetic acid; slightly soluble in dilute alcohol, benzene, chloroform, and petroleum ether; practically insoluble in water and dilute mineral acids.

Grade: N. F. XI.

Use: Medicine.

benzethonium chloride. A synthetic quaternary ammonium compound, $C_{27}H_{42}ClNO_2 \cdot H_2O$. (Benzyl dimethyl {2-[2-(para-1,1,3,3-tetramethylbutylphenoxy) ethoxy] ethyl} ammonium chloride or $(CH_3)_3CCH_2C(CH_3)_2C_6H_4OC_2H_4OC_2H_4N-(CH_2C_6H_5)(CH_3)_2Cl \cdot H_2O$).

Properties: Colorless, odorless crystals. Very bitter taste; m. p. $164-166^\circ C$. Soluble in water, alcohol, and acetone. Aqueous solution yields flocculent white precipitate with soap solutions.

Grade: U. S. P. XVI.

Use: Antiseptic; cationic detergent.

benzhydrol (benzohydrol; diphenylmethanol; diphenylcarbinol) $(C_6H_5)_2CHOH$.

Properties: Needlelike colorless crystals; m. p. $69^\circ C$; b. p. $298^\circ C$ (748 mm), $176^\circ C$ (13 mm). Slightly soluble in water, easily soluble in alcohol, ether, chloroform and carbon disulfide; insoluble in ligroin.

Derivation: Reduction of benzophenone with magnesium or zinc dust.

Use: Preparation of other organic compounds, including certain antihistamines.

benzhydryl chloride $(C_6H_5)_2CHCl$.

Properties: A water-white to light straw colored liquid; refractive index 1.596; b. p. $140^\circ C$ (3 mm); used for synthesis.

2-(benzhydryloxy)-N, N-dimethylethylamine hydrochloride. See diphenhydramine hydrochloride.

benzidine (benzidine base; para-diaminodiphenyl) $NH_2(C_6H_4)_2NH_2$.

Properties: Grayish-yellow, white or reddish gray crystalline powder; m. p. $127^\circ C$, but varies with rate of heating, and is lowered by presence of moisture in sample; b. p. $400^\circ C$; soluble in hot water, alcohol, and ether; slightly soluble in water.

Derivation: (a) By reducing nitrobenzene with zinc dust in alkaline solution followed by distillation; (b) by electrolysis of

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- nitrobenzene, followed by distillation;
(c) nitration of diphenyl followed by reduction of the product with zinc dust in alkaline solution, with subsequent distillation.
Method of purification: Crystallization.
Grades: Technical (paste, powder 80-85%).
Containers: Paste, 500-lb barrels; powder, 250-lb barrels.
Uses: Organic synthesis; manufacture of dyes, especially of Congo red; detection of blood stains; stain for microscopic work; reagent to determine lignification of wood; as a stiffening agent in rubber compounding.
Warning: Hazardous solid and vapor. Rapidly absorbed through skin. Repeated absorption may result in bladder tumors.
MCA warning label.
Shipping regulations: None.*
- benzidine base.** See benzidine.
- benzidinedicarboxylic acid.** See diaminodiphenic acid.
- benzidine hydrochloride** $C_{12}H_{12}N_2 \cdot 2HCl$.
Properties: Crystals; soluble in water and alcohol.
Grades: Reagent; technical.
Containers: Barrels.
Use: Quantitative determination of sulfates; reagent for metals; detection of blood.
- benzidine orange.** A family of organic azo pigments prepared by coupling the tetrazonium salt of 3,3'-dichlorobenzidine with substituted pyrazolones. These pigments have properties and uses similar to those described under benzidine yellow.
- benzidine sulfate** (para-diaminodiphenyl sulfate) $C_{12}H_{12}N_2 \cdot H_2SO_4$.
Properties: White crystalline powder. Soluble in ether; sparingly soluble in water, alcohol, dilute acids.
Derivation: Action of sulfuric acid or sodium sulfate on benzidine with subsequent recovery by precipitation.
Method of purification: Crystallization.
Grades: Technical.
Containers: Wooden barrels; kegs.
Use: Organic synthesis.
Shipping regulations: None*
- benzidine yellow.** A family of organic azo pigments prepared by coupling the tetrazonium salt of 3,3'-dichlorobenzidine with acetoacetylides having good brightness, light-fastness and alkali resistance. They are approximately twice as strong as hansa yellow but somewhat poorer in light permanency.
Containers: Barrels.
Uses: Printing ink; linoleum and floor tile; plastics and rubber.
- benzil** (dibenzoyl) $C_6H_5CO \cdot COC_6H_5$.
Properties: Yellow needles. Soluble in alcohol and ether; insoluble in water. M.p. 95°C; b.p. 346-348°C; sp. gr. 1.521
Derivation: From benzoin by oxidation with nitric acid.
Method of purification: Crystallization from alcohol.
- Grades: Technical.
Containers: Tins.
Use: Organic synthesis.
Shipping regulations: None.*
- benzine.** See ligroin. Note: Term is misleading and outmoded. Do not confuse with benzene, also known commercially as benzol.
- benzoate of soda.** See sodium benzoate.
- benzocaine.** See ethyl-para-aminobenzoate.
- benzodihydropyrene** (dihydrocoumarin).
Properties: White to light yellow oily liquid with a sweet odor; congeals at 23°C. Insoluble in water; soluble in alcohol; chloroform and ether.
Containers: Glass bottles; cans; drums.
Uses: In perfumery and flavors.
Shipping regulations: None.*
- benzodioxine.** See piperoxan.
- "Benzoform."** ³⁰⁷ Brand name of proprietary line of direct dyestuffs for aftertreatment with formaldehyde. Used for the dyeing of cotton and rayon. Characterized by fair fastness to washing, water, and perspiration and good dischargeability.
- benzofuran.** See coumarone.
- benzofuran resin.** See coumarone-indene resins.
- benzoglycolic acid.** See mandelic acid.
- benzoguanamine** (2,4-diamino-6-phenyl-s-triazine) $C_6H_5C_3N_3(NH_2)_2$.
Properties: Crystals; sp. gr. 1.40 (d 25/4); m.p. 227-228°C. Soluble in alcohol, ether and dilute hydrochloric acid; partially soluble in dimethylformamide; practically insoluble in acetone, chloroform, ethyl acetate; insoluble in water.
Derivation: Prepared from benzonitrile and dicyandiamide in the presence of sodium and liquid ammonia.
Containers: Drums; tank cars.
Uses: Manufacture of thermosetting resins, resin modifiers, chemical intermediate for pesticides, pharmaceuticals and dyestuffs.
- benzohydrol.** See benzhydrol.
- benzoic acid** (carboxybenzene; benzene carboxylic acid; phenylformic acid) C_6H_5COOH . It occurs naturally in benzoin gum and some berries.
Properties: White scales or needle crystals with odor of benzoin or benzaldehyde; sp. gr. 1.2659; m.p. 121.25°C; b.p. 249.2°C; sublimes at 100°C; flash point (closed cup) 250°F; soluble in alcohol, ether, chloroform, benzene, carbon disulfide, carbon tetrachloride, and turpentine; slightly soluble in water.
Derivation: (a) Decarboxylation of phthalic acid by steam, in the presence of catalysts; (b) chlorination of toluene to yield benzo-trichloride, which is hydrolyzed to benzoic acid; (c) by the direct oxidation of toluene.
Method of purification: Sublimation.
Grades: Technical; C. P.; U. S. P. XVI.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: 200-lb barrels; multiwall paper sacks; 25-, 50-, 100-lb drums; tanks.

Uses: Chemicals (benzoates), especially sodium and benzyl benzoates; mordant in calico printing; seasoning tobacco and improving the aroma; flavors; perfumes; dentifrices; medicine (germicide); plasticizer and resin intermediate; food packaging; textiles; dyes.

Shipping regulations: None.*

benzoic aldehyde. See benzaldehyde.

benzoic ether. See ethyl benzoate.

benzoic trichloride. See benzotrichloride

benzoin (bitter almond oil camphor; phenylbenzoyl carbinol) $C_6H_5CHOHCOC_6H_5$.

Properties: White or yellowish crystals; m.p. 137°C; b.p. 344°C; slightly soluble in water, alcohol, and ether.

Derivation: Condensation of benzaldehyde in potassium cyanide solution.

Use: Antiseptic.

Do not confuse with benzoin gum, of which it is not a constituent.

benzoin gum, Siam (benzoin Siam; Benjamin gum; benzoin resin).

Properties: Almond-shaped, pale, reddish-brown tears; balsamic, vanilla-like odor; aromatic; slightly acrid taste; hard and brittle at ordinary temperature, but softened by heat; soluble in warm alcohol and carbon disulfide; insoluble in water. Not less than 90% is soluble in alcohol (U.S.P.).

Chief constituents: An ethereal oil, benzoic acid, cinnamic acid, vanillin, resins.

Derivation: Balsamic resin from *Styrax benzoin* and other species.

Occurrence: Siam, Cambodia, Cochin-China.

Grades: Technical; U.S.P. XVI.

Containers: Tins.

Uses: Medicine; perfumery; cosmetics.

Shipping regulations: None.*

benzoin gum, Sumatra (benzoin Sumatra; Benjamin gum; benzoin resin).

Properties: Differs from benzoin gum, Siam, in many respects. The odor is not so strong and it does not melt so easily.

Generally contains 12-15% of woody matter. Soluble in warm alcohol and carbon disulfide; insoluble in water. Not less than 75% is soluble in alcohol (U.S.P.).

Chief constituents: Cinnamic acid, benzoic acid, vanillin, resins

Derivation: Balsamic resin from *Styrax benzoin* or Sumatra benzoin.

Occurrence: Sumatra, Java and Sunda Islands.

Grades: Technical; U.S.P. XVI.

Containers: Bags; cases.

Uses: Cinnamic acid; varnishes; medicine; cosmetics.

Shipping regulations: None.*

benzoin resin. See benzoin gum, Siam; benzoin gum, Sumatra.

benzoin Siam. See benzoin gum, Siam.

benzoin Sumatra. See benzoin gum, Sumatra.

benzol. See benzene. The term benzol is still used commercially, but is not in favor in modern nomenclature.

benzol 160°. See naphtha, solvent.

benzol black. A carbon black made by incomplete combustion of benzene or benzene-containing liquids.

benzonaphthol (beta-naphthol benzoate; naphthyl benzoate; benzoyl naphthol) $C_{10}H_7COOC_6H_5$.

Properties: White crystalline powder, odorless, tasteless; darkens with age. Soluble in chloroform and in alcohol (more so in hot); almost insoluble in water. M.p. 11°C. Derivation: Interaction of benzoyl chloride and beta-naphthol.

Use: Medicine.

Shipping regulations: None.*

benzonate (omega-methoxypoly(ethyleneoxy) ethyl-para-butylaminobenzoate; nonaethyl-ene glycol monomethyl ether para-n-butylaminobenzoate) $C_4H_9NHC_6H_4COO(CH_2)_2(OC_2H_4)_nOCH_3$ n=8, average.

Properties: Colorless to faintly yellow oil. Soluble in most organic solvents except aliphatic hydrocarbons

Grade: N.N.D.

Use: Medicine.

benzonitrile (phenyl cyanide) C_6H_5CN .

Properties: Transparent, colorless oil; odor of essential oil of almonds; viscosity (100°F) 1.054 centistokes; refractive index (n_D²⁰) 1.5289. Very toxic! Soluble in hot water, alcohol, and ether; insoluble in cold water. Sp. gr. 1.0051; b.p. 190.7°C; m.p. -13.1°C.

Derivation: From benzoic acid by heating with lead thiocyanate.

Method of purification: Distillation.

Grades: Technical.

Containers: Glass bottles; iron drums

Uses: Organic synthesis; possible uses include production of pharmaceuticals; dye-stuffs; intermediate for rubber chemicals; solvent for vinyl resins

benzophenol. Phenol itself, C_6H_5OH , as distinguished from higher phenols such as the cresols.

benzophenone (diphenylketone) $(C_6H_5)_2CO$.

Properties: White prisms, with sweet, rose-like odor. Soluble in alcohol and ether; insoluble in water. Congealing point -47.5°C; chlorine-free

Purification: Crystallization from alcohol.

Grades: Free from chlorine.

Containers: Tin cans; fiberboard containers; drums.

Uses: Organic synthesis; perfumery, for floral odors and as fixative; derivatives are used as ultraviolet absorbers.

Shipping regulations: None.*

benzophenone oxide. See xanthone.

benzopurpurin (Eclipse; Eclipse Red). A red substantive dye formed by combining naphthionic acid with diazo compound of ortho-toluidine. (Brownish-red powder.)

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Used in dyeing wool and silk; various shades known by combinations of letters and numbers, such as 4B, 10B, etc., placed after the name.

benzopyrene (benzpyrene) $C_{20}H_{12}$. A polynuclear (five-ring) aromatic hydrocarbon, held to be a cause of cancer. Found in coal tar, cigarette smoke, and in the atmosphere as a product of incomplete combustion. Occurs as benzo[a]pyrene (1,2-benzopyrene); also called 3,4-benzpyrene) and benzo[e]pyrene (4,5-benzopyrene).

Properties (benzo[a]pyrene): Yellowish crystals; m. p. 179°C ; b. p. $310\text{--}312^{\circ}\text{C}$ (10 mm). Insoluble in water; slightly soluble in alcohol; soluble in benzene, toluene, xylene.

benzopyrone. See coumarin.

benzoquinone. See quinone.

benzosulfimide. See saccharin.

1,2,3-benzotriazole (aziminobenzene; benzene azimide) $C_6H_4NHN_2$

Properties: White to light tan; odorless, crystalline compound; boiling range $201\text{--}204^{\circ}\text{C}$ (15 mm); very stable toward acids and alkalis, and toward oxidation and reduction. Its basic characteristics are very weak but it forms stable metallic salts. Can exist in 2 tautomeric forms. Soluble in alcohol and benzene; slightly soluble in water.

Containers: 1-lb bottles; 5-, 50-, 100-lb fiber drums.

Uses: Photographic restrainer; as a chemical intermediate; derivatives used as ultraviolet absorbers.

Shipping regulations: None.*

benzotrichloride (toluene trichloride; benzenyl trichloride; benzoic trichloride; phenylchloroform) $C_6H_5CCl_3$.

Properties: Colorless to yellowish liquid; characteristic, penetrating odor. Soluble in alcohol and ether; insoluble in water. Sp. gr. 1.38; b. p. $213\text{--}214^{\circ}\text{C}$; m. p. -5°C ; refractive index (n 19/D) 1.5584.

Derivation: By the chlorination of boiling toluene.

Method of purification: Rectification.

Grades: Technical.

Containers: Iron drums; carboys.

Use: Synthetic dye industry.

Shipping regulations: None.*

benzotrifluoride (toluene trifluoride; trifluoromethyl benzene) $C_6H_5CF_3$.

Properties: Water-white liquid with aromatic odor. B. p. 102.1°C ; f. p. -29.1°C ; sp. gr. 1.1812 ($25/4^{\circ}\text{C}$); refractive index (n 20/D) 1.4146. Flash point (closed cup) 54°F . Miscible with alcohol, acetone, benzene, carbon tetrachloride, ether, and n-heptane; decomposes in water.

Containers: 55-gal drums.

Uses: Intermediate for dyes, and pharmaceuticals; as a solvent and dielectric fluid; vulcanizing agent; insecticides.

Shipping regulations: Flammable liquid.

Red label.*

trans-beta-benzoylacrylic acid

$C_6H_5COCH:CHCOOH$.

Properties: Straw yellow needles or plates; m. p. 99°C ; soluble in most solvents but only slightly soluble in cold water and ligroin.

Containers: Polyethylene-lined fiber drums.

Uses: Ovicide for eggs of the body louse; reagent for characterizing phenols; intermediate in the manufacture of bactericides, insecticides, surface active agents and the upgrading of drying oils.

benzoylamide. See benzamide.

benzoylaminoacetic acid. See hippuric acid.

benzoylanilide. See benzanilide.

benzoyl chloride C_6H_5COCl .

Properties: Transparent, colorless pungent liquid; vapor causes tears. Sp. gr. 1.2188; m. p. -0.5°C ; b. p. 197.2°C ; refractive index (n 20/D) 1.5536; flash point 72°C . Soluble in ether and carbon disulfide; decomposes in water.

Derivation: (a) Interaction of benzoic acid and sulfur chloride; (b) benzotrichloride and water in the presence of zinc chloride; (c) phosphorus tri- or pentachloride and benzoic acid.

Containers: 1-lb bottles; returnable carboys of 50- and 100-lbs net; tank trucks.

Grades: Technical; C. P.

Uses: Medicine; intermediate for introduction of benzoyl groups; intermediate for other organics.

Warning! Causes burns; vapor irritating. MCA warning label.

Shipping regulations: Corrosive liquid. White label.*

benzoylglycin. See hippuric acid

benzoylglycocol. See hippuric acid.

benzoyl hydride. See benzaldehyde.

benzoylnaphthol. See benzonaphthol.

benzoyl peroxide $(C_6H_5CO)_2O_2$.

Properties: White, granular, crystalline solid; tasteless; odorless; dangerous, has been known to explode spontaneously. Active oxygen, about 6.5%. Soluble in nearly all organic solvents; slightly soluble in alcohols and vegetable oils; insoluble in water. M. p. $103\text{--}105^{\circ}\text{C}$ (dec).

Grades: Technical, wet or dry.

Containers: 1-lb net fiber containers or polyethylene-lined bags; standard shipping cases contain 5, 25, and 50 containers.

Uses: Bleaching agent for flour, fats, oils, and waxes; polymerization catalyst; drying agent for unsaturated oils; pharmaceutical and cosmetic purposes; rubber compounding; burn out agent for acetate yarns.

Fire hazard: Dangerous.

Shipping regulations: Oxidizing material. Yellow label.*

2-benzoylpyridine $C_6H_5COC_5H_4N$.

Properties: Freezing point 42.7°C ; insoluble

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

in water.

Grade: 98% (minimum).

Use: Organic synthesis.

4-benzoylpyridine $C_6H_5COC_5H_4N$.

Properties: Freezing point $71.4^\circ C$; insoluble in water.

Grade: 98% (minimum).

Use: Organic synthesis

benzoysalicylic acid, methyl ester. See methyl benzoysalicylate.

benzoysulfonic imide. See saccharin.

benzozone. See acetylbenzoyl peroxide.

1,2-benzophenanthrene. See chrysene.

benzpyrene. See benzopyrene.

benzpyrinium bromide

$(CH_3)_2NCOOC_5H_4NCH_2C_6H_5Br$. 1-Benzyl-3-(dimethylcarbamyloxy)-pyridinium bromide

Properties: White to slightly yellow crystalline powder; almost odorless. M.p. $114-120^\circ C$; very soluble in alcohol and water; practically insoluble in ether; pH (1% solution) 4.5-5.5.

Use: Medicine.

benztropine methanesulfonate (3-diphenylmethoxytropane methanesulfonate)

$C_{21}H_{25}NO \cdot CH_3O_3S$.

Properties: White, colorless, odorless, slightly hygroscopic, crystalline powder. Very soluble in water, freely soluble in alcohol, and very slightly soluble in ether. Melting range $142-144^\circ C$.

Grade: N. F. XI.

Use: Medicine.

benzyl abietate $C_{19}H_{29}COOC_6H_5CH_2$.

Properties: Stable, nonvolatile, viscous liquid which resembles Canada balsam. Soluble in most anhydrous solvents

benzyl acetate (phenylmethyl acetate) $C_6H_5CH_2OOCCH_3$.

Properties: A water-white liquid with a pleasant flowery odor which should not be stale, flat or sharp in a well-manufactured product. The odor should not change on keeping or on exposure to air or on evaporation. Should give a negative test for chlorine by all qualitative methods. Soluble in alcohol and ether; almost insoluble in water and glycerol. Flash point $102^\circ C$. Sp. gr. $1.059-1.062$ ($15^\circ C$); b.p. $212^\circ C$; refractive index $1.5015-1.5035$.

Derivation: (a) By treating benzyl chloride with acetate of soda in various solvents; (b) by esterification of benzyl alcohol with acetic anhydride or acetic acid.

Method of purification: Distillation.

Grades: Free-from-chlorine grade which should have an ester content of 97% but for which lower grade material is sometimes substituted; technical grade which is not free from chlorine and for which ester content varies considerably.

Containers: 55-gal, 100-lb tinned drums; carboys; cans; bottles.

Uses: Essential ingredient of artificial jasmine

and many other flowery perfumes; soap perfume; in some flavors; solvent and high boiler for cellulose acetate and nitrate, natural and synthetic resins; oils; lacquers; dopes; polishes; printing inks; varnish removers.

Shipping regulations: None.*

benzyl alcohol (alpha-hydroxytoluene; phenylcarbinol) $C_6H_5CH_2OH$

Properties: A water-white liquid with a faint aromatic odor which in the course of time, especially on exposure to air, smells slightly of benzaldehyde. Has a sharp, burning taste. B.p. $206^\circ C$; flash point $96^\circ C$; sp. gr. $1.040-1.050$; refractive index ($20^\circ C$) $1.5385-1.5405$. Somewhat soluble in water; miscible with alcohol, ether and chloroform.

Derivation: (a) By hydrolysis of benzyl chloride; (b) by hydrolysis of other benzyl esters, such as benzyl acetate; (c) by Cannizzaro method from benzaldehyde.

Method of purification: Distillation and chemical treatment.

Grades: Free from chlorine (F. F. C.); technical; N. F. XI.

Containers: 1-, 5-gal cans; 100-gal carboys; 450-lb drums.

Uses: Solvent in perfumery and flavoring materials; intermediate in preparing other benzyl esters and ethers; high-boiling solvent in cellulose derivative products; medicine (local anesthetic). Solvent for: cellulose esters and ethers, benzyl abietate, resins, sulfur; lacquers; films; paint and varnish removers.

Shipping regulations: None.*

benzylamine (aminotoluene) $C_6H_5CH_2NH_2$.

Properties: Colorless liquid; strongly alkaline reaction. Soluble in alcohol, ether, and water. Sp. gr. 0.9813 ; b.p. $184.5^\circ C$; refractive index ($n_{20/D}$) 1.540 .

Derivation: From benzyl chloride and ammonia.

Method of purification: Distillation.

benzyl-para-aminophenol (BAP)

$C_6H_5CH_2NHC_6H_4OH$.

Properties: Light brown, finely ground powder, melts between $84-90^\circ C$; 96-99% pure; solubility is 50% in anhydrous methanol, 50% in 95% ethyl alcohol, 0.06% in water; 0.1-0.5% in gasoline, varying with chemical nature of gasoline.

Containers: Iron drums (200 lbs net).

Use: In cracked gasoline, in concentration of 0.001-0.004% by weight, to prevent gum formation.

2-benzylamino-1-propanol

$C_6H_5CH_2NHCH(CH_2OH)CH_3$.

Properties: White to yellow solid. Both *l* and *dl* forms are available. M.p. (*dl*-form) $70-73^\circ C$. Specific rotation (*l*-form) $+38^\circ$ to $+44^\circ$ (1.0% solution in alcohol) at $25^\circ C$.

benzylaniline $C_6H_5NHCH_2C_6H_5$.

Properties: Colorless prisms. Soluble in alcohol and ether; insoluble in water. M.p. $33^\circ C$; b.p. $310^\circ C$.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: By heating aniline with benzyl chloride.

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden barrels.

Use: Organic synthesis.

Shipping regulations: None.*

benzylbenzene. See diphenylmethane.

benzyl benzoate $C_6H_5CH_2OOCCH_2C_6H_5$.

Properties: A water-white liquid which readily freezes to a solid. Has a sharp, burning taste and a faint aromatic, pleasant odor which should not be harsh or have any trace of benzaldehyde or toluene odor even after long standing. Supercools easily. Insoluble in water and glycerin; soluble in alcohol, chloroform and ether. Sp. gr. 1.119; b.p. 325°C; m.p. 18.8°C; should be free from even traces of chlorine and have less than 0.03% free acid; refractive index 1.568-1.569 (20°C).

Derivation: (a) By a Cannizzaro reaction from benzaldehyde; (b) by esterifying benzyl alcohol with benzoic acid; (c) by treating benzoate of soda with benzyl chloride.

Method of purification: By distillation and crystallization.

Grades: N. F. XI; technical.

Containers: 55-gal drums (tinned); 100-lb drums; cans; bottles; aluminum containers

Uses: Fixative and solvent for musk in perfumes and flavors; medicine; plasticizer; miticide.

Shipping regulations: None.*

benzyl bichloride. See benzyl dichloride

benzyl bromide (alpha-bromotoluene)

$C_6H_5CH_2Br$.

Properties: Clear, refractive liquid. Pleasant odor. Not easily hydrolyzed. Soluble in alcohol, benzene, ether, insoluble in water. A lachrymator. Sp. gr. 1.438 at 16°C; b.p. 198-199°C; m.p. -3.9°C, vapor density 5.8

Derivation: (a) Bromination of toluene; (b) interaction of benzyl alcohol and hydrobromic acid.

Grades: Technical.

Uses: Making foaming and frothing agents; organic synthesis.

Shipping regulations: Corrosive liquid. White label.*

benzyl butyrate $C_3H_7COOCH_2C_6H_5$.

Properties: Liquid; heavy fruity odor; b.p. 240°C; density 1.016 (17.5°C); soluble in alcohol.

Grades: Technical

Uses: Plasticizer; for blending in odorants and flavoring.

benzyl carbinol. See phenethyl alcohol.

benzyl chloride (alpha-chlorotoluene)

$C_6H_5CH_2Cl$.

Properties: Colorless liquid; pungent odor. Sp. gr. 1.1027; m.p. -43°C; b.p. 179°C; n_D²⁵ 1.5365; flash point 165°F. Soluble in alcohol and ether; insoluble in water.

Derivation: By passing chlorine over boiling

toluene until it has increased 38% in weight.

The product is washed with water and separated by fractional distillation.

Method of purification: Redistillation.

Grades: Technical; C. P.; 95%; redistilled.

Forms: Anhydrous; stabilized (with aqueous soda ash solution).

Containers: Anhydrous: 475-lb nickel drums; 100-lb carboys. Stabilized: 475-lb steel drums; tank trucks.

Uses: Dyes; intermediates; benzyl compounds; synthetic tannins; perfumery; pharmaceuticals; manufacture of photographic developer; gasoline gum inhibitors; penicillin precursors; quaternary ammonium compounds.

Warning: Causes burns. MCA warning label.

Shipping regulations: Corrosive liquid. White label.*

benzyl chlorocarbonate (carbobenzoxy chloride; benzyl chloroformate) $C_6H_5CH_2OCOC_6H_5$.

Properties: Oily liquid, with lachrymatory properties; acrid odor. Decomposes over 100°C.

Use: Peptide synthesis

Shipping regulations: Corrosive liquid. White label.*

benzyl chloroformate. See benzyl chlorocarbonate.

ortho-benzyl-para-chlorophenol

$C_6H_5CH_2C_6H_4OHCl$.

Properties: White to light tan or pink flakes; crystallizing point 45°C min; sp. gr. 1.202-1.206 (55/55°C); odor slight phenolic max. Insoluble in water; highly soluble in alcohol and other organic solvents; dispersible in aqueous media with the aid of soaps or synthetic dispersing agents; noncorrosive to most metals or other engineering materials.

Containers: 22- and 55-gal lacquer-lined drums.

Uses: As the active principle, or as an enhancing agent for disinfectants.

benzyl cinnamate (cinnamein) $C_9H_7O_2 \cdot C_7H_7$.

Properties: White crystals; aromatic odor; m.p. 39°C; congealing point min 34°C; b.p. 244°C (25 mm); insoluble in water; soluble in alcohol.

Containers: Cans.

Uses: Perfumery and flavors

benzyl cyanide (phenylacetic acid nitrile)

$C_6H_5CH_2CN$

Properties: Colorless oily liquid; aromatic odor; soluble in alcohol and ether; insoluble in water. Sp. gr. 1.0157; m.p. -24°C; b.p. 233.5°C; refractive index (n_D²⁵) 1.5211

Derivation: By the interaction of benzyl chloride and potassium cyanide

Method of purification: Distillation.

Grades: Technical.

Containers: Iron drums.

Use: Organic synthesis.

benzyl dichloride (benzylidene chloride; benzyl bichloride; benzal chloride; chlorobenzal) $C_6H_5CHCl_2$

Properties: Colorless oily liquid; faint aromatic odor; sp. gr. 1.295 (16°C); m.p.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

-16.1°C; b.p. 207°C; refractive index 1.5502 (20°C); soluble in alcohol, ether, and in dilute alkali; insoluble in water.

Derivation: By the chlorination of toluene, until two formula weights of chlorine are absorbed, in absence of catalysts but presence of light.

Method of purification: Distillation.

Grades: Technical.

Containers: Carboys.

Uses: Dyes

Shipping regulations: None.*

N-benzyl-diethanolamine $C_6H_5CH_2N(C_2H_4OH)_2$

Properties: Colorless to light yellow liquid.

Sp. gr. 1.073; refractive index 1.5345-1.5375; distilling range 155-165°C (2 mm).

Containers: 200-, 400-lb steel drums.

Uses: Corrosion inhibitor; intermediate

N-benzyl-dimethylamine $C_6H_5CH_2N(CH_3)_2$

Properties: Colorless to light yellow liquid.

Sp. gr. 0.894 (27°C); refractive index 1.4985-1.5005 (25°C); b.p. 180-182°C; distilling range 65-68°C (18 mm)

Containers: 200-, 400-lb steel drums.

Uses: Intermediate, especially for quaternary ammonium compounds; a dehydrohalogenating catalyst; corrosion inhibitor; acid neutralizer.

N-benzylethanolamine $C_6H_5CH_2NH(C_2H_4OH)$

Properties: Colorless to light yellow liquid.

Sp. gr. 1.044 (27°C); refractive index 1.5400-1.5430; distillation range 240-255°C (760 mm).

Containers: 200-, 400-lb drums

Uses: Corrosion inhibitor; intermediate

benzyl ethyl ether $C_6H_5CH_2OC_2H_5$

Properties: Colorless, oily liquid; aromatic odor; volatile in steam; insoluble in water; miscible with alcohol and ether. B.p. 185°C; sp. gr. 0.949; refractive index 1.4955 at 20°C

Derivation: By boiling benzyl chloride with either sodium or potassium ethylate.

Grades: Technical.

Use: Organic synthesis

benzyl fluoride $C_6H_5CH_2F$

Properties: Colorless liquid. Forms acicular crystals on prolonged cooling. Sp. gr. 1.022 at 25°C; b.p. 139.8°C (753 mm); m.p. -35°C.

Derivation: By decomposing benzyl trimethylammonium fluoride.

Grades: Technical

Use: Organic synthesis

benzyl formate $C_6H_5CH_2OOCH_3$

Properties: Colorless liquid; fruity-spicy odor. Resembles benzyl acetate in many respects but differs in its greater volatility. Sp. gr. 1.083-1.087; refractive index, 1.511-1.513; b.p. 203°C; miscible with alcohols, ketones, oils, aromatic, aliphatic and halogenated hydrocarbons; insoluble in water.

Grades: Technical.

Containers: Cans

Uses: Solvent for nitrocellulose, acetylcellulose, and some cellulose ethers, benzyl

abietate, ester gum, copal ester; perfumery; flavors.

benzylidene acetone (benzalacetone; acetocinnamone; methylcinnamyl ketone; methylstyryl ketone) $C_6H_5CH=CHCOCH_3$

Properties: Colorless crystals; odor of coumarin. Soluble in alcohol, ether, benzene, and chloroform; insoluble in water.

M.p. 42°C; congealing point 39°C (min); b.p. 260-262°C; refractive index 1.5836 at 46°C; density (15/15°C) 1.0377.

Derivation: By the condensation of benzaldehyde and acetone.

Method of purification: Crystallization.

Grades: Technical.

Containers: Bottles; tin cans; aluminum containers

Use: Organic synthesis; perfumery (fixative, balsamic odors, artificial essence of sweet pea)

Shipping regulations: None.*

benzylidene chloride. See benzyl dichloride.

2-benzyl-2-imidazoline hydrochloride. See tolazoline hydrochloride.

benzyl iodide $C_6H_5CH_2I$

Properties: Colorless crystals or liquid; vapors cause tears. Soluble in alcohol, carbon disulfide and ether; insoluble in water. Sp. gr. 1.7335; m.p. 34.1°C; b.p., decomposes.

Derivation: By the interaction of benzyl chloride and hydriodic acid.

Method of purification: Crystallization.

benzyl isoamyl ether. See isoamyl benzyl ether

benzyl isoeugenol

$CH_3CHCHC_6H_5(OCH_3)OCH_2C_6H_5$

Properties: White crystalline material, having a light floral odor of the carnation type. Soluble in alcohol and ether. Congealing point, 57°C min

Purification: Crystallization.

Containers: Cans.

Use: Perfumery, in carnation types and in other florals as a fixative.

N-benzylisopropylamine

$C_6H_5CH_2NH(CH_2CHCH_3)$

Properties: Colorless to yellow liquid; sp. gr. 0.895 (25°C); refractive index 1.4995-1.5015 (25°C)

Containers: 200-, 400-lb steel drums.

Uses: Rust inhibitor; intermediate.

benzylmethylamine $C_6H_5CH_2NHCH_3$

Properties: Colorless to light yellow liquid.

Sp. gr. 0.936 (25°C); refractive index 1.5185-1.5220 (25°C); distillation range 183-188°C (760 mm).

Containers: 200-, 400-lb steel drums.

Uses: Organic synthesis.

N-benzyl-N-methylethanolamine

$C_6H_5CH_2NCH_3(C_2H_4OH)$

Properties: Colorless to light yellow liquid; sp. gr. 1.006 (27°C); refractive index 1.5250-1.5270 (25°C); distillation range 95-105°C (2 mm).

Containers: 200- and 400-lb steel drums.

Uses: Corrosion inhibitor; intermediate.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

3-benzyl-4-methyl umbelliferone $C_6H_5CH_2CH_3C_9H_6O_3$.

Properties: Fine tan crystalline powder; m. p. 255°C min; slightly soluble in ethyl alcohol; insoluble in water.

Use: Optical whitening agent; intermediate.

benzyl penicillin potassium. See potassium penicillin G, under penicillin.

benzyl penicillin sodium. See sodium penicillin G, under penicillin.

ortho-benzylphenol (2-hydroxydiphenylmethane). $C_6H_5CH_2C_6H_4OH$.

Properties: White crystals; m. p. 52°C; soluble in organic solvents; insoluble in water.

Use: Disinfectant.

Note: Ortho-benzylphenol also exists in an unstable form; m. p. 21°C; b. p. 312°C.

para-benzylphenol (4-hydroxydiphenylmethane) $C_6H_5CH_2C_6H_4OH$.

Properties: White crystals from ethyl alcohol; m. p. 84°C; b. p. 320-322°C. Soluble in ethyl alcohol, ether, chloroform, benzene, acetic acid, caustic alkalis; moderately soluble in hot water.

Containers: 100-lb drums.

Uses: Antiseptic and germicide; also for organic synthesis.

benzyl phenylacetate $C_6H_5CH_2COOCH_2C_6H_5$.

Properties: Colorless liquid, with sweet honeylike odor. Soluble in alcohol; sp. gr. 1.097-1.099; refractive index 1.554-1.556.

Uses: Perfumery and flavors.

benzyl propionate $C_2H_5COOCH_2C_6H_5$. A compound similar to benzyl acetate but has a sweeter odor and is more expensive.

Properties: B. p. 220°C; sp. gr. 1.036 (17.5°C); insoluble in water.

2-benzylpyridine $C_6H_5CH_2C_5H_4N$.

Properties: Boiling point (760 mm) 276.8°C; freezing point 13.6°C; density (20°C) 1.061; refractive index (n_D 20/D) 1.5797. Insoluble in water.

4-benzylpyridine $C_6H_5CH_2C_5H_4N$.

Properties: Boiling point (760 mm) 291.1°C; freezing point 11.6°C; density (20°C) 1.067; refractive index (n_D 20/D) 1.5825. Insoluble in water.

benzyl rhodanide. See benzyl thiocyanate.

benzyl salicylate $C_6H_4(OH)COOCH_2C_6H_5$.

Properties: Colorless liquid, except at rather cold room temperatures; very faint sweet odor. Soluble in 9 vols. of 90% alcohol.

Constants: Sp. gr. 1.176-1.179; refractive index 1.580-1.581; m. p. min 24°C; b. p. (26 mm) 208°C.

Uses: Perfumery, particularly as a solvent for nitro-musks; and in floral odors as a fixative.

benzyl succinate (dibenzyl succinate)

 $C_6H_5CH_2OOCCH_2CH_2COOCH_2C_6H_5$.

Properties: White crystalline powder, almost tasteless. Soluble in alcohol, ether, chloroform, also in fixed and volatile

oils; insoluble in water. M. p. 45°C.

benzyl sulfide $(CH_2C_6H_5)_2S$.

Properties: Colorless plates. Soluble in alcohol and ether; insoluble in water. Sp. gr. 1.0712; m. p. 49°C.

Derivation: By the action of potassium sulfide on benzyl chloride and subsequent distillation.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Wooden kegs.

Use: Organic synthesis.

Shipping regulations: None.*

benzyl thiocyanate (benzyl rhodanide).

 $C_6H_5CH_2CNS$.

Properties: Colorless crystals; m. p. 41°C; b. p. 230°C; insoluble in water; soluble in alcohol and ether.

Containers: 525-lb drums.

Use: Insecticide.

benzyltrimethylammonium chloride

 $C_6H_5CH_2N(CH_3)_3Cl$. A quaternary ammonium salt.

Properties: Colorless crystals; stable up to 135°C, above which benzyl chloride and trimethylamine are formed. Readily soluble in water, ethyl alcohol, and butanol; slightly soluble in dibutyl phthalate and tributyl phosphate. Properties of 60% solution: Sp. gr. (20/20°C) 1.07; wt/gal 8.90 lbs; f. p. less than -50°C.

Grades: 60-62% aqueous solution.

Containers: 1-gal bottles; 5-gal carboys; 50-gal wax-lined barrels.

Uses: Solvent for cellulose; catalyst in production of phenolic resins; reclaiming scrap rubber.

4-benzyltrimethylammonium methoxide

 $C_6H_5CH_2(CH_3)_3NOCH_3$. A quaternary ammonium salt.

Properties: Yellow liquid; decomposes on distillation.

Containers: Steel drums.

Uses: Catalyst; organic-soluble strong base

benzynes C_6H_4 . A ring-structured intermediate, in which two adjoining carbons of the ring are attached by triple bonds. It is known to exist in solution in some organic reactions and has been important in explaining known reactions and predicting new ones.

"Beraloy." ¹⁵⁵ Trademark for beryllium-copper alloys supplied in two grades: "Beraloy" A (1.80-2.05% beryllium) and "Beraloy" D (1.60-1.80% beryllium) "Beraloy" A meets A.S.T.M. Specifications B-194-51T and B-197-51T.

Properties: High electrical conductivity; high resistance to fatigue; very low hysteresis or drift; easily formed when annealed; high strength and rigidity when heat treated; corrosion resistant.

Forms: Strip, round wire, flat wire.

Uses: Diaphragms; springs; fabrication of lightweight, intricate parts.

*berbamine. See berberamine.

berberamine (berbamine) $C_{19}H_{19}NO_3 \cdot 2H_2O$. An alkaloid.

*See "I. C. C. Shipping Regulations," page xili.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Properties: White lumps; m p. 156°C (anhydrous); soluble in alcohol, ether, dilute acids; slightly soluble in water. Extract of root of *Berberis* shrub.

Use: Medicine

berberine $C_{20}H_{17}O_4N \cdot 6H_2O$ or $C_{20}H_{19}O_5N$.

Properties: White to yellow crystals; poisonous alkaloid, m p. 145°C (anhydrous); soluble in water and alcohol; very slightly soluble in ether. Some important salts of berberine are: berberine disulfate $C_{20}H_{17}O_4N \cdot H_2SO_4$, berberine sulfate $(C_{20}H_{17}O_4N)_2H_2SO_4$, berberine hydrochloride $C_{20}H_{17}O_4N \cdot HCl$. All three are yellow crystalline salts, slightly soluble in water.

Derivation: From the root of *Berberis vulgaris* or *Hydrastis canadensis*. The salts of this alkaloid are obtained by the action of the respective acid on the alkaloid.

Method of purification: Crystallization.

Grades: Technical

Containers: 1-oz vials, 1-lb bottles; cans

Use: Medicine, in form of alkaloid or its sulfate or hydrochloride

Shipping regulations: None.*

bergamot oil.

Properties: Brownish-yellow or honey-colored liquid, often colored green by copper content; agreeable odor, bitter taste. Linalyl acetate content 34-45% (usually 34-40%). Soluble in 2 vols of 90% alcohol, soluble in glacial acetic acid, affected by light.

Chief known constituents: Limonene, linalyl acetate; linalool; terpineol

Constants: Sp gr (25/25°C) 0.875-0.880, optical rotation +8° to +22° (occasionally +5° 24' and +24°), refractive index 1.464-1.468; acid value 1-3.5, evaporation residue 4.5-6% (occasionally 4%), acid value of evaporation residue 19-30.

Derivation: By expression from the fruits of *Citrus bergamia* Risso et Poiteau.

Adulteration: Turpentine, lemon, orange oils; distilled bergamot oil, fatty oils, cedarwood oil, gurgun-balsam oil.

Grade: N. F. XI.

Use: Perfumery

Shipping regulations: None.*

berkelium Bk. A synthetic radioactive element with atomic number 97 first produced as the 243 isotope by bombarding americium with helium ions in a cyclotron. See actinide elements. The chemical properties of berkelium have been studied by tracer techniques and are similar to those of the other transuranium elements.

Berlin blue. A name applied loosely to any of a number of the varieties of iron blue pigments. See iron blues.

Berlin red. A red pigment consisting, essentially, of red iron oxide. See iron oxide reds, and hematite, red.

bertram. See pyrethrum root.

beryl $Be_3Al_2(SiO_3)_6$, sometimes with replace-

ment of Be by Na, Li, Cs. A natural silicate of beryllium and aluminum. Found in pegmatites.

Properties: Various shades of green, blue, yellow, red, white, or colorless; white streak; vitreous luster. Inert to any reagent at low temperature except hydrofluoric acid. Sp. gr. 2.63-2.8; hardness 7.5-8.

Varieties: Emerald: bright emerald green color due to some chromium; aquamarine: sky blue to greenish blue color;morganite: pink color; heliodor: golden color.

Occurrence: South Dakota, New Hampshire, Colorado; Brazil; Argentina; India; Australia.

Uses: Source of beryllium salts; gem stone; dielectric for spark plugs.

beryllium Be. Element of atomic number 4, group II of the periodic system.

Properties: A hard, gray-white metal.

Sp. gr. 1.85; m p. 1280°C. Active metal at high temperatures. Resistant to oxidation at ordinary temperatures. Similar to aluminum chemically. Once called glucinum. The principal source is beryl, containing 5-3% Be. Soluble in acids and alkali hydroxides. Caution! Beryllium dust is toxic when inhaled or in prolonged external contact with the body.

Derivation: By a large variety of processes, as electrolysis of the double fluoride of beryllium and potassium; reduction of the oxide with carbon in the presence of copper to give a beryllium-copper alloy, reduction of beryllium fluoride with magnesium metal, also by a sulfate leaching process. Beryllium as the fabricated metal is obtained by powder metallurgy techniques.

Grades: Technical, pure

Containers: Drums

Uses: In copper, nickel and aluminum alloys; production of neutrons, special windows for x-ray tubes; neutron moderator in nuclear energy devices; in certain aircraft components, fuel-element cladding in nuclear reactors, suggested for high energy fuels and missile parts.

Shipping regulations: (Metal powder) Poison, class B. Poison label.*

beryllium acetylacetonate $Be(C_5H_7O_2)_2$. Crystalline powder; slightly soluble in water; resistant to hydrolysis. A chelating non-ionizing compound.

beryllium carbonate (basic beryllium carbonate) $(BeO)_3 \cdot CO_2 \cdot 5H_2O$.

Properties: White powder. Variable composition. Soluble in acids; insoluble in water.

beryllium carbonate, basic. See beryllium carbonate.

beryllium chloride $BeCl_2$.

Properties: White or slightly yellow, deliquescent crystals. M p. 440°C; b. p. 520°C; sp. gr. 1.90. Very soluble in water; soluble in alcohol, benzene, ether, carbon disulfide. Readily hydrolyzed.

Derivation: By passing chlorine over a mixture of beryllium oxide and carbon.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

beryllium copper. Alloys, often also containing nickel or cobalt, and having relatively high electrical conductivity, high strength, and high hardness.

Properties: Specific gravity 8.22. Tensile strength of heat treated sheet 175,000 psi, elongation 5% in 2 inches; Brinell hardness 350. Typical analysis: Copper 97.4; beryllium 2.25; nickel 0.35.

Uses: In electrical switch parts; watch springs; optical alloys; valves and parts; springs and diaphragms; shims; cams; and bushings.

beryllium hydrate. See beryllium hydroxide.

beryllium hydroxide (beryllium hydrate) $\text{Be}(\text{OH})_2$.

Properties: Amorphous, white powder; decomposed to the oxide by heat; soluble in acids, alkalis; insoluble in water.

Derivation: By precipitation with alkali from pure beryllium acetate.

Grades: Technical.

beryllium metaphosphate $\text{Be}(\text{PO}_3)_2$.

Properties: White porous powder or granular material; has a high melting point; insoluble in water.

Uses: Raw material for special ceramic compositions; as a catalyst carrier.

beryllium nitrate $\text{Be}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$.

Properties: White to faintly yellowish, deliquescent mass; m.p. 60°C ; soluble in water, alcohol.

Derivation: By the action of nitric acid on beryllium oxide, with subsequent evaporation and crystallization.

Method of purification: Recrystallization

Grades: Technical; C P

Containers: Glass bottles

Uses: Chemical reagent; gas mantle hardener.

Fire hazard: Dangerous.

Shipping regulations: Oxidizing material. Yellow label.*

beryllium oxide BeO .

Properties: White amorphous powder Sp. gr. 3.016; m.p. 2570°C . Hardness 9 (Mohs) The dust is quite poisonous!

Soluble in acids and alkalis; insoluble in water.

Derivation: By heating beryllium nitrate or hydroxide.

Grades: Technical; C P.; pure

Containers: Bottles.

Uses: Preparation of beryllium compounds; ceramics and refractories; phosphor; is under consideration for use in missiles, nucleonics and electronics because of its light weight, heat resistance, electrical insulating properties, transparency to microwave radiation, near-immunity to nuclear radiation, hardness and thermal conductivity.

beryllium-potassium (potassium-beryllium fluoride) $\text{BeF}_2 \cdot 2\text{KF}$.

Properties: White, crystalline masses.

Soluble in water; insoluble in alcohol.

Poisonous!

Grades: Technical.

beryllium-sodium fluoride (sodium-beryllium fluoride) $\text{BeF}_2 \cdot 2\text{NaF}$. Poisonous!

Properties: White, crystalline mass. Soluble in water. M.p. about 350°C .

Grades: Technical.

Use: Making pure beryllium metal.

beryllium sulfate $\text{BeSO}_4 \cdot 4\text{H}_2\text{O}$.

Properties: Colorless crystals. Soluble in water; insoluble in alcohol. Poisonous!

Sp. gr. 1.713; decomposes at 540°C .

Grades: Technical.

beryllonite NaBePO_4 . A natural sodium beryllium phosphate, sometimes used as a gem stone. Colorless, white or light yellow; sp. gr. 2.84; hardness 5.5-6.

"Be Square."¹²⁸ Brand name for a grade of petroleum microcrystalline wax.

Properties: Colors, black, amber or white; m.p. ranges, $190-195^\circ\text{F}$, $180-185^\circ\text{F}$, or $170-175^\circ\text{F}$.

Containers: 10-lb slabs, 8/carton or 168/pallet; 350-lb drums.

Uses: Polishes; crayons; candles; bakery board coating; electrical insulation, as in potting compounds

Bessemer process. A method for the production of steel which utilizes an air blast through the molten pig iron to remove silicon, carbon, manganese, phosphorus and sulfur as their respective oxides. The gaseous oxides escape, while the solid oxides combine with one another or with an oxide from the converter lining to form an easily fusible slag. This floats on the surface of the molten iron and can easily be removed from it. The method has been used chiefly on irons with a low phosphorus content. Invented in England by Sir Henry Bessemer in 1857 and independently in America by William Kelley the same year, it was the first process to make steel available for construction on a large scale.

beta-. Prefix applied to chemical names to denote the position of a substituent or radical. In this book, beta is not ordinarily used in alphabetizing. See also alpha

betacaine hydrochloride. See eucaine hydrochloride.

"Betachlor."²⁰³ Trademark for a chlorinated solvent of the dichloroethyl ether type.

Properties: A clear liquid; sp. gr. 1.20-1.23; flash point (COC) 180°F ; total chlorine 47.8%

Containers: 55-gal steel drums.

Uses: Detergent additive; selective extractant; for degreasing; for fumigant formulations; in paint and plastics industry as solvent

Caution: Avoid prolonged or repeated breathing of vapor and contact with skin. Use with adequate ventilation. Do not take internally.

betahypophamine. See vasopressin

betaine (lycine; oxyneurine; trimethylglycine) $(\text{CH}_3)_3\text{NCH}_2\text{CO}_2\text{H}$. An alkaloid.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Properties: Colorless, sweet crystals; deliquescent; lose water at 100°C; anhydrous material melts 293°C; soluble in water and alcohol; slightly soluble in ether.

Derivation: Occurs widely in plants, recovered from sugar beets; also made synthetically from chloroacetic acid and trimethylamine.

Use: Medicine, as the hydrochloride.

betaine hydrochloride (lycine hydrochloride) $C_5H_{11}O_2N \cdot HCl$.

Properties: Colorless crystals; m.p. 227-228°C (dec.); soluble in water and alcohol; insoluble in chloroform and ether. Aqueous solutions are strongly acid. Liberates hydrogen chloride at the melting point.

Grades: Technical.

Containers: Drums.

Uses: Source of hydrogen chloride in solders and fluxes; organic synthesis; medicine.

betaine phosphate $C_5H_{11}O_2N \cdot H_3PO_4$.

Properties: White, odorless granules; acid taste; m.p. 198-200°C; very soluble in water.

Grades: Technical.

Uses: Crystalline source of phosphoric acid.

"Betalin" 12. ¹⁰⁰ Trademark for cyanocobalamin. See vitamin B₁₂.

"Betalin" S. ¹⁰⁰ Trademark for thiamine hydrochloride U.S.P. (q.v.).

"Betanol." ³⁵⁴ Trademark for a group of dispersing agents consisting of high molecular weight esters. They form dispersions which are stable over a wide pH range in the presence of acids and mineral salts. They can be used to prepare both water-in-oil and oil-in-water emulsions.

Uses: In the preparation of cosmetics, pharmaceuticals, textiles, paints, wherever a dispersing agent or wetting agent is needed in the presence of acids or bases.

"Betanox" Special. ²⁴⁸ Trademark for low-temperature reaction product of phenol-beta-naphthylamine and acetone.

Properties: Tan-colored powder; sp. gr. 1.16; m.p. above 120°C; soluble in acetone, benzol, and ethylene dichloride, insoluble in water and gasoline.

Uses: Antioxidant for use in wire insulation, tire treads, carcass, inner tubes, dark-colored footwear, proofing, and mechanicals.

beta particles. Electrons ejected from the nucleus of an atom as a result of certain kinds of radioactive decomposition or nuclear change. These electrons are emitted at very high speeds, sometimes approaching the speed of light. The energies of the emitted electrons are characteristic of the parent element. Beta decay is the kind of radioactive change in which beta particles are emitted. A stream of beta particles is referred to as a beta ray. The high speed electrons produced by man-made accelerator devices such as the betatron should not be referred to as

beta particles.

beta ray. The name given to one of the first three recognized kinds of radiations emitted by the nuclei of atoms undergoing spontaneous radioactive transformation. See beta particles.

"Betasol." ⁵⁷ Trade name for a line of organic wetting agents

betatron. An electron accelerator which operates on the same principle as an ordinary electric generator. The electrons are accelerated by means of magnetic induction. The betatron consists of a ring-shaped evacuated glass tube called the "doughnut" which is placed between the poles of an electromagnet. The magnet produces in the "hole" of the doughnut a strong magnetic field which in turn induces a voltage within the doughnut itself. Electrons are produced from a heated filament and after preliminary acceleration are injected into the doughnut where the induced voltage increases their energy. They move in a circular path and gain energy in each turn. The electrons may be used for the production of x-rays or may be directed out of the apparatus for other purposes.

"Betaxin." ¹⁶² Trademark for thiamine hydrochloride

betazole hydrochloride $C_5H_5N_3 \cdot 2HCl$.

Properties: White, crystalline, nearly odorless powder, pH of 5% solution 1.5; m.p. not higher than 240°C. Soluble in water; practically insoluble in chloroform.

Grades: U.S.P. XVI.

Use: Medicine

betel.

1. Dried leaves of Piper betel, a shrub of India, Malay, etc., also cultivated in Madagascar and the West Indies. The material is chewed by natives to blacken teeth and possibly as a narcotic and stimulant.

2. Material from nuts of the betel palm (Areca catechu), the source of betel oil and alkaloids. The latter are used in veterinary medicine.

betel nut. See areca nut.

bethanechol chloride (carbamylmethylcholine chloride) $C_7H_{17}ClN_2O_2$, or $H_2NCOOCH(CH_3)CH_2N(CH_3)_3Cl$.

Properties: Colorless hygroscopic crystals with amine-like odor. M.p. 217-221°C (dec). Very soluble in water; freely soluble in alcohol; practically insoluble in chloroform, benzene, and ether. Stable in air; pH (1% solution) 5.5-6.5.

Derivation: Propylene chlorohydrin is treated with phosgene and then with ammonia in ether. The product is heated with trimethylamine.

Grade: U.S.P. XVI.

Use: Medicine.

Bettendorf's reagent. A reagent used for the detection of arsenic in presence of bismuth and antimony compounds. It consists of a

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

concentrated solution of stannous chloride in fuming hydrochloric acid.

"Better Blend Soda." ²⁰³ Trademark for bicarbonate of soda treated with approximately 0.7% tricalcium phosphate. Available in food and rubber grades, both of which have a density of 64.5 lbs/cu ft.

Betterton-Kroll process. A process for obtaining bismuth and purifying desilverized lead that contains bismuth. Metallic calcium or magnesium is added to the molten lead to cause formation of high melting intermetallic compounds with bismuth. These separate as a surface scum and are skimmed off. The excess calcium and magnesium are removed from the lead by use of chlorine gas as mixed molten chlorides of lead or zinc.

Betts process. An electrolytic process in which pure lead is deposited on a thin cathode of pure lead, from an anode containing as much as 10% of silver, gold, bismuth, copper, antimony, arsenic, selenium, and other impurities. The electrolyte is lead fluosilicate and fluosilicic acid. The scrap anodes and the residues of impurities associated with them are either recast into anodes or treated to recover antimonial lead, silver, gold, bismuth, etc.

betula oil. See methyl salicylate.

"Beutene." ²⁴⁸ Trademark for a butyraldehyde-aniline reaction product.

Properties: A reddish-brown, free-flowing liquid; sp. gr. 0.95; soluble in acetone, benzol, and ethylene dichloride, slightly soluble in gasoline, insoluble in water.

Uses: Accelerator for tire treads, carcass, belt friction, inner tubes, mechanicals, hard rubber, molded heels and soles and air-cured footwear.

bev. Abbreviation for billion electron volts. See electron volt.

bevatron. See cyclotron.

BFE. Abbreviation for bromotrifluoroethylene.

BF3-MEA. See boron fluoride monoethylamine.

BFPO. Abbreviation for bis(dimethylamino)-fluorophosphine oxide. See dimefox.

BHA. Abbreviation for butylated hydroxyanisole.

BHC. Abbreviation for benzene hexachloride. Common and accepted designation for commercial mixtures of isomers of 1,2,3,4,5,6-hexachlorocyclohexane (q. v.) used as insecticide.

bhilawan nut. See semecarpus nut.

BHT. Abbreviation for butylated hydroxytoluene. See di-tert-butyl-para-cresol.

Bi. Symbol for bismuth.

bi-. Prefix meaning two or twice. A compound not found under bi- should be looked for under bis- or di-, since bi-, bis-, and di-

are equivalent prefixes, assigned with slight differences in meaning for particular compounds, or according to customary usage.

biacetyl. See diacetyl.

biacetylenes. See diacetylenes.

Biazzi continuous nitration process. The material to be nitrated and the nitrating acid mixture enter the top of a cylindrical vessel containing an impeller type agitator and cooling coils. The mixture is drawn downwards through the central portion of the cylinder and then forced upwards through the spaces between the cooling coils. Part of the material overflows near the top and passes to an acid separator, which in this process is a flat tank of stainless steel. Separation depends upon centrifugal action. A similar device is used for separation of water, after the water-washing steps.

bibenzyl. See diphenylethane, symmetrical.

bicalcic phosphate. See calcium phosphate, dibasic.

bicarbonate of soda. See sodium bicarbonate.

bicarburetted hydrogen. See ethylene.

Bicheroux process. A process for the production of high-quality plate glass. Molten glass is poured between rollers and fed onto a moving table which delivers the strip to alehr, where the glass cools slowly while passing between a series of asbestos-covered rollers. After being cut into suitable lengths the glass is ground and polished as individual plates.

bichloroacetic acid. See dichloroacetic acid.

bichromate of soda. See sodium dichromate.

"Bicillin." ²⁴ Trademark for benzathine penicillin G (dibenzylethylenediamine dipenicillin G), a penicillin salt, composed of two molecules of crystalline penicillin G and one of base (dibenzylethylenediamine), which has a penicillin potency of 1200 units per milligram and is stable in aqueous suspension. Used in medicine.

bicyclohexyl (dicyclohexyl) C₁₂H₂₂.

Properties: Colorless, mobile liquid with pleasant odor. B. p. 238.5°C; f. p. 1 to 3°C; sp. gr. 0.883 (25/16°C); wt./gal. 7.37 lbs; refractive index (n_D²⁰) 1.480; flash point (open cup) 215°F.

Derivation: Hydrogenation of biphenyl.

Grades: Technical.

Uses: High-boiling solvent and penetrant.

Biebrich red. See scarlet red.

biformin. An antibiotic produced by the fungus *Polyporus biformis*, reported to be active against various bacteria and fungi.

bihexyl. See dodecane.

"B-I-K." ²⁴⁸ Trade name for a surface coated urea.

Properties: A fine white powder; sp. gr. 1.32;

* See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

melting range 129-134°C; soluble in water. Surface coating not soluble in water, but is soluble in rubber. Slightly soluble in acetone; insoluble in benzene, gasoline and ethylene dichloride.

Uses: Promoter for "Celogen AZ," a nitrogen blowing agent; activator for thiazole accelerators; odor reducer when used with nitrosoamine type blowing agents.

"**Bikalith**," ⁸⁸ Trademark for a series of lithium ores including lepidolite, petalite, spodumene and amblygonite. Origin: South Africa. Used in glass-making, ceramics; coatings.

bile acids. Acids which are found in the bile (the secretion of the liver). They are steroids, having an alcoholic group, and a five-carbon-atom side chain terminating in a carboxyl group. Cholic acid is by far the most abundant bile acid in human bile. Others are deoxycholic and lithocholic acids. The bile acids do not occur free in bile but are linked to the amino acids, glycine and taurine. These conjugated acids are water-soluble; their salts are powerful detergents and as such, aid in the absorption of fats from the intestine.

bilifulvin. See bilirubin

bilirubin (bilifulvin) $C_{32}H_{36}O_6N_4$. Red coloring matter of bile. Chemical structure related to hemoglobin.

Properties: Orange-red powder; m. p. 192°C, soluble in acids, alkalies, chloroform and benzene; insoluble in water; very slightly soluble in alcohol and ether

Derivation: From bile pigment.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles; tins.

Use: Analytical chemistry

Shipping regulations: None *

bimethyl. See ethane.

binder (paint). See description of liquid "vehicle," under paint.

binitrobenzene. See dinitrobenzene.

binitronaphthalene. See dinitronaphthalene

binitrotoluene. See dinitrotoluene

"**Biobate**," ¹⁷³ Trademark for an enzymatic preparation for use in bating in the leather and tanning industry.

biochemical oxygen demand (B.O.D.). A standardized means for estimating the degree of contamination of water supplies, especially those which receive contamination from sewage and industrial wastes. It is measured as the quantity of dissolved oxygen (in mg./liter) required during stabilization of the decomposable organic matter by aerobic biochemical action in sewage effluents, polluted water or industrial wastes. Determination of this quantity is accomplished by diluting suitable portions of the sample with water saturated with oxygen and measuring the dissolved oxygen in the mixture both immediately

and after a period of incubation, usually five days. See also dissolved oxygen (D.O.) and oxygen consumed (C.O.D.) as related terms.

"**Biocides**" **B-2 and B-7.** ¹⁰⁸ Biocides (effective against most microorganisms) and exceptionally toxic to sulfate-reducing bacteria even in concentrated brines.

Containers: B-2: 40-lb lined cans; 435-lb drums. B-7: 55-gal drums.

Uses: In oilfield water injection systems, producing wells and water disposal systems. Protects against corrosion, cleans up systems by removing scale

"**Biocide**" **RP.** ¹⁰⁸ Potent liquid biocide that very quickly kills most types of green algae and other microorganisms. Film forming, gives longer protection

Containers: 8-oz bottles; 5-gal cans.

Uses: Used to destroy most types of slime bacteria; protects wood from fungi attack. Not for use in swimming pools.

biocytin $C_{16}H_{28}N_4O_4S$ (epsilon-N-biotinyl-L-lysine) A naturally occurring complex of biotin isolated from yeast. Water-soluble crystals; m. p. 228.5°C. It is believed to be an intermediate in the utilization of biotin by animal organisms.

bioflavonoids (vitamin P complex; citrus flavonoid compounds) A group of naturally occurring substances concerned with the maintenance of normal conditions in the walls of the small blood vessels. The bioflavonoids are widely distributed among plants, especially citrus fruits, black currants and rose hips. In commercial methods the rinds of citrus fruits are extracted with aqueous alkalies, hot water and water-miscible organic solvents. The more important bioflavonoids are hesperidin, hesperidin methyl chalcone, naringin, and rutin (q.v.). The name vitamin P has been discarded.

bioluminescence. The emission of energy, as light, from living organisms or products derived from them. Light production in the plant kingdom (bacteria and fungi) is continuous and independent of stimulation, varying only with environmental changes. Among animals (fish, fireflies, protozoa) no light appears until the luminous region is excited in some way - by nerves or directly by mechanical, electrical and chemical stimulation. See luminescence.

"**Bionol**" **A-50.** ³⁰⁷ Trademark for a cationic bactericidal agent composed of 50% alkyl dimethyl benzyl ammonium chloride.

Properties: Pale yellow, slightly viscous liquid; sp. gr. 0.98, soluble in water; stable to dilute acids and alkalies.

Uses: Disinfectant, germicide, deodorant; can be combined with nonionic detergents to produce detergent-sanitizers

"**Biopal CVL-10.**" ³⁰⁷ Brand name of an iodophor, consisting of a solution of 10% available iodine in alkyl phenoxy polyoxyethylene ethanol.

*See "I. C. C. Shipping Regulations," page xiii. *

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Properties: Brownish-black liquid; readily soluble in water.

Uses: Bactericide, sporocide, fungicide, virucide and protozoacide in hard or soft water and at high or low temperatures. Has both detergent and sanitizing properties.

Stability: "Biopal CVL-10," as well as its aqueous solutions, slowly decreases in activity in the presence of light and should be packed in dark amber bottles or in suitably lined metal containers.

Handling: Must be handled with due caution.

biotin (vitamin H) $C_{10}H_{16}N_2O_3S$. 2'-Keto-3, 4-imidazolido-2-tetrahydrothiophene-*n*-valeric acid. Biotin, frequently referred to as a member of the vitamin B_7 complex, is necessary for the maintenance of health in animals and for growth of many microorganisms. The exact metabolic role of biotin is not clear. However, it does influence fat metabolism, decarboxylation and carbon dioxide fixation and deamination of some amino acids. It is closely related metabolically to pantothenic acid and folic acid. A biotin deficiency may be induced by the ingestion of avidin, a raw-egg protein, because of the formation of a nonabsorbable biotin-avidin complex. Biotin is synthesized in the intestinal tract of humans; therefore, normally not required.

Properties: White crystals; m. p. 230-232°C; soluble in water and alcohol; insoluble in petroleum ether, chloroform; stable to heat; stable in neutral or acid solutions; destroyed by strong alkali or oxidizing agents.

Sources: Food sources: egg yolk, kidney, liver, yeast, milk, molasses. Commercial sources: synthetic preparations of biotin or its methyl ester.

Units: Amounts are expressed in milligrams or micrograms of biotin.

Containers: Bottles.

Uses: Medicine; nutrition.

biphenyl. See diphenyl.

ortho-biphenylamine. See ortho-aminobiphenyl.

ortho-biphenyl biguanide

$NH_2(CNHNH)_2C_6H_4C_6H_5 \cdot H_2O$.

Properties: White to faintly pink powder; m. p. above 150°C on dried material; ash not over 0.5%. Soluble in alcohol, "Carbitol" and "Cellosolve;" very slightly soluble in water.

Containers: 50-lb paper bags; 150-lb fiber drums.

Use: Soap antioxidant.

2,2'-biphenyldicarboxylic acid. See diphenic acid.

bipropargyl. See dipropargyl

bipropenyl. See 2,4-hexadiene.

birch oil (birch-tar oil).

Properties: Yellowish-brown liquid; characteristic odor; poisonous! Soluble in alcohol, ether, chloroform, glacial acetic acid,

amyl alcohol, benzene, carbon disulfide, oil of turpentine.

Chief known constituents: Phenols, guaiacol, cresol, creosol, and xylene. Sp. gr. 0.956.

Derivation: Distilled from birch-tar, obtained from the dry distillation of the wood of *Betula alba*.

Method of purification: Rectification.

Grades: Crude; rectified.

Containers: Iron drums; cans.

Uses: Leather dressing; disinfectant; medicine (external use); in small quantities in perfumery.

Shipping regulations: None.*

birch oil, sweet. See methyl salicylate.

birch-tar oil. See birch oil.

bird pepper. See capsicum.

bis- Prefix meaning two or twice. A compound not found under bis- should be looked for under bi- or di-, since bi-, bis-, and di- are equivalent prefixes, assigned with slight differences in meaning for particular compounds, or according to customary usage.

1,3-bis(2-benzothiazolyl-mercaptomethyl)-urea.

Properties: Buff to light tan powder; m. p. 220°C; sp. gr. 1.29

Use: Rubber accelerator.

para-bis[2-(5-para-biphenyloxyazoyl)]-benzene (BOPOB) $C_{26}H_{20}O_2N_2$.

Properties: Shiny yellow flakes; m. p. 327-328°C; fluorescence peak 4400Å; sparingly soluble in toluene.

Grade: Purified.

Use: Scintillation counter; wave length shifter in liquid scintillators.

bis(2-chloroethoxy)methane. See dichloroethyl formal.

4-{para-[bis(2-chloroethyl)amino]phenyl}butyric acid. See chlorambucil.

3,3-bis(chloromethyl)oxetane. See "Penton"

2,2-bis(para-chlorophenyl)-1,1-dichloroethane. See TDE.

1,1-bis(para-chlorophenyl)ethanol. See di(para-chlorophenyl)ethanol.

1,1-bis(para-chlorophenyl)-2,2,2-trichloroethanol $CCl_3C(C_6H_4Cl)_2OH$. An alcohol analog of DDT. See "Kelthane."

bis[S-(diethoxyphosphinothioyl)mercapto]-methane. See ethion.

bis(diethylthiocarbamyl)disulfide. See tetraethylthiuram disulfide

bis(diethylthiocarbamyl)sulfide. See tetraethylthiuram sulfide.

bis(dimethylamino)fluorophosphate. A systemic insecticide. See dimefox.

bis(1,3-dimethyl butyl)amine

$[(CH_3)_2CHCH_2CH(CH_3)]_2NH$

Properties: Sp. gr. 0.772-0.778 (20/20°C);

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

distillation range 179-205.0°C (760 mm);
6.5 lbs/gal; flash point 160°F

bis(dimethylthiocarbamyl)disulfide. See tetramethylthiuram disulfide.

bis(dimethylthiocarbamyl)sulfide. See tetramethylthiuram sulfide.

1,3-bisethylaminobutane

$C_2H_5NHCH_2CH_2CHNH(C_2H_5)CH_3$. A water white amine, boiling range 179-185°C.

bis(2-ethylhexyl) 2-ethylhexyl phosphonate. See di(2-ethylhexyl) 2-ethylhexyl phosphonate.

bis(2-ethylhexyl) hydrogen phosphate. See di(2-ethylhexyl) hydrogen phosphate.

bis(2-ethylhexyl) phosphite. See di(2-ethylhexyl) phosphite.

2,2-bis(para-ethylphenyl)-1,1-dichloroethane. See 1,1-dichloro-2,2-bis(para-ethylphenyl) ethane.

bisethylxanthogen $(C_2H_5OCSS)_2$.

Properties: Yellow needles; onion-like odor; m. p. 28-32°C. Insoluble in water; freely soluble in benzene, ether, petroleum ethers, oils

Grades: 58% solution in oil.

Containers: 5-gal cans; 30-gal drums

Uses: Weed control; rubber vulcanizer; fungicide.

bishydroxycoumarin (dicoumarol) $C_{19}H_{12}O_6$. 3,3'-Methylenebis(4-hydroxycoumarin).

Properties: White or creamy-white, crystalline powder; faint pleasant odor and slightly bitter taste; m. p. 287-29°C. Readily soluble in solutions of fixed alkali hydroxides; slightly soluble in chloroform; practically insoluble in water, alcohol and ether.

Derivation: (a) Originally, extracted from spoiled sweet clover; (b) synthetically from methyl acetylsalicylate, sodium, and formaldehyde.

Grade: U. S. P. XVI.

Use: Medicine.

bis(2-hydroxy-3,5-dichlorophenyl) sulfide. See bithionol

beta-bishydroxyethyl sulfide. See thiodiglycol.

1,8-bis(para-hydroxyphenyl)methane $C_{22}H_{20}O_2$.

Properties: Pale amber crystalline material; m. p. 102°C min; slightly soluble in benzene, methanol, ethanol, and isopropanol; soluble in aqueous alkalis.

4,4-bis(4-hydroxyphenyl)pentanoic acid. See "Diphenolic Acid."

bishydroxyphenyl sulfone.

See dihydroxydiphenyl sulfone.

bismanol. An alloy of bismuth and manganese which possesses unusually high magnetic force. It is supposed to be manganese bismuthide. It is prepared by powder metallurgy techniques and is separated magnetically from its constituents. Its coercive force is said to be 3000 oersteds.

Bismarck Brown G $C_{18}H_{20}N_6Cl_2$. Benzene-meta-diazo-bis-meta-phenylenediamine hydrochloride.

Properties: Dark blackish-brown powder; soluble in water and alcohol.

Derivation: Action of nitrous acid on meta-phenylenediamine hydrochloride in aqueous solution.

Use: Dye for wool, silk, leather.

Bismarck Brown R $C_{21}H_{24}N_6Cl_2$. Toluene-2,4-diazo-bis-meta-toluylenediamine hydrochloride.

Properties: Dark brown powder; soluble in water and alcohol.

Derivation: Action of nitrous acid on toluylene diamine.

Use: Dye for wool and leather.

"Bismate." ⁶⁹ Trademark for proprietary product, bismuth dimethylthiocarbamate $[(CH_3)_2NC(S)_2]_3Bi$.

Properties: Lemon yellow powder; sp. gr. 2.04 ± .03; melts above 230°C. with decomposition; soluble in chloroform; slightly soluble in benzene, carbon disulfide; insoluble in water.

Uses: Primary accelerator for natural rubber and SBR; secondary accelerator with thiazole accelerators in natural rubber and SBR; used in wire, cable, extruded and molded goods

Also supplied in natural yellow "rodform" or in green colored "rodform."

bismon (bismuth oxide, colloidal).

Properties: Translucent, yellowish or light brown amorphous mass. Contains 22.3% bismuth oxide. Cannot be used hypodermically. Soluble in water to form an opalescent suspension.

Derivation: Interaction of bismuth salts and alkaline solutions of sodium lysalbinat or protalbinat.

Use: Medicine.

bismuth B₁ Element of atomic number 83, of group V of the periodic system.

Properties: Grayish-white, hard, brittle metal, with a reddish tinge; sometimes found native. Soluble in hydrochloric acid (in presence of oxygen), hot concentrated sulfuric acid and nitric acid; insoluble in water

Constants: Sp. gr. 9.78 at 20°C; m. p. 271°C; b. p. 1460-1480°C; hardness 2 to 2.5. The thermal conductivity, 0.018 cal/sec/cc at 100°C, is less than that of any other metal except mercury.

Source: (1) Metallurgical byproducts (often lead bullion) obtained chiefly from ores of lead, silver, copper and gold, and (2) ores used chiefly for their bismuth and one or two other metals, as tin and tungsten. See also bismuthinite, bismutite, cosalite, and tetradyomite.

Derivation: Debismuthizing of lead bullion by (a) fractional crystallization, (b) electrolytic (Betts) refining, or (c) addition of calcium or magnesium (Betterton-Kroll process) which removes bismuth.

Purification: By addition of molten caustic,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

zinc, and finally chlorine (to make removable chlorides of the impurities).
 Impurities: Lead, iron, copper, arsenic, antimony, selenium.
 Forms available: Bars, pieces, lump, powder; 99.5+ % pure; high purity (impurities less than 10 ppm).
 Uses: Low-melting alloys (see fusible alloys); metallic coating of other metals; heat transfer medium in nuclear power production (suggested); ingredient, with manganese, of alloy forming unusually permanent magnets (see bismanol); in molten-metal continuous dyeing process; bismuth salts.
 Shipping regulations: None.*
bismuth alloys. See Tables under fusible alloys.
bismuth ammonium citrate.
 Properties: Pearly, shining, transparent scales or white powder; slightly acid, metallic taste; composition varies. Soluble in water; slightly soluble in alcohol.
 Derivation: By the interaction of bismuth subnitrate, citric acid and ammonium hydroxide
 Grades: Technical.
 Containers: Tins; amber glass bottles.
 Use: Medicine.
 Shipping regulations: None.*
bismuth bromide (bismuth tribromide) BiBr_3 .
 Properties: Yellow, crystalline powder. Hygroscopic. Decomposed by water with formation of bismuth oxybromide. Soluble in hydrochloric acid (dilute), solutions of potassium iodide, potassium bromide and potassium chloride; insoluble in alcohol. Sp. gr. 5.7; b.p. 453°C ; m.p. 218°C .
bismuth bromide, basic. See bismuth oxybromide.
bismuth carbolate. See bismuth phenate.
bismuth carbonate. See bismuth subcarbonate.
bismuth carbonate, basic. See bismuth subcarbonate.
bismuth cerium oxalate.
 Properties: White powder. Soluble in hydrochloric acid; insoluble in alcohol and water.
 Derivation: Mixture of cerium oxalate and bismuth oxalate.
bismuth cerium salicylate.
 Properties: White powder; insoluble in alcohol and water.
 Use: Medicine.
bismuth cerium valerate.
 Properties: White powder; soluble in mineral acids; insoluble in water.
 Use: Medicine.
bismuth chloride (bismuth trichloride) BiCl_3 .
 Properties: White, very deliquescent crystals; volatilized by heat. Soluble in acids; insoluble in alcohol; decomposes in water to the oxychloride. Sp. gr. 4.56; m.p. 227°C ; b.p. decomposes at 300°C .
 Derivation: By the action of hydrochloric acid on bismuth.

Grades: Technical; C. P.
 Containers: 1-, 5-lb bottles; jars.
 Use: Bismuth salts.
 Shipping regulations: None.*
bismuth chloride, basic. See bismuth oxychloride.
bismuth chromate (basic dichromate) $\text{Bi}_2\text{O}_3 \cdot 2\text{CrO}_3$.
 Properties: Orange-red amorphous powder; soluble in alkalis and acids; insoluble in water.
 Derivation: By the interaction of bismuth nitrate and potassium chromate.
 Grades: Technical.
 Containers: Tins; kegs.
 Use: Pigment.
 Shipping regulations: None.*
bismuth citrate $\text{BiC}_6\text{H}_5\text{O}_7$.
 Properties: White powder; soluble in ammonia or alkali citrates; insoluble in water.
 Derivation: Boiling bismuth subnitrate with citric acid.
 Use: Medicine.
 Shipping regulations: None.*
bismuth, cosmetic. See bismuth oxychloride.
bismuth ditannate. See bismuth tannate.
bismuth dithiosalicylate $\text{SC}_6\text{H}_3\text{OHCOOBiO}_2\text{BiO}_3 \cdot 2\text{H}_2\text{O}$.
 Properties: Yellowish-gray powder; odorless; tasteless. Contains 72% bismuth oxide. Insoluble in water, alcohol, and ether.
bismuth ethyl camphorate $\text{C}_{16}\text{H}_{17}\text{BiO}_{12}$.
 Properties: Solid; faint aromatic odor; m.p. $61-67^\circ\text{C}$. Insoluble in water; soluble in ether, chloroform and oils.
 Derivation: Reaction of sodium ethyl camphorate and bismuth nitrate in glycerin solution.
 Use: Medicine.
bismuth gallate, basic. See bismuth subgallate.
bismuth glance. See bismuthinite.
bismuth para-glycolylaminophenylarsonate. See glycobiarisol.
bismuth glycolylarsanilate. See glycobiarisol.
bismuth hydrate. See bismuth hydroxide.
bismuth hydroxide (bismuth hydrate; bismuth oxyhydrate; bismuth trihydroxide; bismuth trihydrate; hydrated bismuth oxide) $\text{Bi}(\text{OH})_3$.
 Properties: White, amorphous powder. Soluble in acids; insoluble in water. Sp. gr. 4.36.
 Derivation: By the action of sodium hydroxide on a solution of a bismuth salt.
 Grades: Technical; C. P.
 Containers: Glass bottles; tins; drums.
 Use: Bismuth salts.
 Shipping regulations: None.*
bismuthinite (bismuth glance) Bi_2S_3 , may contain Cu or Fe.
 Properties: Lead-gray mineral, often with yellow tarnish, metallic luster. Contains 81.2% bismuth, 18.8% sulfur. Soluble in nitric acid. Sp. gr. 6.4-6.5; hardness 2.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Occurrence: Utah; Bolivia; Mexico.

Use: Ore of bismuth

bismuth iodate $\text{Bi}(\text{IO}_3)_3$.

Properties: White powder. Slightly soluble in nitric acid; insoluble in acetic acid and water.

bismuth iodide (bismuth triiodide) BiI_3 .

Properties: Grayish-black, metallic, glistering crystals. Soluble in alcohol, hydriodic acid and potassium iodide; insoluble in water; decomposes in hot water; sp. gr. 5.65; m.p. 408°C.

Derivation: By the interaction of bismuth and iodine.

Method of purification: Crystallization

Grades: Technical

Containers: Glass bottles.

Uses: Analytical chemistry; bismuth oxyiodide.

Shipping regulations: None.*

bismuth iodide, basic. See bismuth oxyiodide.

bismuth lactate $\text{BiH}(\text{C}_3\text{H}_5\text{O}_2)_2$.

Properties: White powder; slightly soluble in water and decomposed by it.

bismuth magistery. See bismuth subnitrate.

bismuth nitrate (bismuth ternitrate; bismuth trinitrate) $\text{Bi}(\text{NO}_3)_3 \cdot 5\text{H}_2\text{O}$.

Properties: Lustrous, clear, colorless, hygroscopic crystals; acid taste. Soluble in dilute nitric acid, alcohol and acetone; slowly decomposed by water to the subnitrate.

Constants: Sp. gr. 2.78, m.p. 74°C; b.p., decomposes 75-80°C.

Derivation: By the action of nitric acid on bismuth with subsequent recovery by evaporation and crystallization

Method of purification: Recrystallization.

Grades: Technical; C P

Containers: 1-, 5-lb bottles; tins; 250-lb drums; multiwall paper sacks

Uses: Preparation of other bismuth salts; bismuth luster on tin; luminous paints and enamels; medicine

Shipping regulations: Oxidizing material. Yellow label.*

bismuth nitrate, basic. See bismuth subnitrate.

bismuth oleate.

Properties: Yellowish-brown, soft, granular mass. Soluble in ether; insoluble in water

Derivation: A combination of bismuth trioxide and oleic acid.

Grades: Technical.

Containers: Tins.

Use: Medicine.

Shipping regulations: None *

bismuth oxide. See bismuth trioxide; bismuth tetroxide.

bismuth oxide, colloidal. See bismon

bismuth oxide, hydrated. See bismuth hydroxide.

bismuth oxybromide (basic bismuth bromide; bismuthyl bromide) BiOBr

Properties: White powder. Soluble in hydro-

chloric acid (dilute), nitric acid (dilute); insoluble in alcohol and water; sp. gr. 8.08.

Use: Medicine.

bismuth oxycarbonate. See bismuth subcarbonate.

bismuth oxychloride (bismuth chloride, basic; bismuth subchloride; bismuthyl chloride; cosmetic bismuth; pearl white; flake white) BiOCl .

Properties: White, lustrous crystalline powder Sp. gr. 7.717. Soluble in acid; insoluble in water.

Derivation: By action of water on bismuth chloride; interaction of dilute nitric acid solution of bismuth nitrate with sodium chloride.

Grades: Technical; C P.

Containers: 25-lb drums.

Uses: Medicine; face powder; pigment; artificial pearls.

Shipping regulations: None.*

bismuth oxyhydrate. See bismuth hydroxide.

bismuth oxyiodide (basic bismuth iodide; bismuth subiodide) BiOI .

Properties: Red powder. Decomposed by acids and alkalis. Caution! Keep away from light! Sp gr. 7.82. Insoluble in alcohol, chloroform, water.

Containers: Fiber drums.

Use: Medicine

bismuth oxynitrate. See bismuth subnitrate

bismuth pentafluoride BiF_5 . Used as a fluorinating agent.

bismuth permanganate $\text{Bi}(\text{MnO}_4)_3$.

Properties: Black powder Soluble in acids (dilute)

Use: Medicine.

bismuth phenate (bismuth carbolate; bismuth phenolate; bismuth phenylate; phenolbismuth) $\text{C}_6\text{H}_5\text{O} \cdot \text{Bi}(\text{OH})_2$.

Properties: Grayish-white powder; odorless and tasteless. Insoluble in water, alcohol and ether

Derivation: By the interaction of bismuth nitrate and sodium phenolate.

Grades: Technical, 80% Bi_2O_3

Containers: Tins.

Use: Medicine.

Shipping regulations: None.*

bismuth phenolate. See bismuth phenate

bismuth phenolsulfonate (bismuth sulfocarbonate; bismuth sulfophenate; bismuth sulfophenylate).

Properties: Pale, reddish powder. Slightly soluble in water

Derivation: By the interaction of bismuth hydroxide and phenolsulfonic acid.

Grades: Technical.

Containers: Tins.

Uses: Medicine; antiseptic

Shipping regulations: None.*

bismuth phenylate. See bismuth phenate.

bismuth phosphate BiPO_4 .

Properties: White powder. Sp. gr. 6.323.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Soluble in hydrochloric acid, nitric acid; insoluble in alcohol, water.

Use: Medicine.

bismuth potassium iodide $\text{Bi}_3 \cdot 4\text{KI}$.

Properties: Red crystals. Decomposed by water. Soluble in potassium iodide solution.

Use: Medicine.

bismuth-potassium tartrate. See potassium-bismuth tartrate.

bismuth pyrogallate (helcosol; basic bismuth pyrogallate) $\text{C}_6\text{H}_3(\text{OH})_2\text{OBiOH}$.

Properties: Yellowish-green amorphous powder; odorless; tasteless. Soluble in dilute acid and alkaline solutions; insoluble in water and alcohol.

Derivation: By the action of pyrogallic acid on bismuth carbonate.

Grades: Technical, 60% Bi_2O_3 .

Containers: Tins.

Use: Medicine.

Shipping regulations: None *

bismuth pyrogallate, basic. See bismuth pyrogallate

bismuth salicylate, basic. See bismuth subsalicylate.

bismuth sodium iodide $\text{BiI}_3 \cdot 4\text{NaI}$.

Properties: Red crystals. Decomposed by water. Soluble in solution of sodium iodide.

Use: Medicine.

bismuth sodium tartrate.

Properties: White powder. Odorless; tasteless; contains about 73% bismuth. Soluble in water; insoluble in organic solvents

Use: Medicine.

bismuth sodium triglycollamate

$\text{C}_6\text{H}_7\text{NNaBiO}_7 \cdot 3\text{C}_6\text{H}_7\text{NNa}_2\text{O}_6$. A sodium bismuth complex of nitrilotriacetic acid. Contains approximately 18.3% bismuth.

Properties: White, odorless, crystalline powder. Somewhat salty taste. Stable to air or light. Very soluble in water; insoluble in organic solvents; pH (2% solution) 7.0-8.0.

Grade: U. S. P. XVI.

Use: Medicine

bismuth solders. See data under fusible alloys.

bismuth stannate $\text{Bi}_2(\text{SnO}_3)_3 \cdot 5\text{H}_2\text{O}$.

Properties: Light colored crystalline powder. Insoluble in water. Approximate temperature of dehydration is 140°C .

Uses: Component of ceramic capacitors, especially useful with barium titanate.

bismuth subcarbonate (bismuth oxycarbonate; bismuth "carbonate"; bismuth carbonate, basic) $(\text{BiO})_2\text{CO}_3$ or $\text{Bi}_2\text{O}_3 \cdot \text{CO}_2$, with one-half H_2O .

Properties: White, odorless powder; tasteless; insoluble in water and alcohol; soluble in nitric or hydrochloric acid with effervescence.

Constants: Sp. gr. 6.86.

Derivation: By adding ammonium carbonate to a solution of a bismuth salt.

Grades: Technical; C. P. ; U. S. P. XVI

(90% Bi_2O_3 min)

Containers: Up to 250-lb drums

Uses: Bismuth compounds; face powder; medicine; x-ray work.

Shipping regulations: None *

bismuth subchloride. See bismuth oxychloride.

bismuth subgallate (basic bismuth gallate)

$\text{C}_6\text{H}_2(\text{OH})_3\text{COOBi}(\text{OH})_2$

Properties: Saffron-yellow powder; odorless and tasteless. Soluble in dilute alkalis; insoluble in water, alcohol and ether. Stable in air, but affected by light.

Derivation: Interaction of bismuth nitrate, glacial acetic acid, and gallic acid in aqueous solution.

Grades: Technical; N. F. XI

Containers: 1-lb cans; 5- to 200-lb drums

Use: Medicine.

Shipping regulations: None. *

bismuth subiodide. See bismuth oxyiodide.

bismuth subnitrate (magistery of bismuth; basic bismuth nitrate; Spanish white; flake white; pearl white; bismuth oxynitrate)

$4\text{BiNO}_3(\text{OH})_2 \cdot \text{BiO}(\text{OH})$.

Properties: White, heavy, slightly hygroscopic powder, which shows acid to moistened litmus paper. Soluble in acids; insoluble in water and alcohol.

Constants: Sp. gr. 4.928; m. p. decomposes at 260°C .

Derivation: By adding bismuth nitrate to water, filtering and drying.

Impurities: Arsenic, lead, silver carbonates.

First two especially should be watched for, if article is to be used in pharmacy or medicine.

Grades: Technical; C. P. ; N. F. XI.

Containers: Multiwall paper sacks; 5- to 250-lb drums

Uses: Bismuth salts; perfumery and cosmetics; ceramic enamels; burning gold on ceramic ware; bismuth luster on metals; pharmaceuticals (preparations, antiseptic and deodorizing compositions, drug; analytical reagent)

Shipping regulations: None. *

bismuth subsalicylate (basic bismuth salicylate)

$\text{Bi}(\text{C}_7\text{H}_5\text{O}_3)_3 \cdot \text{Bi}_2\text{O}_3$

Properties: White, bulky crystalline powder; tasteless; odorless; soluble in acids and alkalis; insoluble in water, alcohol and ether. Stable in air but affected by light.

Derivation: By treating freshly prepared bismuth hydroxide with salicylic acid

Grades: Technical, U. S. P. XVI

Containers: 5-lb cans; 25-, 100-lb drums

Use: Medicine

Shipping regulations: None *

bismuth sulfate $\text{Bi}_2(\text{SO}_4)_3$.

Properties: White needles or powder. Contains 68.5% (approx.) bismuth. Sp. gr. 5.08. Soluble in hydrochloric acid (dilute), nitric acid (dilute); insoluble in alcohol, water.

Use: Medicine.

bismuth sulfide Bi_2S_3 .

Properties: Blackish-brown powder. Soluble in nitric acid; insoluble in water.

* See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Constants: Sp. gr 7.00-7.81; m p., decomposes

Derivation: (a) By melting bismuth and sulfur together. (b) By passing hydrogen sulfide into a solution of a bismuth salt.

(c) Occurs as the mineral bismuthinite

Grades: Technical; C P

Containers: Tins.

Use: Bismuth compounds.

Shipping regulations: None.*

bismuth sulfofocarbonate. See bismuth phenol-sulfonate.

bismuth sulfophenate. See bismuth phenol-sulfonate.

bismuth sulfophenylate. See bismuth phenol-sulfonate

bismuth tannate (bismuth ditannate)

Properties: Light brownish-yellow powder containing about 36% bismuth. Insoluble in water and alcohol; soluble in mineral acids.

Derivation: From freshly prepared bismuth hydroxide and tannin

Use: Medicine

bismuth telluride (bismuth tritelluride)

Bi_2Te_3

Properties: Gray hexagonal platelets M p. 585°C; sp gr 7.642

Derivation: Stoichiometric combination of the elements

Grades: Ingots, single crystals

Use: Semiconductors, for thermoelectric cooling and power generation applications See also tetradymite

bismuth ternitrate. See bismuth nitrate

bismuth tetroxide Bi_2O_4

Properties: Heavy, yellowish-brown powder Soluble in acids; insoluble in water

Constants: Sp gr 5.6, m p 305°C

Derivation: By further oxidation of bismuth trioxide.

Grades: Technical; C P

Containers: 1-lb bottles; tins

Use: Bismuth salts.

bismuth tribromide. See bismuth bromide

bismuth tribromophenate (tribromophenol-bismuth) $\text{Bi}_2\text{O}_3(\text{C}_6\text{H}_2\text{Br}_3\text{OH})$ (?)

Properties: Yellow, odorless powder. Insoluble in water and alcohol; soluble in dilute hydrochloric acid.

Derivation: By the interaction of bismuth chloride and sodium tribromophenolate

Grades: Technical.

Containers: Glass bottles; boxes

Use: Medicine

Shipping regulations: None *

bismuth trichloride. See bismuth chloride.

bismuth trihydrate. See bismuth hydroxide.

bismuth trihydroxide. See bismuth hydroxide.

bismuth triiodide. See bismuth iodide.

bismuth trinitrate. See bismuth nitrate.

bismuth trioxide (bismuth oxide; bismuth yellow) Bi_2O_3

Properties: Heavy, yellow powder. Soluble in acids; insoluble in water.

Constants: Sp gr 8.8; m.p. 820°C.

Derivation: Ignition of bismuth nitrate.

Grades: Technical, C P

Containers: 1-lb bottles, tins; 100-lb drums.

Uses: Medicine; bismuth salts; ceramic colors.

Shipping regulations: None.*

bismuth tritelluride. See bismuth telluride and tetradymite

bismuth valerate $\text{Bi}(\text{C}_5\text{H}_9\text{O}_2)_3 \cdot 2\text{Bi}(\text{OH})_3$.

Properties: White powder. Insoluble in water or alcohol; soluble in dilute acid.

Derivation: Interaction of solutions of bismuth trinitrate and sodium valerate

Use: Medicine.

bismuth yellow. See bismuth trioxide.

bismuthyl bromide. See bismuth oxybromide.

bismuthyl chloride. See bismuth oxychloride

bismutite $(\text{BiO})_2\text{CO}_3$ A natural carbonate of bismuth, resulting from alteration of bismuth minerals

Properties: Color yellow, green, gray, black; streak gray; luster vitreous to dull; hardness variable; sp.gr 6.1-7.7 Soluble in strong hydrochloric acid

Occurrence: South Carolina, Arizona, California; Europe

Use: Minor ore of bismuth

para-bis[2-(5-alpha-naphthylloxazolyl)]benzene (NOPON) $\text{C}_{22}\text{H}_{20}\text{O}_2\text{N}_2$

Properties: Crystals; m p 215-217°C

Grade: Purified

Use: Scintillation counter

bis(3-nitrophenyl) disulfide. See nitrophenide.

bisphenol A (para,para'-isopropylidenediphenol) $(\text{CH}_3)_2\text{C}(\text{C}_6\text{H}_4\text{OH})_2$

Properties: White flakes with a mild phenolic odor B p 220°C (4 mm); freezing point 153°C; sp.gr 1.195 (25/25°C), insoluble in water; soluble in alcohol and dilute alkalis; slightly soluble in carbon tetrachloride

Containers: 50-lb bags; 400-lb metal drums.

Uses: In the manufacture of phenolic, epoxy and polycarbonate resins.

1,4-bis-2-(5-phenylloxazolyl)-benzene

(POPOP) $\text{C}_{24}\text{H}_{19}\text{O}_2\text{N}_2$.

Properties: Light yellow, cottony needles; m p. 245-246°C; fluorescence max 4200 Å; solubilities g/100 g at 25°C: water 0.00; 95% ethanol 0.00; toluene 0.12; hexane 0.02.

Grade: Purified.

Containers: Glass bottles

Use: Efficient band-shifter in scintillation counting.

bis(tetrachloroethyl)disulfide $\text{C}_4\text{H}_2\text{Cl}_8\text{S}_2$.

Properties: Sp gr (23.3°C) 1.785; b.p. 185°C (3 mm). Soluble in benzene, hexane, ethanol.

Uses: Agricultural chemicals; additives.

bis(tri-n-butyltin) oxide $(\text{C}_4\text{H}_9)_3\text{SnOSn}(\text{C}_4\text{H}_9)_3$.

Properties: Slightly yellow liquid; b.p. 180°C

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

(2 mm); f. p. less than -45°C ; sp. gr. 1.17 (25°C); flash point, above 212°F (TCC); viscosity 4.8 centistokes at 25°C ; practically insoluble in water; miscible with organic solvents.

Derivation: Hydrolysis of tributyl tin chloride.

Uses: Fungicide and bactericide; forms compound with cellulosic and lignin-containing materials not easily decomposed or dissolved in water.

bis-trichlorosilylbenzene $\text{Cl}_3\text{SiC}_6\text{H}_4\text{SiCl}_3$.
Colorless liquid; b. p. (30 mm) 168°C .

bis-trichlorosilyl ethane $\text{Cl}_3\text{SiCH}_2\text{CH}_2\text{SiCl}_3$.
1,1,1,4,4,4-Hexachloro-1,4-disilabutane.
Properties: Colorless liquid. B. p. 202.9°C ; sp. gr. 1.475 ($29/29^{\circ}\text{C}$); flash point (Cleveland open cup) 190°F . Readily hydrolyzed by moisture, with the liberation of hydrochloric acid.

Derivation: By the reaction of acetylene and trichlorosilane in the presence of a peroxide catalyst.

Grades: Technical.

Use: Intermediate for silicones.

Shipping regulations: Corrosive liquid
White label *

1,3-bis(trimethylamino)-2-propanol diiodide.
See propiodal.

bithionol (bis(2-hydroxy-3,5-dichlorophenyl)sulfide) $\text{HOCl}_2\text{C}_6\text{H}_3\text{SC}_6\text{H}_3\text{Cl}_2\text{OH}$. 2,2'-Thio-bis(4,6-dichlorophenol).

Properties: White or grayish-white crystalline powder, m. p. 187°C . Odorless or with slight aromatic or phenolic odor. Insoluble in water; freely soluble in acetone, alcohol and in ether; soluble in chloroform and dilute solutions of fixed alkali hydroxides.

Grade: U. S. P. XVI

Containers: 50-, 200-lb drums.

Uses: Medicine; deodorant; germicide; fungistat; cosmetics; pharmaceuticals.

"**Bitrex**." Trademark for benzyldiethyl(2,6-xylylcarbamoylmethyl)ammonium benzoate, produced in Europe, and approved by the Alcohol and Tobacco Tax Division for Specially Denatured Alcohol No. 40. Is said to be more bitter than brucine or quassia, also permitted for SDA No. 40.

bitter almond. See almond, bitter.

bitter almond oil. See almond oil, bitter.

bitter almond oil, synthetic. See benzaldehyde.

bitter almond oil camphor. See benzoin.

bitter apple. See colocynth.

bitter ash. See euonymus or quassia.

bitter cucumber. See colocynth.

bitter gourd. See colocynth.

bittern. The solution of bromides, magnesium, and calcium salts that remains after sodium chloride has been crystallized by concentration of sea water or salt brines.

bitter orange-flower oil. See orange-flower oil.

bitter root. See gentian.

bittersweet. See dulcamara.

bitterwood. See quassia.

"**Bitumastic**." ¹¹ Trademark for a protective coating made from refined coal tar pitch and fillers. It is used primarily for waterproofing concrete or masonry surfaces.

bitumen. A general term for native asphalt-like hydrocarbons. Bitumens are solid or semisolid, insoluble in water, but largely soluble in carbon disulfide and other organic solvents. They include asphalt, asphaltites, asphaltic pyrobitumens and mineral waxes (q. v.). Bitumen is also used to refer to the components of coal that are soluble in organic solvents.

bituminous coal (soft coal). Designation for a broad class of coals having 46-86% fixed carbon and approximately 20-40% volatile matter. They run about 11,000 or more Btu/lb. Bituminous coals are further classified, in order of increasing volatile matter or decreasing fixed carbon, as: low volatile (semi-bituminous), medium volatile, high volatile. They are also classified as coking and non-coking coals.

Occurrence: Pennsylvania, West Virginia, Illinois, Indiana, Wyoming, Utah.

Uses: Fuel; coke production; manufacture of producer gas, illuminating gas, fuel gas and briquets.

bituminous varnish. See varnish.

biuret (allophanamide; carbamylurea)
 $\text{NH}_2\text{CONHCONH}_2 \cdot \text{H}_2\text{O}$.

Properties: White needles; odorless; m. p. 190°C with decomposition; soluble in water and alcohol; very slightly soluble in ether. Loses water of crystallization at about 110°C .

Derivation: From urea by heat.

Methods of purification: Crystallization.

Grades: Technical

Containers: Glass bottles.

Use: Analytical chemistry.

Shipping regulations: None. *

bivinyll. See butadiene.

bixin. See annatto.

Bk. Symbol for berkelium.

"**B-K B-K**." ²⁰⁴ Trademark for concentrated uniform flake alkali for machine bottle washing and heavy duty cleaning. Packed in 340-lb and 130-lb steel drums.

"**B-K Bottle Compound**." ²⁰⁴ Trademark. A machine bottle washing compound.

"**B-K Chlorine-Bearing Powder**." ²⁰⁴ Trademark. Calcium hypochlorite powder containing 50% available chlorine.

Use: As dairy bactericide in plants and on farms, restaurants. A disinfectant and deodorant.

"**B-Kleer**." ²⁰⁴ Trademark for a heavy duty caustic alkali; contains polyphosphate and wetting agent in fused flake form.

* See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Dustless, uniform, highly soluble and effective in hard water.

Containers: Packed in 350-lb open-head and 100-lb steel drums.

Uses: In machine bottle washing; H. T. S. T. Pasteurizer; vacuum pan cleaning.

"B-K Liquid." ²⁰⁴ Trademark. A bactericide.

"BL-60." ¹⁷² Trade name for a modified form of sodium aluminum phosphate specifically designed for use in cakes made with lactylated type shortening.

Containers: Drums.

Uses: Leavening agent in prepared cake mixes.

black. See specific types of blacks such as acetylene black, animal black, benzol black, bone black, carbon black, channel black, drop black, furnace black, gas black, ivory black, lamp black, mineral black, thermal black, vegetable black, vine black. All are more or less impure forms of carbon, characterized by fine state of subdivision and/or relatively large surface area, and are made by thermal decomposition or incomplete combustion of carbon compounds. The term black is also applied to other black powdery materials such as minerals.

black, aniline. See aniline black

black antimony. See antimony trisulfide

black ash. 1. The product obtained by heating black liquor in furnaces. The organic material is reduced to carbon. The alkaline components are leached out and used again in papermaking. The carbon may be treated to obtain activated carbon.
2. See barium sulfide.

black balsam. See Peru balsam.

blackband. An earthy carbonate of iron containing considerable carbonaceous matter. An iron ore

blackberry bark. See rubus.

black boy gum. See accroides gum

"Black Bull." ⁴²³ Trademark for a series of asphalt-gilsonite roof coatings

black cohosh. See cimicifuga

black cyanide. Term for mixture containing 45% calcium cyanide, made from calcium cyanamid by heating it with salt and carbon. Formerly the main source of cyanides, but now superseded by the methane-ammonia process for making hydrocyanic acid

black glass. Manganese or ferric oxides are added to ordinary glass.

black haw. See viburnum prunifolium.

black henbane. See hyoscyamus.

black Indian hemp. See apocynum

black jack. See sphalerite.

black lead. See graphite

black liquor. 1. The liquor resulting from

cooking pulpwood in an alkaline solution in the soda or sulfate papermaking process.

It is a source of lignin and tall oil.

2. Iron acetate liquor.

black mordant. See iron acetate liquor

black mustard oil. See mustard oil, volatile.

black oil. See residual oils.

"Black-Out." ⁶⁹ Trademark for a series of proprietary products, modified elastomers in solvent

"Clear" total solids 11-12%; sp. gr. 0.88
± 0.3; flash point 41°F

"Black" total solids 11-12%; sp. gr. 0.88
± 0.3; flash point 41°F

"White" total solids 15-16%; sp. gr. 0.91
± 0.3; flash point 41°F

"Metallic" total solids 18.5-20.5%; sp. gr. 0.89-1.0; flash point 43°F

Uses: Rubber finish

Shipping regulations: Red label.*

black oxide of manganese. See pyrolusite

"Black Pearls." ²⁷⁵ Trade name for a series of pelleted channel carbon blacks for paints, inks, and plastics. Available as "Black Pearls"

A Longest flow channel carbon black

S Long flow channel carbon black.

O Medium color all-purpose channel black

2 Standard high color channel black

46 High color channel black

70 Medium color channel black

71 Medium color channel black

74 Medium color channel black

80 Medium color channel black.

81 Regular color all-purpose channel black

black plate. Thin sheet steel obtained by rolling and usually used for containers. It is not coated with any metal but a special lacquer or baked enamel finish is usually applied by the can manufacturer

black, platinum. See platinum black

black powder. See gunpowder

black precipitate. See mercurous nitrate, ammoniated.

black root. See leptandra

black rouge. See iron oxide, black

black sampson. See echinacea

black sand. A deposit of dark minerals with a high specific gravity found in stream beds and on beaches. Magnetite and ilmenite are usually present, and gold, monazite and other minerals are sometimes present.

black smalt. A darker form of smalt. See smalt.

black snake-root. See cimicifuga.

blackstrap. See molasses.

blackstrap molasses. See molasses.

blanc fixe. See barium sulfate.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

bleaching liquor. A solution of calcium hypochlorite.

"Blancol." ²³² Brand name for a series of optical bleaching agents for wool, cotton and synthetic fabrics and paper.

"Blancol." ³⁰⁷ Trademark for an anionic dispersing agent, composed of the sodium salt of a sulfonated naphthalene condensate; 90% active.

Properties: Coarse granules ranging in color from tan to brown; density 1.00-1.05; soluble in water, glycerin, ethylene glycol. Also available as a free-flowing granular powder ("Blancol" N), and as a liquid ("Blancol" W Conc)

Uses: Dispersing agent for pigments, earths, and solids in water; peptizing agent in insecticide formulations; in the paper trade for slime control, preventing coagulation of pitch, reducing two-sidedness, to improve sizing, etc.; in the leather trade as a bleaching, dispersing, leveling, and neutralizing agent.

"Blancophor." ³⁰⁷ Trademark for optical whitening agents.

"Blancophor" FFG. A coumarin derivative.

Properties: Tan powder; density 1.05; soluble in water; compatible with urea or melamine formaldehyde resin finishes; produces blue-violet brilliancy on fabrics.

Uses: Whitening agent for wool, nylon, acetate rayon and mixed fibers.

"Blancophor" HS Brands. Stilbene derivatives. Fine yellowish tan, water-soluble powders used on cellulosic fibers, cotton and rayon fabrics, paper, and in household and industrial detergents.

"Blandol." ⁴⁵ Trademark for white mineral oil, N. F.

Properties: Sp. gr. 0.850-0.860 (60°F); Saybolt viscosity 80-90 (100°F); odorless and tasteless.

Uses: Pharmaceutical and cosmetic formulations, plasticizers; paper penetrants; foam depressants

"Blankit I." ³⁰⁷ Trademark for a bleaching and reducing agent composed of a stabilized, buffered hydrosulfite product; 67% active

Properties: White, fine, slightly granular powder; density 1.23-1.30; soluble in water

Containers: Must be stored in air-tight, dry containers protected from heat and moisture

Uses: Bleaching agent for wool, jute, linen and hemp; textile stripping agent.

blast-furnace dust. Dust deposited by or recovered from blast-furnace gases. It contains a variable amount of potash which renders it valuable. The black dust is comparatively poor in potash, the reddish dust deposited in the stoves and boilers is richer and the light-colored dust found at the base of the stacks is the richest.

blast-furnace gas. A by-product gas from

the smelting of iron ore. It is obtained by the passage of hot air over the coke in the blast furnaces. A typical gas will analyze 12.9% carbon dioxide, 26.3% carbon monoxide, 3.7% hydrogen, 57.1% nitrogen.

Uses: For heating blast-furnace stoves, and as boiler- or gas-engine fuel.

blast-furnace slag. See slag.

blasting agent. Shall mean any material or mixture, consisting of a fuel and oxidizer, intended for blasting, not otherwise classified as an explosive and in which none of the ingredients are classified as an explosive, provided that the finished product, as mixed and packaged for use or shipment, cannot be detonated by means of a No. 8 test blasting cap when unconfined.

(National Fire Protection Association, 1959)

An example is a mixture of 94% fertilizer grade ammonium nitrate (prills) and 6% oil

blasting gelatin. A type of dynamite containing some nitrocellulose, usually in addition to nitroglycerin

blasting powders. Black, granular, slow-acting explosives which burn with explosive rapidity when ignited under confinement, but do not detonate. They are known, therefore, as deflagrating powders in distinction from high explosives or detonating powders. All blasting powders are Class A explosives under I. C. C. Regulations.

Uses: Mining; road building; quarries.

Shipping regulations: Explosives. Class A, by freight; not accepted by express. *

"B-L-E." ²⁴⁸ Trademark for high-temperature reaction product of diphenylamine and acetone.

Properties: Dark-brown viscous liquid; sp. gr. 1.087; soluble in acetone, benzol, and ethylene dichloride; insoluble in gasoline and water.

Uses: Antioxidant for tire treads and carcass, inner tubes, and as a general purpose antioxidant

bleaching agents. As used for paper or textiles, these include hydrogen peroxide (the most common), sodium hypochlorite, sodium peroxide, sodium chlorite, and calcium hypochlorite, among inorganic agents, and many organic chlorine derivatives. See, for example, dichloroisocyanuric acid

bleaching assistants. Any materials added to bleaching baths to secure more rapid and complete penetration of the bleach or improved regulation of the bleaching action. Typical bleaching assistants include compounds of sulfonated oils and solvents, soluble pine oils, fatty alcohol salts, sodium silicate, sodium phosphate, magnesium sulfate, and borax.

bleaching clays. Clays that possess superior decolorizing characteristics for use in refining of mineral, petroleum, vegetable, and animal oils.

bleaching powder. Any powder used, in solution,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

for textile bleaching. Specifically, the term refers to chlorinated lime, which is an important industrial agent. Among other powders developed for household use are sodium perborate, and dichlorodimethylhydantoin. See also calcium hypochlorite.

bleach liquor. A solution of calcium hypochlorite (q. v.)

blende. See sphalerite

"Blendene." ⁷³ Brand name for proprietary product; a terpene-soap composition
Properties: Oily liquid having a pine odor; dispersible in water, in toluene, mineral spirits, and mineral oil. Soluble (hot) in methyl alcohol, ethyl alcohol, and naphtha; partly soluble in cottonseed oil
Constants: Sp. gr (25°C) 0.947, titer below 6°C; pH (10% dispersion) 9.2.
Containers: 1-gal cans (8 lbs); 5-gal cans (40 lbs); 55-gal drums (430 lbs).
Uses: For the manufacture of fluid emulsions, oils, solvents, etc., for water paint base, emulsion sprays, furniture and automobile polishes.

blind coal. A term sometimes used to designate anthracite.

blister copper. Copper (96-99% purity) produced by the reduction and smelting of copper ores. It has a blistered appearance probably caused by gas pockets. It is usually further refined electrolytically.

blistering beetles. See cantharides.

blistering fly. See cantharides.

block polymer. A polymer whose molecule is made up of comparatively long sections that are of one chemical composition, these sections being separated from one another by segments of a different chemical character, as for example, blocks of polyvinyl chloride interspersed with blocks of polyvinyl acetate.

block tin lining. Block tin is a common designation for pure tin. Copper vessels are lined or coated with tin by the application of molten tin upon clean copper with the aid of fluxing. Such coatings are sometimes called hot dippings. Tin is sometimes used for coating lead sheet or lining lead pipe, and owing to the method of fabrication, these articles may be called two-ply metal. Frequently tin is the metal chosen for making, holding, and conveying distilled water and it is used in contact with some chemicals.

blood charcoal (blood char). Made by adding caustic potash to blood, evaporating and calcining the residue.

Grades: Fresh; spent.

Uses: (Fresh) decolorizing; deodorizing and filtering.

blood, dried. A packing house by-product obtained by coagulating animal blood, followed by drying and grinding. It is a brown powder with an odor similar to that

of glue and contains about 11.8% nitrogen and 1.2% phosphorus.

Grades: According to nitrogen content expressed as ammonia, as, 16-16.5% ammonia; 14% ammonia.

Containers: Bags.

Uses: Fertilizer, also as an ingredient of proprietary fertilizer compounds; clarifying agent for wines, syrups, etc.; ingredient of patent medicines used for blood diseases; in work on immunity by serum therapy; manufacture of adhesives; feed for hogs and chickens.

Shipping regulations: None.*

blood geranium. See sanguinaria.

blood red. A red pigment consisting essentially of red iron oxide. See iron oxide reds.

blood-root. See sanguinaria.

bloodstone.

1. A variety of chalcedony (q. v.) or quartz (q. v.) Color is dark-green with bright red spots. It is engraved for signet ring stones.
2. This term has also been used for hematite (q. v.).

blowing agents. Substances used to produce foam or sponge rubber through the fact that they undergo decomposition when heated. Thus their incorporation into a soft rubber compound results in its conversion to a foam or sponge as soon as heat is applied during vulcanization. Blowing agents are similarly used in producing plastic foams. See, for example, "Celogen," "Nitrosen."

blown asphalt. Hard, friable solid obtained by blowing air at high temperature through mineral residual oils. They are also known as oxidized asphalts, condensed asphalts, and mineral rubber. See also pitches, artificial.

blown oils (oxidized oils; base oils; thickened oils; polymerized oils)

1. Vegetable and animal oils which have been heated and agitated by a current of air or oxygen. They are partially oxidized, deodorized and polymerized by the treatment, and are increased in density, viscosity and drying power. Important blown oils are castor, linseed, rape, whale and fish oils.

Uses: Paints, varnishes, lubricants, and plasticizers.

2. Mineral oils. See blown asphalt.

blubber oil. See whale oil.

blue asbestos. See crocidolite.

blue copperas. See copper sulfate.

blue gas. See water gas.

blue glass. Cobalt oxide is added to a soda lime glass. Cupric oxide gives a green blue.

blue gum tree. See eucalyptus.

blue, iron. See iron blues.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

blue, laundry. See laundry blue.

blue lead. See lead sulfate, blue basic.

blue oil. Name given to the heavy oil from crude Scottish shale oil after paraffin has been removed.

blue ointment. One of the ointments containing mercury, white wax, and petrolatum. It contains not less than 29% and not more than 31% of mercury; about 20% white wax, and 40% petrolatum.

blue powder. See zinc.

blueprinting. A process for the reproduction of drawings or printed material in which sensitized paper containing ferric ammonium citrate and potassium ferricyanide is placed under tracing (i. e., transparent) paper imprinted with the lines or data to be reproduced and then exposed to bright light. The ferric ions are reduced to ferrous ions by the effect of the light, and the ferrous ions react with the ferricyanide ions forming Turnbull's blue ($\text{Fe}_3[\text{Fe}(\text{CN})_6]_2$). Under the black lines on the tracing paper no ferrous ions are reduced and no blue color is produced. Thus the black lines of the tracing paper appear on the sensitized paper as white lines against a blue background.

blueprint paper. Paper dipped in solutions of ammonium ferric citrate and potassium ferricyanide and dried in the dark. Exposure to ultraviolet or sunlight reduces the ferric compound to the ferrous state, forming blue ferrous ferricyanide which is fixed on the paper. Unexposed portions are washed out.

blue, Prussian. See iron blues.

bluestone. A variety of thin bedded or easily cleavable sandstone, usually dark in color, used for flagstone. Quarried in New Jersey, Pennsylvania, and New York. The name has also been applied to other types of blue rocks. Note the distinction from blue stone (q. v.)

blue stone. See copper sulfate.

blue verdigris. See copper acetate, basic.

blue verditer. See Bremen blue

blue vitriol. See copper sulfate

blue vitriol, natural. See chalcantithite.

blue, washing. See laundry blue.

blue water gas. See water gas.

"3B" Mercaptan. ²⁰⁴ Trademark for tert-dodecylmercaptan.

Properties: Color, water-white to very pale yellow; sp. gr. (20°C), 0.85-0.86; mercaptan content, 93% min; distillation, 95% between 200-235°C; flash point, 205°F; soluble in most organic solvents; insoluble in water.

Uses: Organic synthesis; modifier in polymerization of diene polymers such as nitrile and styrene rubbers.

BMU. Abbreviation for beta-methyl umbelliferone.

B. O. D. Abbreviation for biochemical oxygen demand; see also dissolved oxygen (D. O.) and oxygen consumed (C. O. D.).

body oil. See whale oil.

"Boerite." ³⁰⁹ Trademark for a series of sulfonated fatty acids having a general use in the industrial arts.

boghead coal. A variety of bituminous or sub-bituminous coal resembling cannel coal in appearance and behavior during combustion. It is characterized by a high percentage of algal remains and volatile matter. Upon distillation it gives exceptionally high yields of tar and oil. (ASTM definition, ASTM D493-39.)

bog iron ore. See limonite.

bog manganese. See wad.

bog moss. See sphagnum.

"Bogol." ⁴⁸ Trademark for a crude tall oil.

boiler scale. A rocklike deposit occurring on boiler walls and tubes in which hard water has been heated or evaporated. Consists largely of calcium carbonate or calcium sulfate or similar materials, depending on the mineral content of the water. Boiler scale decreases the rate of heat transfer through the boiler and tube walls resulting in increased heating costs and shortening of boiler life. Most boiler feed water is softened (treated to remove calcium and magnesium ions) before being led into the boiler in order to prevent the formation of boiler scale.

boiling point. The temperature at which the vapor pressure of a liquid is just slightly greater than the total pressures of the surroundings. This temperature may be approximately determined in many cases by noting the temperature at which ebullition first occurs, that is, when bubbles of vapor are formed within the body of the liquid as its temperature is gradually raised. Precise determination of the boiling point is more complicated, and requires special methods because of superheating of the liquid, formation of bubbles of air or other dissolved gases, and for other reasons.

bois de rose oil. See oil bois de rose Brazilian.

bole. A red variety of hematite (naturally occurring ferric oxide) used as a pigment. See iron oxide reds.

boletic acid. See fumaric acid.

"Bolidensalt" BIS. ³¹⁷ Trade name for zinc chrome arsenate.

Approximate composition: H_3AsO_4 , 20%; Na_2HAsO_4 , 19%; $\text{Na}_2\text{Cr}_2\text{O}_7 \cdot 2\text{H}_2\text{O}$, 16%; $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$, 43%. The zinc sulfate is to be added at the treating plant.

Containers: Steel drums with wooden crates (220-lbs net).

Uses: Wood preservative used in water

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

solution in plants working under vacuum and pressure; zinc and chromium arsenates are precipitated in the wood fibers making the treated wood resistant to leaching.

"Bolidensalt" BIS Copperized. ³¹⁷ Trade name for zinc copper chrome arsenate
Approximate composition: H_3AsO_4 , 20%; Na_2HASO_4 , 19%; $Na_2Cr_2O_7 \cdot 2H_2O$, 16%; $ZnSO_4 \cdot 7H_2O$, 22%; $CuSO_4 \cdot 5H_2O$, 22%.
Zinc and copper sulfate to be added at treating plant.
Containers: Steel drums with wooden crates (220-lbs net).
Uses: As listed for "Bolidensalt" BIS.

"Bolidensalt" K33. ³¹⁷ Trade name for non-ionic copper chrome arsenate.
Approximate composition: As_2O_5 , 34%; CrO_3 , 26.6%; CuO , 14.8%; H_2O , 24.6%.
Containers: Steel drums with wooden crates (220-lbs net).
Uses: Suitable for cooling towers; sleepers and high-transmission line poles as electrical resistance of wood is increased by salt; effective against all wood destroyers including soft-rot organisms. All ingredients in salt are practically completely fixed in the wood and no soluble by-products are formed.

"Boltaron." ⁹⁶ Trademark for a line of polyvinyl chloride products used for corrosion resistant piping, ducts, hoods, tanks, machined parts

bolus alba. See kaolin.

bombardment, nuclear or atomic. The directing of gamma rays or a stream of high energy particles such as electrons, neutrons, protons, etc., against a target element. The projectiles may come from cosmic rays, particle accelerators, nuclear reactors or other sources. When a high energy particle hits the target nucleus, (1) it may bounce off and leave the struck nucleus unchanged; (2) it may be absorbed, sometimes producing a new element of higher atomic number; (3) it may bring about the formation of entirely new particles; or (4) it may cause the nucleus to disintegrate. Several new elements and many of the previously unknown subatomic particles (mesons, etc.) first appeared in these reactions

"Bomber." ²⁴⁴ Trademark for a compound consisting of a balanced blend of buffered alkalis and a surface active agent
Properties: White, granular, free-flowing mechanical mix; soluble in water; total Na_2O content 43.5%.
Containers: 125-lb plywood drums; 325-lb wooden barrels.
Uses: A general dairy and creamery detergent for heavy duty cleaning in low water-hardness areas having a predominance of magnesium.

BON. Abbreviation for beta-oxynaphthoic acid.
See 3-hydroxy-2-naphthoic acid.

"Bonadettes." ²⁹⁹ Trademark for meclizine hydrochloride

"Bonadoxin." ²⁹⁹ Trademark for a combination drug containing meclizine hydrochloride and pyridoxine hydrochloride (vitamin B_6). Used in medicine.

"Bonadur." ⁵⁷ A trade designation for a series of acid azo red pigments which are made by diazotizing and coupling a substituted toluidine sulfonic acid with beta-hydroxynaphthoic acid and forming a metallic salt with an appropriate metal compound.
Uses: Inks for cartons, food wrappers and waxed papers, plastics, rubber, floor covering, and metal-decorating lacquers and enamels

"Bonamine." ²⁹⁹ Trade name for meclizine hydrochloride.

"Bonaril." ²³³ Trademark for a hydrolyzed polyacrylamide for use in foundry sands.

bond clay. Clays which, in addition to a high refractoriness, have a strong bonding power, thus making them of value for crucibles to melt steel and brass and as a bond for abrasive wheels. They are all fire clays and some are also ball clays.

"Bonderizing." ³⁴³ Trademark for a process for furnishing a corrosion-resisting base for paint finishes on steel, aluminum, zinc, and their alloys and diecastings. Also used as an aid in deep drawing on steel and aluminum.

"Bondogen." ⁶⁹ Trademark for proprietary product. Oil soluble sulfonic acid of high molecular weight with a high boiling hydrophilic alcohol and a paraffin oil
Properties: Dark mahogany liquid; sp. gr 0.90-0.92; acid number 40-42.
Uses: Peptizing agent and plasticizer for all elastomers

bone ash (bone earth). An ash containing from 67 to 85% basic calcium phosphate, 2 to 3% magnesium phosphate, 3 to 10% calcium carbonate, some caustic lime and calcium fluoride
Derivation: By calcining bones.
Uses: Fertilizer; in the preparation of superphosphates; cleaning and polishing compounds; ceramic products

bone black (bone char; bone charcoal) Black pigment made by carbonizing bones. Carbon content is usually about 10% unless calcium phosphate and other salts are extracted with acid. It is an inferior black pigment but a superior adsorbent for purification of sugar solutions.
Containers: Multiwall paper sacks; fiber drums
Uses: Manufacturing blackings and polishes; decolorizing agent and filtering medium; cementation reagent; absorptive medium in gas masks; paint and varnish pigment; clarifying shellac; decolorizing paraffin and sugar; filtering, decolorizing and deodorizing water.

bone brown. Partially charred ivory dust or bones.

Use: As a pigment.

bone char. See bone black.*

bone charcoal. See bone black.

bone, dissolved. A ground bone or bone meal which has been treated with sulfuric acid.

Use: As fertilizer material.

bone earth. See bone ash.

bone fat (bone tallow). Fat obtained from animal bones by any of the following methods: (a) by boiling fresh bones in water; (b) by treating with steam under pressure; (c) by extraction with an organic solvent.

Use: Manufacture of candles and cheap soaps.

bone fat pitch. See stearin and fatty acid pitches.

bone, fine. The trade terms "bone meal," "bone dust," and "fine bone" are used to indicate mechanical condition, or fineness of division, and do not refer especially to composition.

bone glue. See glue.

bone meal, raw. A meal produced by drying and grinding animal bones not previously steamed under pressure.

Properties: Contains 4-5% ammonia, 20-25% phosphoric acid, 43-55% bone phosphate.
Use: As fertilizer.

bone meal, steamed. A meal produced by grinding animal bones which have been previously steamed under pressure.

Properties: Contains 2-3% ammonia, 50-55% bone phosphate.
Use: As fertilizer.

bone oil (animal oil; Dippel's oil; hartshorn oil; Jeppel's oil)

Properties: Dark brown, fixed oil; repulsive odor. Soluble in water.

Chief constituents: Hydrocarbons, pyridine bases, and amines.

Constants: Sp. gr. 0.900-0.980.

Derivation: By the destructive distillation of bones or other animal substance. After extraction with benzene or carbon disulfide, they are distilled in iron or clay retorts, the volatile products, consisting of gaseous ammonium salts and bone oil, are condensed and the gases containing the ammonium compounds collected in sulfuric acid. The bone oil and aqueous liquor collected are separated by gravity. The crude bone oil is subjected to fractional distillation. The constituents are numerous, the most important being pyridine.

Method of purification: Rectification.

Grades: Technical.

Containers: Iron drums; tank cars.

Uses: Organic preparations; source of pyrrole; denaturant for alcohol.

Shipping regulations: None.*

bone phosphate (BPL; bone phosphate of lime).

Phosphoric acid is found in bones in the

form of tribasic calcium phosphate (q. v.).

bone tallow. See bone fat.

bone turquoise. See turquoise.

"Bonine." ²⁹⁹ Trademark for meclizine hydrochloride.

BON red. A class name for a group of organic azo pigments made by coupling beta-hydroxynaphthoic acid to various amines and forming the barium, calcium, strontium or manganese salts. They have bright shades ranging from yellow red to deep maroon. They are characterized by good light resistance, good heat resistance, non-bleeding in vehicles and solvents and good opacity. They are widely used in printing inks, paints, enamels, lacquers, rubber plastics, wall paper, textiles, floor coverings, and crayons.

boort. See diamond.

"Boot." ¹⁷³ Trademark for a pre-spotting material for use in treating stains prior to dry cleaning so as to facilitate the dry cleaning process. It is a concentrated soapless pre-spotter used on the wet side to soften spots and stains on garments prior to dry cleaning.

BOPOB. See para-bis[2-(5-para-biphenyloxy-azoly)]-benzene.

boracic acid. See boric acid.

boracite $Mg_3B_7O_{13}Cl$. A natural chloride and borate of magnesium, occurring in salt beds.

Properties: Colorless, white to yellowish or greenish; pyroelectric; occurs as crystals or as soft masses. Sp. gr. 2.9-3; hardness 7.

Occurrence: Germany; France; Louisiana.

boral. A "sandwich" consisting of boron carbide crystals in aluminum, with a cladding of commercially pure aluminum. Concentrations of up to 50% boron carbide can be obtained.

Uses: As a shielding material against the passage of thermal neutrons, as in reactor shields; neutron curtains; shutters for thermal curtains; safety rods; containers for fissionable material.

"Boran." ¹⁶⁹ Trademark for diaminochrysazin used in the colorimetric determination of boron.

borax (tincal; borax decahydrate)

$Na_2B_4O_7 \cdot 10H_2O$. A natural hydrated sodium borate, found in salt lakes and alkali soils. Borax is also used as the commercial name for sodium borate (q. v.).

Properties: Color white to grayish or greenish; luster vitreous to dull; taste sweetish alkaline; sp. gr. 1.7; hardness 2-2.5; readily soluble in water.

Containers: Paper bags; bulk.

Occurrence: Tibet; California, Nevada.

Uses: As raw material for the manufacture of commercial sodium borate. Now largely displaced by kernite.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

borax, anhydrous. See borax, dehydrated.

borax decahydrate. See borax.

borax, dehydrated (borax, anhydrous)

Properties: White, free-flowing crystals; hygroscopic; forms partial hydrate in damp air; m.p. 741°C; sp. gr. 2.367; rate of solution, slow.

Grades: Technical (99% $\text{Na}_2\text{B}_4\text{O}_7$); standard; fine granular form.

Containers: 100-lb paper bags; boxcars.

Uses: Manufacture of glass, enamels, and other ceramic products.

borax glass. See sodium borate.

borax pentahydrate $\text{Na}_2\text{B}_4\text{O}_7 \cdot 5\text{H}_2\text{O}$.

Properties: Begins to lose water of hydration at 122°C; sp. gr. 1.815; stable; free-flowing.

Grades: Crude; technical (99.5% $\text{Na}_2\text{B}_4\text{O}_7 \cdot 5\text{H}_2\text{O}$).

Containers: 100-lb bags; bulk.

Uses: Weed killer and soil sterilant; same uses as sodium borate.

borazon. A boron nitride formed at very high pressures and temperatures from mixtures of boron and nitrogen, or from ordinary hexagonal boron nitride in the presence of catalysts such as lithium, calcium, magnesium, or their nitrides. Comparable to diamond in hardness, and has cubic arrangement of atoms in its crystal lattice. Density 3.48 g/cc. Reacts extremely slowly with water; dissolves in fused sodium carbonate.

Borcher's metal. A group of alloys of chromium with nickel and cobalt, or of chromium and iron with a small proportion of molybdenum and/or silver or gold. Heat and corrosion resistant.

Uses: For chemical apparatus; crucibles; pyrometer tubes; heat treating or annealing pots.

Bordeaux mixture. A liquid fungicide and insecticide mixture made by adding slaked lime to a copper sulfate solution. It is either made by the user or bought as a powder ready for dissolving. Stabilizing agents are sometimes added to delay settling.

Borden's "38." ⁶⁵ Trademark for ureaform; plant nutrient containing 38% nitrogen.

boric acid (boracic acid; orthoboric acid) H_3BO_3 .

Properties: Colorless, odorless scales or white powder. Stable in air; sp. gr. 1.4347; m.p. 184°C; soluble in water, alcohol, and glycerin.

Derivation: (a) By adding hydrochloric or sulfuric acid to a solution of borax and crystallizing; (b) decomposing boracite with hydrochloric acid; (c) found native in Tuscany. See also sassolite.

Method of purification: Recrystallization.

Grades: U. S. P. XVI; C. P.; technical.

Containers: Bags; drums.

Uses: Chemicals (borates, water-glass

manufacture, nitric acid from saltpeter with simultaneous production of borax); ceramic glazes; high grade cements capable of taking high polishes; impregnating wicks of stearin candles; glass pastes, and special glasses; intermediates; laundry starch glazes; leather preparation of hides prior to tanning (leather-dressing compounds); artificial precious stones; metallurgy (welding flux, brazing copper, enamel coatings on iron); fireproofing compositions and linings for safes; pigments (Guignet's green, borated ultramarine); enamel paints; manufacture of imitation hard wood from soft wood; paper glazes; medicine; cosmetics; soaps, textiles (fireproofing, mordant, solvent bleach); fiberglass insulation.

Shipping regulations: None.*

boric acid esters. Trimethyl, tri-n-butyl, tricyclohexyl, tridodecyl, tri-p-cresyl, etc. borates. Compounds which are readily hydrolyzed to boric acid and the respective alcohols.

Properties: Colorless to yellow liquids; b.p. 230-350°C.

Suggested uses: Dehydrating agents; catalysts; sources of boric oxide; special solvents; fire retardants in plastics and paints; plasticizers or adhesion additives to latex paints; ingredients of soldering and brazing fluxes.

boric acid, ortho-. See boric acid.

boric anhydride. See boric oxide.

boric oxide B_2O_3 (boric anhydride, boron oxide)

Properties: Colorless transparent glass or powder; hard and brittle; slightly bitter to taste; sp. gr. 1.83-1.88; b.p. above 1500°C. The material has no melting point since it is a congealed liquid which has never crystallized but is nevertheless harder than many crystalline solids. Soluble in alcohol and acids; slightly soluble in cold water with decomposition; soluble in hot water.

Uses: Production of boron; chemical analysis of silicates; in heat resistant glassware; fire-resistant additive for paints.

"Boriresin." ³⁵⁴ Trademark.

Properties: An amber-colored, water-soluble, viscous synthetic resin, miscible with polyhydric alcohols, and on drying forms a hard, transparent film.

Use: For fireproofing fabrics.

borneol (bornyl alcohol; Malayan camphor)

Properties: White, translucent lumps; peculiar camphor-like odor; burning taste; soluble in alcohol and ether; very slightly soluble in water.

Constants: Sp. gr. 1.011; m.p. 203°C minimum; b.p. 212°C.

Derivation: (a) By reduction of ordinary camphor with nascent hydrogen. (b) From the wood of *Dryobalanops camphora*, a tree

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

found in Sumatra and Borneo—deposited in the trunks in solid crystalline mass.

(c) A constituent of certain volatile oils including citronella, thyme, African ginger, Canada snake root, nutmeg.

Grades: Technical.

Containers: 1-, 5-lb tins; 5-, 15-lb boxes; cans.

Uses: Medicine; manufacture of synthetic camphor; perfumery; chemical esters.

Caution: Combustible.

Shipping regulations: None.*

bornite (purple copper ore) Cu_5FeS_4 . A natural sulfide of copper and iron, usually found with other copper minerals in igneous rocks and vein deposits.

Properties: Color brownish bronze, tarnishing to variegated purple and blue to black; luster metallic; streak grayish black.

Constants: Sp. gr. 5.07; hardness 3.

Occurrence: Arizona; Montana, Virginia, Utah; Canada; Chile; Peru; Bolivia.

Use: An ore of copper.

bornyl acetate $\text{C}_{10}\text{H}_{17}\text{OOCCH}_3$.

Properties: Colorless liquid at warm room temperature; solidifies to colorless crystals at cooler temperature; piney-camphoraceous odor. Soluble in 3 volumes of 70% alcohol; miscible with 95% alcohol and with ether.

Constants: Sp. gr. 0.980-0.984; refractive index 1.463-1.465; m. p. 29°C .

Derivation: (a) Interaction of borneol and acetic anhydride in the presence of formic acid. (b) Intermediate in making synthetic camphor.

Grades: Technical.

Uses: Perfumery; nitrocellulose solvent and plasticizer.

bornyl alcohol. See borneol.

bornyl chloride (pinene hydrochloride; turpentine camphor; terpene hydrochloride) $\text{C}_{10}\text{H}_{16}\cdot\text{HCl}$.

Properties: White, crystalline mass, resembling camphor; turpentine and camphor odor; m. p. $131-132^\circ\text{C}$; b. p. 208°C ; soluble in alcohol; insoluble in water.

Derivation: By treating pinene with dry hydrochloric acid in the cold.

Grades: Technical.

Containers: Boxes.

Use: Medicine.

Shipping regulations: None.*

bornyl formate $\text{C}_{10}\text{H}_{17}\text{OOCH}$.

Properties: Colorless liquid, having a piney odor. Sp. gr. 1.007-1.009.

Grades: Technical.

Uses: In the perfuming of soaps, disinfectants, and sanitary products.

bornyl isovalerate $\text{C}_{10}\text{H}_{17}\text{OOC}_3\text{H}_7$. A constituent of valerian oil.

Properties: Limpid fluid, aromatic, valerian-like odor. Soluble in alcohol and ether; insoluble in water.

Constants: Sp. gr. 0.951 at 20°C ; b. p. $255-260^\circ\text{C}$.

Use: Medicine; essential oil intermediate.

bornyl salicylate $\text{C}_{10}\text{H}_{17}\text{OCOC}_6\text{H}_4\text{OH}$.

Properties: Brown, oily liquid. Incompatible with alkalies and alkaline salts.

Insoluble in water; soluble in alcohol, ether, chloroform, and oils.

Use: Medicine.

Shipping regulations: None.*

boroethane. See diborane.

boron B. Element of atomic number 5, of group III in the periodic system. It is an essential plant nutrient.

Properties: Very soft, brown, amorphous powder; or as crystals; ignites in air. Soluble in concentrated nitric acid and sulfuric acid; insoluble in water, alcohol and ether.

Constants: Sp. gr. 2.45; m. p. 2300°C ; hardness of crystals 9.3 (Mohs).

Sources: Borax; kernite; colemanite; ulexite; pricite; boracite; sassolite.

Derivation: (a) Electrolysis of a fused bath of potassium chloride or potassium fluoride, potassium fluoborate, and boric oxide; (b) by heating boric oxide with powdered magnesium; (c) by reduction of boron halides with a gaseous dispersion of molten alkali metal.

Grades: Technical; 99% pure; high purity (electronic)

Uses: Catalytic agent; ceramics and heat resistant glassware (a glass in which boric oxide (B_2O_3) replaces the calcium oxide in ordinary lime soda glass); metallurgy (alloy steels, cementation of iron); thermometers and thermoregulators; controlling agent in uranium graphite piles (in the form of boron steel or boron carbide); scavenger to remove gaseous impurities from molten copper; component of delayed action fuses; semiconductors; abrasives (crystals).

Shipping regulations: None.*

boron alloys. These are usually alloys with iron or manganese, but may be with aluminum, titanium, vanadium, zirconium, manganese, silicon, calcium, or carbon or with two or more of these. Ferroboration usually contains 15-25% boron; manganese boron usually 60-65% manganese. These alloys are used as degasifying and deoxidizing agents, or as a means of increasing the hardenability of steel. Only a few thousandths of a per cent are needed for the latter purpose. The other elements are used for their own beneficial properties, and also to prevent oxidation of boron in the melt.

boronatrocaltite. See úlexite.

boron bromide. See boron tribromide.

boron carbide B_4C . Probably not a true compound, but instead a solution of varying amounts of carbon in a slightly distorted boron lattice.

Properties: Black hard crystals ranking next to diamond in hardness (9.3, Mohs); sp. gr. 2.6; m. p. 2350°C ; b. p. 3500°C . Soluble in fused alkali; insoluble in water.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

and acids. Has high capture cross-section for thermal neutrons.

Derivation: By heating boron oxide with carbon in an electric furnace.

Uses: In powder form as an abrasive and in molded form as an abrasion resister; also as control rods for nuclear reactors.

boron chloride. See boron trichloride.

boron fluoride monoethylamine (BF₃-MEA)
BF₃-C₂H₅NH₂.

Properties: White to pale tan flakes. Sp. gr. 1.38; m.p. 88-90°C. Soluble in furfuryl alcohol, polyglycol, acetone. Releases boron trifluoride above 110°C.

Use: Elevated temperature cure of epoxy resins

boron fuels. Fuels for air-breathing engines and rockets made up principally of boron hydrides or their compounds with carbon. See also rocket propellants.

boron hydride. A compound of boron and hydrogen. See diborane; pentaborane; decaborane.

boronia oil.

Properties: Dark green oil, having a violet-type odor.

Derivation: Derived by volatile solvent extraction of the flowers of the brown boronia of Western Australia (*Boronia megastigma* Nees).

Constituents: Beta-ionone, ethyl alcohol, ethyl formate.

Use: Perfumery, mainly in Australia

boron nitride BN

Properties: Crystals or powder; m. p. about 3000°C; an electrical nonconductor; resists corrosion at temperatures above 3000°F; somewhat soluble in water. Boron nitride is anisotropic and some properties vary according to method of preparation and crystal form. See borazon. The powder has a hardness of 2 on the Mohs' scale.

Derivation: By heating a mixture of boric acid and tricalcium phosphate or similar materials in an ammonia atmosphere in an electric furnace.

Uses: Refractory; furnace insulation; high temperature lubricant, as in glass molds; component of rectifying tubes; dielectric; chemical equipment parts; molten metal pump parts.

boron phosphide BP. A refractory-like material harder than silicon carbide and inert to corrosion. Oxidizes in air at about 800°C but is more stable in reducing atmospheres.

Derivation: Direct union of boron and phosphorus at about 1000°C in a reducing atmosphere

Use: Suggested for a transistor operable at high temperatures.

boronotungstic acid. See borotungstic acid.

boron oxide. See boric oxide.

boron phosphate (sometimes called boro-

phosphoric acid) BPO₄.

Properties: White, non-hygroscopic crystals; sp. gr. 1.873. Soluble in water; pH (1% solution) 2.0.

Containers: 400-lb barrels.

Use: Special glasses; ceramics; acid cleaner; especially promising as ceramic when fused with silica.

boron steel. See ferroboron.

boron tribromide (boron bromide) BBr₃.

Properties: Colorless, fuming liquid. Decomposed by alcohol and by water.

Constants: Sp. gr. 2.69 at 15°C; b. p. 90°C; m. p. -46°C

Grades: Technical.

Use: Catalyst in organic syntheses.

boron trichloride (boron chloride) BCl₃.

Properties: Colorless, fuming liquid.

Decomposed by alcohol and by water

Constants: Sp. gr. 1.35 at 15°C; b. p. 18°C (approximate); m. p. -107°C.

Grades: Technical (99%); C. P. (99.5%).

Containers: Up to 50-lb pressure cylinders; tank cars.

Uses: Catalyst in organic syntheses; source of many boron compounds

Shipping regulations: Corrosive liquid

White label *

boron trifluoride BF₃.

Properties: Colorless gas; 2.3 times as dense as air; m. p. -126.8°C; b. p. -101°C; soluble in cold water; hydrolyzes in hot water; decomposes in alcohol. Easily forms double compounds such as that with ether, known as boron trifluoride etherate, or BF₃-ether complex.

Derivation: From boron trichloride and anhydrous hydrogen fluoride or by combination of elements

Grades: Pure (99% min).

Containers: Steel cylinders.

Uses: Catalyst in organic synthesis; instruments for measuring neutron intensity

Shipping regulations: Nonflammable gas.

Green label. *

borophosphoric acid. See boron phosphate.

borosilicate glass. A silicate glass containing at least 5% boric oxide.

"Boro-Spray." ** Trademark for a crystalline product consisting chiefly of sodium pentaborate. Used for spray applications to tree fruit and truck crops where boron deficiency is indicated.

borotungstic acid (borowolframic acid; boronotungstic acid) B₂O₃(WO₃)₆·24H₂O

Properties: Yellowish liquid. Soluble in water, alcohol. Sp. gr. 3.00.

Derivation: By heating ammonium borotungstate with aqua regia.

Grades: Technical.

Containers: Glass bottles.

Use: Mineralogic assays.

Shipping regulations: None. *

borowolframic acid. See borotungstic acid.

bort. See diamond.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Bosch-Meiser process. A process for producing urea from ammonia and carbon dioxide in the presence of some moisture. Ammonium carbamate is formed first, and then converted to urea.

boson. Also called Bose particle, or Bose-Einstein particle. Consideration of symmetry properties of the wave-mechanical description of systems of particles allow the classification of the particles into two kinds. Bosons are particles with integral or zero spin, and their most important property is that the Pauli exclusion principle does not hold for bosons. The other class of particles are fermions (q. v.).

Botany Bay gum. See accroides gum.

bourbonal. See ethyl vanillin.

bournonite (cogwheel ore) PbCuSbS_3 . A natural sulfantimonide of lead and copper. Color steel gray to black; metallic luster. Often in wheel-shaped crystals. Sp. gr. 5.8; hardness 2.5-3. Found in metallic veins.

Occurrence: Europe; Mexico, Chile, Bolivia.

Use: Minor ore of copper, lead, and antimony.

boxberry. See gaultheria

Boyle point. The temperature at which a gas obeys the perfect gas laws of Boyle and Avogadro.

Boyle's Law. The volume of a sample of gas varies inversely with the pressure, if the temperature remains constant. The relation is strictly true only for an imaginary perfect or ideal gas, but the law is satisfactory for practical calculations except when pressures are high, or temperatures are approaching the liquefaction point. Van der Waal's equation is a refinement to take care of the inherent inaccuracy of Boyle's Law.

b. p. Abbreviation for boiling point.

BPL. 1. Abbreviation for bone phosphate of lime. See bone phosphate.

2. Abbreviation for beta-propiolactone.

"BP Pyro No. 5." ¹⁷² Trade name for a grade of sodium acid pyrophosphate possessing a controlled slow rate of reaction.

Derivation: Dehydration of NaH_2PO_4 .

Containers: Bags.

Uses: Leavening agent for use in the manufacture of canned biscuit doughs; for compounding bakers' baking powder

"BPR." ⁵⁵ Trademark for insecticidal material containing varying proportions of pyrethrin, piperonyl butoxide and rotenone; in liquid or dust base

Br. Symbol for bromine.

BRA. Abbreviation for beta-resorcylic acid.

"Bradosol." ³⁰⁵ Trademark for domiphen bromide, dodecylmethyl (2-phenoxyethyl) ammonium bromide. Used in medicine.

bran. The coarse, husky outer-coat of wheat,

rye, and other cereals, which, after grinding, is separated from the flour by sifting or bolting

brandy mint. See peppermint.

bran oil. A name sometimes used for furfural.

brasilin (brazilin; pernambuco extract; hypernic extract; Brazilwood extract) $\text{C}_{16}\text{H}_{14}\text{O}_5$. The crystalline colorizing principle of pernambuco and sappan wood.

Properties: White or pale yellow rhombic needles from alcohol; turns orange in air or light. Soluble in water, alcohol, ether and in alkali hydroxide solution with a carmine-red color. Decomposes above 130°C

Uses: Dyeing red and purple shades of wood, ink, textiles, etc. Recommended also as acid-base indicator, turning yellow in acid and carmine-red in alkali.

brass and bronze. Copper base alloys.

Brass is mainly a copper-zinc alloy and bronze mainly copper-tin. However, brass may contain some tin, and bronze, some zinc. Other metals, commonly lead, are added to some varieties to give desired properties. A large variety of compositions is produced for various uses in which such characteristics as corrosion resistance, hardness, tensile strength, color, and machinability are of different importance. In commercial practice the terms brass and bronze may be used without much regard for their original meanings. As a class these alloys are inferior to iron base alloys (steels) in hardness and strength, but superior in workability and resistance to corrosion. Some examples of brasses and bronzes with approximate compositions are:

coinage bronze, 95% Cu, 4% Sn, 1% Zn;
bronze, gun metal, 90% Cu, 10% Sn;
phosphor bronze, 79.7% Cu, 10% Sn, 9.5% Sb, 0.8% P;
commercial bronze, 90% Cu, 10% Zn;
cartridge brass, 67-70% Cu, 30-33% Zn, Pb, Fe;
high brass, 65% Cu, 35% Zn;
muntz metal, 60% Cu, 40% Zn;
red brass, 85% Cu, 15% Zn.

Available forms: Sheet, rod, wire, tubing, etc.

See also: admiralty metal; aluminum bronze; phosphor bronze 30; phosphor bronze 47; phosphor bronze 209; red brass.

brassidic acid $\text{C}_{22}\text{H}_{42}\text{O}_2$ or $\text{CH}_3(\text{CH}_2)_7\text{CHCH}(\text{CH}_2)_{11}\text{COOH}$. The trans isomer of erucic acid

Properties: White crystals. M. p. $61-62^\circ\text{C}$; b. p. 282°C (30 mm); sp. gr. 0.859; refractive index ($n_{57/D}$) 1.448. Insoluble in water; slightly soluble in alcohol; soluble in ether.

Derivation: By treating erucic acid with nitrous acid (catalyst).

"Brasslyfe." ³⁰² Trademark for corrosion-preventive compositions used to form a metal protective coating.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Braze Bonding Agent." ⁶⁹ Trademark for proprietary product, halogenated rubber derivatives and selected modifiers in solvent

Properties: Deep red liquid; sp gr. 1.01 ± .02; total solids 20-22%; flash point 93°F.

Uses: Cement to bond natural rubber, SBR or neoprene to steel.

"Braze Cover Cements." ⁶⁹ Trademark for a series of proprietary products, specially compounded elastomers in appropriate solvents.

"For Natural Rubber and SBR", black liquid; solvent aliphatic; sp. gr. 0.835 ± .02; flash point 39°F

"For Neoprene", black liquid, solvent system aromatic-aliphatic; sp gr 0.86 ± .02; solids 16.5-18%; flash point 39°F.

"For Butyl", black liquid; solvent aliphatic; sp. gr 0.835 ± .02; solids 15-17%; flash point 46°F

Uses: Applied over "Braze Bonding Agent" to improve bond strength and uniformity of adhesion after vulcanization.

Shipping regulations: Red label *

brazillin. See brasilin

brazilite. See baddeleyite.

Brazil-nut oil. See castanha oil

Brazil wax. See carnauba wax.

Brazilwood extract. See brasilin

"BRC" Hydrocarbons. ¹⁷⁵ Trademark for solid coal-tar hydrocarbons Available in the following grades:

No. 20 Softening point 175-185°F; sp gr 1.25-1.32 (25/25°C); carbon disulfide insolubles 15-25%.

No. 21 Softening point 205-220°F; sp gr. 1.26-1.35 (25/25°C); carbon disulfide insolubles 15-25%.

No. 22 Softening point 205-220°F; sp gr 1.26-1.35 (25/25°C); carbon disulfide insolubles 25-35%

No. 30 Softening point 280-305°F; sp gr. 1.28-1.36 (25/25°C); carbon disulfide insolubles 25-40%.

Uses: Processing aid for all elastomers and rubber reclaiming; used in mechanicals where hardness and stiffness are requisite.

breeder. Name generally applied to any nuclear chain reactor which is capable of producing more fissionable material than it consumes in its operation. By the use of the breeding process, the stockpile of fissionable materials can be steadily increased since a complete conversion of all fertile material such as ordinary uranium 238 or thorium 232 into fissionable material can be accomplished. The first experimental breeder reactor was put into operation in 1951. If breeding succeeds, twenty pounds of natural uranium will yield 51,800,000 kilowatt hours of electricity—enough to light 25,000 average American homes for a year. Natural uranium contains only about 0.7% of directly fissionable uranium 233 and 235 so that without breed-

the twenty pounds of natural uranium can provide a correspondingly smaller fraction of the above power.

"Brellin." ³⁴² Trademark for gibberellic acids as plant growth-stimulating compositions.

Bremen blue (blue verditer; copper blue).

Greenish-blue pigment consisting chiefly of copper hydroxide together with some carbonate and oxychloride. These blues are opaque in water, become slightly transparent in oil and lose body. They are soluble in acids and ammonia and are darkened by hydrogen sulfide or sulfur fumes.

bremsstrahlung. The continuous x-ray spectrum. When a charged particle is accelerated it must radiate energy as electromagnetic radiation. Therefore if beta rays are stopped in matter, or when the electron beam of an x-ray tube impinges on the target, part of the energy appears as a continuous spectrum of electromagnetic radiation, the bremsstrahlung, superimposed on the x-ray line spectrum

"Brentamine." ²⁰⁶ Brand name of proprietary line of amino bases and stabilized, diazotized amino bases used in the production of azoic colors on the fiber by dyeing and printing methods.

"Brenthol." ²⁰⁶ Brand name of proprietary line of phenolic and naphtholic bodies, for use in the production of azoic colors on the fiber by dyeing and printing methods.

"Brentogen." ²⁰⁶ Brand name for a proprietary line of dyestuff powders based on mixtures of stabilized diazo compounds and naphthol arylamides; used in textile printing mainly for direct and certain resist styles giving fast bright shades of high tinctorial value. Assistants used in development of these powders are also given this brand name

"Brentosyn." ²⁰⁶ Brand name of a proprietary line of azoic coupling components for "Terylene" and other polyester fibers.

"Bretol." ⁴³⁰ Trade name for cetyl dimethyl ethyl ammonium bromide, a quaternary ammonium compound used in dental preparations and soldering fluxes

breunnerite. See magnesite.

"Brevital." ¹⁰⁰ Trademark for methohexital (q. v.)

Brewster process. A method for the extraction of acetic acid from the acid distillate of the destructive distillation of wood. Isopropyl ether is used as the solvent for the acetic acid.

"BRH" 2 Rubber Softener. ¹⁷⁵ Trademark for a proprietary asphaltic product

Properties: Viscous fluid; sp. gr. 1.0 (25/25°C); flash point, 400°F; max. evaporation loss of 1% in 5 hours on heating 50 g at 163°C.

Uses: In compounding friction, adhesive, and electrical tapes because of excellent aging and tack characteristics; as a reclaiming

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

oil for natural rubber scrap, especially in pan process reclaiming.

brick, alumina (high alumina brick). Refractory bricks of higher alumina content than ordinary fire-clay brick. They are made from several alumina materials, such as diaspore, bauxite, kaolin, etc.

See also refractories.

Typical properties of bauxite brick: Refractoriness, cone 36-39; ret. U-load, 50 lbs/sq.in., cone 14; true sp.gr., 3.1-3.4; apparent sp.gr., 1.8-2.1; porosity 30-40%; coefficient thermal expansion (0° - 1000° C), 65×10^{-7} .

Analysis of one bauxite brick: silica, 8.82%; iron oxides (Fe_2O_3), 6.30%; alumina, 78.01%; lime, 0.98%; magnesia, 4.41%; titania, 1.16%.

Uses: The use of high alumina brick has become increasingly general in the last few years under certain types of operating conditions where the service is severe. A large use of brick of this type is in the hot zone portion of rotary lime, cement or dolomite kilns as well as in the firing zone of shaft lime kilns. High alumina brick are also used in certain portions of large boiler settings and in ceramic kilns of both the continuous and the periodic types; in brief, they find application under certain types of conditions where the service is very severe.

brick, bauxite. See brick, alumina.

brick, chemical. See chemical stoneware.

brick, chrome. Refractory bricks made from chrome ores, largely the spinel chromite. They contain about 35-44% Cr_2O_3 . See also refractories.

Typical properties: Refractoriness, cone 40-42; ret. U-load, 50 lbs/sq.in., cone 15; true sp.gr., 3.1-3.6; apparent sp.gr., 2.3-2.6; porosity 20-30%; coefficient thermal expansion (0° - 1000° C) 90×10^{-7} .

Uses: Chrome brick are used to some extent in place of magnesia brick because they are somewhat less expensive. Chrome brick resist the action of both acidic and basic oxides. They are also used as a dividing material to separate refractories of opposite chemical character; for example, in the open-hearth furnace, frequently a course or two of chrome brick is used to separate the silica roof from the magnesia sidewalls, thereby preventing chemical interaction.

brick clay. Usually a relatively impure clay that contains considerable fluxing impurities and burns to a red brick. These clays must mold readily, burn hard at as low a temperature as possible and give minimum loss from warping or cracking during burning. Better grade clays (lower impurities, particularly lower amounts of soluble salts, more uniform color, greater hardness, less porosity, and uniform color on burning) are used for pressed brick or face brick. Two common varieties of brick clay found west of the Mississippi River

are adobe which is a calcareous silty clay used for sun dried bricks in the Southwest, and loess, a similar material found throughout the Mississippi Valley.

brick, fire-. The term "fire-brick" is sometimes used to refer to any refractory brick. Its use should more properly be limited to those brick manufactured essentially from refractory fire-clays, and containing up to about 48-50% alumina.

Analysis of one low-grade fire-clay brick:

Silica 61-72%, iron oxide (Fe_2O_3) 6.43%, alumina 28.7%, lime 0.46%, magnesia 1.04%, soda 0.05%, potash 0.05%, titania 1.60%.

Analysis of one high-grade fire-clay brick:

Silica 53.52%, iron oxide (Fe_2O_3) 2.00%, alumina 41.00%, lime 0.30%, magnesia 0.30%, soda 0.90%, potash 0.20%, titania 1.60%.

Typical properties: Refractoriness, cone 30-35; ret. U-load 50 lbs/sq in, cone 14-20; true sp.gr. 2.5-2.6; apparent sp.gr. 1.9-2.1; porosity (per cent) 20-30; coefficient thermal expansion (0° - 1000° C) 40×10^{-7} .

See also refractories.

Uses: Restricting the term to fire-clay brick:

Entire linings of iron blast furnaces; linings and checkers of blast-furnace stoves; checker work in other operations as in open-hearth furnaces, glass tanks, etc. Large quantities are used in connection with power plants and industrial boiler stations, cupolas, malleable furnaces, heating furnaces of various kinds, gas producers, water gas sets. A large portion of the lining of rotary cement and lime kilns as well as cement coolers is also built of fire-brick.

brick, high alumina. See brick, alumina.

brick, magnesia (magnesite brick). Refractory bricks consisting essentially of MgO (periclase) with about 15% of other oxides. See also refractories.

Typical properties: Refractoriness, cone 30-40; ret. U-load 50 lbs/sq in, cone 16; true sp.gr. 3.1-3.5; apparent sp.gr. 2.4-2.7; porosity (per cent) 20-30; coefficient thermal expansion (0° - 1000° C) 100×10^{-7} .

Uses: Magnesia brick are used wherever the corrosion of basic slags is severe, as for almost the whole of open-hearth steel furnaces, of copper reverberatory furnaces, in soaking pits and in the basic electric steel furnace. Certain factors tend to reduce their application, including higher cost, comparatively lower mechanical strength at elevated temperatures and greater thermal expansion.

brick, magnesite. See brick, magnesia.

"Brickmaster" Periclase. ⁴²⁶ Trademark for magnesium oxide, periclase.

Derivation: Synthetic.

Grades: Kiln run.

Containers: Bags and bulk.

Uses: In the manufacture of refractories.

brick, silica. Refractory bricks consisting essentially of lime-bonded quartzite (q. v.).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

The best American brands contain approximately 94-96% SiO_2 , with about 2% CaO . See also refractories.

Typical properties: Refractoriness, cone 32-35; ret. U-load 50 lbs/sq in., cone 18-30; true sp. gr., 2.3-2.5; apparent sp. gr., 1.7-1.9; porosity, 20-30%; coefficient thermal expansion:

Practical users of silica brick give their expansion as being $3/16$ to $1/4$ in. (1.6-2.1%) per foot. Most of this occurs below 600°C . A sudden acceleration in expansion takes place at about 575°C .

Analysis of one brick: Silica 96.42%; iron oxides (Fe_2O_3) 0.50%; alumina, 0.75%; lime, 2.01%; magnesia, 0.08%; titania, 0.06%.

Uses: Because of their excellent mechanical strength at high temperature, their positive expansion at high heat and the fact that they do not begin to deform except at temperatures within a very few degrees of their actual fusion point, silica brick are extensively used for arch work whenever operation is steady. Thus silica brick are used in the open-hearth roof, in the caps of glass tanks and in the crowns of copper reverberatory furnaces. Silica brick are also used in the by-product coke oven because of their higher thermal conductivity as compared with fire-clay brick and their resistance to abrasion; the same factors make them suited for coal-gas retorts. The roofs of electric steel furnaces are usually of silica material. Silica brick, however, are attacked by basic slags and dusts.

brick, zirconia. Refractory bricks containing a high percentage of zirconium oxide.

Typical properties: Refractoriness, cone 39-42; ret. U-load 50 lbs/sq in., cone 19; true sp. gr., 4.8-5.9; apparent sp. gr., 4.0-4.6; porosity, 15-30%; coefficient thermal expansion (0° - 1000°C), 8.4×10^{-7} .

Use: In metallurgical furnaces to resist basic slag.

bright stock. Lubricating oil of high viscosity, obtained from residues of petroleum distillation by dewaxing and treatment with fuller's earth or similar material. Sometimes also applied to viscous petroleum distillates.

Use: For blending with neutral oils in preparing automotive engine lubricating oils.

"Brij." ⁸⁹ Trademark for each of a series of emulsifiers and wetting agents developed for use in emulsions of high alkalinity or acidity. They are polyoxyethylene ethers of higher aliphatic alcohols. Soluble in water and lower alcohols. Insoluble in coal tar hydrocarbons.

Brilliant Croceine

$\text{C}_6\text{H}_5\text{N}_2\text{C}_6\text{H}_4\text{N}_2\text{C}_{10}\text{H}_4\text{OH}(\text{SO}_3\text{Na})_2$.

Properties: Light brown powder; cherry red solution in water.

Use: To dye wool and silk red from acid solution, and cotton and paper with aid of a mordant; also used for red lakes.

"Brilliant Toning Red." ¹⁴¹ Trade name for Permanent Red 2B azo pigments derived from beta-hydroxynaphthoic acid.

Properties: Good light resistance; good heat resistance; non-bleeding in water and organic vehicles and solvents.

Grades: Light yellow shade red and medium shade red. Resinated and nonresinated.

Uses: Printing inks; paints; enamels; lacquers; rubber; plastics; wallpaper; textiles; floor coverings; crayons; paper coatings.

brimstone. See sulfur

brimstone acid. A surfuric acid (q.v.) prepared from sulfur.

briquettes. Bricks and blocks of finely divided material molded into shape by pressure, frequently with a specially chosen binder; e.g., coal dust is mixed with pitch for fuel, ore dust with lime for smelting.

brisance index. A measure of the shattering powder of an explosive. The brisance index is the ratio of the weight of graded sand which is shattered when a charge of the explosive is packed in the sand in a bomb and detonated in a standard manner to the weight of sand shattered by TNT, when detonated in the same manner.

britannia metal. See pewter and white metal.

"Britecast O." ⁹⁹ Trademark for an attapulgitic-based binder and thickener for oil-bound foundry sands. Good permeability and excellent green strength.

Properties: Tamped bulk density, 45.4 lbs/cu. ft.; sp. gr. 1.62 g./cc.; free moisture, 14%.

Containers: 50-lb multiwall bags.

British Anti-Lewisite. See 2,3-dimercaptopropanol

British gum. See dextrin

British thermal unit. See Btu.

"Britone Reds." ¹⁴¹ Trade name for resinated type lithol reds. See "Graphic Red."

brittle silver ore. See stephanite.

Brix degree. A measure of the density or concentration of sugar solutions. There are two different Brix scales: (1) Degrees Brix equals percent by weight of sucrose in the solution and is related empirically to the specific gravity. (2) Degrees Brix = $400 - [400/(\text{sp. gr. at } 15.6^\circ\text{C})]$.

brochantite $\text{Cu}_4\text{SO}_4(\text{OH})_6$. Native basic copper sulfate. Found in the oxidized zones of copper deposits.

Properties: Color green; luster vitreous; sp. gr. 3.8; hardness 3.5-4.

Occurrence: Rumania; U. S. S. R.; Bolivia; Mexico; Chile; Arizona.

Use: Minor ore of copper.

Broenner's acid. See 2-naphthylamine-6-sulfonic acid.

bröggerite. A thorium-bearing variety of uraninite (q.v.).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Brom 55." ²²⁵ Trademark for dibromo-dimethylhydantoin (q. v.).

bromacetone. See bromoacetone.

bromal. See tribromoacetaldehyde.

bromargyrite. See bromyrite.

"Bromat." ⁴³⁰ Trade name for cetyl trimethyl ammonium bromide, a quaternary ammonium compound with high germicidal activity.

bromated camphor. See camphor bromate

bromauric acid. See bromoauric acid

bromcamphor. See camphor bromate

bromcresol green. Tetrabromophenol-metacresolsulfonphthalein, an acid base indicator, showing color change from yellow to blue over the range pH 3.8-5.4. Yellow crystals; m. p. 218°C; slightly soluble in water, soluble in alcohol

bromcresol purple. Dibromo-ortho-cresol-sulfonphthalein, an acid base indicator, changes from yellow to purple between pH 5.2-6.8. Yellow crystals; m. p. 241°C; insoluble in water, soluble in alcohol.

bromelain. See bromelin

bromelia. See beta-naphthyl ethyl ether.

bromelin (bromelain). A milk-clotting, protein-digesting enzyme. It is precipitated from pineapple juice with alcohol or ammonium sulfate.

Use: Biochemical research.

bromeosin. See eosin

bromic acid HBrO₃.

Properties: Colorless or slightly yellow liquid; turns yellow on exposure; unstable except in very dilute solution; soluble in water.

Constants: Sp. gr. 3.1883; b. p. decomposes at 100°C

Derivation: Sulfuric acid is added to a solution of barium bromate and the product recovered by subsequent distillation and absorption in water.

Uses: Dyes; intermediates; pharmaceuticals

Shipping regulations: Corrosive liquid.

White label.*

brominated camphor. See camphor bromate

brominated lime. A bleaching agent prepared by treating lime with bromine.

brominated poppyseed oil. Contains 33% bromine. Used in medicine.

bromine Br. Element of atomic number 35, of group VII of the periodic system; one of the halogens.

Properties: Very dark, reddish-brown liquid; irritating fumes; burns skin. Soluble in alcohol, ether, chloroform, carbon disulfide, potassium bromide; slightly soluble in water.

Constants: B. p. 58.8°C; m. p. -7.3°C; sp. gr. (20/4°C) 3.1193; vapor density (air=1) 3.5; wt/gal (20°C) 25.7 lbs.

Derivation: From sea water and natural brines by oxidation of bromide salts with chlorine.

Method of purification: Distillation.

Grades: Technical; C. P.; 99.8%.

Containers: 1-, 6.5-lb bottles; 10-gal drums; tank cars; tank trucks.

Uses: Principally, in manufacture of ethylene dibromide (component of antiknock mixtures); also, water treatment; intermediate for fumigants (methyl bromide), fire extinguisher fluid, bromide salts and organics (used in pharmaceuticals, dyes, photography, catalysis, extraction of gold); military poison gas; shrinkproofing wool.

Fire hazard: May produce fire on contact with organic matter such as sawdust, excelsior, etc. These fumes or vapors are poisonous

Danger: Causes severe burns; vapor hazardous. MCA warning label

Shipping regulations: Corrosive liquid. White label.*

bromine-chloride (chlorine-bromide) BrCl. Properties: Reddish-yellow, mobile liquid.

Volatile! Vapors are irritant to the eyes.

Decomposes with evolution of chlorine at 10°C. Caution! Keep well stoppered!

Soluble in carbon disulfide, ether, water

Grades: Technical.

Use: Medicine

bromine cyanide. See cyanogen bromide.

bromine iodide. See iodine monobromide.

bromine pentafluoride BrF₅.

Properties: A colorless liquid; sp. gr. 2.466 (25°C); m. p. 8.8°C; b. p. 40.5°C; vapor pressure 70°F 7 psia; decomposes in water.

Grade: 98% min.

Containers: Cylinders.

Use: Synthesis; oxidizer in liquid rocket propellants

Shipping regulations: Corrosive liquid.

White label.*

bromine trifluoride BrF₃.

Properties: Colorless to yellow liquid; m. p. 9°C; b. p. 135°C; vapor pressure 70°F 0.15 psia; decomposed violently by water.

Grade: 98% min

Containers: Cylinders.

Use: Fluorinating agent

Shipping regulations: Corrosive liquid.

White label.*

bromine water. A solution of bromine in water.

"Brominol." ³ Trademark for brominated olive oil.

Properties: Clear, reddish-brown, oily liquid with no taste or odor. Sp. gr. between 1.235 and 1.245 at 25°C. Insoluble in water; soluble in organic solvents.

Uses: Medicine; weighting agent for citrus oils in the production of citrus emulsions for use in soft drinks.

bromisovalum. See bromoisovaleryl urea.

N-bromoacetamide (NBA) CH₃CONHBr.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: White powder with bromine odor. M. p. 105-108°C. Contains about 57% active bromine; decomposes appreciably at temperatures above 80°F

Grades: Technical.

Containers: Glass bottles; polyethylene-lined fiber drums.

Warning! Poison.

Uses: Brominating and oxidizing agent in organic synthesis

Shipping regulations: Poison, Class B. Poison label. *

bromoacetic acid CH_2BrCOOH .

Properties: Colorless, deliquescent crystals. Keep from air and moisture. Soluble in water, alcohol and ether

Constants: M. p. 51°C; b. p. 208°C; sp. gr. 1.93.

Derivation: By heating acetic acid and bromine.

Method of purification: Crystallization from alcohol

Grades: Technical.

Containers: Barrels; tins.

Use: Organic synthesis.

Shipping regulations: None *

bromoacetone (bromacetone) $\text{CH}_2\text{BrCOCH}_3$.

Properties: Colorless liquid when pure, rapidly becomes violet even in absence of air. Powerful irritant and lachrymator. Soluble in acetone, alcohol, benzene, and ether; slightly soluble in water.

Constants: Sp. gr. 1.631 at 0°C; b. p. 136°C (partial decomposition); m. p. -54°C; vapor density 4.75; vapor tension 9 mm (20°C)

Derivation: By treating aqueous acetone with bromine and sodium chlorate at 30-40°C.

Grades: Technical.

Containers: Lead-lined containers.

Uses: Organic synthesis; tear gas

Shipping regulations: Poison, class A.

Poison gas label. * Not accepted by express.

bromoacetone cyanohydrin.

Properties: Colorless liquid. Soluble in alcohol, ether, and water.

Constants: Sp. gr. 1.584 at 13°C; b. p. 94.5°C (5 mm Hg)

Derivation: Interaction of bromoacetone and hydrocyanic acid at (approximate) 0°C.

Grades: Technical.

Use: Organic synthesis.

5-(2-bromoallyl)-5-sec-butylbarbituric acid.

See butallylonal.

bromoallylene. See allyl bromide.

bromauric acid (bromauric acid; gold tri-bromide, acid) $\text{HAuBr}_3 \cdot 5\text{H}_2\text{O}$.

Properties: Dark, red-brown needle crystals or granular masses; odorless; metallic and acid taste. Stable in air if pure but deliquescent if chloride is present. Soluble in water and alcohol.

Constants: M. p. 27°C

Derivation: By dissolving auric bromide in hydrobromic acid, concentrating and

crystallizing.

bromobenzene (phenyl bromide) $\text{C}_6\text{H}_5\text{Br}$.

Properties: Heavy, mobile, colorless liquid. Pleasant, characteristic odor

Constants: Sp. gr. 1.499 (15°C); wt/gal

12.51 lbs; b. p. 156.6°C, 312.9°F;

freezing point -30.5°C, -22.9°F; flash

point 65°C; refractive index 1.5625.

Miscible with most organic solvents; insoluble in water

Derivation: By bromination of benzene in presence of iron.

Method of purification: Washing with caustic soda, followed by steam distillation

Grades: Technical; pure.

Containers: 100-, 600-, 1200-lb drums.

Uses: Solvent; motor fuels; top-cylinder compounds; crystallizing solvent; organic synthesis

Shipping regulations: None *

para-bromobenzoic acid $\text{C}_6\text{H}_4\text{BrCOOH}$

Properties: Colorless or reddish crystals.

Soluble in alcohol and ether; very slightly soluble in water

Constants: M. p. 254°C

Derivation: From para-bromotoluene by oxidation

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden kegs.

Use: Organic synthesis.

Shipping regulations: None. *

ortho-bromobenzyl cyanide (ortho-bromo-phenyl-acetonitrile; 2-bromo-7-cyanotoluene) $\text{BrC}_6\text{H}_4\text{CH}_2\text{CN}$.

Properties: Colorless liquid; sp. gr. 1.519; m. p. 25.5°C; b. p. 242°C (decomposes).

Lachrymator! Poisonous!

Shipping regulations: Poison, class C. Tear gas label. *

1-bromobutane. See n-butyl bromide

2-bromobutane. See sec-butyl bromide

alpha-bromobutyric acid $\text{CH}_3\text{CH}_2\text{CHBrCOOH}$

Properties: Clear, colorless, oily liquid.

Soluble in alcohol and ether; sparingly soluble in water.

Constants: Sp. gr. 1.54; b. p. 181° at 250 mm, 214-217°C with decomposition; m. p. -4°C

Derivation: By heating bromine and butyric acid.

Method of purification: Distillation.

Grades: Technical

Containers: Iron drums.

Use: Organic synthesis

Shipping regulations: None. *

bromocamphor. See camphor bromate.

bromocarnallite. An artificial carnallite (q. v.) in which chlorine is replaced by bromine.

bromochlorodimethylhydantoin.

Properties: Free-flowing white powder; faint halogen odor; m. p. 163-164°C; soluble in benzene, methylene dichloride, chloroform. Active bromine, 33% min.; active chlorine, 14% min.

*See "I. C. C. Shipping Regulations," page xiii. *

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

- Grade: Commercial
Containers: 200-lb fiber drums
Uses: Germicide and fungicide in treatment of water; disinfectant; halogenating agent; catalyst of ionic type; selective oxidant
- sym-bromochloroethane** (ethylene chlorobromide) $\text{CH}_2\text{BrCH}_2\text{Cl}$
Properties: Colorless volatile liquid. Chloroform-like odor; soluble in alcohol and ether; insoluble in water. Sp. gr. 1.70; b. p. 107-108°C; wt/gal 14.9 lbs (0°C); f. p. -16.6°C.
Derivation: By action of bromine and chlorine on ethylene gas.
Method of purification: Distillation.
Grades: Technical
Containers: 50 gal iron drums, 750-lb each.
Use: Solvent for general purposes and for cellulose esters and ethers; organic synthesis.
- bromochloromethane** (methylene chlorobromide) BrCHCl
Properties: Clear, colorless, volatile liquid with chloroform-like odor; sp. gr. 1.93 (25°C); b. p. 67°C; m. p. -86.5°C, refractive index (n 25/D) 1.48; nonflammable. Soluble in organic solvents; insoluble in water.
Containers: Drums, tankcars.
Uses: In fire extinguishers; organic synthesis.
Caution: Vapors and decomposition products are hazardous, particularly in unventilated or confined spaces.
Shipping regulations: None.*
- bromochlorophosgene** COBrCl
Properties: Liquid; sp. gr. 1.82 (15°C); b. p. 25°C
Derivation: Interaction of phosgene with either aluminum or boron bromides.
- 1-bromo-3-chloropropane** (trimethylene chlorobromide) $\text{BrCH}_2\text{CH}_2\text{CH}_2\text{Cl}$
Properties: Colorless liquid. Freezing point below -50°C; b. p. 143-145°C (760 mm), sp. gr. 1.594 (25/25°C); lbs/gal 13.27 (25°C) refractive index 1.484 (n 25/D); flash point none. Insoluble in water. Soluble in methanol and ether.
Uses: Organic synthesis; pharmaceuticals.
- 2-bromo-2-chloro-1,1,1-trifluoroethane.**
See halothane.
- 2-bromo-7-cyano-toluene.** See bromobenzyl cyanide.
- bromocyclopentane.** See cyclopentyl bromide.
- bromodiethylacetylurea** (carbromal) $\text{C}(\text{C}_2\text{H}_5)_2\text{BrCONHCONH}_2$
Properties: White, crystalline powder; odorless; tasteless. Soluble in chloroform, ether, alcohol, concentrated mineral acids and alkali hydroxide solutions; almost insoluble in cold water; slightly soluble in hot water. M. p. 116-117°C.
Derivation: Interaction between bromodiethylacetyl bromide and urea.
Grade: N. F. XI (as carbromal).
Containers: Drums.
- Use: Medicine.
Shipping regulations: None.*
- 3-bromo-5,5-dimethylhydantoin**
 $\text{HNCONBrCO}(\text{CH}_3)_2$
Properties: Solid
Containers: Glass bottles, fiber drums.
- 1-bromododecane.** See lauryl bromide.
- bromoethane.** See ethyl bromide.
- 2-bromoethylamine hydrobromide**
 $\text{BrCH}_2\text{CH}_2\text{NH}_2 \cdot \text{HBr}$
Uses: Intermediate; suggested as a soldering flux.
- bromoethyl chlorosulfonate**
 $\text{BrCH}_2\text{CH}_2\text{OSO}_2\text{Cl}$
Properties: Colorless. Caution: Very irritant: B. p. 100-105°C (18 mm)
Derivation: Interaction of sulfuryl chloride and glycol bromohydrin.
Grades: Technical
- para-bromofluorobenzene** $\text{C}_6\text{H}_4\text{BrF}$
Properties: Colorless liquid; b. p. 151-152°C; freezing point -17.4°C, sp. gr. (15°C) 1.593; refractive index (n 25/D) 1.5245; insoluble in water
Uses: Intermediate, production of para-fluorophenol
- bromoform** (r bromomethane; methenyl tribromide) CHBr_3
Properties: Colorless, heavy liquid, odor and taste similar to those of chloroform. Soluble in alcohol, ether, chloroform, benzene, solvent naphtha, fixed and volatile oils; slightly soluble in water.
Constants: Sp. gr. 2.8887; m. p. 9°C; b. p. 151.2°C; wt/gal 24 lbs; boiling range 150.3-151.2°C; freezing point 9°C; surface tension 41.53 dynes/cm (20°C); dielectric constant 4.5 (20°C); refractive index 1.6005.
Derivation: By heating acetone or ethyl alcohol with bromine and alkali hydroxide, and recovery by distillation. (Similar to acetone process for chloroform.)
Method of purification: Redistillation.
Grades: Technical, pure.
Containers: 1-, 5-lb bottles; bottles in 50-lb cases; 5-gal carboys
Uses: Intermediate in organic synthesis; geological assaying.
Shipping regulations: None.*
- "Bromofume."** ** Trademark for a soil fumigant composition, consisting of ethylene dibromide in volatile solvent.
Use: In the control of wireworms and root-knot nematodes.
- 1-bromohexane.** See n, hexyl bromide.
- 2-bromoisovaleryl urea** (bromisovalum) $(\text{CH}_3)_2\text{CHCHBrCONHCONH}_2$
Properties: White needles; slightly bitter in taste. Soluble in hot water, alcohol, and ether. M. p. 147-149°C.
Grades: N. F. XI (as bromoisovalum).
Use: Medicine.
Shipping regulations: None.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

bromol (2,4,6-tribromophenol) $C_6H_2Br_3OH$.

Properties: Soft, white needles; sweet taste; disagreeable penetrating bromine odor. Soluble in alcohol, chloroform, ether, and caustic alkaline solutions; almost insoluble in water.

Constants: M. p. $96^\circ C$, sublimes; sp. gr. 2.55 (20/ $20^\circ C$); b. p. $244^\circ C$.

Derivation: Action of bromine on phenol.

bromomethane. See methyl bromide.

bromomethyl ethyl ketone $BrCH_2COC_2H_5$.

Properties: Colorless to pale-yellowish liquid. Subject to the action of light.

Caution! Very irritant to the eyes. Soluble in alcohol, benzene, ether; insoluble in water.

Constants: Sp. gr. 1.43; b. p. $145-146^\circ C$ (decomposes).

Derivation: Interaction of sodium bromide and methyl ethyl ketone in the presence of sodium chlorate.

Grades: Technical.

Uses: Organic synthesis.

alpha-bromonaphthalene $C_{10}H_7Br$.

Properties: Clear, white liquid; sp. gr. 1.4870; m. p. $6.2^\circ C$, b. p. $279^\circ C$; refractive index 1.6601; soluble in alcohol, ether, and benzene; slightly soluble in water.

Derivation: By bromination of naphthalene.

Method of purification: Rectification.

Uses: Organic synthesis; microscopy; refractometry.

2-bromopentane $CH_3CH_2CH_2CHBrCH_3$.

Properties: A clear, colorless to yellow-colored liquid. It has a strong odor. Sp. gr. 1.1850 (25/ $25^\circ C$).

meta-bromophenol $HO(C_6H_4)Br$.

Properties: Crystals; m. p. $33^\circ C$; b. p. $235-236^\circ C$; insoluble in water; soluble in alcohol, ether, and alkalis.

ortho-bromophenol $HO(C_6H_4)Br$.

Properties: A yellow to red oily liquid; unpleasant odor; sp. gr. 1.5; b. p. $194^\circ C$; m. p. $6^\circ C$; insoluble in water; soluble in alcohol, ether, and chloroform.

para-bromophenol $HO(C_6H_4)Br$.

Properties: Crystals; sp. gr. 1.840 ($15^\circ C$), 1.5875 ($80^\circ C$); m. p. $64^\circ C$; b. p. $238^\circ C$, slightly soluble in water; soluble in alcohol, chloroform, ether, and glacial acetic acid. Used as a disinfectant.

bromophenol blue. Tetrabromophenolsulfonphthalein, an acid-base indicator, showing color change from yellow to purple over the range pH 3.0 to 4.6.

ortho-bromophenylacetonitrile. See bromobenzyl cyanide.

2-bromo-4-phenylphenol $C_6H_5C_6H_3BrOH$.

Properties: Light-colored solid with faint characteristic odor; sp. gr. (25/ $4^\circ C$)

1.536; m. p. $93.6-95.6^\circ C$; flash point $207^\circ C$; b. p. with decomposition (18 mm) $195-200^\circ C$. Soluble in alkalis, most organic solvents; insoluble in water.

Use: Germicide.

bromophosgene (carbonyl bromide; carbon oxybromide) $COBr_2$.

Properties: Heavy, colorless liquid. Strong odor. Hydrolyzed by water and is decomposed by light and heat. Caution! Very toxic.

Constants: Sp. gr. 2.5 (approx.) ($15^\circ C$); b. p. $64-65^\circ C$.

Derivation: By the action of sulfuric acid upon carbon tetrabromide.

Grades: Technical.

Uses: Military poison gas (toxic suffocant); making crystal violet-type coloring agents.

Shipping regulations: Poison, class A.

Poison gas label *

bromopicricin (nitrobromoform; tribromonitromethane) CBr_3NO_2 .

Properties: Prismatic crystals; decomposes with explosive violence if heated rapidly.

Caution! Very irritant! Soluble in alcohol, benzene, and ether; slightly soluble in water. Sp. gr. 2.79 at $18^\circ C$; b. p. $127^\circ C$ (118 mm Hg); m. p. $103^\circ C$.

Derivation: Action of picric acid on an aqueous solution of bromine and calcium oxide, followed by distillation under reduced pressure.

Grades: Technical.

Uses: Organic synthesis; military poison gas.

3-bromopropene. See allyl bromide.

alpha-bromopropionic acid (2-bromopropionic acid) $CH_3CHBrCOOH$.

Properties: Colorless liquid. Sp. gr. 1.69; m. p. $24.5^\circ C$, b. p. $203^\circ C$, with decomposition, soluble in water, alcohol, and ether.

Derivation: By heating propionic acid with bromine.

Method of purification: Distillation.

3-bromo-1-propyne. See propargyl bromide.

2-bromopyridine C_5H_4NBr .

Properties: Boiling point $194.8^\circ C$ (at 760 mm), sp. gr. 1.627 ($20^\circ C$); refractive index 1.5714 ($n_{20/D}$); solubility in 100 g . water 2.08 ($20^\circ C$).

Use: Synthesis of pyridine compounds.

3-bromopyridine C_5H_4NBr .

Properties: B. p. $174.4^\circ C$ (760 mm); sp. gr. 1.628 ($20/20^\circ C$); refractive index 1.5710 ($n_{20/D}$). Difficultly soluble in water, readily soluble in common organic solvents.

bromostyrol $C_6H_5CHCHBr$.

Properties: Yellowish liquid, with a strong floral odor. Soluble in 4 volumes of 90% alcohol. Sp. gr. 1.395-1.424; refractive index 1.602-1.608; m. p., min $-2^\circ C$.

Grades: Technical.

Use: Perfumery.

Shipping regulations: None.*

bromosuccinic acid $HOOCCH_2CHBrCOOH$.

Properties: Colorless crystals; sp. gr. 2.073; m. p. $159-161^\circ C$; soluble in water and alcohol; insoluble in ether.

Derivation: By heating bromine and succinic acid.

*See "I. C. C. Shipping Regulations," page xiii.
Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Wooden casks.

Use: Organic synthesis. *

Shipping regulations: None. *

Note: The above are the properties of the *dl* form. Optically active forms are also known.

N-bromosuccinimide (NBS) $(\text{CH}_2\text{CO})_2\text{NBr}$.

Properties: Fine crystal, white to cream in color; melting range 172-178 °C (decomposes). Soluble in carbon tetrachloride.

Use: For controlled low-energy bromination.

Containers: Bottles, fiber drums.

Shipping regulations: None. *

Caution. Respirators are recommended for personnel handling the dry material.

bromothymol blue. Dibromothymolsulphophthalein, an acid-base indicator, showing color change from yellow to blue over the range pH 6.0-7.6.

alpha-bromotoluene. See benzyl bromide

bromotrichloromethane (trichlorobromomethane) CCl_3Br .

Properties: A clear, colorless heavy liquid with chloroform-like odor. Miscible with many organic liquids; sp. gr. 2.0; b.p. 104 °C.

Use: Organic synthesis.

bromotrifluoroethylene (BFE) BrFCF_2 .

The name is used both for the monomer and polymers made from it. The polymers are usually clear oils at room temperature and noncracking solids at -65°F. Viscosities and densities can be varied widely. They are typical fluorocarbons, chemically inert, thermally stable, and nonflammable.

Uses (BFE polymers): Flotation fluids for gyros or accelerometers used in inertial guidance systems. BFE polymers can also be used like CFE polymers, but are more expensive.

bromotrifluoromethane CBrF_3 .

Properties: Colorless gas; f.p. -175°C; b.p. -58°C; nonflammable.

Use: Fire extinguisher.

brompheniramine maleate (2-[para-bromo-alpha-(2-dimethylaminoethyl)benzyl]pyridine maleate) $\text{C}_{16}\text{H}_{19}\text{BrN}_2\cdot\text{C}_4\text{H}_4\text{O}_4$.

Properties: Crystals. Rather soluble in water; less soluble in alcohol.

Grade: N.N.D.

Use: Medicine.

"Bromsulphalein." ³⁴⁸ Trademark for sulfo-bromophthalein sodium (q.v.).

"Bromural." ⁹ Trade name for bromoisovalerylurea (bromisovalum).

"Bromvegol." ³⁴² Trademark for brominated vegetable oils used for weighting soft-drink emulsions.

bromyrite (bromargyrite) AgBr . Natural silver bromide, similar to cerargyrite (q.v.).

bronze. See brass and bronze.

bronze blues. A name applied loosely to any of a number of the varieties of iron-blue pigments.

See iron blues.

bronze orange. See red lake C pigments.

bronzing liquid.

1. A solution of pyroxylin in amyl acetate together with a bronze powder, usually aluminum bronze.

2. Gloss oils and aluminum bronze.

3. Spirit varnishes and aluminum bronze.

In general, any liquid used for bronzing.

brookite TiO_2 . A natural crystallized titanium oxide.

Properties: Color ranges from brown to yellow, red and iron black; rhombic crystals; Mohs' hardness 5.5-6; sp. gr. 3.8-4.1.

Occurrence: Europe; Massachusetts, New York, Arkansas.

broom. See scoparius.

brosylate ester. An ester of para-bromobenzenesulfonic acid.

brown acetate. See calcium acetate.

brown hematite. See limonite.

Brownian movement. An incessant motion of colloidal particles caused by the impact of the molecules of the liquid phase, first noted by Robert Brown, a British botanist. See also colloid.

brown iron ore. See limonite.

brown ironstone clay. See limonite.

brown rock. A type of phosphate rock (q.v.) resulting from weathering of phosphatic limestones. Found in Tennessee and used as raw material for fertilizer.

brown sienna. See sienna.

brown umber. See umber.

"Brozone." ²³³ A liquid formulation of methyl bromide in solvent and "Trizone"; used as soil fumigant to control weeds, nematodes and fungi.

"BRS" 700 Rubber Softener. ¹⁷⁵ Trademark for a refined coal-tar product.

Properties: Dark-colored, viscous liquid; sp. gr. 1.17-1.22 (25/25°C); float test, 40-100 (32°C); carbon disulfide insoluble, 4-10 wt %.

Containers: 55-gal steel drums; tank trucks; tank cars.

Uses: As a softener and extender for natural rubber and synthetic elastomers conferring high tensile strength, good resilience, low heat build-up, and low set to vulcanizates; in manufacture of tires, mechanical goods, automotive items, etc.

"BRT" 3 Coal Tar Saturant. ¹⁷⁵ Trademark for a refined coal tar.

Properties: Sp. gr. 1.15-1.20 (25/25°C); specific Engler viscosity, 13-18 (40°C); carbon disulfide insoluble, 4-10 wt %.

Containers: 55-gal drums; tank trucks; tank

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

cars.

Use: As a saturant for brake linings.

"BRT" 4 Rubber Reclaiming Tar. ¹⁷⁵ Trade-mark for a refined coal-tar product

Properties: Dark-colored liquid; sp. gr. 1.15-1.20 (25/25°C); specific viscosity, Engler, 15-30 (50°C); carbon disulfide insolubles, 4-10 wt %

Containers: 55-gal steel drums; tank trucks; tank cars.

Uses: Reclaiming natural and synthetic rubbers.

"BRT" 7 Rubber Softener. ¹⁷⁵ Trademark for a rubber-compounding material refined from crude coal-tar.

Properties: Heavy fluid; sp. gr. 1.20-1.25 (25/25°C); specific viscosity, Engler, 6-9 (100°C); carbon disulfide insolubles, 15-20 wt %.

Containers: 55-gal drums.

Use: Rubber softener for easy calendaring and tubing of rubber compounds

brucine (dimethoxystrychnine)

$C_{23}H_{26}O_4N_2 \cdot H_2O$ or $2H_2O$.

Properties: White crystalline alkaloid; poisonous! Very bitter taste; loses water at 100°C; m.p. 178°C. Soluble in alcohol, chloroform, and benzene; slightly soluble in water, ether, glycerin, and ethyl acetate. Forms brucine sulfate, hydrochloride, and nitrate (m.p. 230°C)

Derivation: By extraction and subsequent crystallization from *nux vomica* or *ignatia* seeds.

Method of purification: Crystallization.

Grades: Technical.

Containers: 1-, 5-, 10-oz vials; cans.

Use: Medicine; denaturing alcohol; lubricant additive; separation of racemic mixtures

Shipping regulations: Poison, class B
Poison label *

brucine sulfate ($C_{23}H_{26}O_4N_2 \cdot H_2SO_4 \cdot 7H_2O$).

Bitter white crystalline solid; used for denaturing alcohol, oils, and in medicine.

Containers: Cans.

brucite $Mg(OH)_2$. Natural magnesium hydroxide, usually found as a decomposition product of magnesium silicates, or as an alteration of dolomite. Frequently found with magnesite

Properties: Color white, gray, greenish; luster pearly or waxy, good micaceous cleavage. Sp. gr. 2.39; hardness 2.5

Occurrence: Nevada, Washington; Canada.

Uses: Refractories.

bruisewort. See saponaria.

brun rouge. A red pigment obtained by calcining yellow ochre. See ochre.

Brunswick blue. Applied loosely to any of a number of varieties of iron blue pigments, usually containing considerable extender such as barytes.

"BRV" Rubber Softener. ¹⁷⁵ Trademark for a heavy high-boiling coal-tar distillate.

Properties: Dark, coal-tar oil; sp. gr. 1.14-1.18 (25/25°C); Engler specific

viscosity, 5-10 (50°C); distillation, 26% max at 355°C

Containers: 55-gal steel drums; tank trucks; tank cars.

Uses: Primary uses as plasticizer, softener, and reclaiming oil, secondary use as dispersing agent. Added directly to rubber; acts as solvent type softener; is highly effective in dispersing blacks; gives good aging properties; used on natural, natural reclaim, GR-S, nitrile, and neoprene rubbers; is especially suited for heat resistant stocks, hard rubber, and as a reclaiming oil for highly loaded natural rubber scrap.

"BryKo." ²⁰⁴ Trademark for a multi-purpose liquid cleaner, non-ionic, not affected by any kind of water. Easy on hands, speedy, powerful, safe on metal, wood, painted surfaces, plastic, glass, and rubber. Packaged in quarts, gallons, and thirty-gallon drums

"Brymul." ⁵¹ Trademark for an emulsifiable grade of cleaner for general use on metals, etc. Contains Stoddard-type solvent.

bryonin. A mixture of a glucoside and an alkaloid obtained from bryonia

Properties: Yellow, amorphous, bitter powder. Poisonous! Slightly soluble in water; soluble in alcohol; insoluble in ether.

B-stage resin (resitol). The second stage of condensation of phenol-formaldehyde resins (q.v.). Thermoplastic; swells in some liquids but does not dissolve readily. Used in molding powders. See A-stage resin

"BTC-1100" ³²⁸ Trade name for alkyl naphthal ammonium chloride, 100% active powder.

Uses: Disinfectant; deodorant, germicide; fungicide.

Btu (British thermal unit). The quantity of heat required to raise the temperature of one pound of water one degree Fahrenheit (usually from 39 to 40°F). This is the accepted standard for the comparison of heating values of fuels. For example, fuel gases range from 100 (low producer gas) to 3200 (pure butane) Btu per cu ft. The usual standard for a city gas is about 500 Btu.

BTX. Abbreviation for benzene, toluene, xylene

bubulum oil. See neats-foot oil

bucco. See buchu.

buchu (bucco; bucku; buku; diosma).

Derivation: Dried leaves of *Barosma betulina* or other species of *Barosma*.

Habitat: Southern Africa

Containers: Wooden boxes

Grades: Technical

Use: Medicine.

Shipping regulations: None.*

•• **buchu-leaf oil.**

Properties: Dark-colored essential oil of strong, sweetish, mint-like odor; bitter, cooling taste. Solubility in alcohol: One

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

volume dissolves in 3 to 5 volumes of 70% alcohol.

Chief known constituents: Diosphenol, menthone, limonene, dipentene

Constants: Betulina oil: Sp. gr. 0.937-0.97; optical rotation -14° to -48° ; refractive index 1.474-1.478

Derivation: Distilled from the leaves of *Barosma betulina*. There are also oils distilled from the leaves of *B. crenulata* and *B. serratifolia*.

Shipping regulations: None.*

bucku. See *buchu*.

bucizine hydrochloride. 1-para-chlorobenzhydryl-4-(para-(tert)-butylbenzyl) piperazine dihydrochloride. Used in medicine.

"**Budene.**" ²⁶⁵ Trademark for a cis-1,4-polybutadiene synthetic rubber.

buffer solution. A solution to which moderate amounts of either a strong acid or base may be added without causing any large change in the pH value (q. v.) of the solution. Such solutions usually contain (a) a weak acid and a salt of the weak acid, (b) a mixture of an acid salt with the normal salt, or (c) a mixture of two acid salts, for example NaH_2PO_4 and Na_2HPO_4 .

bufotenin $\text{HOC}_6\text{H}_5\text{NCH}_2\text{CH}_2\text{N}(\text{CH}_3)_2$. 3-(beta-Dimethylaminoethyl)-5-hydroxyindole. A poisonous alkaloid obtained from the skin glands of toads. M. p. $138-140^{\circ}\text{C}$. It is used in medical research on mental disorders.

bugbane. See *cimicifuga*.

"**Bug-Geta.**" ²⁵³ Brand name for insecticide bait containing metaldehyde and calcium arsenate.

bugroot. See *cimicifuga*.

bugwort. See *cimicifuga*.

buhrstone (burrstone; millstone).

Properties: A hard tough stone used for grinding cereals, cement rock, paint, etc. It is white, gray or creamy in color and is a chalcedonic silica or form of quartz of cellular texture. See quartz and chalcedony.

Occurrence: United States (Alabama, Georgia, Mississippi, New York, North Carolina, Ohio, Pennsylvania, Virginia); Canada; France

buku. See *buchu*.

bulbocapnine $\text{C}_{19}\text{H}_{19}\text{NO}_4$.

Properties: White crystalline powder. Soluble in alcohol and ether; insoluble in water. M. p. 199°C .

Derivation: By extraction and subsequent crystallization from the tubers of *Corydalis cava*.

Grades: Technical.

Containers: Tins; glass bottles.

Use: Medicine.

butamiodyl $\text{C}_8\text{H}_7\text{CONHC}_6\text{H}_4\text{CH}_2\text{C}(\text{C}_2\text{H}_5)\text{COONa}$ 3(3-Butyrylamino-2,4,6-tri-iodophenyl)-2 ethyl sodium acrylate. Used in medicine

(radiopaque contrast media, diagnostic aid).

buna-S. Name of German origin used rather generally for synthetic rubbers resulting from emulsion polymerization of butadiene and styrene. See styrene-butadiene rubber.

bunker "C" fuel oil. A heavy residual oil used as fuel by ships, industry, and for large-scale heating installations.

bunker fuel. A general term for residual oils used as fuel on steamships and in industry.

"**Bunnatol-G.**" ³⁵⁴ Trademark for a plasticizer for synthetic and reclaimed rubber*. It is insoluble in mineral and vegetable oils, and imparts to rubber a high resistance to greases and oils.

Burgundy mixture. Same as soda Bordeaux (q. v.).

Burgundy pitch.

Properties: An opaque yellowish or reddish-brown hard brittle resin obtained either from the Norway spruce or the European silver fir. It has a sweet and aromatic taste. Soluble in glacial acetic acid, acetone, and alcohol. The resin of *Pinus sylvestris* is also offered as Burgundy pitch and it can be recognized by the fact that it is soluble in ether, chloroform, and solutions of salts of ammonium or sodium carbonate and borax in which true Burgundy pitch is only partially soluble. Common pitch, rosin and turpentine are agitated with water and also offered as Burgundy pitch.

Containers: 500-lb drums.

Use: In medicine (plasters)

Shipping regulations: None.*

burnable poison. See *poison*.

burning bush. See *euonymus*.

burnt lime. See calcium oxide.

burnt sugar. See *caramel*.

burnt umber. See *umber*.

burn-up. A term in nuclear technology referring to the utilization, or extent of utilization of nuclear fuel. It may be expressed either as a fraction of the fissionable material that has been used or "burned," or as the amount of energy that has been extracted from the fuel. In the latter case it is frequently quoted as megawatt days per ton.

"**Buromin.**" ¹⁰⁸ Trademark for sodium hexametaphosphate in glass plate form for boiler water conditioning.

Containers: 25-lb cloth bags; 100-lb paper bags; 100-lb drums.

"**Burosil.**" ¹⁰⁸ Trademark for a granular, alkaline, phosphate-silicate compound used in boiler water conditioning to precipitate calcium and magnesium as a loose sludge. Containers: 125-lb drums.

burrstone. See *buhrstone*.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

busulfan (1,4-dimethanesulfonylbutane; tetramethylene bismethanesulfonate)
 $\text{CH}_3\text{SO}_2\text{OCH}_2(\text{CH}_2)_2\text{CH}_2\text{OSO}_2\text{CH}_3$.

Properties: White, crystalline powder; almost odorless; m. p. 115-118°C. Very slightly soluble in water and slightly soluble in alcohol and acetone. Very poisonous!

Grade: U. S. P. XVI.

Use: Medicine

butabarbital sodium $\text{C}_{10}\text{H}_{13}\text{N}_2\text{O}_3\text{Na}$. Sodium 5-sec-butyl-5-ethylbarbiturate; sodium 5-ethyl-5-(1-methylpropyl) barbiturate.

Properties: White, bitter powder. Very soluble in water; soluble in alcohol; practically insoluble in benzene and dry ether; pH (1% solution) 9.0-10.2.

Grade: N. F. XI.

Use: Medicine

butacaine sulfate (3-di-n-butylaminopropyl-para-aminobenzoate sulfate)
 $(\text{C}_{18}\text{H}_{30}\text{N}_2\text{O}_2)_2\text{H}_2\text{SO}_4$.

Properties: White, odorless, crystalline powder; m. p. 100-103°C; affected by light; rapidly produces numbness when placed upon the tongue; soluble in water; very soluble in warm alcohol and in acetone; slightly soluble in chloroform; insoluble in ether

Use: Medicine

"Butacite,"²⁸ Trademark for polyvinyl butyral resin (q. v.) available as soft pliable sheeting. See also polyvinyl acetal resins

butadiene (butadiene-1,3; vinyl ethylene; erythene; bivinyl; divinyl B)
 $\text{H}_2\text{C}=\text{CH}:\text{CH}=\text{CH}_2$.

Properties: Colorless gas with mild aromatic odor; easily liquefied; flammable; b. p. -4.41°C; sp. gr. 0.6211 (liquid at 20°C); f. p. -108.9°C; flash point -76°C; specific volume 6.9 cu ft/lb (70°F); vapor pressure 17.65 psia (0°C). Soluble in alcohol and ether; insoluble in water. The material polymerizes readily, particularly if oxygen is present, and the commercial material contains an inhibitor to prevent spontaneous polymerization during shipment or storage.

Derivation: (a) Catalytic dehydrogenation of field or refinery butanes and butenes; (b) by-product of ethylene production.

Methods of purification: Extractive distillation in the presence of furfural and absorption in aqueous cuprous ammonium acetate.

Grades: Technical, 98.0%; C. P. 99.0%; instrument 99.4%

Containers: Cylinders; pressure tank trucks and tank cars.

Uses: Principally in styrene-butadiene and nitrile-butadiene rubbers (SBR, NBR); starting material for adiponitrile (nylon 66); styrene-butadiene latex in paints and as binder in nonwoven fabrics; component in rocket fuels (butadiene-acrylonitrile polymer); as cis-polybutadiene, an extender or substitute for natural rubber, and as trans-polybutadiene, a unique new type of rubber.

Danger! Extremely flammable, may form explosive peroxides on exposure to air. MCA warning label.

Shipping regulations (butadiene, inhibited): Flammable gas. Red gas label.*

butadiene-1,3. See butadiene.

butadiyne. See diacetylenes.

butaldehyde. See butyraldehyde.

butallylonal (5-(2-bromoallyl)-5-sec-butyl-barbituric acid) $\text{C}_{11}\text{H}_{15}\text{BrN}_2\text{O}_3$.

Properties: Fine, white crystals or crystalline powder; slightly bitter taste; m. p. 130-134°C; soluble in alcohol or ether; slightly soluble in cold water; insoluble in paraffin hydrocarbons.

Use: Medicine.

"Butamer" Process.⁴¹⁶ Patented process for the isomerization of normal butane to isobutane in the presence of hydrogen and a solid, noble metal catalyst of undisclosed composition. By recycling unconverted normal butane, ultimate yield of isobutane on a volumetric basis exceeds 100%.

butamin. See tutocaine.

butanal. See butyraldehyde.

butane (n-butane; butyl hydride) C_4H_{10} .

Properties: Colorless gas; characteristic natural-gas odor; extremely stable; has no corrosive action on metals; does not react with moisture; b. p. -0.5°C; f. p. -138.33°C; condensing pressure (approx) 30 lbs gauge at 90°F; sp. gr. of liquid at 0°C, 0.599; sp. gr. of vapor at 0°C (760 mm) (air=1) 2.07; critical temperature 153.2°C; critical pressure (absolute) 525 psi; explosive limits in air, % by volume, lower 1.9; upper 8.5; heating value (77°F) 3266 Btu/cu ft; specific volume (70°F) 6.4 cu ft/lb.

Grades: Research, 99.99 mole %; pure, 99 mole %; also available in various mixtures with isobutane, propane, pentanes, etc.

Containers: 16-gal returnable cylinder (approximate net content 71 lbs); 28-gal returnable cylinder (approx. net content 122 lbs); tank car (approx. net content 10,000 gal).

Uses: Organic synthesis; raw material for synthetic rubber and high-octane liquid fuels; fuel for household and for many industrial purposes, either alone or in admixture with propane or air; extractant; solvent; refrigerant; standby and enricher gas; propellant in aerosols.

Caution! Flammable gas under pressure.

Shipping regulations: Flammable gas. Red label.*

n-butane. See butane.

butanedial. See succinaldehyde.

1,4-butanedicarboxylic acid. See adipic acid.

butanedioic anhydride. See succinic anhydride.

1,3-butanediol. See 1,3-butylene glycol.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

1,4-butanediol. See 1,4-butylene glycol.

2,3-butanediol. See 2,3-butylene glycol.

butanediolamine. See 2-amino-2-methyl-1,3-propanediol.

butanedione. See diacetyl.

2,3-butanedione oxime thiosemicarbazone
 $\text{CH}_3\text{C}(\text{NOH})\text{C}(\text{CH}_3)_2\text{HCSNH}_2$. A test reagent for manganese in very dilute solutions made from dimethylglyoxime and thiosemicarbazide.

butane dioxime. See dimethylglyoxime.

butanenitrile. See butyronitrile.

1-butanethiol. See butyl mercaptan.

2-butanethiol. See sec-butyl mercaptan.

1,2,4-butanetriol $\text{HOCH}_2\text{CHOHCH}_2\text{CH}_2\text{OH}$.

Properties: Almost colorless, odorless liquid; low toxicity, completely miscible in water and ethyl alcohol; hygroscopic. B.p. 312°C (extrap); sp. gr. 1.184; refractive index 1.473; flash point 332°F

Derivation: Reaction of 2-butyne-1,4-diol with water, followed by reduction

Grades: Technical; nitration

Containers: Bung-type, lined steel drums

Uses: Intermediate for alkyd resins and explosives; cellulose plasticizer; emulsifier for cosmetics, inks, finishes, paper, cork, textiles

Shipping regulations: None *

butanoic acid. See butyric acid.

1-butanol. See n-butyl alcohol

2-butanol. See sec-butyl alcohol

butanoyl chloride. See butyryl chloride.

"Butaprene." ⁵ Trademark for synthetic rubbers, latices, and resins comprising copolymers of butadiene with other monomers except those copolymers of butadiene with styrene which are classified as general purpose synthetic rubbers. See "FR-S."

"Butaprene N." ²⁷⁷ Trademark for a series of oil resistant synthetic rubbers composed of copolymers of butadiene and acrylonitrile.

Grades: "Butaprene NH," "Butaprene NXM,"

"Butaprene NAA," "Butaprene NL,"

"Butaprene NF" in the order of decreasing acrylonitrile content, decreasing oil resistance, and increasing flexibility at low temperatures

Containers: 75-lb boxes (milled sheets); 50-lb bales in paper bags.

Uses: Oil and fuel resistant tank linings; hose; mechanical rubber parts; modification of vinyl, styrene and phenolic resins

Shipping regulations: None. *

"Butaprene N Latex." ²⁷⁸ Trademark for a series of oil resistant rubbers in latex form, consisting of copolymers of butadiene and acrylonitrile. Acrylonitrile content varies from 30 to 40%.

Grades: N-300, N-400.

Containers: 5-gal drums to tank cars.

Uses: Adhesives, paper impregnation, textile and paper coatings, leather finishes, oil resistant coatings, modification of phenolic resin emulsions, etc.

Hazards: Keep from freezing.

Shipping regulations: None. *

"Butaprene PL." ³⁵ Trademark for a complete series of latexes comprising copolymers of butadiene with styrene, acrylonitrile, acrylate esters, etc.

Properties: Air dries; forms continuous films capable of carrying high pigment and/or filler loadings.

Containers: 55-gal drums; tank truck; tank cars.

Uses: Interior and exterior water-based paints; metal primers; adhesives; paper coating; grease resistant coatings and saturants.

Hazards: Keep from freezing.

"Butaprene SL." ²⁷⁷ Trademark for a series of high styrene-butadiene copolymer resins used as reinforcing agents for rubber.

Grades: "Butaprene SL," "Butaprene SL/AB," "Butaprene SL-1" covering a range of hardness and dispersibility. All grades are

supplied as white, friable, resinous crumbs. Containers: 50-lb paper bags or suitably sized fiber drums.

Use: For imparting stiffness, strength, and abrasion resistance to rubber and synthetic rubber compounds, especially shoe soles, floor tile and similar compounds.

Shipping regulations: None. *

"Butasan." ⁵⁸ Trademark for zinc dibutyl-dithiocarbamate (q. v.)

Uses: Accelerator for latex; activator for thiazole type accelerators

"Butazate." ²⁴⁸ Trademark for zinc dibutyl-dithiocarbamate (q. v.).

Uses: Accelerator for latex, dispersions, cements and proofing

butazolidine. See phenylbutazone.

2-butenal. See crotonaldehyde

butene-1 (ethylethylene; alpha-butylene)

Properties: Colorless gaseous hydrocarbon; b.p. -6.3°C ; sp. gr. 0.5951 ($20/4^\circ\text{C}$); f.p. about -185°C . Specific volume 6.7 cu ft/lb (70°F); flash point -80°C ; soluble in most organic solvents

Derivation: Gases containing appreciable content of butene-1, along with other butene and butane hydrocarbons, are obtained by fractional distillation of refinery gas.

Grades: Technical, 95%; C.P. 99.0%

Containers: Cylinders, tanks

Uses: Polymer and alkylate gasoline; polybutenes; butadiene; intermediate for C_4 and C_5 oxides, aldehydes and alcohols

Shipping regulations: Flammable gas. Red gas label. *

"cis-butene-2 (dimethylethylene; beta-butylene; also called the "high-boiling" butene-2).
 $\text{CH}_3\text{CH:CHCH}_3$ Cis- and trans-butene-2

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

are geometric structural isomers

Properties: Colorless, gaseous hydrocarbon; b.p. 3.7°C; sp.gr. 0.6213 (20/4°C) freezing point -139°C; specific volume 6.7 cu ft/lb (70°F); flash point -73°C; soluble in most organic solvents.

Derivation: Gases containing appreciable content of cis-butene-2, along with other butene and butane hydrocarbons, are obtained by fractional distillation of refinery gas.

Grades: Technical 95%; C.P. 99%.

Containers: Cylinders; tanks.

Uses: Solvent; cross-linking agent; polymer gasoline; butadiene synthesis; synthesis of C₄ and C₅ derivatives

Shipping regulations: Flammable gas Red gas label.*

trans-butene-2 (dimethylethylene; beta-butylene; also called the "low-boiling" butene-2) CH₃CH:CHCH₃ Cis- and trans-butene-2 are geometrical structural isomers

Physical properties: Colorless, gaseous hydrocarbon; b.p. 0.88°C; freezing point -105.8°C; sp.gr. 0.6042 (20/4°C); specific volume 6.7 cu ft/lb (70°F); flash point -73°C; soluble in organic solvents.

Derivation: Gases containing appreciable content of trans-butene-2, along with other butene and butane hydrocarbons, are obtained by fractional distillation of refinery gas

Grades: Technical, 95%; C.P., 99.0%

Containers: Cylinders; tanks.

Uses: Same as for cis-butene-2.

Shipping regulations: Flammable gas Red gas label *

2-butene-1,4-diol HOCH₂CH:CHCH₂OH

Properties: Almost colorless, odorless liquid; very soluble in water, ethyl alcohol and acetone, sparingly soluble in benzene Technical butenediol is predominantly the cis isomer. F.p. range 4.0-7.0°C; b.p. range 232-235°C; sp.gr. 1.067-1.074, refractive index (n_D²⁵) 1.476-1.478; flash point 263°F.

Derivation: By reduction of 2-butyne-1,4-diol; by high pressure synthesis from acetylene and formaldehyde.

Containers: Lined steel drums

Uses: Intermediate for alkyd resins, plasticizers, nylon, pharmaceuticals; cross linking agent for synthetic resins; fungicides.

Caution: Primary skin irritant but not sensitizer.

Shipping regulations: None.*

3-butenenitrile. See allyl cyanide

butenoic acid. See crotonic acid.

"Butesin." ³ Trademark for n-butyl para-aminobenzoate.

"Butesin" picrate. ³ Trademark for di-(butyl-para-aminobenzoate) trinitrophenol. Butamben picrate.

Properties: Yellow powder having a bitter taste; m.p. 110°C; soluble in organic solvents; slightly soluble in water

Use: Medicine (external application).

butethal (5-butyl-5-ethylbarbituric acid)

C₁₀H₁₆N₂O₃.

Properties: White crystals or powder; odorless; butter taste; m.p. 124-127°C; fairly soluble in alcohol or ether; practically insoluble in water.

Use: Medicine.

butethamine formate C₁₃H₂₀N₂O₂·HCOOH.

2-(Isobutylamino)ethyl-para-aminobenzoate formate.

Properties: Odorless, white crystals. M.p. 136-139°C; freely soluble in alcohol and water; very slightly soluble in benzene; slightly soluble in chloroform and ether. pH (1% solution) about 6.1.

Grade: N.N.D.

Use: Medicine

butethamine hydrochloride [2-(Isobutylamino)-ethyl-para-aminobenzoate hydrochloride]

NH₂C₆H₄COOCH₂CH₂NHCH₂CH(CH₃)₂·HCl.

Properties: White, odorless, crystals or crystalline powder with bitter taste and local anesthetizing effects on tongue M.p. 192-196°C; sparingly soluble in water; slightly soluble in alcohol and chloroform; very slightly soluble in benzene; practically insoluble in ether. pH (1% solution) about 4.7; stable in air

Grade: N.F. XI

Use: Medicine

"Butoben." ¹²³ Trademark for a chemical preparation for prevention of molding and putrefaction of pastes and certain animal and vegetable substances

butonate (CH₃O)₂P(O)CH(CCl₃)OOCCH₃H, O,O-Dimethyl 2,2,2-trichloro-1-n-butyryloxyethyl phosphonate.

Properties: Colorless, somewhat oily liquid with slight ester odor; miscible with most organic solvents; stable in neutral or acid aqueous solutions, unstable in aqueous alkali. Sp.gr. 1.3742; refractive index 1.4707; wt/gal 11.5 lbs.

Use: Insecticide

"Buton" Resins. ²⁹ Trademark for butadiene-styrene copolymers for surface coatings and thermosetting plastics Characteristics of Buton coatings include chemical resistance, hardness, flexibility, adhesion, abrasion resistance, and gloss range. Cure temperatures range from 70° to 1100°F

Grades and Uses:

Buton 100 - Basic all-hydrocarbon resin for can coatings, metal sheet primers, and chemical intermediates

Buton 200 - Polar modification for baked metal primers, tank, and drum linings

Buton 300 - Higher polarity gives greater compatibility and reactivity for resistant lacquers and low-bake coatings

Buton A-500 - High molecular weight resin. Excellent electricals for laminating, potting and encapsulation.

butopyronoxyl (butyl mesityl oxide) C₁₂H₁₈O₄. n-Butyl 3,4-dihydro-2,2-dimethyl-4-oxo-1,2H-pyran-6-carboxylate.

Properties: Yellow to pale reddish-brown liquid with aromatic odor. Reasonably

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

stable in air; slowly affected by light. Insoluble in water; miscible with alcohol, chloroform, ether, glacial acetic acid. Sp. gr. 1.052-1.060 (25/25°C); refractive index (n_D²⁵) 1.4745-1.4755. Distilling range 256-270°C.

Derivation: Condensation of mesityl oxide and dibutyl oxalate in the presence of sodium ethoxide.

Grade: Technical.

Use: Insect repellent.

"Butoxone." ¹⁴⁷ Brand name for a selective hormone type weedkiller based on 2,4-dichlorophenoxybutyric acid (2,4-DB). Contains 2 lbs. of acid equivalent as the dimethylamine salt.

Containers: 1-gal cans; 5-, 30-, and 55-gal drums.

2-butoxyethanol. See ethylene glycol monobutyl ether.

butoxyethyl laurate.

Properties: Oily liquid, mild odor; sp. gr. (25°C) 0.884; color 100 APHA max; boiling range (4 mm) 160-220°C; flash point (open cup) 320°C; viscosity (25°C) 7 cps; f. p. -7°C.

Use: Plasticizer and solvent.

butoxyethyl oleate.

Properties: Oily liquid, mild odor; sp. gr. (25°C) 0.886; Color 250 APHA max; boiling range (4 mm) 199-233°C; viscosity (25°C) 10 cps; f. p. -37°C.

Uses: Plasticizer and solvent.

1-butoxyethoxy-2-propanol

Properties: Sp. gr. 0.9310 (20/20°C); b. p. 230.3°C; freezing point -90°C. Solubility in water is infinite; wt/gal 7.8 lbs; flash point 250°F

Uses: Solvent; hydraulic fluid components; plasticizer intermediate.

butoxyethyl stearate $\text{C}_{17}\text{H}_{35}\text{COOC}_2\text{H}_4\text{OC}_4\text{H}_9$

Properties: Sp. gr. (20°C) 0.882; refractive index (25°C) 1.446; vapor pressure (20°C) <0.01 mm; b. p. (4 mm) 210-233°C; m. p. 16.5°C; insoluble in water

Containers: 1-, 5-, 55-gal drums.

Use: Plasticizer

para-butoxyphenol $\text{HOC}_6\text{H}_4\text{OC}_4\text{H}_9$

Properties: White to faint yellow crystalline powder m. p. 61-65°C Soluble in alcohol, acetone, ether, benzene, aqueous alkali; insoluble in water.

Grade: 93% pure.

Containers: Fiber drums.

Use: Synthesis.

4'-butoxy-3-piperidinopropiophenone hydrochloride. See dyclonine.

butter. The fat of milk, obtained from cream of milk, churned into a smooth deep yellow semisolid substance with a sp. gr. of 0.926-0.940. It contains 82.5% fat (see butter fat) as required by the USDA with the remainder largely water containing small amounts of sugar, proteins, vitamins, mineral salts, and coloring matter.

butter color. See annatto.

buttercup yellow. See zinc yellow.

butter fat. The oily portions of the milk of mammals. Composition is largely glycerides of oleic, stearic, and palmitic acids with smaller amounts of the glycerides of butyric, caproic, caprylic and capric acids. Sp. gr. range 0.910-0.914.

butterfly weed. See asclepias

butter of antimony. See antimony trichloride.

butter of arsenic. See arsenic trichloride.

butter of tin. See stannic chloride.

butter of zinc. See zinc chloride.

butterweed oil. See erigeron oil.

butter yellow. See dimethylaminoazobenzene.

button lac. See shellac.

"Butvar." ⁶¹ Trademark for polyvinyl butyral resins. Various types available (B-72A, B-73, B-76, B-90 and B-98) as free flowing powders covering a molecular weight range of 32,000 to 225,000 (weight average), hydroxyl content of about 10 to 20 (as % polyvinyl alcohol), butyral content of 80 to 88 (as % polyvinyl butyral) and viscosity of about 75 to 1570 cps. (10% in 95% ethanol solution at 25°C. by Ostwald Viscometer). Also available as small particle, stable, aqueous dispersions with various amounts and types of plasticizers and dispersants. B R type is an anionic dispersion of 50% solids with 40% plasticizer by weight of resin.

Uses: Coatings (metal, textile, wood, etc.) film; adhesives; sealers; molded materials; strip coatings; insulation and safety glass

butyl. 1. The radical C_4H_9 -. 2. Short or slang for butyl rubber

n-butyl acetate $\text{CH}_3\text{COOCH}_2\text{CH}_2\text{CH}_2\text{CH}_3$.

Properties: Limpid colorless liquid; fruity odor Soluble in alcohol, ether, and hydrocarbons; slightly soluble in water

Constants: Sp. gr. 0.8826 (20/20°C), b. p. 126.3°C; vapor pressure 8.7 mm Hg (20°C); freezing point -75°C; refractive index 1.3951 (20°C); wt/gal 7.29 lbs (20°C); flash point (Tag open cup) 100°F.

Derivation: Esterification and then distillation, after contact of butyl alcohol with acetic acid in the presence of a catalyst such as sulfuric acid.

Method of purification: Distillation.

Grades: Technical; pure.

Containers: 1-gal cans; 5-, 55-gal drums; tank cars.

Uses: Solvent in production of lacquers, lacquer enamels, pyroxylin solutions, leather dope, airplane dope, perfumes, flavoring extracts; solvent for natural gums and synthetic resins.

Caution: Keep away from heat and open flame. Avoid prolonged breathing of vapor. Use with adequate ventilation. Avoid prolonged or repeated contact with skin. MCA warning label.

Shipping regulations: None.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

sec-butyl acetate $\text{CH}_3\text{COOCH}(\text{CH}_3)(\text{C}_2\text{H}_5)$
(2-butanol acetate.)

Properties: Colorless liquid; b. p. 112.2°C;
sp. gr. 0.8905 at 0/4°C, 0.870 at 20/4°C;
refractive index 1.389 (20°C); wt/gal
7.21 lb; flash point (closed cup) 66°F.

Miscible with alcohol and ether; insoluble
in water.

Derivation: Esterification of sec-butyl alco-
hol.

Grades: Technical; pure.

Containers: 1-gal cans; 55-gal drums; tank
cars.

Uses: Solvent for nitrocellulose; lacquers;
thinners; nail enamels; celluloid products;
artificial leather; leather finishes; plastic
wood; washable wallpaper.

Shipping regulations: Flammable liquid.
Red label.*

tert-butyl acetate $\text{CH}_3\text{COOC}(\text{CH}_3)_3$

Properties: Colorless liquid, b. p. 96°C;
sp. gr. 0.896 (20°C). Insoluble in water;
soluble in alcohol and ether

Use: Suggested as an antiknock agent in
gasoline.

butyl acetoacetate

$\text{CH}_3\text{COCH}_2\text{COOCH}_2\text{CH}_2\text{CH}_2\text{CH}_3$

Properties: Colorless liquid; insoluble in
water; soluble in alcohol and ether. Sp. gr.
0.9694 (20/20°C); b. p. (760 mm) 213.9°C,
vapor pressure 0.19 mm (20°C); flash
point 185°F; wt/gal 8.1 lbs (20°C).

Grades: Technical.

Use: Intermediate in synthesis of metal
derivatives, dyestuffs, pharmaceuticals.

butyl acetoxystearate

$\text{CH}_3(\text{CH}_2)_3\text{CH}(\text{CH}_3\text{COO})(\text{CH}_2)_{10}\text{COOC}_4\text{H}_9$

Like butyl acetyl ricinoleate, but the double
bond is saturated.

Derivation: From castor oil, butyl alcohol,
and acetic anhydride, with hydrogenation.

Uses: Plasticizer; textile oils; adhesives

butyl acetylene. See 1-hexyne

butyl acetyl ricinoleate $\text{CH}_3(\text{CH}_2)_3\text{CH}-$
 $(\text{CH}_2\text{CO}_2)\text{CH}_2(\text{CH})_2(\text{CH}_2)_7\text{CO}_2\text{C}_4\text{H}_9$

Properties: Yellow, oily liquid; mild odor,
miscible with most organic solvents Sp.
gr. 0.940 (20/20°C); saponification number
235; f. p., indefinite, becomes cloudy at
-32°C, solidifies at -65°C; flash point
230°F; refractive index 1.4614 (20°C),
Saybolt viscosity 123 secs at 100°F;
wt/gal 7.8 lbs (68°F), practically insoluble
in water.

Derivation: From castor oil, butyl alcohol
and acetic anhydride.

Grades: Technical.

Containers: 1-gal cans; 5-, 55-gal steel
drums; tank cars.

Uses: Plasticizer; emulsifier; lubricant;
detergent; protective coatings; special
cleansing compounds; quick-breaking
emulsions.

N-tert-butylacrylamide $\text{H}_2\text{C}=\text{CHCONHC}(\text{CH}_3)_3$

Properties: White crystalline solid; m. p.
128-130°C; sp. gr. 1.015 (30°C). Soluble
in methanol, ethyl alcohol, chloroform,

and acetone.

Uses: Monomer; organic intermediate.

n-butyl acrylate $\text{CH}_2=\text{CHCOOC}_4\text{H}_9$

Properties: Colorless liquid; m. p. -64°C;
polymerizes readily on heating; vapor pres-
sure (20°C) 3.2 mm; sp. gr. 0.9015
(20/20°C); wt/gal 7.5 lbs (20°C); flash
point 120°F; nearly insoluble in water.

Derivation: Reaction of acrylic acid or
methyl acrylate with butyl alcohol.

Grades: Technical (inhibited).

Containers: 1-gal cans; 5-, 55-gal drums;
tank cars.

Uses: Intermediate in organic synthesis;
polymers and copolymers for solvent coat-
ings, adhesives, paints, binders; emulsifier.
See also acrylate resins.

Shipping regulations: None.*

n-butyl alcohol (1-butanol; butyric alcohol)
 $\text{CH}_3(\text{CH}_2)_3\text{CH}_2\text{OH}$

Properties: Colorless liquid; vinous odor.

B. p. 117.7°C; f. p. -89.0°C; sp. gr.

(20/20°C) 0.8109; wt/gal (20°C) 6.76 lb;

refractive index (n_D 20) 1.3993; flash

point (Tag open cup) 115°F. Solubility in

water (20°C) 7.7 wt %; solubility of water

in n-butyl alcohol 20.1% Miscible with

alcohol and ether

Derivation: (a) Condensation of acetaldehyde
to form crotonaldehyde, which is hydro-
genated at 30 psi and 180°C; (b) bacterial
fermentation of grain or molasses; (c) by-
product in the high-pressure oxidation of
butane and propane; (d) by the Fischer-
Tropsch process.

Grades: Technical.

Containers: 1-, 5-, 55-gal drums; tank cars.

Uses: Preparation of esters, especially butyl
acetate; solvent for resins and coatings;
plasticizers; dyeing assistant; hydraulic
fluids; detergent formulations; dehydrating
agent (by azeotropic distillation); intermed-
iate; "butylated" urea and melamine resins.

Caution! Keep away from heat and open
flame. Avoid prolonged breathing of vapor
Use with adequate ventilation. Avoid pro-
longed or repeated contact with skin MCA
warning label.

Shipping regulations: None.*

sec-butyl alcohol (SBA; 2-butanol; methylethyl-
carbinol) $\text{CH}_3\text{CH}_2\text{CHOHCH}_3$

Properties: Colorless liquid; strong, pleas-
ant odor B. p. 99.5°C; m. p. -114.7°C;
sp. gr. (20/4°C) 0.808; wt/gal (20°C) 6.74
lbs; refractive index (n_D 25) 1.3949; flash
point (closed cup) 75°F Moderately solu-
ble in water; miscible with alcohol and
ether.

Derivation: Absorption of butene, from
cracking petroleum or natural gas, in sul-
furic acid with subsequent hydrolysis by
steam.

Grades: Technical.

Containers: 1-, 5-, 55-gal drums; tankcars.

Uses: Preparation of methyl ethyl ketone;
solvent in varnishes, lacquers, and paint
removers; organic synthesis.

Caution! Keep away from heat and flame.

Avoid prolonged breathing of vapor. Use

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

with adequate ventilation. Avoid prolonged or repeated contact with skin. MCA warning label.

Shipping regulations: Flammable liquid Red label *

tert-butyl alcohol (2-methyl-2-propanol; tri-methyl carbinol). $(\text{CH}_3)_3\text{COHCH}_3$.

Properties: Low-melting colorless crystals; camphor odor. M.p. 25.5°C ; b.p. 82.9°C ; sp. gr. (liquid, 26°C) 0.779; refractive index (n 20/D) 1.3878; flash point (closed cup) 52°F . Miscible with water, alcohol, and ether.

Derivation: Absorption of isobutene, from cracking petroleum or natural gas, in sulfuric acid with subsequent hydrolysis by steam.

Grades: Technical.

Containers: Bottles; barrels; 55-gal drums; tanks.

Uses: Solvent; alcohol denaturant; organic synthesis.

Warning: Flammable; use with adequate ventilation MCA warning label

Shipping regulations: Flammable liquid. Red label. *

butyl alcohol, iso-. See isobutyl alcohol.

n-butyl aldehyde. See butyraldehyde.

butyl aldehyde, iso-. See isobutyraldehyde.

n-butylamine $\text{C}_4\text{H}_9\text{NH}_2$.

Properties: Colorless, volatile liquid with amine odor. B.p. 77.1°C ; f.p. -49.1°C ; sp. gr. (20/20°C) 0.7385; wt/gal (20°C) 6.2 lbs; refractive index (n 20/D) 1.401; flash point (open cup) 10°F . Miscible with water, alcohol, and ether.

Derivation: By reaction of butanol or butyl chloride with ammonia.

Grades: Technical.

Containers: 1-gal cans; 5- and 55-gal drums; tank cars

Uses: Intermediate for emulsifying agents, pharmaceuticals, insecticides, rubber chemicals, dyes, tanning agents

Warning: Flammable; may cause skin irritation MCA warning label

Shipping regulations: Flammable liquid Red label *

sec-butylamine $\text{CH}_3\text{CHNH}_2\text{C}_2\text{H}_5$.

Properties: Colorless liquid; sp. gr. (20°C) 0.725; boiling range $63-68^\circ\text{C}$; refractive index (20°C) 1.395; solidification point -104.5°C ; odor, amine; wt/gal (20°C) 6.0 lbs

Fire hazard: Flash point less than 20°F

Shipping regulations: Flammable liquid. Red label. *

tert-butylamine $(\text{CH}_3)_3\text{CNH}_2$.

Properties: Colorless liquid; b.p. $44-46^\circ\text{C}$; sp. gr. 0.700 (15°C); refractive index (n 18/D) 1.3794; flash point below room temperature. Miscible with water; soluble in common organic solvents.

Grades: Technical

Containers: Drums; tank cars.

Uses: Intermediate for rubber accelerators, insecticides, fungicides, dyestuffs,

pharmaceuticals.

Caution! Avoid prolonged contact with skin; prolonged inhalation.

Shipping regulations: Flammable liquid Red label. *

n-butyl-para-aminobenzoate $\text{H}_2\text{NC}_6\text{H}_4\text{COOC}_4\text{H}_9$.

Properties: White, crystalline powder, odorless, tasteless; m.p. $57-59^\circ$; b.p. 174°C (8 mm). Soluble in dilute acids, alcohol, chloroform, ether, and fatty oils. Almost insoluble in water

Grade: N.F. XI

Use: Medicine (local anesthetic)

butylaminoethanol $\text{C}_4\text{H}_9\text{NHC}_2\text{H}_4\text{OH}$.

Properties: Liquid; sp. gr. 0.88-0.99 (20/20°C); distillation range $192-210^\circ\text{C}$ (760 mm); wt/gal 7.4 lbs; flash point 170°F

N-n-butyl aniline $\text{C}_6\text{H}_5\text{NHC}_4\text{H}_9$.

Properties: Sp. gr. (20°C) 0.932; boiling range $236-242^\circ\text{C}$; refractive index 1.534 (20°C); color amber; odor aniline; very soluble in alcohol and ether; insoluble in water.

Fire hazard: Flash point 225°F

Shipping regulations: None. *

2-tert-butylanthraquinone $\text{C}_{18}\text{H}_{14}\text{O}_2$.

Properties: Yellow powder. M.p. $102-104^\circ\text{C}$; soluble in alcohol and acetone.

Grades: Technical (98%)

Use: Organic synthesis; manufacture of hydrogen peroxide.

butylated hydroxyanisole (BHA)

$(\text{CH}_3)_2\text{CC}_6\text{H}_4\text{OH}(\text{OC}_2\text{H}_5)$.

Grade: Food inhibitor grade

Containers: 1-pt and 1-gal glass bottles; net weights 1 and 8.5 lbs; drums.

Uses: Antioxidant for fats and oils; food packaging

butylated hydroxytoluene. See di-tert-butyl-para-cresol

n-butylbenzene $\text{C}_6\text{H}_5\text{C}_4\text{H}_9$.

Properties: Colorless liquid; b.p. 183.2°C ; f.p. -87.9°C ; sp. gr. 0.860 (20°C); refractive index (n 20/D) 1.489; flash point 71°C

Grades: Technical; pure; research.

Uses: Organic synthesis

sec-butylbenzene (2-phenylbutane)

$\text{C}_6\text{H}_5\text{C}(\text{CH}_3)(\text{C}_2\text{H}_5)$

Properties: Colorless liquid; b.p. 170.65°C ; vapor pressure 15 mm Hg (60°C); f.p. -75.68°C ; sp. gr. 0.8618 (20/4°C); wt/gal 7.2 lbs (20°C); refractive index (n 20/D) 1.4901; flash point (open cup) 120°F .

Typical specification: Boiling range $160-185^\circ\text{C}$; sp. gr. 0.865-0.870 (60°F); no copper corrosion.

Containers: 1- and 5-gal cans; 55-gal black iron drums; tank trucks and tank cars.

Use: As a medium-high boiling solvent for coating compositions and organic synthesis

tert-butylbenzene (2-methyl-2-phenylpropane) $\text{C}_6\text{H}_5\text{C}(\text{CH}_3)_2$.

Properties: Colorless liquid; insoluble in water; soluble in alcohol; b.p. 169.1°C ; f.p. -57.8°C ; sp. gr. 0.866 (20°C); re-

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

fractive index (n 20/D) 1.492; flash point 60°C.

Grades: Technical; pure; research

Use: Organic synthesis.

butyl benzenesulfonamide (N-n-butyl benzene-sulfonamide) $C_6H_5SO_2NHC_4H_9$.

Properties: Liquid; pleasant odor; amber to straw color; sp. gr. 1.148 (25/25°C); refractive index 1.5235 (25°C); b. p. 189-190°C (4.5 mm).

Uses: Synthesis of dyes; pharmaceuticals, and other organic chemicals; in resin manufacturing; and as plasticizer for some synthetic resins

butyl benzoate (n-butyl benzoate) $C_6H_5COOC_4H_9$

Properties: Colorless oily liquid; insoluble in water; miscible with alcohol or ether
Sp. gr. 1.00 (20°C), b. p. 247.3°C; m. p. -22°C

Grades: Technical.

Uses: Solvent for cellulose ether; plasticizer; perfume ingredient

butyl benzyl phthalate (BBP)

$C_6H_4(COO)_2C_6H_5C_7H_7$.

Properties: Clear, oily liquid. Sp. gr. 1.113-1.121 (25/25°C)

Grades: Technical.

Containers: 5- and 55-gal drums; tankcars.

Uses: Plasticizer for polyvinyl and cellulosic resins

butyl benzyl sebacate $C_4H_9OOC(CH_2)_8COOC_7H_7$.
Ester used as plasticizer.

Typical specifications: Light straw color; b. p. (10 mm) 245-285°C; sp. gr. 1.023 (25°C); wt/gal 8.6 lbs. As a plasticizer it combines the desirable properties of dibenzyl sebacate and dibutyl sebacate (q. v.).

butyl borate. See tributyl borate

n-butyl bromide (1-bromobutane) C_4H_9Br

Properties: Colorless liquid; sp. gr. (20/20°C) 1.279; b. p. 101.6°C, m. p. -112.4°C
Insoluble in water; soluble in alcohol and ether

Grade: 99.7%

Use: Alkylating agent.

sec-butyl bromide (2-bromobutane)

$CH_3CHBrCH_2CH_3$.

Properties: Clear, colorless liquid with pleasant odor; boiling point 91.2°C; sp. gr. 1.2425 (25/25°C); refractive index at 25°C 1.4320-1.4344; soluble in alcohol and ether.

Containers: Steel drums

Use: Synthesis

butyl butanoate. See n-butyl butyrate.

n-butyl butyrate (butyl butanoate)

$CH_3(CH_2)_2COOC_4H_9$.

Properties: Colorless liquid; sp. gr. 0.8721 (20/20°C); refractive index (n 20/D) 1.4059; m. p. -91.5°C; b. p. 165.7°C (36 mm); slightly soluble in water; soluble in alcohol and ether.

butylcarbamoylsulfanilamide. See 1-butyl-3-sulfanilylurea.

n-butyl carbinol. See n-amyl alcohol, primary
sec-butyl carbinol. See 2-methyl-1-butanol.

butyl "Carbitol." ²¹⁴ $C_4H_9OCH_2CH_2OCH_2CH_2OH$.
Trademark for diethylene glycol monobutyl ether (q. v.).

butyl "Carbitol" acetate. ²¹⁴ Trademark for diethylene glycol monobutyl ether acetate, $CH_3CO(OC_2H_4)_2OC_4H_9$ (q. v.).

para-tert-butylcatechol (4-tert-butyl-1,2-dihydroxybenzene) $(CH_3)_3CC_6H_3(OH)_2$.

Properties: Colorless crystals; m. p. 56-57°C; sp. gr. 1.049 (60/25°C); b. p. 285°C; soluble in ether, alcohol, and acetone; slightly soluble in water at 80°C.

Containers: Glass bottles; lined drums

Use: Polymerization inhibitor.

Warning: Causes skin irritation. Causes burns when moist. MCA warning label.

Shipping regulations: None. *

butyl "Cellosolve." ²¹⁴ Trademark for ethylene glycol monobutyl ether, $CH_2OHCH_2OC_4H_9$ (q. v.).

butyl "Cellosolve" acetate. ²¹⁴ Trademark for ethylene glycol monobutyl ether acetate (q. v.).

butyl chloral (2,2,3-trichlorobutanal; tri-chlorobutyraldehyde; crotonchloral)
 $CH_3CHClCCl_2CHO$

Properties: Colorless, oily liquid with pungent odor. B. p. 164.5-165.5°C; sp. gr. 1.3956 (20/4°C); refractive index (n 20/D) 1.47554. Forms a crystalline hydrate. Soluble in water; miscible with alcohol and ether. Polymerizes.

Derivation: By the action of chlorine on acetaldehyde or paraldehyde; or from crotonaldehyde, hydrogen chloride, and chlorine

Use: Medicine

butyl chloral hydrate (trichlorobutyraldehyde hydrate) $CH_3CHClCCl_2CH(OH)_2$.

Properties: Colorless leaflets; sp. gr. 1.693 (20/4°C); m. p. 78°C. Slightly soluble in water; soluble in alcohol and ether.

Derivation: Action of chlorine on paraldehyde.

Use: Medicine

n-butyl chloride (1-chlorobutane)

$CH_3CH_2CH_2CH_2Cl$ or C_4H_9Cl .

Properties: Colorless liquid. Insoluble in water. Miscible with alcohol and ether. Water is insoluble in butyl chloride

Constants: Sp. gr. 0.8875 (20/20°C); b. p. 78.6°C; wt/gal 7.35 lbs (20°C); refractive index 2.4015 (20°C); vapor pressure 80.1 mm (20°C); f. p. -122.8°C; viscosity 0.0045 poise (20°C); flash point 15°F (open cup). Extremely flammable!

Typical specifications: (a) Distillation range 71-86°C with 95% distilling between 76 and 79.5°C; purity 99.11%; (b) color water-white; sp. gr. (20°C) 0.88-0.89; water content none; acidity as hydrochloric acid not over 0.01%; not more than 25% boils below 77.5°C; wt/gal 7.35 lbs.

Grades: N. F. XI; technical.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Containers: 1- and 5-gal cans; 55-gal drums.
- Uses: Organic synthesis (alkylating agent, butyl cellulose), solvent; anthelmintic.
- Danger! Extremely flammable; avoid prolonged breathing of vapor. MCA warning label.
- Shipping regulations: Flammable liquid Red label.*
- butyl citrate.** See tributyl citrate.
- tert-butyl-meta-cresol (MBMC)**
 $\text{CH}_3\text{C}_6\text{H}_4\text{OC}(\text{CH}_3)_3$
 Properties: Clear liquid that solidifies slightly below room temperature; f. p. 23.1°C; b. p. 244°C; sp. gr. 0.922 (80°C). Soluble in organic solvents and aqueous potassium hydroxide.
- Containers: 5- and 55-gal drums; tank cars.
- Uses: Germicide; disinfectant; synthesis of antioxidants and rubber-processing chemicals; additives to lubricating oils; in synthetic resins; in perfumes as a fixative.
- butyl crotonate** $\text{CH}_3\text{CH}:\text{CHCOOC}_4\text{H}_9$
 Properties: Water-white liquid; pleasant, persistent odor.
- Constants: Sp. gr. 0.9037 (20/20°C); b. p. 180.5°C; wt/gal 7.52 lbs (20°C); soluble in alcohol and ether; insoluble in water
- butyl cyclohexyl phthalate.**
 Properties: Clear liquid; very mild, characteristic odor; color (Hazen) 80 max; sp. gr. 1.078; saponification number 369; acidity (as phthalic acid), 0.01% max; miscible with most organic solvents.
- Containers: Drums; tank trucks; tankcars.
- Use: Plasticizer for polymers and elastomers.
- n-butylidiamylamine** $\text{C}_4\text{H}_9\text{N}(\text{C}_5\text{H}_{11})_2$
 Properties: Sp. gr. (20°C) 0.788; boiling range 229-241°C; color light straw; odor amine; flash point 200°F.
- Shipping regulations: None.*
- n-butylidichloroarsine** $\text{C}_4\text{H}_9\text{AsCl}_2$
 Properties: Oily liquid. Somewhat agreeable odor. Decomposed by water.
- Caution! Very irritant! B. p. 192-194°C.
- Derivation: Interaction of hydrochloric acid and n-butylarsenic acid in the presence of sulfur dioxide.
- 1-n-butyl-3-(3,4-dichlorophenyl)-1-methylurea (neburon)** $\text{Cl}_2\text{C}_6\text{H}_3\text{NHCONCH}_3(\text{C}_4\text{H}_9)$
 Properties: White crystalline solid; m. p. 102°C; very low solubility in water and hydrocarbon solvents. Stable towards oxidation and moisture.
- Use: Weed killer.
- n-butyl diethanolamine** $\text{C}_4\text{H}_9\text{N}(\text{CH}_2\text{CH}_2\text{OH})_2$
 Properties: Liquid; sp. gr. (20°C) 0.97; b. p. 272°C; color very light straw; odor faint amine; wt/gal 8.08 lbs (20°C); flash point 245°F
- Shipping regulations: None.*
- butyl diglycol carbonate** (diethylene glycol bis(n-butylcarbonate) $\text{C}_{14}\text{H}_{26}\text{O}_7$
 Properties: Colorless liquid of low volatility; insoluble in water (very stable to hydrolysis by water); widely soluble in organic solvents; compatible with many resins and plastics.
- Typical specifications: Sp. gr. 1.07 (20/4°C); boiling range 164-166°C (2 mm); flash point 475°C; Saybolt viscosity 21 cps (20°C); refractive index 1.435 (20°C); evaporation rate 0.59 mg/sq cm/hr (100°C).
- Uses: Plasticizer; high-boiling-point solvent and softening agent; manufacture of pharmaceuticals and lubricant compositions.
- 4-tert-butyl-1,2-dihydroxybenzene.** See para-tert-butylcatechol.
- 5-tert-butyl-4,6-dinitrohemimellitene.** See "Musk Tibetene."
- 2-sec-butyl-4,6-dinitrophenol.** See dinitro-ortho-sec-butylphenol.
- 4-butyl-1,2-diphenyl-3,5-pyrazolidinedione.** See phenylbutazone.
- "Butyl Eight."® Trade name for an ultra-accelerator of the dithiocarbamate type
- Properties: Dark red liquid, odor distinct; sp. gr. 1.01; non-toxic. Partly soluble in water; soluble in acetone, benzene, carbon disulfide, chloroform, and gasoline.
- Use: Ultra-accelerator in self-curing naphtha cements for proofing and for self-curing calendered and tubed goods.
- butylene.** See butene-1; cis-butene-2; trans-butene-2; isobutene.
- 1,3-butylene glycol** (1,3-butanediol)
 $\text{HOCH}_2\text{CH}_2\text{CH}(\text{OH})\text{CH}_3$
 Properties: Practically colorless, odorless liquid; hygroscopic; sp. gr. 1.0059 (20/20°C); 8.4 lbs/gal (20°C); b. p. 207.5°C (760 mm); vapor pressure 0.06 mm (20°C); refractive index 1.4401 (20°C); flash point (Cleveland open cup) 250°F; completely soluble in water and alcohol; slightly soluble in ether.
- Derivation: Reduction of aldol.
- Containers: Drums; tankcars.
- Uses: Polyesters; polyurethanes; surface active agents; plasticizers; humectant; coupling agent
- 1,4-butylene glycol** (1,4-butanediol; tetramethylene glycol) $\text{HOCH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{OH}$
 Properties: Colorless, oily liquid. B. p. 230°C; m. p. 16°C; sp. gr. 1.020 (20/4°C). Miscible with water; soluble in alcohol; slightly soluble in ether.
- Derivation: From acetylene and formaldehyde by the Reppe process (high pressure synthesis).
- Grades: Technical.
- Containers: Drums; tankcars.
- Uses: Solvents; humectant; intermediate for plasticizers, pharmaceuticals, polyester and polyurethane resins.
- Shipping regulations: None.*
- 2,3-butylene glycol** (2,3-dihydroxybutane), 2,3-butanediol; pseudobutylene glycol; sym-dimethylethylene glycol)
 $\text{CH}_3\text{CHOHCHOHCH}_3$
 Properties: Nearly colorless crystalline

* See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

solid; hygroscopic; sp. gr. 1.045 (20/20°C), m.p. 23-27°C, b.p. 179-182°C; refractive index 1.48 (20°C); solubl. in alcohol and ether; miscible with water in all proportions.

Derivation: From corn sugar by acid hydrolysis; also from fermentation of sugar beet molasses.

Grades: 99%.

Uses: Resins; solvent for dyes; intermediate; blending agent.

Shipping regulations: None.*

butylene glycol, pseudo-. See 2,3-butylene glycol.

butylene oxides C_4H_8O . Mixtures of 1,2- and 2,3-butylene oxides

Typical specification: Nearly colorless liquid; boiling range (5-95%) 60-67°C; sp. gr. 0.826 (25/25°C); refractive index 1.381; flash point 5°F.

Grades: Technical

Uses: Chemical intermediate, especially for various polymers

Shipping regulations: Flammable liquid
Red label.*

1,2-butylene oxide $H_2COCHCH_2CH_3$.

Properties: Colorless liquid, sp. gr. 0.8312 (20/20°C); b.p. 63°C, sets to a glass below -150°C, flash point (closed cup) -1°F. Soluble in water and miscible with most organic solvents

Grades: About 97.5% purity

Uses: Intermediate, especially for various polymers

Shipping regulations: Flammable liquid
Red label.*

butyl epoxy stearate.

Properties: Clear, colorless liquid with mild, slightly fatty, slightly fruity odor; sp. gr. (20°C) 0.910; wt./gal. 7.59 lbs

Containers: 1-, 5-gal cans; 55-gal drums, tankcars

Use: Plasticizer for low temperature flexibility improvement of vinyls

n-butylethanolamine $C_4H_9NHCH_2CH_2OH$.

Properties: Sp. gr. (20°C) 0.892; boiling range 194-204°C; color water-white; odor, very faint amine type; flash point 170°F

Shipping regulations: None.*

butyl ether (n-dibutyl ether) $C_4H_9OC_4H_9$.

Properties: Colorless liquid; stable; mild, ethereal odor; sp. gr. 0.7694 (20/20°C), b.p. 142°C (760 mm) vapor pressure 4.8 mm (20°C), flash point 100°F, f.p. -95.2°C; latent heat of vaporization 67.8 cal/g at 140.9°C, refractive index 1.3992 (20°C); wt./gal. 6.4 lbs (20°C);

viscosity 0.0069 poise (20°C)
Typical specification. Sp. gr. 0.7680-0.7710 (20/20°C); boiling range 137-143°C (760 mm); acidity not more than 0.02% (as butyric); miscible with most common organic solvents; immiscible in water.

Grades: Technical

Containers: 1-gal cans; 5- and 55-gal drums; tankcars.

Uses: Solvent for hydrocarbons, fatty

materials; extracting agent; solvent purification, organic synthesis (reaction medium).

Caution: Tends to form explosive peroxides, especially when anhydrous. Avoid prolonged breathing of vapor or contact with skin
MCA warning label

butylethyl acetaldehyde. See 2-ethylhexaldehyde.

5-butyl-5-ethylbarbituric acid. See butethal

n-butyl ethyl ether. See ethyl n-butyl ether.

2-butyl-2-ethylpropanediol-1,3. See 2-ethyl-2-butylpropanediol-1,3.

butyl formate $HCOOC_4H_9$.

Properties: Colorless liquid. Sp. gr. 0.885-0.9108, b.p. 107°C; m.p. -90°C; miscible with alcohols, ethers, oils, hydrocarbons, and water

Grades: Technical.

Uses: Solvent for nitrocellulose, some types of cellulose acetate, many cellulose ethers, many natural and synthetic resins; lacquers; perfumes; organic synthesis (intermediate).

n-butyl furfuryl ether $C_4H_9OCH_2C_4H_3O$.

Properties: Colorless liquid turning dark on exposure to air; extremely hygroscopic, unstable in presence of moisture. Sp. gr. 0.955 (20/0°C); b.p. 189-190°C (765 mm); refractive index (n_D 20/D) 1.4522

Derivation: A reaction of alpha-furfuryl bromide on butyl alcohol

Shipping regulations: None.*

n-butyl furoate $C_4H_9OCO_2C_4H_9$.

Properties: Colorless oil; decomposes on standing. Sp. gr. 1.055 (20/4°C); b.p. 83-84°C (1 mm), 118-120°C at 25 mm. Insoluble in water; soluble in alcohol and ether

butyl glycol phthalate

Properties: Liquid; b.p. 370°C; soluble in most organic solvents

butyl hydride. See butane.

tert-butyl hydroperoxide $(CH_3)_3COOH$. A highly reactive peroxy compound.

Properties: Liquid; m.p. -8°C; decomposes at 75°C; sp. gr. 0.896 (20/4°C). Soluble in organic solvents

Use: Polymerization catalyst

"tert-Butyl Hydroperoxide-70" $(CH_3)_3COOH$.

Properties (typical): Sp. gr. 0.875 (min.) at 25°C; refractive index 1.394 (min.) at 25°C; f.p. -35°C. Slightly soluble in water, very soluble in esters, alcohols, ketones, aliphatic, aromatic and chlorinated hydrocarbons

Containers: 1-7.35-lb polyethylene bottles

Uses: Polymerization catalyst for vinyl type monomers.

Shipping regulations: Red label.*

tert-butylhydroquinone $C_6H_3(OH)_2C(CH_3)_3$.

Chemical intermediate; m.p. 125°C; insoluble in water; soluble in alcohol, acetone and ethyl acetate.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

butyl isodecyl phthalate.

Properties: Clear liquid; mild, characteristic odor, color (Hazen) 50 max; sp. gr. 0.997 (20/20°C); saponification number 310; acidity (as phthalic acid) 0.01% max.
Containers: Drums; tankcars; tank trucks.
Use: Plasticizer.

tert-butylisopropyl benzene hydroperoxide.

Shipping regulations: Oxidizing material.
Yellow label.*

butyl lactate $\text{CH}_3\text{CHOHCOOC}_4\text{H}_9$.

Properties: Water-white, stable, non-toxic liquid. Mild odor. Miscible with many lacquer solvents, diluents, and oils; slightly soluble in water; hydrolyzed in presence of acids and alkalis.

Constants: Sp. gr. 0.974-0.984 (20/20°C), flash point 168°F (Tag open cup); m. p. -43°C; wt per U S gal 8.15 lbs (68°F); b. p. 188°C; refractive index 1.4216 (20°C); vapor pressure 0.4 mm Hg (20°C); latent heat of vaporization 77.4 cal/g (20°C).

Typical specifications: Purity not less than 95% ester, by wt; acidity not more than 0.15% calculated as lactic acid; water no turbidity when one volume is mixed with 19 volumes of 60° B_é gasoline at 20°C, nonvolatile matter not more than 0.01 g when 100 cc are evaporated and heated to constant weight at 120°C; distillation range below 140°C none, between 155 and 195°C not less than 90%, between 187 and 189°C not less than 60%, above 200°C none

Grades: Technical.

Containers: 1-gal cans; 5- and 55-gal steel drums; tank trucks; tankcars

Uses: Solvent for nitrocellulose, ethyl cellulose, oils, dyes, natural gums and many synthetic resins; lacquers; varnishes; inks; stencil pastes; antiskinning agent; chemical (intermediate); perfumes; dry-cleaning fluids; adhesives.

Shipping regulations: None.*

N-n-butyl lauramide $\text{C}_{11}\text{H}_{23}\text{CONHC}_4\text{H}_9$.

Properties: Boiling range 200-225°C at 2 mm; white solid; odor lauric acid; flash point 375°F

Shipping regulations: None *

butyl laurate $\text{C}_{11}\text{H}_{23}\text{COOC}_4\text{H}_9$.

Properties: Liquid with sp. gr. (25°C) 0.855; b. p. (5 mm) 130-180°C; m. p. < -10°C; insoluble in water.

Derivation: Alcoholysis and fractionation of coconut oil.

Containers: Drums

Use: Plasticizer.

n-butyllithium $\text{C}_4\text{H}_9\text{Li}$.

Properties: Liquid at room temperature; sp. gr. 0.68-0.70. Also described as a powder. B. p. 80-90°C (10⁻⁴ mm); soluble in most organic solvents. Usually sold as a solution in the C_3 to C_7 hydrocarbons, in which it is quite stable.

Derivation: Reaction of finely dispersed lithium metal with butyl chloride.

Grades: Sold according to percentage butyllithium in the solution.

Containers: Bottles; cylinders (1-100 lbs

active ingredient); tankcars; tank wagons; multi-unit ton containers.

Uses: As a catalyst in the stereospecific polymerization of isoprene and butadiene; metalating agent for sterically hindered positions; alkylating agent for other metal organics and pharmaceuticals.

n-butylmagnesium chloride $\text{C}_4\text{H}_9\text{MgCl}$

Properties: Flammable liquid; sp. gr. 0.88.

Derivation: From magnesium and butyl chloride.

Grade: Available in solution in ethyl ether.

Containers: Glass bottles; 5-gal drums.

Warning: Flammable.

Use: Grignard reagent, as an alkylating agent.

Shipping regulations: Flammable liquid.

Red label.*

n-butyl mercaptan (1-butanethiol) $\text{C}_4\text{H}_9\text{SH}$.

Properties: A colorless liquid; sp. gr. 0.8412 (20/4°C), refractive index 1.4427 (20/D); flash point 0°C; b. p. 92°C; occurs in the odorous secretion of the skunk. Slightly soluble in water; very soluble in alcohol and ether.

Grades: 95%.

Uses: Intermediate; solvent.

Shipping regulations: Flammable liquid.

Red label.*

sec-butyl mercaptan (2-butanethiol) $\text{C}_4\text{H}_9\text{CH}(\text{SH})\text{CH}_3$.

Properties: Boiling range 73-89°C; sp. gr. (20/4°C) 0.8288; refractive index (20/D) 1.4363; flash point -15°C.

Grades: 95%.

Containers: Cars and drums.

Shipping regulations: Flammable liquid.

Red label.*

tert-butyl mercaptan $(\text{CH}_3)_3\text{CSH}$.

Properties: Colorless liquid with strong skunk odor; sp. gr. 0.79-0.82 (60/60°F); distillation range 62-67°C; refractive index (20/D) 1.422; flash point -15°F; wt/gal 6.71 lbs.

Containers: 1-qt cans; 1-, 5-, 54-gal drums; tank cars.

Use: Intermediate; gas odorant for detecting leaks

Shipping regulations: Flammable liquid.

Red label.*

butyl mesityl oxide. See butopyronoxyl.**n-butyl methacrylate $\text{H}_2\text{C}=\text{C}(\text{CH}_3)\text{COOC}_4\text{H}_9$.**

Properties: Colorless liquid; b. p. 163-164°C; f. p. below -75°C; sp. gr. 0.895 (25/25°C); flash point (open cup) 130°F; readily polymerized; insoluble in water.

Derivation: Reaction of methacrylic acid or methyl methacrylate with butyl alcohol.

Grades: Technical (inhibited).

Containers: Drums.

Uses: Potting compound; cement for optical glass; polymerizable monomer for resins, solvent coatings, adhesives, oil additives; emulsions for textile, leather and paper finishing. See also acrylate resins.

para-tert-butyl-alpha-methylhydrocinnamaldehyde. See "Lilial."

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

n-butyl myristate $\text{CH}_3(\text{CH}_2)_{12}\text{COOC}_4\text{H}_9$. The butyl ester of myristic acid. An oily liquid at room temperature

Typical specification: Color, water-white; saponification number 193-203; f. p. 1-7°C; boiling range 167-97°C at 5 mm sp. gr. (25°C) 0.850-0.858; insoluble in water; soluble in acetone, castor oil, chloroform, methanol, mineral oil, and toluene.

Derivation: Alcoholysis of coconut oil with butyl alcohol followed by fractional distillation.

Containers: 1-, 7-, and 35-lb tins; 400-lb drums.

Uses: Plasticizer; lubricant for textiles, paper stencils; cosmetic preparations

"Butyl Namate." ⁶⁹ Trademark for an aqueous solution of sodium dibutylthiocarbamate; 47% minimum assay.

Properties: Pale amber liquid; sp. gr. 1.09 ± 0.02 at 25°C

Uses: Ultra accelerator for natural and synthetic latices

n-butyl nitrate $\text{C}_4\text{H}_9\text{NO}_3$.

Properties: Sp. gr. (20°C) 1.03, b. p. 123°C; color water-white; odor ethereal. Insoluble in water; soluble in alcohol and ether; flash point 97°F

butyl octadecanoate See butyl stearate

butyl octyl phthalate.

Properties: Clear water-white liquid, mild characteristic odor; sp. gr. 0.991-0.997 (20/20°C), saponification number 298-308. Miscible with most organic solvents

Containers: Drums; tank trucks; tankcars

Uses: Plasticizer for vinyl resins

butyl oleate $\text{CH}_3(\text{CH}_2)_7\text{CH}:\text{CH}(\text{CH}_2)_7\text{COOC}_4\text{H}_9$

Properties: Light-colored, oleaginous liquid, mild odor, insoluble in water; miscible with alcohol, ether, vegetable and mineral oils.

Constants: Sp. gr. 0.873 (20/20°C); flash point 356°F; iodine value 76.8; f. p. opaque at 12°C, solid at -26.4°C; wt./gal. 7.26 lbs (20°C); boiling range 173-227°C (2 mm)

Derivation: Alcoholysis of olein or esterification of oleic acid with butyl alcohol

Containers: 7-, 35-lb tins; 380-lb drums

Uses: Plasticizer; solvent; lubricant; water-resisting agent; coating compositions; polishes; water-proofing compounds.

Shipping regulations: None.*

tert-butyl perbenzoate $\text{C}_6\text{H}_5\text{CO}_2\text{O}_2\text{C}(\text{CH}_3)_3$

Properties: Liquid; sp. gr. 1.04 (25°C); f. p. 8°C, vapor pressure 0.33 mm (50°C); very soluble in alcohols, esters, ethers, ketones.

Containers: 1-, 8-, 40-lb polyethylene bottles

Grades: 95% min.

Uses: High temperature catalyst for polymerization of acrylates, styrene, and curing of polyesters; compounding of silicones and polyethylene.

Shipping regulations: Oxidizing material. Yellow label *

tert-butyl permaleic acid
 $(\text{CH}_3)_3\text{CCO}_2\text{COCH}:\text{CHCOOH}$.

Properties: White crystalline solid; m. p. 114-116°C (dec); slightly soluble in water, cool 5% alkaline solutions and alcohols; moderately soluble in oxygenated organic solvents, polyester monomers; slightly soluble in petroleum ether, carbon tetrachloride, and chloroform; insoluble in benzene.

Grade: 95% pure.

Containers: 1- and 5-lb glass bottles.

Uses: Polymerization catalyst; in bleaching and in pharmaceuticals.

tert-butyl perphthalic acid

$(\text{CH}_3)_3\text{CO}_2\text{COC}_6\text{H}_4\text{COOH}$

Properties: White crystalline solid; m. p. 96-99°C, insoluble in water, soluble in cool 5% alkaline solutions and in alcohols; moderately soluble in oxygenated organic solvents, chlorinated hydrocarbons, polyester monomers; slightly soluble in petroleum hydrocarbons.

Grades: 95% pure

Containers: 1- and 5-lb glass bottles

Uses: Polymerization catalyst and oxidizing agent

ortho-tert-butylphenol $(\text{CH}_3)_3\text{CC}_6\text{H}_4\text{OH}$

Properties: Light yellow liquid, freezing point -65°C, density 0.982 (20°C); b. p. 224°C flash point (open cup) 110°C. Soluble in isopentane, toluene, and ethyl alcohol; insoluble in water

Uses: Chemical intermediate for synthetic resins, plasticizers, surface-active agents, perfumes, and other products.

para-tert-butyl phenol $(\text{CH}_3)_3\text{CC}_6\text{H}_4\text{OH}$.

Properties: White crystalline solid, with a distinctive odor; sp. gr. (crystals) 1.03; sp. gr. (molten) 0.908 (114/4°C); b. p. 239°C; m. p. 98°C

Grades and Containers: Flake in 50-lb bags; molten in insulated tank cars and tank trucks.

Uses: Plasticizer for cellulose acetate; intermediate for antioxidants, special starches, pour-point depressors and emulsion breakers for petroleum oils and some plastics; synthetic lubricants; insecticides; industrial odorants.

2-(para-tert-butylphenoxy)isopropyl 2-chloroethyl sulfite. See aramite

n-butyl phenyl ether $\text{C}_4\text{H}_9\text{OC}_6\text{H}_5$.

Properties: Sp. gr. (20°C) 0.929; boiling range 202-212°C; color water-white; odor aromatic, flash point 180°F.

Shipping regulations: None.*

4-tert-butylphenyl salicylate

$(\text{CH}_3)_3\text{CC}_6\text{H}_4\text{OOCOC}_6\text{H}_3\text{OH}$

Properties: Off-white, odorless crystals; m. p. 62-64°C; soluble in alcohol, ethyl acetate, toluene; insoluble in water

Use: Light absorber, best at 290-330 μ.

n-butylphosphoric acid $\text{C}_4\text{H}_9\text{H}_2\text{PO}_4$.

Properties: Mobile reddish amber liquid; sp. gr. 1.25 (25°C); insoluble in water; can be neutralized with alkalis or amines to give water-soluble salts.

Purity: 97%, with remainder being orthophosphoric acid and n-butyl alcohol

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Uses: Textile and paper processing compounds; catalysts in urea-resin formation; polymerizing agents for resins and oils.

n-butyl propionate $C_2H_5CO_2C_4H_9$.

Properties: Water-white liquid. Apple-like odor. Soluble in alcohol and ether; miscible with all coal-tar and petroleum distillates; very slightly soluble in water.

Constants: Sp. gr. 0.875 (20°C), 0.874 (15.5°C); wt/gal 7.3 lbs; b. p. 146°C (commercial grades boil over a range of 130-150°C due to presence of butyl alcohol and esters); m. p. -89°C; flash point 63°F (approx); dilution ratio (nitrocellulose solution method) with toluol 2.1, with petroleum naphtha 1.2.

Derivation: Esterification of propionic acid with butyl alcohol, with sulfuric acid as a catalyst.

Method of purification: Fractional distillation.

Grades: Technical (85-90% to 95% ester content)

Containers: 1-gal cans; 5- and 55-gal steel drums; tank cars

Uses: Solvent for nitrocellulose retarder in lacquer thinner; lacquers; ingredient of perfumes, flavors

Fire hazard: Flammable; flash point under 80°F. Keep lights and fire away.

Shipping regulations: Flammable liquid. Red label. *

butyl ricinoleate $C_{17}H_{32}(OH)COOC_4H_9$.

Properties: Yellow to colorless oleaginous liquid; soluble in alcohol and ether, insoluble in water

Constants: Sp. gr. 0.916 (20/20°C); b. p. approximately 275°C (13 mm); flash point 220°C (428°F); Saybolt viscosity 112 (100°F); freezing point indefinite, slightly opaque at -30°C, and very viscous at -50°C; wt/gal 7.62 lbs (20°C).

Derivation: Castor oil and butyl alcohol.

Containers: 5-gal cans; 55-gal drums.

Uses: Plasticizer, lubricant.

Shipping regulations: None *

butyl rubber Synthetic rubber produced by copolymerization of isobutene (approx 98%) with a small proportion (2%) of isoprene or butadiene. Polymerization is carried out at -50 to -100°C in a liquid hydrocarbon with aluminum chloride as a catalyst. Its outstanding property compared with other rubbers is impermeability to gases; it is practically the only rubber used in inner tubes and similar gas-retaining applications.

The uncured rubber is tacky, but may be compounded like natural rubber and vulcanized. Butyl rubber has good resistance to chemical attack and aging, even at high temperatures. It has superior vibration insulation characteristics and abrasion resistance, but relatively low tensile strength and poor flame resistance. Tires made entirely of butyl show good friction on wet surfaces and do not squeal. Important uses other than inner tubes are as vibration insulators and electrical insulation for

wires. Available as latex (paper coating, textile treating, leather finishing, adhesive formulation), liquid (roof coatings), and in halogenated forms (high temperature hose). Also used as binder fuel in solid rocket propellants.

butyl stearamide $C_{17}H_{35}CONHC_4H_9$.

Properties: Light straw color; sp. gr. (20/20°C) 0.869; boiling range 195-200°C (2 mm); flash point 430°F; amide odor.

Use: Suggested as a plasticizer and as an intermediate for the synthesis of insecticides, surface-active agents, pharmaceuticals, and textile assistants.

butyl stearate (butyl octodecanoate)

Properties: Colorless, stable, oleaginous material solidifying at about 19°C. Practically odorless, sometimes with faint fatty odor.

Constants: Sp. gr. 0.855-0.860 (25/20°C); m. p. 19.5-20°C; flash point 370°F; wt/gal 7.14 lbs (68°F); refractive index 1.4430 (20°C); b. p. 220-225°C (25 mm).

Miscible with mineral and vegetable oils; soluble in alcohol and ether; insoluble in water.

Derivation: Alcoholysis of stearin or esterification of stearic acid with butyl alcohol.

Grades: Technical.

Containers: 7-, 35-lb tins; 213-, 380-lb drums.

Uses: Constituent in polishes, special lubricants and coatings, lubricants for metals, and in textile and molding industries; in wax polishes as the dye solvent; plasticizer for laminated fiber products, rubber hydrochloride, chlorinated rubber, and cable lacquers; in carbon paper; as an emollient in cosmetic and pharmaceutical products; damp-proofer for concrete.

Shipping regulations: None. *

1-butyl-3-sulfanilylurea (N-(butylcarbamoyl)sulfanilamide; N-sulfanilyl-N-butylurea; carbutamide) $H_2NC_6H_4SO_2NHCONH(CH_2)_3CH_3$. **Properties.** Crystals; m. p. 144-145°C. Soluble in water (pH 5-8).

Derivation: Prepared from butylurea and sulfanilamide.

Use: Medicine.

butyl titanate. See tetrabutyl titanate.

para-tert-butyltoluene. See 1-methyl-4-tert-butylbenzene.

1-butyl-3-para-tolylsulfonylurea. See tolbutamide.

n-butytrichlorosilane $C_4H_9SiCl_3$

Properties. Colorless liquid, b. p. 148.9°C; sp. gr. 1.1608 (25/25°C); refractive index (n_D²⁵) 1.4363; flash point (Cleveland open cup) 126°F. Readily hydrolyzed by moisture, with the liberation of hydrochloric acid.

Derivation: By Grignard reaction of silicon tetrachloride and n-butylmagnesium chloride.

Grades: Technical.

Use: Intermediate for silicones.

* See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Shipping regulations: Corrosive liquid
White label.*

tert-butyltrimethylmethane. See hexamethyl-
ethane.

N-n-butylurea $C_4H_9HNCONH_2$.

Properties: White solid; decomposes on heating; odor none; m. p. $96^\circ C$; soluble in water, alcohol, and ether.

Shipping regulations: None.*

n-butyl vinyl ether. See vinyl n-butyl ether.

butyl xanthate. See xanthic acids.

"Butyl Zincate." ⁶⁹ Trademark for zinc dibutyldithiocarbamate, $[(C_4H_9)_2NC(S)_2]_2Zn$.

Properties: White to cream colored powder; sp. gr. $1.21 \pm .03$; melting range $104-108^\circ C$; Zn content 13-15%; soluble in benzene, carbon disulfide, chloroform, gasoline; insoluble in water, dilute caustic.

Uses: Accelerator in some latex formulations.

butynediol $HOCH_2C \equiv CCH_2OH$.

Properties: White orthorhombic crystals; m. p. $58^\circ C$; b. p. $238^\circ C$; flash point $152^\circ C$, refractive index 1.450 (n 25/D); soluble in water, aqueous acids, alcohol and acetone. Insoluble in ether and benzene. Very reactive! Toxic!

Derivation: By high pressure synthesis from acetylene and formaldehyde. A bismuth copper acetylide catalyst has been used.

Grades: Crystalline solid, 97%; aqueous solution, 35%.

Containers: Drums; tank cars; tank trucks.

Uses: Intermediate; corrosion inhibitor; electroplating brightener; defoliant for agricultural crops, polymerization accelerator; cross-linker

3-butyn-1-ol (beta-ethynyl ethanol)

$HC \equiv CCH_2CH_2OH$.

Properties: Water-white liquid with characteristic odor; sp. gr. 0.9257 ($20/4^\circ C$), refractive index 1.4409 ($20^\circ C$); b. p. (760 mm) $128.9^\circ C$; f. p. $-63.6^\circ C$.

Uses: Preparation of perfume bases, acetylenic esters, plastics, plasticizers, pharmaceuticals, wetting agents, medicinal, and organic synthesis.

"Butyn Sulfate." ³ Trademark for butacaine sulfate (q.v.)

butyraldehyde (butaldehyde, n-butanal; n-butyl aldehyde; butyric aldehyde) $CH_3(CH_2)_2CHO$.

Properties: Water-white liquid; characteristic, pungent, aldehyde odor. Flammable. Sp. gr. 0.8048 ($20/20^\circ C$); b. p. $75.7^\circ C$ (760 mm); vapor pressure 91.5 mm ($20^\circ C$); flash point $20^\circ F$; wt/gal 6.7 lbs ($20^\circ C$); coefficient of expansion 0.00114 ($20^\circ C$); freezing point $-99^\circ C$; viscosity 0.0043 poise ($20^\circ C$). Slightly soluble in water; soluble in alcohol and ether.

Derivation: (a) By the Oxo process: the reaction of propylene with carbon monoxide and hydrogen in the presence of a cobalt catalyst; (b) by dehydrogenating butanol vapors over a catalyst, the

butyraldehyde being separated by distillation; (c) by partial reduction of crotonaldehyde.

Grades: Technical (93% min.)

Containers: Drums; tank cars

Uses: Intermediate

Warning: Flammable. Avoid prolonged breathing of vapor. Avoid prolonged or repeated contact with skin. MCA warning label.

Shipping regulations: Flammable liquid. Red label.*

butyric acid (n-butyric acid; butanoic acid; ethylacetic acid; propylformic acid). $CH_3CH_2CH_2COOH$.

Properties: Colorless limpid liquid; rancid odor; refractive index 1.3981 ($20^\circ C$); sp. gr. 0.9583 ($20/4^\circ C$); m. p. -5.0 to $-8^\circ C$; b. p. $163.5^\circ C$ (757 mm), $75^\circ C$ (25 mm); vapor pressure 0.84 mm ($20^\circ C$); flash point $170^\circ F$; viscosity 1.61 cps ($20^\circ C$); slightly soluble in water; miscible with alcohol and ether.

Typical specifications: Purity not less than 99%; sp. gr. 0.957-0.961 ($20/20^\circ C$); boiling range (760 mm) below $158^\circ C$ none, above $165^\circ C$ none, esters not more than 0.5%; chlorides none; average wt 7.99 lbs/gal ($20^\circ C$).

Derivation: Occurs as glyceride in animal milk fats. Produced as a byproduct in hydrocarbon synthesis, by oxidation of n-butyraldehyde, and by butyric fermentation of molasses or starch.

Grades: 90%; 95%; 99%; edible; synthetic; reagent; technical

Containers: 1-gal cans; 5-, 55-, 110-gal drums; tank cars

Uses: For synthesis of butyrate ester perfume and flavor ingredients; tanning and deliming; butter making; pharmaceuticals; water purification; varnish; disinfectants; emulsifying agents, for sweetening gasolines

butyric alcohol. See n-butyl alcohol

butyric aldehyde. See butyraldehyde

butyric anhydride $(CH_3CH_2CH_2CO)_2O$

Properties: Water-white liquid. Hydrolyzes to butyric acid in the presence of water. Sp. gr. 0.9681 ($20/20^\circ C$); m. p. $-75^\circ C$; b. p. (760 mm) $199.5^\circ C$; vapor pressure 0.3 mm ($20^\circ C$); flash point $190^\circ F$; wt/gal 8.1 lbs ($20^\circ C$); coefficient of expansion 0.00100 ($20^\circ C$); freezing point $-65.1^\circ C$; viscosity 0.0159 poise ($20^\circ C$), decomposes in water.

Typical specifications: Purity not less than 85%; sp. gr. 0.965-0.970 ($20/20^\circ C$); color water-white; boiling range (760 mm) below $190^\circ C$ none, above $200^\circ C$ none, below $195^\circ C$ not more than 10%; average wt/gal 8.05 lbs ($20^\circ C$).

Grades: Technical.

Containers: 1-gal glass jugs; 5- and 12-gal (returnable) glass carboys; 55-gal (returnable) aluminum drums.

Use: Manufacture of various butyrates, drugs, and tanning agents

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

butyrolactone $\text{OCH}_2\text{CH}_2\text{CH}_2\text{CO}$

Properties: Colorless liquid with pleasant odor B p. 240°C , m p. -44°C , sp. gr. 1.144; flash point 209°F . Miscible with water, alcohol and ether

Derivation: By high pressure synthesis from acetylene and formaldehyde.

Grades: Technical.

Containers: Drums; tank cars.

Uses: Intermediate for butyric and succinic acids; solvent for resins; in paint removers; petroleum processing.

butyrone. See dipropyl ketone.

butyronitrile (propyl cyanide; butanenitrile) $\text{CH}_3(\text{CH}_2)_2\text{CN}$.

Properties: Colorless liquid; sp. gr. (15°C) 0.796; m. p. -112.6°C ; b. p. $116-117.7^\circ\text{C}$ Slightly soluble in water; soluble in alcohol and ether.

Containers: Drums and tank cars.

Uses: Basic material in industrial, chemical and pharmaceutical intermediates and products; poultry medicines.

butyryl chloride (butyryl chloride; butanoyl chloride) $\text{C}_3\text{H}_7\text{COCl}$

Properties: Clear colorless liquid with characteristic pungent acid chloride odor Reacts with alcohol and water; infinitely miscible with ether. Freezing point -89°C ; distillation range $100-110^\circ\text{C}$; sp. gr. 1.028 (15°C), refractive index 1.4121 (n 20/D).

Containers: 5-, 13-gal glass carboys.

Use: Organic synthesis.

butyryl chloride. See butyryl chloride.

"Buxine." ²²⁷ Trademark for amylcinnamic aldehyde (alpha-n-amy-beta-phenylacrolein). minimum 97% pure.

Properties: Clear yellow liquid; color No. 15' maximum; strong floral odor, suggesting jasmin and lily Sp gr. 0.963-0.968 ($25/25^\circ\text{C}$), refractive index 1.5540-1.5590 (20°C); flash point (Tag closed cup) 221°F . Clearly soluble in 6 parts of 80% alcohol.

Occurrence: Not found in nature.

Uses: In jasmin perfumes; in soap perfumes.

BVE. Abbreviation for butyl vinyl ether. See vinyl n-butyl ether

"BWH-1." ²⁴⁸ Trademark for a specially selected mixture of plasticizing oils.

Properties: Free-flowing, dark brown liquid; sp gr. 1.01, soluble in acetone, benzol and ethylene dichloride; insoluble in water and gasoline.

Uses: Rubber plasticizer and reclaiming oil.

"B-X-A." ²⁴⁸ Trade name for a diarylamine-ketone-aldehyde reaction product.

Properties: Brown powder; sp. gr. 1.10; melting range, $85-95^\circ\text{C}$; store in a cool place. Soluble in acetone, benzol and ethylene dichloride; insoluble in water and gasoline Used as rubber antioxidant.

"BxDC." ¹⁷⁷ Trademark for butoxyethyl diglycol carbonate.

"B. Y." ³¹⁹ Trademark for dried fermentation solubles used as animal feed supplements.

* See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

C

C. Symbol for carbon.

C. Abbreviation for centigrade.

"C₂." ⁸⁴ Brand name of a proprietary product, a sodium chlorite product that bleaches paper pulp (wood, rag, flax) to high brightness without degradation of the fibers. Also used as a slimicide and biocide in paper machines

"C-46," ³⁰⁶ Trademark for hexachlorobutadiene.

"C-56," ³⁰⁶ Trademark for hexachlorocyclopentadiene (q. v.)

"C-64," ²³³ Trademark for a proprietary synthetic aromatic chemical Colorless, crystalline material; soluble even in diluted alcohol; powerful spicy odor with a slight camphoraceous touch, somewhat reminiscent of patchouli oil

"C-66 (Dow)," ²³³ Trademark for a proprietary synthetic aromatic chemical Colorless liquid; soluble in alcohol and essential oils; fresh neutral floral note.

CA. Abbreviation for cellulose acetate and cortisone acetate.

Ca. Symbol for calcium.

ca. Abbreviation for circa, meaning about or approximately.

C₃A. Abbreviation for tricalcium aluminate, as used in cement. See cement, Portland

CAB. Abbreviation for cellulose acetate-butyrate.

"Cab-O-Lite" ²⁷⁵ (wollastonite, CaSiO₃) Trade name for brilliant white nonmetallic mineral extender pigment for paints; filler for ceramics; mineral filler for polyester resins.

"Cab-O-Sil," ²⁷⁵ Trade name for anhydrous and particulate colloidal silica; reinforcing, thixotropic, thickening and gelling, suspending, flattening, anticaking, antislip agent.

Uses: In plastics, silicones, rubber, paints, varnishes and lacquers, printing inks, adhesives, pharmaceuticals, cosmetics, floor waxes, lubricating oils and greases, sealants, reproduction paper, dusting powders, sulfur and low temperature thermal insulation.

cacao (cocoa). Powder prepared from roasted cured kernels of ripe seed of Theobroma cacao.

Properties: Weak reddish to brown powder, with chocolate-like taste and odor.

Grade: U. S. P. XVI.

Use: Flavoring agent for pharmaceuticals.

cacao beans. Seed of the cacao tree, Theobroma cacao, native to Mexico, West Indies, and South America and cultivated in all tropical countries The seeds contain from 50 to 57% cacao butter. Used in the manufacture of cocoa, chocolate, cacao butter, and theobromine.

cacao butter (theobroma oil; cocoa butter; cacao oil). The fat obtained from the roasted seed of Theobroma cacao.

Properties: Yellowish-white, brittle solid with chocolate-like taste and odor. Sp. gr. 0.858-0.864 (100/25°C); m.p. 30-35°C; refractive index (n_D 40) 1.4537-1.4585; saponification number 188-195; iodine number 35-43; solidification range 45-50°C. Insoluble in water; slightly soluble in alcohol; soluble in boiling dehydrated alcohol; freely soluble in ether and chloroform.

Derivation: From the cacao bean, by expression, decoction, or extraction by solvent.

Chief constituents: Glycerides of stearic, palmitic, and lauric acids

Grades: Crude; refined; U. S. P. XVI (as theobroma oil).

Containers: Tins; bags; barrels.

Uses: Confectionery and pharmaceuticals; soaps.

Shipping regulations: None.*

cacao oil. See cacao butter.

C acid. See 2-naphthylamine-4,8-disulfonic acid

cacodylic acid (dimethylarsinic acid) (CH₃)₂AsOOH.

Properties: Colorless, odorless, deliquescent crystals; poisonous! M p. 200°C; soluble in water, alcohol, and acetic acid; insoluble in ether.

Derivation: (a) By distilling a mixture of arsenic trioxide and potassium acetate and oxidizing the resulting product with mercuric oxide; (b) hydrolysis of dimethyltrihaloarsine.

Grades: C P.

Containers: 1- and 5-lb glass bottles.

Use: Synthesis of dyes, drugs and perfumes; preparation of cacodylates; making dimethylarsine and derivatives; herbicide.

Shipping regulations: Poison, class B.

Poison label.*

"Cadallume L," ⁷²

Trade name for materials for bright cadmium plating; includes cadmium oxide, sodium cyanide and proprietary brighteners.

*See "I. C. C. Shipping Regulations," page xiii. *

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

"Cadalyte," ²⁸ Trademark for a series of cadmium electroplating compounds.

"Cadalyte" Bright Dip Clear, colorless liquid; corrosive; miscible with water.

"Cadalyte" Brightener. Light brown, free-flowing, fine powder.

"Cadalyte" Maintenance Compound. Buff-colored, free-flowing, fine powder; water-soluble. Contains "Cadalyte" Brightener and sodium cyanide in proportions consumed in cadmium plating.

Containers: 100-lb drums.

Uses: Replenishing "Cadalyte" cadmium plating baths

"Cadalyte" Plating Salts. Reddish-brown powder consisting of a mixture of sodium cyanide, cadmium oxide, and brighteners; contains approximately 19.2% cadmium. Free-flowing, water-soluble, stable.

Containers: 50-lb drums

Uses: To prepare cadmium plating baths which deposit cadmium in a bright, ductile, adherent form on iron and steel to prevent rusting and corrosion

cadaverine (1,5-diaminopentane; pentamethylenediamine) $\text{NH}_2(\text{CH}_2)_4\text{NH}_2$. A ptomaine formed in the decay of animal bodies; relatively nonpoisonous

Properties: Syrupy colorless fuming liquid; m.p. +9°C; b.p. 178-179°C; soluble in water and alcohol; slightly soluble in ether

Uses: Preparation of high polymers; intermediate; biological research.

"Caddy," ⁴⁹ Trade name for a liquid cadmium fungicide used on turf grass

cade oil (juniper tar; juniper tar oil)

Properties: Thick, clear, dark brown liquid; tarry odor; burning, bitter taste. Chief known constituent: cadinene $\text{C}_{15}\text{H}_{24}$. Sp.gr. 0.950-1.055; soluble in ether, glacial acetic acid, chloroform; partially soluble in alcohol; very slightly soluble in water

Derivation: By the dry distillation of the wood of *Juniperus oxycedrum*.

Method of purification: Rectification

Grades: Technical; U.S.P. XVI.

Containers: 1-, 5-, 10-lb bottles; 25-lb tins.

Uses: Soap; pharmaceuticals; perfumery (Russian leather type odors)

Shipping regulations: None.*

"Cadminate," ³²⁹ Trademark for a cadmium-containing turf fungicide. It is used for the prevention and cure of dollar spot, copper spot and red thread (pink patch). It can be mixed with water and sprayed.

Containers: 1/2-oz paper packets (32/canister); bulk.

cadmium Cd Element of atomic number 48, of group II of the periodic system.

Properties: Soft, blue-white, ductile, malleable metal, or grayish-white powder.

Tarnishes in moist air; metal becomes brittle at 80°C and burns when heated.

Toxic. Sp.gr. 8.642 (17°C); m.p. 320.9°C; b.p. 767°C; soluble in acids and in ammonium nitrate solutions; insoluble in water.

Derivation: Occurs chiefly as greenockite (CdS) associated with zinc blende; cadmium

content of the blende is usually less than 1%. Cadmium is therefore ordinarily obtained as a by-product in zinc (and lead) production. It is more volatile than zinc and distills over in the first stages of zinc distillation; the resulting high-cadmium spelter is redistilled (often refluxed) and refined by distillation at 800°C in the presence of coal. Cadmium is also recovered electrolytically from zinc-dust residues of electrolytic zinc plants and from lead blast-furnace dust.

Grades: Technical; powder; pure sticks; ingots; slabs; anodes; etc.; high purity (less than 10 ppm impurities).

Uses: Cadmium plating; manufacture of cadmium salts; cadmium-vapor lamps; smoke bombs; small-arms ammunition; white pigment; bearing and low-melting alloys; electric instruments; incandescent light filaments; aluminum solder; substitute for tin in solders; dental amalgams; ceramic coatings; deoxidizer in metallurgy; coloring glass; nickel plating; process engraving; lithography; Weston standard cell; nickel-cadmium storage battery. See also cadmium plating.

cadmium acetate $\text{Cd}(\text{CH}_3\text{COO})_2 \cdot 3\text{H}_2\text{O}$.

Properties: White monoclinic crystals; slight odor of acetic acid; sp.gr. 2.01; m.p., loses water at 130°C; soluble in water, alcohol, and ether.

Derivation: Interaction of acetic acid and cadmium oxide.

Grades: Technical.

Uses: Ceramics (iridescent glazes); manufacture of acetates; assistant in dyeing and printing textiles; dentistry; laboratory reagent.

cadmium ammonium bromide (ammonium-cadmium bromide) $\text{CdBr}_2 \cdot 4\text{NH}_4\text{Br}$.

Properties: Colorless crystals. Soluble in alcohol and water.

cadmium-base Babbitt. A bearing metal composed of 95% cadmium and 5% silver. Used for relatively high temperatures but is susceptible to corrosion. See Babbitt metal.

cadmium borotungstate $2\text{CdO} \cdot \text{B}_2\text{O}_3 \cdot 9\text{WO}_3 \cdot 18\text{H}_2\text{O}$.

Properties: Yellow, heavy crystals. Soluble in water. Solution yellow or light brown

Grades: Technical.

Use: Separating minerals.

cadmium bromate $\text{Cd}(\text{BrO}_3)_2 \cdot \text{H}_2\text{O}$.

Properties: White crystals or crystalline powder; sp.gr. 3.758; m.p., decomposes. Soluble in water; insoluble in alcohol.

Derivation: By adding cadmium sulfate to a solution of barium bromate.

Method of purification: Recrystallization.

Grades: Pure; reagent.

Containers: Glass bottles; 25-lb tin boxes.

Uses: Analytical reagent.

Fire hazard: Dangerous, oxidizing agent.

cadmium bromide CdBr_2 or $\text{CdBr}_2 \cdot 4\text{H}_2\text{O}$. *

Properties: White to yellowish, efflorescent crystalline powder; sp.gr. 5.192; m.p. 568°C; b.p. 963°C; soluble in water, acetone, and alcohol; slightly soluble in ether.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: By heating cadmium in bromine vapor.

Grades: Technical; reagent.

Containers: Bottles; cans; cases.

Uses: Photography; process engraving; lithography

Shipping regulations: None.*

cadmium carbonate CdCO_3 .

Properties: White, amorphous powder; sp.

gr 4 258; decomposes below 500°C

Soluble in acids (dilute) and in concentrated solutions of ammonium salts; insoluble in water

Grades: Reagent

cadmium chlorate $\text{Cd}(\text{ClO}_3)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Colorless, prismatic crystals.

Hygroscopic Caution! Keep well stoppered! Sp gr 2 28 (18°C); m p. 80°C

Soluble in alcohol and water.

Grades: Technical

Shipping regulations: Oxidizing material.

Yellow label.*

cadmium chloride

(a) CdCl_2 ; (b) $\text{CdCl}_2 \cdot 2\frac{1}{2}\text{H}_2\text{O}$

Properties. Small white crystals, odorless; sp gr. (a) 4.05, (b) 3.327; m. p. (a) 568°C ; b. p. (a) $861\text{--}954^\circ\text{C}$. Soluble in water and alcohol.

Derivation: By the action of hydrochloric acid on cadmium with subsequent crystallization

Method of purification: Recrystallization

Grades: Technical; reagent

Containers: 1- and 5-lb bottles; tins; 400-lb drums

Uses: Preparation of cadmium sulfide; analytical chemistry, photography; dyeing and calico printing, ingredient of electroplating baths; addition to tinning solutions, manufacture of special mirrors, vacuum tube industry

Shipping regulations: None *

cadmium-copper alloy. An alloy of copper with 1% cadmium Sp gr. 8 94 Has been used for trolley wires

cadmium ethylhexoate. See soaps, metallic

cadmium hydrate. See cadmium hydroxide.

cadmium hydroxide (cadmium hydrate) $\text{Cd}(\text{OH})_2$

Properties: White, amorphous powder; sp gr 4 79, m p , loses H_2O (300°C); soluble in ammonium hydroxide and in dilute acids, insoluble in water and alkalies; absorbs carbon dioxide from air.

Derivation: By the action of sodium hydroxide on a cadmium salt solution.

Grades: Technical, C P

Containers: Glass bottles; boxes

Use: Cadmium salts, cadmium plating

Shipping regulations: None *

cadmium iodate $\text{Cd}(\text{IO}_3)_2$

Properties: Fine, white powder; sp. gr. 6 48; m. p. , decomposes; slightly soluble in water; soluble in nitric acid or ammonium hydroxide.

Grades: Technical

Use: Oxidizing agent.

cadmium iodide CdI_2 .

Properties: White, flaky, crystals; odorless; becomes yellow on exposure to air and light. Occurs in two allotropic forms. Sp. gr 5.67 (alpha), and 5.30 (beta); m. p. (alpha) 388°C , m. p. (beta) 404°C ; b. p. (alpha) 712°C ; soluble in water, alcohol, ether, acetone, and ammonia.

Derivation: By the action of hydriodic acid on cadmium oxide

Method of purification: Recrystallization.

Grades: Technical; reagent.

Containers: 1-, 5-, 10-lb bottles; 25-lb fiber drums.

Uses: Photography; medicine; process engraving and lithography; analytical chemistry

Shipping regulations: None.*

cadmium lithopone. See lithopone, cadmium.

cadmium naphthenate. See soaps, metallic

cadmium nitrate $\text{Cd}(\text{NO}_3)_2 \cdot 4\text{H}_2\text{O}$.

Properties: White, amorphous pieces or hygroscopic needles Keep well stoppered. Soluble in water and alcohol; sp. gr. 2.455; m. p. 59.5°C , b p. 132°C .

Derivation: By the action of nitric acid on cadmium or cadmium oxide and crystallization

Grades: Technical; reagent.

Containers: Tins; glass bottles; 400-lb drums

Uses: Ceramic industry for coloring glass and porcelain; laboratory reagent; manufacture of other cadmium salts

Fire hazard: Dangerous

Shipping regulations: Oxidizing material

Yellow label *

cadmium octoate. See soaps, metallic.

cadmium orange. An impure form of cadmium selenide, used as a pigment.

cadmium oxalate $\text{Cd}(\text{COO})_2 \cdot 3\text{H}_2\text{O}$

Properties: White, amorphous powder, soluble in dilute acids, ammonium hydroxide; insoluble in alcohol and water; sp gr 3 32 (dehydrated)

Grades: Technical

cadmium oxide (anhydrous cadmium oxide) CdO

Properties: Yellowish-red or brownish-red to brownish-black powder; sp gr 6.95-8 11; soluble in dilute acids and ammonium hydroxide, insoluble in water

Grades: Technical, C P

Containers: 25- and 50-lb packages

Uses: Addition agent for cadmium-plating baths; pigment in ceramics; chemical catalyst; making cadmium salts.

cadmium oxide, anhydrous. See cadmium oxide.

cadmium phosphate $\text{Cd}_3(\text{PO}_4)_2 \cdot 2\text{CdHPO}_4 \cdot 4\text{H}_2\text{O}$.

Properties: White powder; sp. gr 4 06; soluble in dilute acids; insoluble in water.

Grades: Technical.

cadmium plating. The electrodeposition of cadmium on iron wire, steel articles, etc., to make them relatively rust-proof

cadmium potassium iodide $\text{CdI}_2 \cdot 2\text{KI} \cdot 2\text{H}_2\text{O}$.

Properties: White powder, becomes yellowish

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

with age; deliquescent; soluble in water, alcohol, ether, and acid; sp. gr. 3.359; m. p. 76°C, with decomposition.

Derivation: By combining cadmium iodide and potassium iodide in solution, in proportion of their combining weights and subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical; C. P.

Containers: Tins; glass bottles

Uses: Analytical chemistry; medicine

Shipping regulations: None.*

cadmium propionate $\text{Cd}(\text{OOCCH}_2\text{H}_5)_2$ A solid; used in scintillation counters.

cadmium reds (cadmium selenide lithopone)

Pigments manufactured in a series of shades: light, medium light, medium, deep, and maroon. These colors are prepared by precipitating a highly purified solution of cadmium sulfate with barium sulfide in the presence of selenium, forming co-precipitated pigments, containing cadmium sulfide, cadmium selenide, and barium sulfate, which are furnace treated after precipitation. They are fast to light, insoluble in all vehicles (non-bleeding), have high heat and alkali resistance, have acid fastness, are extremely soft and easily ground, and have low oil absorption and good gloss in enamels. Have a tendency to chalk similar to cadmium yellows, but are sometimes used in automotive finishes. Used in manufacture of lacquers, oil paints, and enamels. The approximate specifications are as follows: Sp gr. 4.30; wt/solid gal 39.70 lbs; 1 lb bulks 0 0250 gal; fineness (residue on 325-mesh screen) 0 06%, oil absorption 17 50.

cadmium resinate. See soaps, metallic

cadmium ricinoleate

$\text{Cd}[\text{CH}_2(\text{CH}_2)_7\text{CHOHCH}_2\text{CH}:\text{CH}(\text{CH}_2)_7\text{CO}_2]_2$. A nearly odorless, fine, white powder derived from castor oil

Properties: M p. 104°C; sp. gr 1.11

Uses: Solutions used to stabilize polyvinyl chloride and copolymers against light and heat

cadmium salicylate $\text{Cd}(\text{C}_7\text{H}_5\text{O}_3)_2 \cdot \text{H}_2\text{O}$

Properties: Colorless crystals or white powder; soluble in water, alcohol, ether, and glycerol.

Derivation: Action of salicylic acid on cadmium oxide.

Use: Medicine.

Shipping regulations: None.*

cadmium selenide CdSe . Usually a red powder, but may also occur gray to brown. Sp gr. 5.81 (15/4°C); m.p. above 1350°C; Insoluble in water; stable at high temperatures. The red powder form is used as a paint pigment that withstands light, acid, alkali, and high temperatures. It also serves to increase abrasion resistance of rubber compounds. See also cadmium reds.

cadmium selenide lithopone. See cadmium reds

cadmium stearate. See soaps, metallic.

cadmium sulfate (a) CdSO_4 ; (b) $3\text{CdSO}_4 \cdot 8\text{H}_2\text{O}$; (c) $\text{CdSO}_4 \cdot 4\text{H}_2\text{O}$.

Properties: Colorless, odorless crystals.

Sp. gr. (a) 4.69; (b) 3.09; (c) 3.05; m. p., (a) 1000°C. Soluble in water; insoluble in alcohol.

Derivation: By the action of dilute sulfuric acid on cadmium or cadmium oxide.

Method of purification: Crystallization.

Grades: Technical; reagent.

Containers: 1-lb bottles; tins; kegs.

Use: Manufacture of normal cadmium electric cells; analytical reagent; medicine; vacuum tube manufacture

Shipping regulations: None *

cadmium sulfide (orange cadmium; orient yellow; aurora yellow; jaune brilliant; greenockite; see also cadmium reds and cadmium yellows) CdS

Properties: Light yellow or orange powder.

Sp. gr. 3.9-4.8; sublimes at 980°C; soluble in acids and ammonia; insoluble in water.

Derivation: (a) By passing hydrogen sulfide gas into a solution of a cadmium salt acidified with hydrochloric acid. The precipitate is filtered and dried (b) Occurs naturally as greenockite (q. v.)

Grades: Technical; N N D ; high purity (single crystals)

Containers: 100-lb kegs; 200-lb cases.

Uses: Pigments and inks; ceramic glazes; soap color; pyrotechnics; topical medicine; phosphors; fluorescent screens; scintillation counters; transistor material.

Shipping Regulations: None *

cadmium tellate. See soaps, metallic

cadmium telluride CdTe .

Properties: Brownish-black, cubic crystals.

Oxidizes on prolonged exposure to moist air. Insoluble in water and mineral acids, except nitric, in which it is soluble with decomposition. M p 1041°C; sp gr 6 2 (15/4°C)

Derivation: Fusion of the elements, reaction of H_2Te and CdCl_2

Use: Semi-conductors

cadmium tungstate (cadmium wolframate)

CdWO_4

Properties: White or yellow crystals or powder. Soluble in ammonium hydroxide; alkali cyanides; insoluble in water or dilute acids.

Derivation: By the interaction of cadmium nitrate and ammonium tungstate

Forms: Single crystal rods; broken crystals (crackle).

Grades: Technical

Containers: Barrels

Uses: Fluorescent paint; x-ray screens; scintillation counters; catalyst.

Shipping regulations: None.*

cadmium wolframate. See cadmium tungstate

cadmium yellows. Cadmium sulfide pigments.

The types in most general use are co-precipitated pigments containing barium sulfate. Cadmium yellows are available in a range of shades from a greenish to a reddish

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

yellow or golden shade, and they have good brilliancy, alkali-fastness and do not darken on exposure to light or in the presence of sulfide fumes. In paints and enamels there is some tendency, however, to become chalky or to develop a whitish film or scum on the surface as the paint film weathers. In tints they do not last well on weathering as the yellow seems to go "out", this is particularly evident in green tints made from combinations of cadmium yellow and some suitable blue or bluish-green. The cadmium yellows have excellent heat resistance which is to be expected since they are furnace-treated pigments. They are used in enamels and also in casein paints

"Cadmolith." ²⁹⁶ Brand name for a line of yellow and red cadmium-lithopone pigments manufactured in a series of shades—primrose, lemon, golden, and orange—by the coprecipitation of a highly purified solution of cadmium sulfate with barium sulfide forming cadmium sulfide and barium sulfate. The red shades also contain selenium. These pigments are fast to light; insoluble in all vehicles (non-bleeding), heat and alkali resistant; acid-fast Soft and easily ground

Typical specifications: Sp. gr. 4.22; wt/solid gal 35.17 lbs; 1 lb bulks 0.02825 gal; fineness (residue on 325-mesh screen) 0.04%, oil absorption 17.69. Used as a pigment in automotive finishes, textile coatings, printing inks, lacquer and rubber.

"Cadox." ⁴¹⁹ Trademark for a series of organic peroxide catalysts

"Cadox" B160 Paste containing 55% benzoyl peroxide with butyl benzyl phthalate

"Cadox" BC. Purified benzoyl peroxide, 50%, with camphor.

"Cadox" BCP. Finely divided, white, free flowing powder, consisting of about 35% benzoyl peroxide Safe to handle without any special precautions. The filler is calcium phosphate.

"Cadox" BDP Paste containing 50% benzoyl peroxide with dibutyl phthalate.

"Cadox" BSA Powdered benzoyl peroxide, 95%, with stearic acid

"Cadox" BSD Thick white paste containing 50% finely milled benzoyl peroxide combined with Dow Corning silicone oil.

"Cadox" BSG. Same with General Electric silicone oil

"Cadox" BTP. Paste containing 50% benzoyl peroxide with tricresyl phosphate.

"Cadox" MDP. 60% methyl ethyl ketone peroxide in dimethyl phthalate Assay 60.0% min. Active oxygen 11.0 ± 0.5% Packing: 1- and 8-lb glass bottles; 40-lb non-returnable "JALINER" drums.

"Cadox" TBH. Water-white liquid consisting essentially of 70% tert-butyl hydroperoxide (g.v.) with di-tert-butyl peroxide.

"Cadox" TDP. Thick paste containing 50% 2,4-dichlorobenzoyl peroxide with dibutyl phthalate as a stabilizer Assay 50.0 ± 1.0%. Active oxygen 2.10 ± 0.04%.

Packing: 1 and 10-lb glass jars; 50-lb drums.

"Cadox" TS-40. Thick paste containing 40% 2,4-dichlorobenzoyl peroxide with silicone fluid.

"Cadox" TS-50. Same with 50% 2,4-dichlorobenzoyl peroxide.

caesium compounds. See corresponding cesium compound

C₄AF. Abbreviation for tetracalcium aluminoferrate, as used in cement. See cement, Portland.

cafea. See coffee.

caffearine. See trigonelline.

caffeine (theine; methyltheobromine; trimethylxanthine C₈H₁₀N₄O₂ · H₂O).

Properties: White, fleecy masses or long flexible, silky, crystals; an alkaloid; loses H₂O at 80°C Efflorescent in air. M p. 236.8°C; soluble in chloroform, slightly soluble in water and alcohol, very slightly soluble in ether. Odorless; bitter taste; solutions neutral to litmus

Derivation: By extraction of coffee, tea, guarana, paraguay tea, or kola nuts; also produced synthetically Much of the caffeine of commerce is a by-product of decaffeinated coffee manufacture.

Method of purification: Recrystallization.

Grades: Technical, U S P. XVI

Containers: 1-lb bottles; 5-, 10-, 25-lb cans, 100-, 150-lb drums.

Uses: Beverages; in medicine in form of basic alkaloid or as the arsenate, arsenite, benzoate, borocitrate, citrate, diiodide, hydriodate, hydrobromide, hydrochloride, phosphate, phthalate, salicylate, sulfate, sodium benzoate, sodium salicylate, valerate, etc., because of their solubility in alcohol, water, and ether.

Shipping regulations: None *

caffeine bromide. See caffeine hydrobromide

caffeine, citrated. White odorless powder, slightly bitter acid taste; corresponds closely to the true salt with the formula C₈H₁₀O₂N₄ · C₆H₈O₇; assay 48.0-52.0% anhydrous caffeine and 48-52% anhydrous citric acid after drying; solubility in water (1:4), complete; soluble in alcohol; 15.0% max. retained on 100 mesh.

Grade: N F. XI

Use: Medicine

caffeine hydrobromide (caffein bromide)

C₈H₁₀O₂N₄ · HBr · 2H₂O.

Properties: Colorless, efflorescent crystals; become brownish on exposure to air; decompose at 80-100°C Soluble in water or alcohol (with decomposition)

Use: Medicine

caffeine sodium benzoate. A mixture of caffeine and sodium benzoate containing 47-50% anhydrous caffeine and 50-53% sodium benzoate.

Properties: White, odorless powder with slightly bitter taste. Slightly soluble in

*See "I C. C. Shipping Regulations" page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

chloroform; soluble in alcohol and water.

Grades: U. S. P. XVI.

Uses: Similar to caffeine, but it is more soluble in water.

cajeputene. See dipentene

cajuput oil (cajuput oil)

Properties: Essential oil. Crude: Bluish-green to green. Rectified: Colorless or yellowish; pleasant camphor-like odor; aromatic taste which at first imparts a burning sensation and later changes to a cooling one; sp. gr. 0.915-0.932 (15°C); optical rotation 0 to -4°; refractive index (n_D 20) 1.4660-1.4720; soluble in alcohol, ether, benzyl benzoate, fixed oils, diethyl phthalate; slightly soluble in mineral oil; insoluble in glycerin.

Chief known constituents: Eucalyptol, alpha-terpineol, pinene.

Derivation: Distilled from the fresh leaves and twigs of several species of *Melaleuca* but mostly from those of *Melaleuca leucadendron*, L.

Containers: Cans.

Uses: Medicine and perfumery.

Shipping regulations: None. *

cajuputol. See eucalyptol.

cajuput oil. See cajeput oil.

cake alum. See aluminum sulfate.

calabar bean. See physostigma

calabarine. See physostigmine.

"**Calade**," ¹⁰⁸ Trademark for a powdered, alkaline sodium hexametaphosphate compound containing wetting agents and an aluminum corrosion inhibitor

Containers: 3-lb 9-oz packages (12/case); 100- and 300-lb drums

Uses: Detergent for dishwashing and general cleaning.

calamine (mineral) (hemimorphite)

$\text{Zn}_4\text{Si}_2\text{O}_7(\text{OH})_2 \cdot \text{H}_2\text{O}$.

Properties: White with delicate blue or green shades, also yellow or brownish-white mineral. Luster, vitreous to pearly. Similar to smithsonite (q. v.) but not identical. Contains 67.5% zinc oxide. Loses water only at a red heat, remains unchanged at 340°C, sp. gr. 3.4-3.5; hardness 4.5-5.0. Pyroelectric.

Occurrence: United States; Europe.

Use: An ore of zinc.

calamine (pharmaceutical) (calamine, prepared). Zinc oxide with a small amount of ferric oxide and containing not less than 98% zinc oxide upon ignition.

Properties: Pink, odorless, almost tasteless powder. Insoluble in water, almost completely soluble in mineral acids.

Grades: U. S. P. XVI.

Containers: Drums.

Use: Medicinal and pharmaceutical products.

calamine, prepared. See calamine (pharmaceutical).

calamintha oil. See marjoram oil.

calamus (sweet flag; calmus; sweet cane; sweet grass).

Derivation: Unpeeled, dried rhizome of *Acorus calamus*.

Habitat: Europe; North America; western Asia; cultivated in Burma and Ceylon.

Containers: Bales, bags

Use: Medicine, source of calamus oil.

Shipping regulations: None. *

calamus oil.

Properties: Yellow to brownish-yellow oil

Chief known constituents: Asarone and eugenol.

Constants: Sp. gr. 0.959-0.970 (15°C); refractive index 1.503-1.510; saponification value 6-20. Slightly soluble in water.

Derivation: By steam distillation of calamus.

Containers: Bottles.

Uses: Preparation of liquors, medicine, perfumery.

Shipping regulations: None. *

"**Calaroc**," ²⁰⁶ Brand name of a range of resinous syrups, used for textile and paper finishing. They are fixed to the fibers by a short heating treatment, and give a resinous finish of the thermo-setting type.

"**Calasec**," ²⁰⁶ Brand name of aqueous syrups of ammonium polymethacrylate. These syrups are used as thickening agents for resinous dispersions, for textile-finishing purposes

"**Calatac**," ²⁰⁶ Brand name of a range of resins, supplied in the form of aqueous dispersions of a polymer, and used for textile finishing. The resins are of the thermoplastic type

calaverite AuTe_2 . One of the gold telluride group of minerals. Corresponds to the same general formula as sylvanite and krennerite (q. v.). Pale bronze-yellow color or tin-white, tarnishing to bronze yellow on exposure. Metallic luster. Contains 40-43% gold, 1-3% silver.

Constants: Sp. gr. 9.0; hardness 2.5.

Occurrence: United States (California, Colorado); Australia; Canada.

Use: Important source of gold.

"**Calcene**," ¹⁷⁷ Trademark for a specially prepared precipitated calcium carbonate for use in rubber compounding.

Properties: Fine particle size (0.1 micron average diameter); low alkalinity; only slight activating effect on cure.

Grades: "Calcene" TM, coated with a rubber-soluble agent; "Calcene" NC, non-coated

Containers: 50-lb paper bags.

Uses: In manufacture of drug sundries, heels, wire insulation, and miscellaneous molded and mechanical rubber goods

calcic liver of sulfur. See lime, sulfated

calciferol. See vitamin D.

calcimine (kalsomine). Essentially chalk and glue in powdered form ready to mix with water. Used as temporary decoration for interior plastic walls. Will not withstand washing.

* See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

calcination. The process of heating a material to a high temperature, but below its fusing point, to cause it to lose moisture or other volatile material or be oxidized or reduced; roasting; e.g., calcining limestone to make lime.

calcined baryta. See barium oxide

calcined clay. Ball clay or china clay that has been heated until combined water is removed and plastic character of the clay is destroyed.

calcite (calc spar) CaCO_3 The most common form of natural calcium carbonate. Dog-tooth spar, Iceland spar, nailhead spar, and satin spar are varieties of calcite crystal. It is the essential ingredient of limestone, marble, and chalk (q.v.).

Properties: Colorless, white, and various colors; vitreous to earthy luster; good cleavage in 3 directions. May contain small amounts of magnesium, iron, manganese and zinc. Effervesces in acid.

Constants: Sp. gr. 2.72; hardness 2.

Uses: As a phosphor; Iceland spar is used in optical instruments; limestone, marble, and chalk have a variety of uses

calcium Ca. Element of atomic number 20, group IIa of the periodic system, one of the alkaline earth elements

Properties: Moderately soft, white metal; brilliant crystalline surface when freshly cut. Keep dry, in well-stoppered bottles. Soluble in acid; decomposes water, liberating hydrogen gas.

Constants: Sp. gr. 1.578 (15°C); m p 810°C, sublimes below its m p in vacuum, b p 1170°C

Derivation: By electrolyzing molten calcium chloride

Forms available: Metallic; crystalline

Containers: Air-tight tins; glass bottles

Uses: Manufacture of intermediates; alloys, dehydrating oils; metallurgical purposes; reducing agent in smelting; decarburization and desulfurization of iron and iron alloys; in place of sodium in chemical reactions; getter in vacuum tubes

Shipping regulations: Flammable solid. Yellow label *

calcium 45. Radioactive calcium of mass number 45.

Properties: Half-life 152 days; radiation, beta; radiotoxicity, very hazardous

Derivation: By pile irradiation of calcium carbonate, by neutron bombardment of scandium, or as a by-product of the irradiation of calcium nitrate for the preparation of carbon 14

Forms available: Calcium chloride in hydrochloric acid solution and solid calcium carbonate.

Uses: As a research aid for studying water purification, calcium exchange in clays, detergency, ion exchange, surface wetting and other surface phenomena, calcium uptake and deposition in bone, soil characteristics as related to soil utilization of fertilizer and crop yield, diffusion

of calcium in glass, etc.

Shipping regulations: Poison, class D, radioactive material. Blue label. *

calcium abietate $(\text{C}_{20}\text{H}_{30}\text{O}_2)_2\text{Ca}$. Product of the action of lime on rosin or resin acids. See abietates; see also calcium resinate.

calcium acetate (vinegar salts; gray acetate; lime acetate; brown acetate)
 $\text{Ca}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot \text{H}_2\text{O}$.

Properties: Brown, gray or white (when pure) powder; amorphous or crystalline; decomposes on heating. Soluble in water; slightly soluble in alcohol.

Derivation: By the action of pyroligneous acid on calcium hydroxide, the solution being filtered and evaporated to dryness, yielding gray acetate of lime.

Grades: Technical (80% basis); reagent; C. P.; pure; brown; gray.

Uses: Medicine; manufacture of acetone, acetic acid, acetates; mordant in dyeing and printing of textiles; stabilizer in resins; additive to calcium soap lubricants.

calcium acetylsalicylate (aspirin, soluble)
 $\text{Ca}(\text{CH}_3\text{COOC}_6\text{H}_4\text{COO})_2 \cdot 2\text{H}_2\text{O}$

Properties: White powder. Aqueous solutions are unstable. Soluble in water.

Derivation: (a) Action of acetylsalicylic acid upon calcium carbonate in the presence of a small amount of water. (b) By passing carbon dioxide into an aqueous solution of calcium carbonate and acetylsalicylic acid

Use: Medicine

calcium acrylate $(\text{H}_2\text{C}:\text{CHCOO})_2\text{Ca}$.

Properties: Free-flowing white powder; soluble in water. Forms a dihydrate which is also a free-flowing powder. Solutions polymerize readily to form a resin, which equilibrates with water

Uses: Soil stabilization; sealing oil wells; ion exchange; binder for clay products and foundry molds

calcium alginate ("Calginate").

Properties: A cream-colored, refined powder, having a moisture content of about 10%; insoluble in hot or cold water with slight swelling; pH about neutral; soluble in alkaline solutions; insoluble in organic solvents

Containers: 10-, 100- and 300-lb drums

Uses: For industrial and pharmaceutical applications.

Shipping regulations: None *

calcium aluminate (tricalcium aluminate)

$3\text{CaO} \cdot \text{Al}_2\text{O}_3$ A refractory, and an important ingredient of cements, especially of aluminous cement. See cement, Portland and other cement articles.

calcium-para-aminosalicylate

$[\text{C}_6\text{H}_3(\text{NH}_2)(\text{OH})\text{COO}]_2\text{Ca} \cdot 3\text{H}_2\text{O}$.

Properties: White to cream-colored crystals or powder. Odorless and has alkaline, slightly bitter-sweet taste. Somewhat hygroscopic. Solutions slowly decompose and darken in color. Soluble in water, methanol and acetone; slightly soluble in alcohol.

*See "I. C. C. Shipping Regulations," page xiii. *

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: Fiber drums.

Grade: N. F. XI.

Use: Medicine.

calcium ammonium nitrate. A homogeneous mixture of about 60% ammonium nitrate and 40% limestone and/or dolomite. It is a fertilizer material containing about 20% nitrogen.

Shipping regulations: Oxidizing material. Yellow label.*

calcium arsenate (tricalcium ortho-arsenate) $\text{Ca}_3(\text{AsO}_4)_2$.

Properties: White powder. Poisonous!

Very slightly soluble in water, soluble in dilute acids.

Derivation: By the interaction of calcium chloride and sodium arsenate

Grades: Technical; C P

Containers: Bottles; bags; 100-lb barrels; multiwall paper sacks

Uses: Insecticide; germicide.

Warning: Poisonous if swallowed. M. C. A. warning label.

Shipping regulations: Poison, class B. Poison label.*

calcium arsenite CaAsO_3H .

Properties: White, granular powder. Poisonous! Insoluble in water; soluble in acids.

Grades: Technical

Containers: Wooden barrels

Uses: Germicides; insecticides.

Shipping regulations: Poison, class B. Poison label *

calcium benzoate $\text{Ca}(\text{C}_6\text{H}_5\text{O}_2)_2 \cdot 3\text{H}_2\text{O}$.

Properties: White powder or crystals, odorless. Keep well stoppered. Soluble in water. Sp. gr. 1.44.

Derivation: Oxidation of toluene followed by precipitation by milk of lime.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine

Shipping regulations: None.*

calcium bichromate. See calcium dichromate.

calcium biphosphate. See calcium phosphate, monobasic

calcium bisulfide. See calcium hydrosulfide.

calcium bisulfite $\text{Ca}(\text{HSO}_3)_2$. Exists only in solution and is really a solution of calcium sulfite in an aqueous sulfur dioxide solution.

Properties: Yellowish liquid with strong sulfur-dioxide odor; sp. gr. 1.06; corrosive to metals. Soluble in water and acids.

Derivation: By the action of sulfur dioxide on calcium hydroxide solution.

Grades: Technical (8° Bé.).

Containers: Iron drums.

Uses: Antichlor in bleaching textiles; paper pulp (dissolving lignin); preservative; bleaching sponges; chromium bisulfite; hydroxylamine salts; germicide; disinfectant.

Shipping regulations: None.*

calcium borocitrate.

Properties: Fine, white powder. Soluble in dilute acids; slightly soluble in water.

Use: Medicine.

calcium bromide $\text{CaBr}_2 \cdot 2\text{H}_2\text{O}$.

Properties: White, granular salt; odorless; sharp saline taste; very deliquescent; m. p. 38°C; b. p. 149-150° (dec). Soluble in water and alcohol; insoluble in chloroform and ether.

Derivation: By the action of hydrobromic acid on calcium oxide, carbonate, or hydroxide and subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical; C P; N. F. XI (84-94% CaBr_2).

Containers: 25-, 100-lb jars; 25-, 100-lb drums.

Uses: Manufacturing mineral waters; photography; medicine; dehydrating agent; food preservative; road treatment; freezing mixtures; sizing compounds; wood preservative.

Shipping regulations: None *

calcium carbide (carbide; acetylenogen) CaC_2 .

Properties: Grayish-black, irregular lumps; must be kept dry Sp. gr. 2.22; m. p. about 2300°C. Decomposes in water, with formation of acetylene gas (flammable) and calcium hydroxide (skin irritant upon prolonged contact)

Derivation: By the interaction of finely pulverized limestone or quicklime with crushed coke or anthracite coal in an electric furnace.

Grades: Technical.

Containers: 2 lbs to 5 tons; metal packages, water and airtight.

Uses: Generation of acetylene gas, for welding, illumination, industrial and synthetic chemical purposes; signal fires; reduction of copper sulfide and metallic oxides; production of calcium cyanamide; manufacture of graphite and hydrogen; electric (dehydrating agent in electrostatic work); desiccated foods (dehydrating agent); synthesis of acetaldehyde and acetic acid; steel hardening

Fire hazard: Must be kept away from water

Shipping regulations: None.*

calcium carbonate CaCO_3 .

Properties of pure calcium carbonate:

White powder or colorless crystals, odorless, tasteless; sp. gr. 2.7-2.95; decomposes at 825°C; insoluble in water and alcohol; soluble in acids with evolution of carbon dioxide

Calcium carbonate is one of the most stable, common, and widely dispersed of materials. It occurs in nature as aragonite, calcite, chalk, limestone, lithographic stone, marble, marl, and travertine.

Powdered calcite or limestone and marble chips are accurate source names, but there is confusion and overlapping among the other names for the powdered varieties.

These are the various whites, whittings,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

and chalks. Precipitated chalk is necessarily a synthetic substance and if of U. S. P. grade must meet the strictest purity requirements of all forms.

Prepared chalk is made from chalk and may be identical with whiting, but if of N. F. grade it also must meet strict purity requirements. Whiting may be powdered chalk or limestone, although chalk was the traditional source

Containers: Wooden barrels; multiwall paper sacks; lined box cars.

Uses: See under various forms listed.

calcium carbonate, precipitated. See chalk, precipitated.

calcium carbonate, prepared. See chalk, prepared.

calcium caseinate.

Properties: White or slightly yellow, nearly odorless powder. Insoluble in cold water; forms a milky solution when suspended in water, stirred and heated

Containers: 100-lb bags.

Uses: Medicine; special foods.

calcium chlorate $\text{Ca}(\text{ClO}_3)_2 \cdot 2\text{H}_2\text{O}$.

Properties: White to yellowish crystals.

Keep well stoppered. Melts when rapidly heated at 100°C. Soluble in water and alcohol. Hygroscopic. Sp. gr. 2.711.

Derivation: By the action of chlorine on hot calcium hydroxide slurry.

Method of purification: Crystallization.

Grades: Technical; reagent

Containers: Iron canisters; glass bottles.

Uses: Photography, pyrotechnics; dusting powder to kill poison ivy

Fire hazard: Dangerous.

Shipping regulations: Oxidizing material. Yellow label.*

calcium chloride (a) CaCl_2 ; (b) $\text{CaCl}_2 \cdot \text{H}_2\text{O}$; (c) $\text{CaCl}_2 \cdot 6\text{H}_2\text{O}$.

Properties: White, deliquescent crystals, granules, lumps or flakes. Keep well closed. Sp. gr. (a) 2.151 (25°C); (c) 1.68 (17°C); m. p. (a) 772°C, (b) 260°C, (c) 30°C; b. p. (a) greater than 1600°C, (c) loses all its water at 200°C. Soluble in water and alcohol.

Derivation: (a) By the action of hydrochloric acid on calcium carbonate and subsequent crystallization. (b) Commercially obtained as a by-product in the Solvay soda and other processes.

Method of purification: Recrystallization.

Grades: C. P.; U. S. P. XVI; technical; solid (73-75%); powder (77-80%); flake (77-80%); liquid (40-45%).

Containers: C. P.: 1-, 5-lb bottles; powder: 400-lb drums; solid: 650-, 655-lb drums; flake: 100-lb bags, 375-, 400-lb drums; liquid: tank cars.

Uses: (a) Road treatment (dust-proofing, thawing snow and ice, binding unpaved surfaces); drilling muds; weighting water for drilling; dustproofing, freezeproofing, and thawing coal, coke, stone, sand, ore; concrete conditioning; paper and pulp industry; fungicides; ballast for weighting

implement tires; (a), (b) and (c) are used in general as a cheap drying agent and chemical reagent.

Shipping regulations: None.*

calcium chlorite.

Shipping regulations: Oxidizing material. Yellow label.*

calcium chromate (gelbin; Steinbuhl yellow; yellow ultramarine) $\text{CaCrO}_4 \cdot 2\text{H}_2\text{O}$. M. p., loses water at 200°C. Soluble in dilute acids and alcohol; slightly soluble in water.

Containers: Bags.

Grades: Technical

Use: Pigment; corrosion inhibitor.

calcium citrate (lime citrate)

$\text{Ca}_3(\text{C}_6\text{H}_5\text{O}_7)_2 \cdot 4\text{H}_2\text{O}$. A by-product in the manufacture of citric acid.

Properties: A white odorless powder; loses most of its water at 100°C and all of it at 120°C. Almost insoluble in water; insoluble in alcohol.

Grades: Reagent; technical.

Containers: Glass bottles; 50-lb boxes; 100-lb kegs; barrels.

Use: Medicine; production of citric acid; dietary supplement.

Shipping regulations: None *

calcium cyanamide (lime nitrogen; cyanamide) CaCN_2 .

Properties: Gray-black lumps or powder; sp. gr. 1.083. Decomposes in water, liberating ammonia

Derivation: Calcium carbide is finely powdered and heated in an electric oven, into which nitrogen is passed. The charge remains in the furnace 24 to 26 hrs. It is then removed and any uncombined calcium carbide is leached out.

Grades: Fertilizer, 21% N; industrial.

Containers: 200-lb bags; drums; bulk in cars.

Uses: Fertilizer; weed killer; nitrogen products; hardening iron and steel.

Shipping regulations: None *

calcium cyanide $\text{Ca}(\text{CN})_2$.

Properties: Colorless crystals or white powder; gray-black (technical); decomposes in moist air liberating hydrogen cyanide. Dissolves in water and very weak acid, with liberation of hydrogen cyanide gas.

Grades: Made in different granulations for different uses.

Containers: 4-oz to 100-lb metal containers.

Uses: Killing ants, rats, mice, moles, and similar burrowing insects and rodents; also for fumigating greenhouses, mushroom houses, flour mills, grain, and seed; for fumigating citrus trees under tents for control of scale insects; leaching of gold and silver ores, other cyanides.

Caution: Liberates poisonous gas; avoid contact with skin and breathing gas or dust. MCA warning label.

Shipping regulations: Poison, class B. Poison label.*

calcium cyclamate (calcium cyclohexylsulfamate) $(\text{C}_6\text{H}_{11}\text{NHSO}_3)_2\text{Ca} \cdot 2\text{H}_2\text{O}$.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Properties:** White, crystalline, practically odorless powder with very sweet taste. Freely soluble in water (solutions are neutral to litmus); practically insoluble in alcohol, benzene, chloroform and ether; pH (10% solution) 5.5-7.5. Sweetening power approximately 30 times that of sucrose.
- Grade:** U. S. P. XVI.
- Containers:** 100-lb drums.
- Uses:** Sweetening agent in certain soft drinks, and in low-calorie and diabetic diets.
- calcium cyclohexenylethylbarbiturate.** See cyclobarbitol calcium.
- calcium cyclohexylsulfamate.** See calcium cyclamate.
- calcium dehydroacetate** ($C_8H_7O_4$)₂Ca. See also dehydroacetic acid.
- Properties:** White to cream powder. Almost insoluble in water and organic solvents.
- Grades:** 96% minimum.
- Use:** Fungicide.
- calcium dibromobehenate** ($C_{22}H_{41}O_2Br_2$)₂Ca.
- Properties:** White to yellow powder, odorless; tasteless. Protect from light. Soluble in ether, chloroform, acetone, carbon tetrachloride, and benzene; insoluble in water or alcohol.
- Use:** Medicine.
- Shipping regulations:** None *
- calcium dichromate** (calcium bichromate) $CaCr_2O_7 \cdot 3H_2O$, or $4.5 H_2O$.
- Properties:** Brownish-red crystals; deliquescent; sp. gr. (4.5 H_2O variety) 2.136. Soluble in water.
- Grades:** Technical; C. P.
- Use:** Corrosion inhibitor.
- calcium dioxide.** See calcium peroxide
- calcium disodium EDTA** (calcium disodium ethylenedinitrilotetraacetate, ethylenediaminetetraacetic acid calcium disodium chelate; edathamil calcium disodium) $C_{10}H_{12}N_2O_8CaNa_2 \cdot 2H_2O$.
- Properties:** White, odorless powder or flakes; soluble in water; insoluble in organic solvents. It acts as a chelating agent for heavy metals.
- Grade:** N. N. D. (edathamil calcium disodium)
- Uses:** Medicine; in foods to "complex" trace heavy metals, and as a preservative; antagusting agent in fermented malt beverages.
- calcium disodium ethylenedinitrilotetraacetate.** See calcium disodium EDTA.
- calcium 2,2'-dithiobisdibenzoate** $Ca(OOCC_6H_4S)_2$. Off-white to grayish powder.
- calcium ethylhexoate.** See soaps, metallic.
- calcium ferrocyanide** $Ca_2Fe(CN)_6 \cdot 12H_2O$.
- Properties:** Yellow crystals; decompose on heating. Soluble in water; insoluble in alcohol; sp. gr. 1.68.
- Derivation:** By decomposing ferriferrocyanide with quicklime in a closed vessel with steam. The solution of calcium ferrocyanide is evaporated and recovered by crystallization.
- Grades:** Technical.
- Containers:** Wooden barrels.
- Use:** For the removal of metallic impurities in the manufacture of citric, tartaric, and other acids.
- Shipping regulations:** None. *
- calcium fluoride** CaF_2 .
- Properties:** White powder, occurring in nature as fluorite (pure form) or fluorspar (mineral). Reacts with hot concentrated sulfuric acid to liberate hydrofluoric acid. Insoluble in water; sp. gr. 3.18.
- Derivation:** (a) By powdering pure fluorite or fluorspar; (b) by the interaction of a soluble calcium salt and sodium fluoride.
- Grades and Uses:** See fluorspar. Single pure crystals of calcium fluoride are also produced, for use in spectroscopy.
- calcium fluosilicate** (calcium silicofluoride) (a) $CaSiF_6$; (b) $CaSiF_6 \cdot 2H_2O$
- Properties:** White, crystalline powder. Sp. gr. (a) 2.662 (17.5°C), (b) 2.254. Very slightly soluble in water.
- Derivation:** By the action of fluosilicic acid on calcium carbonate and subsequent crystallization.
- Method of purification:** Recrystallization.
- Grades:** Technical.
- Containers:** Wooden barrels; multiwall paper sacks.
- Use:** Ceramics.
- Shipping regulations:** None. *
- calcium folinate** (calcium leucovorin) $C_{20}H_{21}CaN_7O_7 \cdot 5H_2O$. The calcium salt of folinic acid, formerly called the citrovorum factor.
- Properties:** Yellowish-white or yellow, odorless microcrystalline powder. Very soluble in water. Practically insoluble in alcohol.
- Grade:** U. S. P. XVI.
- Use:** Medicine.
- calcium fructose diphosphate.** See fructose diphosphates, calcium and barium salts.
- calcium gluconate** $Ca(C_6H_{11}O_7)_2 \cdot H_2O$.
- Properties:** White, odorless, practically tasteless, fluffy powder or granules. Soluble in hot water; less soluble in cold water; insoluble in alcohol, acetic acid, and other organic solvents; specific rotation (20/D) about +6°. Solutions neutral to litmus.
- Derivation:** Neutralization of gluconic acid with lime or calcium carbonate.
- Method of purification:** Crystallization.
- Grades:** Technical; U. S. P. XVI; special for ampules.
- Containers:** Cans; fiber drums; barrels.
- Uses:** Medicine and veterinary medicine
- Shipping regulations:** None. *
- calcium glutamate.** Similar to sodium glutamate (q.v.).
- calcium glycerinophosphate** See calcium glycerophosphate.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

calcium glycerophosphate (calcium glycerino-phosphate) $\text{CaC}_3\text{H}_7\text{O}_2\text{PO}_4$.

Properties: White, crystalline powder; odorless; almost tasteless; slightly hygroscopic; decomposes above 170°C ; slightly soluble in water; insoluble in alcohol.

Derivation: By esterification of phosphoric acid with glycerol and conversion of glycerophosphoric acid to the calcium salt.

Grades: Technical; pure.

Containers: 1-, 5-lb bottles; 5-, 10-, 25-lb tins; 200-lb barrels.

Uses: Medicine and veterinary medicine; stabilizer for plastics; dietary supplement.

Shipping regulations: None.*

calcium glycolate $(\text{CH}_2\text{OHCOO})_2\text{Ca}$.

Properties: White solid.

Grades: Technical

Use: As convenient source of glycolic acid and of the glycolic acid radical in chemical synthesis.

calcium grease. See lubricating greases.

calcium hippurate $\text{Ca}(\text{C}_9\text{H}_9\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$.

Properties: White crystals or powder; soluble in water; sp. gr. 1.32

Derivation: Interaction of calcium carbonate with hippuric acid.

Use: Medicine

Shipping regulations: None *

calcium hydrate. See calcium hydroxide.

calcium hydride CaH_2

Properties: Grayish-white lumps or crystals.

Acted upon by moist air with formation of calcium hydroxide and evolution of hydrogen. Sp. gr. 1.7; decomposes at 675°C . Decomposed by water, acids, and lower alcohols.

Grades: Technical; C. P.

Containers: Drums.

Uses: Reducing agent; drying agent; analytical reagent in organic chemistry; easily portable source of hydrogen; cleaner for blocked-up oil wells.

Caution: Avoid humidity. Flammable gas forms.

calcium hydrosulfide (calcium bisulfide; calcium sulfhydrate) $\text{Ca}(\text{HS})_2 \cdot 6\text{H}_2\text{O}$.

Properties: Colorless, transparent crystals. Soluble in alcohol and water.

Caution: Keep well stoppered! Decomposes in air (15 - 18°C).

Use: Leather industry to produce a smoother leather.

calcium hydroxide (calcium hydrate; lime hydrate; caustic lime; slaked lime) $\text{Ca}(\text{OH})_2$.

Properties: Soft, white crystalline powder with alkaline, slightly bitter taste. Sp. gr. 2.34; m. p., loses water at 580°C . Very slightly soluble in water; soluble in glycerin, syrup, and acids; insoluble in alcohol. Absorbs carbon dioxide from air. Derivation: By the action of water on calcium oxide.

Impurities: Calcium carbonate, magnesium

salts, iron.

Grades: Technical; chemical lime (insoluble matter under 2%, Mg under 3%); building lime; U. S. P. XVI; C. P.

Containers: Wooden barrels; multiwall paper sacks; bulk.

Uses: Mortar; plasters; cements; calcium salts, causticizing soda; hydrogen; depilatory; lime paints; medicine; agriculture (to "sweeten" acid soil); ammonia recovery in gas manufacture; candle manufacture; disinfectant; water softening; purification of sugar juices; hard-rubber products; water paints; soil stabilizers, petrochemicals.

Shipping regulations: None.*

calcium hypochlorite (calcium oxychloride) $\text{Ca}(\text{OCl})_2$.

Properties: White crystalline solid; soluble in water; not hygroscopic; practically clear in water solution. Stable chlorine carrier.

Derivation: The chlorination of a slurry of lime and caustic soda with the subsequent precipitation of calcium hypochlorite dihydrate which is dried under vacuum.

Grades: Commercial (70%); high purity (99.2% available chlorine as calcium hypochlorite).

Containers: Steel drums and cans; plastic and glass bottles.

Uses: Algaecide; bactericide; deodorant; disinfectant; fungicide; and bleaching agent.

Shipping regulations: Oxidizing material.

Yellow label *

See also chlorinated lime.

calcium hypophosphite (lime hypophosphite) $\text{Ca}(\text{H}_2\text{PO}_2)_2$.

Properties: Colorless, transparent crystals or white to grayish white crystalline powder; odorless; nauseous bitter taste; soluble in water; insoluble in alcohol. Explosive when triturated or heated with nitrates, chlorates or other oxidants.

Derivation: By boiling lime, water and phosphorus together, with subsequent crystallization from the solution.

Method of purification: Recrystallization.

Grades: Technical.

Containers: 1-lb bottles; cartons; 5-, 10-, 25-, 50-lb tins; drums.

Use: Medicine.

Caution: Evolves spontaneously flammable phosphine when heated above 300°C .

Shipping regulations: None.*

calcium hyposulfite. See calcium thiosulfate.

calcium iodate $\text{Ca}(\text{IO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: White crystals or powder; odorless; m. p. 35°C , decomposes. Soluble in water and nitric acid; insoluble in alcohol.

Grades: Technical; C. P.

Uses: Deodorant; medicine; mouth washes; feed additive.

calcium iodide $\text{CaI}_2 \cdot 6\text{H}_2\text{O}$.

Properties: Yellowish-white crystals; deliquescent; decomposes in air by absorption of carbon dioxide. Soluble in water, ethyl alcohol, and amyl alcohol; sp. gr. 2.55;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

loses 6 H₂O at 42°C; m. p. 783°C.

Derivation: By the action of hydriodic acid on calcium carbonate.

Method of purification: Crystallization.

Grades: Technical; C P.

Containers: 1-, 5-, 7-lb bottles; 25-lb jars

Use: Photography; medicine.

Shipping regulations: None.*

calcium iodobehenate (C₂₂H₄₂O₂I)₂Ca.

Properties: White or yellowish powder containing approximately 24% iodine; unctuous to the touch; odorless, or slight fatty odor. Soluble in warm chloroform; only slightly soluble in alcohol and ether; insoluble in water.

Derivation: Combination of erucic and hydriodic acids with a soluble calcium salt.

Use: Medicine; feed additive.

Shipping regulations: None.*

calcium lactate Ca(C₃H₅O₃)₂·5H₂O.

Properties: White, almost tasteless powder; almost odorless. Soluble in water, practically insoluble in alcohol. Loses H₂O at 120°C.

Derivation: By neutralizing dilute lactic acid with calcium carbonate and evaporating the solution.

Grades: N F XI; edible.

Containers: 25-, 100-, 200-lb drums

Uses: Medicine, veterinary medicine; in the manufacture of foods, beverages.

Shipping regulations: None.*

calcium leucovorin. See calcium folinate

calcium levulinate

Ca[CH₃CO(CH₂)₂COO]₂·2H₂O.

Properties: White crystalline or amorphous powder, having a faint odor like burnt sugar; bitter salty taste. Freely soluble in water; slightly soluble in alcohol; insoluble in ether and chloroform; m. p. 119-125°C.

Grades: C P; N. N. D

Containers: Drums

Use: Medicine; food additive

calcium lignosulfonate. Used as a binder for non-magnetic ores. See also lignin sulfonates

calcium linoleate Ca(C₁₈H₃₁O₂)₂.

Properties: White, amorphous powder. Soluble in alcohol and ether; insoluble in water.

Derivation: By the interaction of solutions of calcium chloride and sodium linoleate

Grades: Technical.

Containers: Wooden kegs.

Uses: Waterproofing compounds; emulsifying agent and stabilizer for flat paints, fillers, and enamels

Shipping regulations: None.*

calcium magnesium aconitate. See dicalcium magnesium aconitate.

calcium magnesium carbonate. See dolomite.

calcium magnesium chloride (magnesium calcium chloride) CaCl₂·MgCl₂.

Properties: White, deliquescent crystals; soluble in water and acid; insoluble in

alcohol and ether

Derivation: (a) A by-product in the salt industry; (b) by the action of hydrochloric acid on dolomite.

Method of purification: Crystallization.

Grades: Technical

Use: Manufacture of intermediates, dyes, fireproof paints, paper and textile sizing; as preservatives; laboratory reagent; dehydrating starch.

Shipping regulations: None.*

calcium mandelate Ca(C₈H₇O₃)₂.

Properties: White, odorless powder. Insoluble in alcohol; slightly soluble in cold water.

Containers: 150-lb drums.

Use: Medicine and pharmaceuticals.

calcium metasilicate. See calcium silicates.

calcium methylate Ca(OCH₃)₂. A white powder; used as a catalyst intermediate.

calcium molybdate CaMoO₄.

Properties: White, crystalline powder; sp. gr. 4.35; soluble in mineral acids; insoluble in alcohol, ether, or water.

Derivation: By the fusion of calcium oxide and a molybdenum ore.

Grades: Technical.

Containers: Wooden barrels.

Use: Molybdc acid; as alloying agent in the production of iron and steel.

Shipping regulations: None.*

calcium naphthenate.

Properties: Light sticky tenacious mass.

Insoluble in water; soluble in ethyl acetate, carbon tetrachloride, gasoline, benzene and ether.

Derivation: Precipitation from aqueous solution of calcium salts and sodium naphthenate

Containers: Drums.

Uses: Waterproofing compositions; adhesives; wood fillers; grafting waxes; cements; varnishes; color lakes.

calcium beta-naphtholsulfonate

Ca(C₁₀H₆OHSO₃)₂·3H₂O.

Properties: Pale red powder; odorless

Decomposes at about 50°C; soluble in water and alcohol.

Use: Medicine; brewing.

Shipping regulations: None.*

calcium nitrate (lime nitrate; nitrocalcite;

Norge niter; lime saltpeter; Norwegian

saltpeter) (a) Ca(NO₃)₂·4H₂O; (b) Ca(NO₃)₂.

Properties: White, deliquescent mass

Soluble in water, alcohol and acetone.

Sp. gr. (a) 1.82, (b) 2.36; m. p. (a) 42°C, (b) 561°C.

Derivation: By oxidation of ammonia to nitric acid, followed by neutralization with lime.

Method of purification: Crystallization.

Grades: Technical; pure; C. P.; reagent.

Containers: Wooden kegs; glass bottles.

Uses: Pyrotechnics; explosives; matches; fertilizers; other nitrates; incandescent gas mantles; radio tube manufacture; coagulant for rubber latex.

Shipping regulations: Oxidizing material.

Yellow label.*

* See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

calcium nitride Ca_3N_2

Properties: Brown crystals; sp. gr. 2.63 (17°C); m.p. 900°C. Soluble in water with decomposition; soluble in dilute acids; insoluble in absolute alcohol.

calcium nitrite $\text{Ca}(\text{NO}_2)_2 \cdot \text{H}_2\text{O}$

Properties: Colorless or yellowish, brittle lumps. Hygroscopic. Caution! Keep well stoppered! Soluble in water, slightly soluble in alcohol. Sp. gr. 2.23 (34°C, anhydrous), m.p., loses water at 100°C.

Grades: Technical.

calcium octoate. See soaps, metallic**calcium orthophosphate.** See calcium phosphate, tribasic.**calcium orthotungstate.** See calcium tungstate**calcium oxalate** CaC_2O_4

Properties: White, crystalline powder; soluble in dilute hydrochloric acid, dilute nitric acid, insoluble in acetic acid and water. Sp. gr. 2.2.

Grades: Technical; C.P.

Containers: Barrels; bags; kegs.

Use: Making oxalic acid and organic oxalates.

calcium oxide (lime; quicklime; burnt lime, calx; fluxing lime) CaO

Properties: White, or grayish-white hard lumps, sometimes with a yellowish or brownish tint, due to iron; odorless. Crumbles on exposure to moist air. sp. gr. 3.40; m.p. 2570°C; b.p. 2850°C. Soluble in acid; very slightly soluble in water, uniting to form calcium hydroxide.

Derivation: Calcium carbonate (usually limestone; sometimes oyster shells) is roasted in kilns until all of the carbon dioxide is driven off.

Impurities: Calcium carbonate; magnesium, iron, and aluminum oxides.

Grades: N.F. XI; technical; chemical lime, agricultural lime; building lime.

Containers: 1-, 5-lb cans; 25-, 50-lb kegs; wooden barrels; bags, freight cars, multi-wall paper sacks.

Uses (in approximate order of volume): refractory; flux in steel manufacture; construction; pulp and paper; calcium carbide; water treatment; nonferrous metallurgy; glass making; other chemicals; waste treatment; insecticides and fungicides, leather tanning; petroleum refining; food processing, sugar refining; in general, as a cheap industrial alkali.

Caution: Heats upon contact with water or moisture and may cause ignition of organic material.

Shipping regulations: None.*

calcium oxychloride. See calcium hypochlorite.

calcium palmitate $\text{Ca}(\text{C}_{15}\text{H}_{31}\text{CO}_2)_2$. White or pale-yellow powder produced by reacting sodium palmitate with a soluble calcium salt. Insoluble in water; soluble in alcohol or ether. Used as waterproofing agent, thickener for lubricating oils, and in the manufacture of solidified oils. Available only as technical grade.

This material is also an important component of the curdy precipitate formed when hard waters act on soap. It is often referred to as a calcium soap.

calcium pantothenate ($9\text{H}_{16}\text{NO}_5)_2\text{Ca}$, or $[\text{HOCH}_2\text{C}(\text{CH}_3)_2\text{CH}(\text{OH})\text{CONH}(\text{CH}_2)_2\text{COO}]_2\text{Ca}$

The calcium salt of pantothenic acid; possessing vitamin activity. It is available in either the dextro- or racemic forms.

Properties: (both forms identical) White, slightly hygroscopic, odorless powder; sweetish taste; stable in air; solutions have a pH of 7-9; soluble in water and glycerol; insoluble in alcohol, chloroform, and ether. M.p. 170-172°C, dec. 195-196°C; specific rotation (5% aqueous solution) +28.2° (25°C).

Source: Same as pantothenic acid.

Grades: U.S.P. XVI (both forms).

Containers: 1-kilo jars.

Uses: Medicine, nutrition; animal feeds. same biological use as pantothenic acid.

calcium perborate $\text{Ca}(\text{BO}_3)_2 \cdot 7\text{H}_2\text{O}$

Properties: Gray-white lumps or powder.

Soluble in acids; also in water with partial decomposition.

Uses: Medicine; as a bleach; in tooth powders.

calcium permanganate $\text{Ca}(\text{MnO}_4)_2 \cdot 4\text{H}_2\text{O}$

Properties: Violet crystals, deliquescent. Keep well stoppered. Soluble in water and ammonia; decomposed by alcohol.

Grades: Technical; pure.

Containers: Glass bottles, tins; wooden barrels.

Uses: Textile industry; sterilizing water; dentistry; disinfectant; deodorizer; an additive (with hydrogen peroxide) in liquid rocket propellants.

Shipping regulations: Oxidizing material. Yellow label.*

calcium peroxide (calcium superoxide; calcium dioxide) CaO_2

Properties: White or yellowish, odorless, almost tasteless powder. Decomposes about 200°C. Practically insoluble in water, soluble in acids with formation of hydrogen peroxide. Available oxygen 22.2% (min 13.3% in technical grade).

Derivation: By the interaction of solutions of a calcium salt and sodium peroxide, with subsequent crystallization.

Grades: 60-75%

Containers: 25-, 100-, 200-lb drums.

Uses: Seed disinfectant; dentifrices; dough conditioners; medicine; bleaching of oils; modification of starches; high temperature oxidations.

Fire hazard: Dangerous.

Shipping regulations: Oxidizing material. Yellow label.*

calcium phenolsulfonate (calcium sulfocarbolate; calcium sulfophenate; calcium sulfophenylate) $\text{Ca}(\text{C}_6\text{H}_4\text{OHSO}_3)_2 \cdot \text{H}_2\text{O}$

Properties: White, crystalline powder; odorless. Soluble in water and alcohol.

Derivation: By the action of phenolsulfonic acid on calcium hydroxide.

Grades: Technical.

Containers: 1-lb bottles; 5-, 25-lb cans; drums.

Uses: Disinfectant; medicine.

Shipping regulations: None.*

calcium phosphate. See calcium phosphate, dibasic; calcium phosphate, monobasic; or calcium phosphate, tribasic.

calcium phosphate, acid. See calcium phosphate, monobasic.

calcium phosphate, antimoniated (James' powder). Mixture of precipitated calcium phosphate and antimony trioxide in the proportion of 2:1.

Properties: Greenish-gray, gritty powder; odorless; tasteless. Insoluble in water.

calcium phosphate, dibasic (dicalcium orthophosphate; bicalcic phosphate; secondary calcium phosphate) $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$ and CaHPO_4 .

Properties: White, tasteless, crystalline powder; odorless; soluble in dilute hydrochloric, nitric, and acetic acids; insoluble in alcohol; slightly soluble in water.

(Hydrate) sp. gr. 2.306.

Derivation: Interaction of fluorine-free phosphoric acid with milk of lime.

Grades: Food grade; dentifrice grade;

N. F. XI; feed grade, 18 1/2 or 21% P.

Containers: Anhydrous: 50-lb bags; 100-, 350-lb drums; hydrate: 60-, 100-lb bags; 100-, 225-lb fiber drums; feed grade: 100-lb bags; bulk.

Uses: Animal feed supplement; food supplement; dentifrice; medicine; glass; fertilizer; stabilizer for plastics.

Shipping regulations: None.*

calcium phosphate, monobasic (calcium biphosphate; acid calcium phosphate; calcium phosphate, primary; monocalcium phosphate) $\text{CaH}_2(\text{PO}_4)_2 \cdot \text{H}_2\text{O}$.

Properties: Colorless, pearly scales or powder, deliquescent in air. Soluble in water and acids. Aqueous solutions are acid.

Constants: M. p., loses H_2O at 100°C, decomposes at 200°C; sp. gr. 2.20.

Derivation: By dissolving either dicalcium or tricalcium phosphates in phosphoric acid and allowing the solution to evaporate spontaneously.

Grades: Technical; C. P.

Containers: 100-lb bags; 350-lb drums.

Uses: Leavening agent (baking powders); as a plant food; mineral supplement; stabilizer for plastics; to control pH in malt; glass manufacture.

Shipping regulations: None.*

calcium phosphate, precipitated. See calcium phosphate, tribasic.

calcium phosphate, primary. See calcium phosphate, monobasic.

calcium phosphate, secondary. See calcium phosphate, dibasic.

"Calcium Phosphate SF-52." ¹⁷² Trade name for a proprietary product, essentially an anhydrous dicalcium phosphate (see calcium

phosphate, dibasic).

Properties: Greyish-white, granular, free-flowing material, designed especially for stock food enrichment. Particularly suitable in animal salt blocks.

Containers: 100-lb paper bags.

Use: Mineral supplement for animal and poultry feeds.

calcium phosphate, tertiary. See calcium phosphate, tribasic

calcium phosphate, tribasic (calcium orthophosphate; tricalcium phosphate; precipitated calcium phosphate; tricalcium orthophosphate; tricalcic phosphate; tertiary calcium phosphate) $\text{Ca}_3(\text{PO}_4)_2$. (Sometimes contains some $\text{Ca}(\text{OH})_2$). See also bone ash.

Properties: The precipitated product is a white, odorless, tasteless, amorphous powder. Sp. gr. 3.18; m. p. 1670°C. Soluble in acids; insoluble in water, alcohol, and acetic acid. Permanent in air.

Derivation: Found abundantly in nature as phosphate rock, apatite, and phosphorite (q. v.). By the interaction of solutions of calcium chloride and sodium triphosphate with excess of ammonia. By interaction of hydrated lime and phosphoric acid.

Grades: Granular; technical; C. P.; N. F. XI; pure precipitated.

Containers: 60-, 100-lb multiwall paper bags; 100-lb drums.

Uses: Ceramics (porcelains, potteries, enamels, milk glass); calcium acid phosphate; phosphorus and phosphoric acid; polishing powder; cattle foods; clarifying sugar syrups; medicine (food); rubber; mordant (dyeing textiles with Turkey red); fertilizers; dentifrices; stabilizer for plastics.

Shipping regulations: None.*

calcium phosphide (photophor) Ca_3P_2 .

Properties: Red-brown crystals or gray granular masses; sp. gr. 2.51 (15°C); m. p. about 1600°C; decomposed by water to form phosphine, which is spontaneously flammable; insoluble in alcohol and ether.

Note: Authorities differ both as to formula and decomposition product. Some claim the formula to be Ca_2P_2 and state that the gas liberated by contact with water is flammable because impurities are present. Apparently calcium phosphide varies in composition according to its method of preparation.

Derivation: By heating calcium phosphate with aluminum or carbon; by passing phosphorus vapors over metallic calcium.

Grades: Technical.

Containers: Iron canisters.

Uses: Signal fires; torpedoes.

Fire hazard: Dangerous.

Shipping regulations: Flammable solid. Yellow label.*

calcium phosphite $\text{CaHPO}_3 \cdot 2\text{H}_2\text{O}$.

Properties: White powder; loses its water at 200-300° (with decomposition). Slightly soluble in water; insoluble in alcohol.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

calcium phytate (hexacalcium phytate)

Derivation: Corn steep liquor.

Containers: 50-lb bags.

- Uses: To remove excess metals from wine and vinegar; as a source of calcium in pharmaceuticals; source of phytic acid and its salts.

calcium plumbate Ca_2PbO_4

Properties: Orange to brown crystalline powder; decomposed by hot water or carbon dioxide; sp. gr. 5.71. Soluble in acids (with decomposition); insoluble in cold water.

Uses: Oxidizing agent; pyrotechnics and safety matches; glass; storage batteries.

calcium propionate $\text{Ca}(\text{OOCCH}_2\text{CH}_3)_2$

(Occurs also with one H_2O) A white powder soluble in water; slightly soluble in alcohol.

Uses: As an antifungal agent in bread.

calcium propyl arsonate $\text{C}_3\text{H}_7\text{AsO}_3\text{Ca}$. Crystals, soluble in water. Used as pre-emergence control of crab grass.**calcium pyrophosphate** $\text{Ca}_2\text{P}_2\text{O}_7$

Properties: White powder. Soluble in dilute hydrochloric and in nitric acids; insoluble in water. Sp. gr. 3.09; m.p. 1230°C.

Containers: 100-lb bags; 400-lb barrels; 100-lb drums.

Uses: Polishing agent in dentifrices; mild abrasive for metal polishing; food supplement

calcium resinate.

Properties: Yellowish-white, an-orphous powder or lumps. Soluble in acid; insoluble in water; soluble in amyl acetate, butyl acetate, ether, amyl alcohol

Derivation: By boiling calcium hydroxide with rosin and filtering; fusion of hydrated lime and melted rosin.

Grades: Technical.

Containers: Wooden barrels; fiber drums

Uses: Waterproofing; manufacturing paint driers, porcelains, perfumes, cosmetics, enamels; for fabrics, wood, paper; as amber substitute, tanning leather

Shipping regulations: Flammable solid. Yellow label. *

calcium rhodanate. See calcium thiocyanate**calcium ricinoleate**

A fine white powder with a slight odor of fatty acids. Derived from castor oil.

Properties: M. p. 98°C; sp. gr. 1.04.

Containers: 50-lb bags.

Uses: Greases and lubricants; nontoxic stabilizer for polyvinyl chloride.

calcium D-saccharate $\text{CaC}_6\text{H}_8\text{O}_8 \cdot 4\text{H}_2\text{O}$

Properties: White, crystalline powder; odorless; tasteless; insoluble in water and alcohol; soluble in calcium gluconate solutions.

Derivation: Oxidation of D-gluconic acid and neutralization with lime.

Containers: Fiber drums; cans.

Uses: Medicine.

Shipping regulations: None. *

calcium saccharin $(\text{C}_6\text{H}_4\text{COSO}_2\text{N})_2\text{Ca}$. Fine white powder; used as a sugar substitute.**calcium salicylate** $\text{Ca}(\text{C}_7\text{H}_5\text{O}_3)_2 \cdot 2\text{H}_2\text{O}$

Properties: White powder; odorless; tasteless. Loses all its water at 120°C.

Soluble in water; insoluble in alcohol.

Grades: Purity 99+%

Use: Medicine.

Shipping regulations: None. *

calcium sequestration. The use of ordinary sodium hexametaphosphate and similar compounds that function as water softeners by forming complex ions with calcium and magnesium ions, thus preventing the formation of insoluble calcium and magnesium curds or precipitates when mixed with soap. See also sequestration.

calcium silicates. Some occur naturally (see wollastonite); some are found in mixtures, especially in Portland cement, which has been extensively studied. (See cement, Portland.) Calcium silicate hydrates are used as coatings for clays, as absorbents and decolorizing agents, and as rubber fillers. The following describes calcium metasilicate, CaSiO_3 .

Properties: White, amorphous powder; sp. gr. 2.9. Insoluble in water.

Containers: Bags.

Uses: Absorbent; antacid.

calcium silicofluoride. See calcium fluosilicate.

calcium stannate $\text{CaSnO}_3 \cdot 3\text{H}_2\text{O}$. White crystalline powder; insoluble in water; approximate temperature of dehydration 350°C

Uses: Additive in ceramic capacitors; production of ceramic colors

calcium stearate $\text{Ca}(\text{C}_{18}\text{H}_{35}\text{O}_2)_2$

Properties: White powder; m. p. 150°C.

Insoluble in any common solvent

Derivation: By the interaction of sodium stearate and calcium chloride; then filtration

Grades: Technical

Containers: Wooden barrels; fiber drums;

cartons; multiwall paper sacks

Uses: Waterproofing; flattening agent in lacquers; also used in varnish, paints, enamels, plastics, lubricant; emulsions; cements; wax crayons; stabilizer for vinyl resins.

Shipping regulations: None. *

Calcium "Sacaryl." ³ Trademark for calcium cyclamate (q. v.)**calcium succinate** $\text{CaC}_4\text{H}_4\text{O}_4 \cdot 3\text{H}_2\text{O}$

Properties: Colorless crystals; indices of refraction 1.460 (alpha), 1.540 (beta), 1.610 (gamma). Slightly soluble in water; soluble in dilute acids.

Use: Medicine.

calcium sulfamate $\text{Ca}(\text{SO}_3\text{NH}_2)_2 \cdot 4\text{H}_2\text{O}$

Properties: White, crystalline solid. Soluble in water. Aqueous solution is stable on boiling.

Grades: Technical.

*See "I. C. C. Shipping Regulations," page xiii. .

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

- Containers: 150-lb fiber drums; 350-lb wooden barrels.
 Use: Flameproofing agent for textiles and certain grades of paper.
- calcium sulfate (anhydrite)** CaSO_4 . See also gypsum, and terra alba, which are hydrated forms. See also gypsum cements.
 Properties: White powder; white crystals with gray, blue, or reddish tinge, or brick-red crystals. Insoluble in water.
 Constants: Sp. gr. 2.964; m. p. 1450°C.
 Derivation: Found in large quantities in nature; by-product in many industrial operations.
 Grades: Technical; C. P.
 Containers: Bags; barrels; freight cars; multiwall paper sacks.
 Uses: Interior plasters; polishing powder; cements (especially "Keene's cement," also as a retarder); paints (white pigment, filler, drier); paper (size, filler, surface-coating); dyeing and calico printing; metallurgy (reduction of zinc minerals); agriculture (as such and in compounds used to correct soils poor in calcium); drying industrial gases, solids, and many organic liquids
 Shipping regulations: None.*
- calcium sulfhydrate.** See calcium hydrosulfide.
- calcium sulfide (hepar calcis)** CaS See also lime, sulfurated.
 Properties: Yellow to light-gray powder with odor of hydrogen sulfide in moist air; unpleasant alkaline taste. Gradually decomposes in moist air or in weak acids. Soluble in acids; slightly soluble in water with partial decomposition; insoluble in alcohol Sp. gr. 2.8.
 Derivation: By strongly heating pulverized calcium sulfate and charcoal.
 Grades: Technical.
 Containers: 1-lb bottles; steel drums; multiwall paper sacks.
 Uses: Luminous paint; medicine; depilatory; preparation of arsenic-free hydrogen sulfide; veterinary medicine.
 Shipping regulations: None.*
- calcium sulfide, crude.** See lime, sulfurated.
- calcium sulfite** $\text{CaSO}_3 \cdot 2\text{H}_2\text{O}$.
 Properties: White powder; loses water at 100°C. Soluble in sulfurous acid; slightly soluble in water
 Derivation: By the action of sulfurous acid on calcium carbonate.
 Method of purification: Crystallization.
 Grades: Technical; C. P.
 Containers: 1-lb bottles; iron drums.
 Uses: Textiles (antichlor); disinfectant in sugar industry, brewing; biological cleansing; food preservative and discoloration retarder; paper manufacture.
- calcium sulfocarbonate.** See calcium phenol-sulfonate.
- calcium sulfocyanate.** See calcium thiocyanate.*
- calcium sulfophenate.** See calcium phenol-sulfonate.
- calcium sulfophenylate.** See calcium phenol-sulfonate.
- calcium superoxide.** See calcium peroxide.
- calcium tallate.** See soaps, metallic.
- calcium tannate.**
 Properties: Yellowish-gray powder. Soluble in dilute acids; slightly soluble in water.
 Uses: Pharmaceuticals; adhesives.
- calcium tartrate** $\text{CaC}_4\text{H}_4\text{O}_6 \cdot 4\text{H}_2\text{O}$.
 Properties: White, crystalline powder. Soluble in dilute acids; slightly soluble in water or alcohol.
 Derivation: By the interaction of a calcium salt and crude cream of tartar.
 Grades: Technical; C. P.
 Containers: 1-lb bottles; wooden kegs.
 Use: Tartaric acid.
 Shipping regulations: None.*
- calcium theobromine salicylate.** See theobromine calcium salicylate.
- calcium thiocyanate (calcium sulfocyanate, calcium rhodanate)** $\text{Ca}(\text{SCN})_2 \cdot 3\text{H}_2\text{O}$.
 Properties: White hygroscopic crystals or powder. Soluble in water and alcohol.
 Uses: Solvent for cellulose and polyacrylate; for parchmentizing; stiffening and swelling of textiles.
- calcium thiosulfate (calcium hyposulfite)** $\text{CaS}_2\text{O}_3 \cdot 6\text{H}_2\text{O}$.
 Properties: White crystals; effloresces at 40°C; sp. gr. 1.872. Soluble in water; insoluble in alcohol.
 Use: Medicine.
- calcium tungstate (calcium orthotungstate; calcium wolframate; calcium wolframate, normal)** CaWO_4 .
 Properties: White crystalline powder; sp. gr. 6.062. Soluble in ammonium chloride; insoluble in water; decomposed by hot acids.
 Derivation: (a) By the interaction of calcium chloride and sodium tungstate. (b) Occurs in nature as scheelite (q.v.).
 Method of purification: A slurry of powdered scheelite is treated with soda ash at about 370°C and 200 psi to form the soluble sodium tungstate. Insoluble impurities are filtered off and calcium tungstate is precipitated with lime.
 Containers: Wooden barrels; fiber drums.
 Uses: Luminous paints; fluorescent lamps; photography; x-ray pictures; medicine.
 Shipping regulations: None.*
 See next entry.
- calcium tungstate, synthetic crystals** CaWO_4 .
 Properties: Clear, colorless anisotropic tetragonal crystals, with good mechanical strength and excellent chemical stability; hardness 4.5-5; m. p. 1535°C; sp. gr. 5.9-6.1; refractive index approx. 1.93.
 Uses: The strong fluorescence of the specially grown crystals on exposure to high-energy radiation recommends them as scintillation-counter crystals.
 See previous entry.

* See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

calcium undecylenate $(\text{CH}_2\text{CH}(\text{CH}_2)_9\text{COO})_2\text{Ca}$.

A fine, white powder of limited solubility
M.p. 155°C.

Uses: Non-toxic bacteriostat and fungistat
in cosmetics and pharmaceuticals

calcium uranite. See autunite

calcium wolframate. See calcium tungstate.

calcium wolframate, normal. See calcium tungstate.

calcium zirconate CaZrO_3

Properties: Solid; m. p. 2345°C; sp. gr.

4.78. Soluble in nitric and other acids.

Uses: Chemical raw material, refractory

calcium zirconium silicate CaZrSiO_3 .

Properties: White solid; m. p. 2900°F;
insoluble in water, alkalis; slightly
soluble in acids; soluble in hydrofluoric
acid

Containers: 80-lb paper bags, 500-lb drums.

Use: Electrical resistor ceramics; glaze
opacifier.

"Calcochrome" Dyes. ⁵⁷ Trade name for a
line of chrome colors applied in the dyeing
of suiting, dress goods, overcoating, hats,
blankets, outing shirts, and uniform cloth

"Calcocid" Dyes. ⁵⁷ Trade name for a line of
acid dyestuffs used in the dyeing of wool
and worsted goods, natural silk, jute, and
in coloring diversified materials such as
leather, soap, foodstuffs, feathers, artifi-
cial flowers, wood, paper, plastic materi-
als, and in the preparation of color lakes.

"Calcodur" Dyes. ⁵⁷ Trade name for a line of
direct colors applied in the dyeing of cot-
ton, rayon, and miscellaneous vegetable
fibers

"Calcofast" Wool Dyes. ⁵⁷ Trade name for a
line of metallized dyes containing chemi-
cally combined chromium used for dyeing
wool in all forms including raw stock, tops,
hand knitting, carpets and other yarns and
piece goods. They can also be applied to
leather, nylon, etc

"Calcofluor" Dyes. ⁵⁷ Trade name for a group
of direct dyeing dyes which possess fluo-
rescent properties. Used for dyeing cot-
ton, linen, viscose, acetate, nylon, wool
and certain synthetics. Used also in soaps
as a brightener for textile use.

"Calcoform" Dyes. ⁵⁷ Trade name for a
selected group of direct cotton dyes which
upon the aftertreatment of the dyeings in a
solution of formaldehyde possess an in-
creased fastness to water, perspiration,
washing and common wet treatments. Used
for the dyeing of ground shades on cotton
and viscose rayon which are to be dis-
charged, also for some sewing threads and
hosiery.

"Calcogas." ⁵⁷ Trademark for a series of dyes.

"Calcogene" Dyes. ⁵⁷ Trade name for a line
of sulfur colors used in the dyeing of cotton
and other vegetable fibers such as linen.

"Calcoloid" Dyes. ⁵⁷ Trade name for a line of
colloidized vat dye pastes and powders used
in the dyeing and printing of cotton and
rayon. Processes to produce extremely
fine dispersions, an important factor in
the successful application of vat dyes

"Calcomine" Dyes. ⁵⁷ Trade name for a line
of direct dyes for cotton and other vegetable
fibers. Also applied to some extent to silk,
wool, mohair, rayon, leather, and paper.

"Calcomites." ⁵⁷ Trademark for sulfonamide
preparations

"Calco Mordant D." ⁵⁷ Trademark. The sodium
salt of a sulfur-phenol condensate used as a
mordant for basic dyes.

"Calco" Naphthosol Dyes. ⁵⁷ Trade name for a
line of naphthols used as developers or pre-
parers and a companion line of fast bases
and salts to be used in combination there-
with

"Calconyl" Dyes. ⁵⁷ Trade name for a line of
coloring matters which are in substance
stabilized combinations of a diazotized
color base and a naphthol. They are used
for dyeing or printing of fast shades on
cotton and rayon.

"Calcophen" Dyes. ⁵⁷ Trade name for a number
of oil dyes that are of particular interest
because of their non-subliming properties
Uses: Varnish stains, foil coating, plastics

"Calcosol" Dyes. ⁵⁷ Trade name for a line of
vat dyestuffs used in the dyeing and printing
of cotton and rayon. Marketed in paste or
powder form

"Calco" Soluble Vat Dyes. ⁵⁷ Trade name for a
line of water-soluble sulfuric-acid esters
of leuco vat dyes used for printing and dye-
ing many kinds of fabrics. They are ex-
tensively used in roller and screen printing
of cotton fabrics in combination with sta-
bilized azoic dyes ("Calconyls"), aniline
black, etc. They are also used in the dye-
ing of cotton, viscose rayon, and wool. The
dyeings possess vat-dye fastness.

"Calcosyn" Dyes. ⁵⁷ Trade name for a line of
direct dyeing dyes for the dyeing of certain
synthetic fibers such as cellulose acetates
and nylon

"Calcotone" Pigment Pastes. ⁵⁷ Trade name for
a line of highly dispersed pigment pastes
used whenever water suspensions of pig-
ments are indicated. When used in com-
bination with water-soluble binders, these
pigment pastes can be used to print fabrics,
both roller and screen, or to color sheers,
laces, and nets. They also find use in
coloring paper, both beater dyeing and
coating.

"Calcozine" Dyes. ⁵⁷ Trade name for a line
of basic colors. Basic colors possess good
affinity to mordanted cotton. Applied ex-
tensively also to leather and paper, and in
pencils and color lakes.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Calcozoic" Dyes. ⁵⁷ Trade name for a line of stabilized azoic dyes developed for the printing of cotton, linen, and viscose fabrics.

calcspar. See calcite.

"Caldent." ¹⁷² Trade name for a dentifrice grade dicalcium phosphate dihydrate, $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$, plus a proprietary additive. Derivation: Lime and high quality phosphoric acid.

Containers: Bags.

Uses: As polishing agent in dentifrices.

"Caledon." ²⁰⁶ Brand name of proprietary line of vat dyestuffs derived from anthraquinone. Used for the dyeing and printing of cotton, rayon and silk and characterized by excellent fastness to washing, light, etc. Also used for coloring high grades of paper

calendula (marigold; Mary-bud; goldbloom).

Dried florets of *Calendula officinalis*

Habitat: Southern Europe and Levant; cultivated everywhere.

Grades: Technical

Containers: Boxes

Uses: Coloring butter and margarine; adulterant for saffron; medicine.

Shipping regulations: None *

calendulin. An amorphous, yellow, tasteless substance contained in marigold flowers and leaves (*Calendula officinalis*) which swells in water, though soluble in alcohol, alkalies, and acetic acid

Use: See calendula.

"Calfalfa." ²⁵³ Brand name for a type of soil sulfur products

"Calginate." ³²² Trademark for calcium alginate (q v)

"Calgolac." ¹⁰⁸ Trademark for a powdered, alkaline, sodium hexametaphosphate detergent.

Containers: 4-lb 5-oz packages (12/case); 100-lb drums

Uses: Cleaning bars, fountains, and laboratory glassware and equipment

"Calgon." ¹⁰⁸ Trademark for a sodium phosphate glass commonly called "sodium hexametaphosphate." It has a molecular ratio of 11 Na_2O :1 P_2O_5 with a guaranteed minimum of 65% P_2O_5 . Made from food-grade phosphoric acid and commercial soda ash by a thermal process. It is supplied in the form of powder, of agglomerated particles, and of broken glassy plates either pure or adjusted with mild alkalies. It is completely soluble in water in all proportions but is insoluble in organic solvents. It possesses sequestering, dispersing and deflocculating properties and precipitates proteins. In very low concentrations, it inhibits corrosion of steel and prevents the precipitation of slightly soluble, scale-forming compounds such as calcium carbonate and calcium sulfate. Used for softening water without precipitate formation as in dyeing, laundering, textile processing and washing operations; for precipitating proteins as in

pretanning hides in the manufacture of leather; for dispersing clays and pigments; and as threshold treatment for scale and corrosion prevention in recirculating, or once-through water systems

"Calgon" Bouquet. ¹⁰⁸ Trademark for a dry bead-like phosphate composition, rapidly soluble in water. Contains added perfume. Containers: 1-lb boxes. Uses: Water softener and conditioner for personal bathing.

"Calgon Composition T." ¹⁰⁸ A complex glassy phosphate produced by a thermal process. White powder passing an 80 mesh sieve. Containers: 100-lb bags. Uses: Dispersing calcium carbonate pigments in the pulp and paper industry.

"Calgon Composition TG." ¹⁰⁸ Colorless glass platelets of sodium zinc hexametaphosphate. Containers: 100-lb bags. Uses: Corrosion protection in recirculating cooling water and municipal water systems, and after mechanical cleaning of water mains where rapid film formation is important

"Calgonite." ¹⁰⁸ Trademark for an alkaline detergent composition containing "Calgon" as a principal ingredient. Generally recommended for spray-type mechanical washing operations where an alkaline cleaner is necessary and superior detergency with freedom from lime deposits is required. Laboratory "Calgonite" is a sudsing detergent composition containing "Calgon" as a principal ingredient to maintain glassware free from objectionable bacteria-retaining films. Effectively removes blood and culture media residues. Used for general hand washing of chemical and biological glassware and instruments

"Calgreen." ¹⁴⁷ Trademark for a non-separating combination of calcium arsenate and Air-Flo Green. Containers: 4- and 50-lb bags. Uses: For control of such insects as tomato hornworms, potato bugs, beet webworms, boll weevil, and bollworms

caliche.

1. (Chile nitrate, Chile niter; Chile salt-peter; soda salt-peter) Crude sodium nitrate found in northern Chile, Bolivia, and United States (Nevada and California); used for fertilizer and dynamite mixtures. See also sodium nitrate.

2. Term used by geologists to refer to a hard subsurface soil layer in arid regions cemented by calcite and other minerals.

californite. A compact massive variety of vesuvianite (q v) found in California. Color, bright to yellowish-green. Takes a high polish and is used as a gem stone and an ornamental stone

californium Cf A synthetic radioactive element with atomic number 98. See actinide elements. The chemical properties of californium have been studied by tracer techniques and are similar to those of the other

* See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

transuranium elements The trichloride, oxide and oxychloride have been prepared

calisaya bark. See cinchona bark, calisaya

"Calktite." ³²⁶ Trade name for an acid- and alkali-proof caulking compound.

Properties: M p. 15°F A special grade has m. p. 55°F

Containers: 35-, 70-, 175-, and 400-lbs

Uses: Protective coating for masonry, acid tanks, and floors

calmus. See calamus

"Calnox." ⁸⁹ Trademark for scale inhibitors, use in preventing the build-up of calcium salt scales from brines encountered in production of crude petroleum

"Calo-Clor." ³²⁹ Trademark for a mercurial turf fungicide containing 73% mercury in chemical combination It is a mixture of mercuric chloride (corrosive sublimate) with mercurous chloride (calomel) and inert ingredients

Use: Prevention and control of brown patch and snow mold

"Calocure." ³²⁹ Trademark for a mercurial turf fungicide especially compounded for positive control of brown patch It contains 36 5% mercury in chemical combination

"Calodorant B-1." ¹⁵¹ Trademark for mixed sulfide gas odorant, recommended for odorization of natural gas

"Calodorant C." ¹⁵¹ Trademark for cyclic sulfide gas odorant, recommended for odorization of natural gas

"Calodorant F." ¹⁵¹ Same as "Calodorant B-1"

"Calogreen." ³²⁹ Trademark for a turf fungicide composed of extremely finely divided form of mercurous chloride Contains 85% mercury (insoluble in water) Long lasting protection against dollar spot and snow mold

calomel. See mercurous chloride and calomel, native

calomel, native (horn mercury; horn quick-silver) Hg_2Cl_2

Properties: White, yellowish-gray, yellowish-white, gray or brown mineral, adamantine luster, pale yellowish-white streak Consistency of horn; very sectile Found as a coating in cavities with or near cinnabar. Contains 84.9% mercury. Soluble in aqua regia; insoluble in water Sp. gr. 6.48; hardness 1-2.

Occurrence: United States (Texas), and Europe.

Use: Not an important source of mercury. See also mercurous chloride.

"Caloria." ⁵¹ Trademark for unique lubricants of both oil and grease consistency, which at elevated temperatures decompose, leaving no residue. Designed for bearing temperatures of 400°F and above, they are intended for those locations where ordinary lubricants leave harmful deposits. (See

"Van Caloria")

calorific value. A measure of the quality of fuels, usually expressed as available Btu (q v.).

calorizing. The process by which steel is coated with aluminum by heating it in aluminum powder The aluminum forms an alloy with the steel surface and produces a thin, tightly adherent coating.

"Calsolene Oil HS." ²⁰⁶ Brand name for highly sulfonated oil, stable to hard water and acid and retaining wetting power in alkaline, neutral and acid conditions.

"Calsolene Oil HSA." ³²⁵ Sulfated ester; anionic wetting and dispersing agent. Used primarily for wet processing of hydrophobic fibers

calx. See calcium oxide.

calx sulfurata. See lime, sulfurated

"Cambar." ⁵¹ Trademark for high temperature block grease, suitable for plain bearings such as dryer rolls in paper mills. Light color of this product makes it especially suitable where lubricant stains are troublesome

cambogia. See gamboge

"Camoform" Hydrochloride. ³³⁰ Trademark for biallylamicol hydrochloride [6,6'-diallyl-alpha, alpha'-bis(diethylamino)-4,4'-bi-ortho-cresol dihydrochloride] Used in medicine

camomile oil. See chamomile oil, German; chamomile oil, Roman

"Camoquin" Hydrochloride. ³³⁰ Trademark for amodiaquine hydrochloride [4-(7-chloro-4-quinolylamino)-alpha-diethyl-amino-ortho-cresol hydrochloride] Used in medicine

2-camphanone. See camphor

camphene $\text{C}_{10}\text{H}_{16}$.

Properties: Colorless crystals Soluble in ether, slightly soluble in alcohol; insoluble in water M p 48-51°C; b p 159-162°C

Derivation: (a) By heating pinene hydrochloride with alkalis, aniline, or alkali salts, such as sodium acetate (b) A constituent of certain essential oils

Grades: Technical (46° m. p.)

Containers: Tins; drums; tanks.

Uses: Medicine; manufacture of synthetic camphor; camphor substitute.

Caution: When heated, gives off flammable vapors

Shipping regulations: None.*

camphor (gum camphor; camphor, natural; 2-camphanone; camphor, synthetic) $\text{C}_{10}\text{H}_{16}\text{O}$ A ketone occurring naturally in the wood of the camphor tree (Cinnamomum camphora) native to Formosa and now cultivated in Florida and California

Properties: Colorless or white crystals, granules or easily broken masses; characteristic odor; sp gr 0.99; m. p. 174-

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

179°C; slowly volatilizes at room temperature; insoluble in water; soluble in alcohol, ether, chloroform, carbon disulfide, and solvent naphtha; fixed and volatile oils

Derivation: Steam distillation of the camphor-tree wood and crystallization. This product is called natural camphor and is dextrorotatory. Synthetic camphor, most of which is optically inactive, may be made from pinene, which is converted into camphene, (q v.), which by treatment with acetic acid and nitrobenzene becomes camphor

Containers: 1-lb tins to 250-lb barrels; drums

Grades: Technical (synthetic, m p 163-168°C); U S.P. XVI (m.p. 174-179°C)

Uses: Medicine (internal and external); plasticizer for "Celluloid," "Celluloid" film, cellulose nitrate, other explosives, and lacquers; insecticides and moth and mildew preventives; tooth powders; embalming; pyrotechnics; intermediate.

Caution: Flammable; gives off flammable vapors when heated which may form an explosive mixture with air

camphor bromate (bromocamphor; brominated camphor; monobromated camphor)
 $C_{10}H_{15}BrO$

Properties: Colorless crystals with slight camphor odor and taste. Also available as powder. Discolors in light and should be stored in cool, dark place. M.p. 76°C, b p 274°C; sp. gr. 1.449. Soluble in alcohol, ether, chloroform, and oils, insoluble in water

Derivation: By heating camphor with bromine

Method of purification: Crystallization

Containers: 100-lb kegs; 25- and 100-lb drums

Uses: Medicine; camphor derivatives

camphor, bromated. See camphor bromate

camphor, cantharides. See cantharidin.

camphoric acid $C_{10}H_{16}O_4$.

Properties: Colorless, odorless needles or scales. Soluble in alcohol, ether, fatty oils, and water; insoluble in chloroform. Sp. gr. 1.186 (20/4°C); m.p. 186-188°C

Derivation: By oxidizing camphor with nitric acid

Method of purification: Crystallization

Grades: Technical

Containers: 1-oz vials; 1/4-, 1-, 5-lb bottles; 5-lb cans; fiber drums

Uses: Celluloid; pharmaceuticals; medicine

Shipping regulations: None *

camphor, liquid. See camphor oil.

camphor, Malayan. See borneol

camphor, natural. See camphor

camphor oil (camphor, liquid).

Properties: Colorless natural oil with characteristic odor; sp. gr. varies from 0.870-1.040; refractive index 1.465-1.481 (20°C). Soluble in ether, chloroform; insoluble in alcohol.

Chief known constituents: Pinene, camphor, cineol, phellandrene, dipentene, safrol, and eugenol.

Derivation: By distilling the wood of the tree *Cinnamomum camphora* and separating the oil and solid camphor.

Grades: White, Japanese; Chinese; by-product (sassafrassy). Also sold as oil of camphor, rectified.

Containers: Drums

Uses: Used as a substitute for turpentine oil in varnish manufacture and for cleaning type, electroplates, and cylinders in the printing industry; perfuming cheap soaps, especially soft soaps; shoe polish; floor ointments; and hiding the odor of mineral oils; wagon greases and lubricating oils; medicine

Shipping regulations: None. *

camphor, parsley. See apiol.

camphor, peppermint. See menthol.

camphor, pulsatilla. See anemonin.

camphor, synthetic. See camphor.

Canada balsam (Canada turpentine; turpentine, Canadian; balsam of fir).

Properties: Pale yellow, or greenish-yellow, transparent, viscous liquid. Agreeable aromatic pine-like odor. Feebly bitter, acid taste. Slowly dries to a transparent varnish when exposed to the air; sp. gr. 0.983-0.997; refractive index (n_D 20/D) 1.52-1.54; acid number 84-87. Soluble in benzene, chloroform, and ether; insoluble in water

Derivation: The oleoresin obtained from *Abies balsamea*.

Habitat: Canada and northern United States

Uses: Medicine; cement for lenses; manufacture of fine lacquers; mounting in microscopy

Not to be confused with balm of Gilead (q v.)

Canada pitch. See hemlock pitch

Canada snake root. See asarum.

Canada snake-root oil. See asarum canadense oil

Canada turpentine. See Canada balsam.

Canadian asarabacca oil. See asarum canadense oil.

Canadian hemp. See apocynum.

Canamin clay. A colloidal clay from British Columbia. Particle size is very small and therefore has great adsorption capacity. Consists mainly of colloidal aluminum silicate

cananga oil.

Properties: A yellowish essential oil, having a floral odor similar to that of oil of ylang ylang (q v.). Sp. gr. 0.908-0.925; optical rotation -15° to -30°; refractive index, 1.495-1.503

Grades: Regular (native); rectified (the latter being lighter in color, has better solubility in alcohol, and is more stable).

* See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: By distillation from the flowers of the Javanese variety of *Cananga odorata*.

Containers: Cans.

Use: Perfumery, particularly for floral types

Shipping regulations: None.*

canarium. See elemi gum.

canavanine $\text{NH}_2\text{CNHNHOCH}_2\text{CH}_2\text{CHNH}_2\text{COOH}$.

An amino acid obtained from jackbean meal. It is found naturally in the L(+) form

Properties: Crystals, from dilute alcohol; m. p. 184°C (dec), soluble in water, nearly insoluble in alcohol. Sulfate: crystals from dilute alcohol; m. p. 172°C (dec), soluble in water

Use: Biochemical research.

candelilla wax.

Properties: Yellowish-brown, opaque to translucent solid wax. Soluble in chloroform, turpentine, carbon tetrachloride, trichlorethylene, toluene, hot petroleum ether and alkalies, insoluble in water. Sp. gr. 0.983; m. p. $67-68^\circ\text{C}$, saponification value 65; iodine number 37; refractive index 1.4555

Derivation: Found as a greenish-gray coating on the entire surface of the wild candelilla plant of Mexico and Texas from which it is obtained by immersing the plant in boiling water, and skimming off the wax which rises to the surface

Method of purification: Treatment with sulfuric acid or niter cake

Impurities: Bark fragments, etc.

Grades: Crude; refined; powdered

Containers: Bags; boxes

Uses: Leather dressing; polishes; candle manufacture, cements; varnishes; substitute for carnauba wax and beeswax, electric insulating compositions, sealing wax; phonograph records; waterproofing and insect-proofing containers; paint removers; dentistry; paper sizes; rubber and rubber substitutes; stiffener for soft waxes

Shipping regulations: None *

candididin. An antifungal antibiotic produced by *Streptomyces griseus*

candidin. An antifungal antibiotic produced by *Streptomyces viridoflavus*

candleberry. See myrica

candle-nut oil. See lumbang oil

candle pitch. See stearin and fatty-acid pitches

candle-tar pitch. See stearin and fatty-acid pitches

cane blackstrap. See molasses

canella (white cinnamon; white wood bark; Bahama white wood; canilla)

Derivation: Bark of *Canella winterana* or *C. alba*

Habitat: West Indies and Florida

Grades: Technical.

Containers: Bales.

Uses: Medicine; condiment; addition to

smoking tobacco

Shipping regulations: None.*

canella oil.

Properties: Colorless; spicy odor and taste. Chief known constituents: eugenol; eucalyptol; caryophyllene. Sp. gr. 0.920-0.935; optical rotation $+1^\circ 8'$. Soluble in alcohol, ether, and chloroform.

Derivation: Distilled from the bark of *Canella alba*

Method of purification: Rectification.

Grades: Technical.

Containers: Tins; glass bottles.

Uses: Medicine; perfume; condiment.

Shipping regulations: None.*

canescine. See deserpidine

cane sugar ($\text{C}_{12}\text{H}_{22}\text{O}_{11}$) Sugar (sucrose) extracted from cane. Chemically identical with beet sugar.

canilla. See canella.

cannabin resin. See cannabis.

cannabis (cannabin resin; Indian hemp; Indian cannabis; hashish; guaza; marihuana).

A habit-forming drug

Derivation: Dried flowering tops of pistillate plants of *Cannabis sativa*

Habitat: Persia; East India; cultivated in Europe, Asia and United States

Grades: Technical.

Containers: Bags

Uses: Medicine; corn removers; ointment and liniment

Shipping regulations: None *

Caution: Manufacture and transportation strictly regulated by law in U S A

cannel coal. A variety of bituminous or sub-bituminous coal of uniform and compact fine-grained texture with a general absence of banded structure. It is dark gray to black in color, has a greasy luster, and is noticeably of conchoidal or shell-like fracture. It is noncaking; yields a high percentage of volatile matter, ignites easily, and burns with a luminous, smoky flame (ASTM definition, ASTM D493-39.)

Cannizzaro reaction. The reaction of an aldehyde with alcoholic potassium hydroxide to produce an alcohol and the salt of an acid

cantala (maguey) Hard, strong, light colored fibers obtained from the leaves of *Agave cantala*. * Finer and more supple than sisal, but not as strong.

Sources: Philippines; India; Indonesia

Uses: Twine and cordage

"Cantaxin."¹⁶² Trademark for ascorbic acid

cantharides (blistering flies; cantharis; blistering beetle; Spanish flies; Russian flies). Dried insects. The species of most commercial importance is *Cantharis vesicatoria*

Habitat: Southern and central Europe

Grades: Chinese; Russian.

Use: Medicine and veterinary medicine.

Shipping regulations: None.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer: See "List of Manufacturers" page v.

cantharidin (cantharides camphor) $C_{10}H_{12}O_4$.

Properties: Colorless, crystalline scales; poisonous. Very slightly soluble in water and alcohol; slightly soluble in chloroform, acetone, acetic ether; soluble in fixed oils. M. p. 218°C ; begins to sublime at about 90°C .

Derivation: From cantharides.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Use: Same as cantharides.

Shipping regulations: None.*

cantharis. See cantharides.

"**Canthus.**" ⁵¹ Trademark for high viscosity, economical, straight mineral oils for use on gears and bearings with large clearances. Not recommended for low temperature service.

"**Cantona.**" ⁵¹ Trademark for filtered steam cylinder oil of excellent quality. Atomizes readily and separates easily from condensate.

caoutchouc. See rubber, natural.

Cape gum. See arabic gum.

Cape ruby. See garnet.

capillarity. The attraction between molecules, both like and unlike, which results in the rise of a liquid in small tubes or fibers, or in the wetting of a solid by a liquid.

capillary rise. The rise or fall of a liquid along the sides of a narrow tube or in plant fibers.

capivi balsam. See copaiba resin.

"**Capracyl.**" ²⁸ Trademark for a group of neutral-dyeing acid colors that produce the highest possible degree of light fastness on nylon. Also suitable for dyeing wool, particularly in blends with cellulosic fibers.

capraldehyde. See decanal.

capric acid (decanoic acid; decoic acid; decylic acid) $\text{CH}_3(\text{CH}_2)_8\text{COOH}$. Occurs as a glyceride in natural oils.

Properties: White crystals. Unpleasant odor; soluble in most organic solvents, and dilute nitric acid; insoluble in water.

Sp. gr. 0.8858 (40°C); b. p. 270°C (760 mm), 172.6°C (30 mm); m. p. 31.5°C ; refractive index 1.4288 (40°C); acid number 308-315.

Derivation: Fractional distillation of coconut oil fatty acids.

Grades: Technical; 90%.

Containers: 1-gal bottles; 55-gal drums; tanks, carload lots.

Uses: Making esters for perfumes and fruit flavors; base for wetting agents; intermediates; plasticizer; resins.

capric aldehyde. See decanal.

caprillic acid. See caprylic acid.

caproic acid (hexanoic acid; hexylic acid; hexoic acid) $\text{CH}_3(\text{CH}_2)_4\text{COOH}$. Present in milk fats to extent of about 2%.

Properties: Oily, colorless or slightly yellow liquid; odor of limburger cheese. Soluble in alcohol and ether; slightly soluble in water. Sp. gr. 0.9276 ($20/4^{\circ}\text{C}$); f. p. -4.0°C ; b. p. 205°C (760 mm); 119°C (30 mm); refractive index 1.4168 (20°C); wt/gal 7.7 lbs; viscosity 0.031 poise (20°C).

Derivation: From crude fermentation of butyric acid; fractional distillation of natural fatty acids.

Method of purification: Rectification.

Grades: Technical; reagent to 99.8%.

Containers: 1-, 5-, 10-lb glass bottles;

carboys; 31-, 55-gal drums; carload lots.

Uses: Analytical chemistry; flavors; manufacture of rubber chemicals, varnish driers, resins and pharmaceuticals.

epsilon-caprolactam (aminocaproic lactam)

$\text{CH}_2(\text{CH}_2)_4\text{NHCO}$.

Properties: White crystals; m. p. $68-69^{\circ}\text{C}$; sp. gr. 70% solution 1.05; refractive index (40°C) 1.4935, (31°C) 1.4965; soluble in water, chlorinated solvents, petroleum distillates and cyclohexene; heat of fusion 29 cal/g ; heat of vaporization 116 cal/g ; viscosity 9 cps at 78°C ; vapor pressure 3 mm Hg at 100°C , 50 mm Hg at 180°C .

Containers: 80-lb paper bags; 300-lb fiber drums; tanks.

Uses: Manufacture of synthetic fibers (especially nylon 6), plastics, bristles, film, coatings, synthetic leather, plasticizers, and paint vehicles; cross-linking agent for curing polyurethanes. A very large use is for nylon tire cords.

Caution: Good ventilation is recommended to avoid any possible irritation from continuous breathing of its vapors or fine particles.

caproyl alcohol. See 1-hexanol.

caproyl chloride. A confusing name, since it might legitimately mean the chloride of either capric (C_{10}) or caproic (C_6) acids, although it seems usually to have meant the latter. For the C_{10} acid chloride, see decanoyl chloride; for the C_6 , see hexanoyl chloride.

capryl alcohol. A term which should be replaced by more exact names wherever possible. This name has been used for both the 1-n-octanol and the 2-n-octanol, and it might also be assumed to mean a decyl alcohol. At the present time, the preponderance of usage favors its meaning the 2-n-octanol.

capryl aldehyde. See octanal.

capryl bromide. See octyl bromide.

caprylene. See octene.

caprylic acid (octanoic acid; octoic acid; octylic acid; caprillic acid) $\text{CH}_3(\text{CH}_2)_6\text{COOH}$.

Properties: Colorless oily liquid; slight unpleasant odor; burning rancid taste; sp. gr. 0.9105 ($20/4^{\circ}\text{C}$); m. p. 16°C ; b. p. 237.9°C (760 mm), 147.9°C (30 mm); refractive index 1.4278 (20°C). Very slightly soluble in water; soluble in alcohol.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

and ether.

Derivation: By saponification and subsequent distillation of coconut oil.

• Method of purification: Crystallization or rectification.

Grades: Technical; 99%.

Containers: 1-gal jars; 55-gal drums; tanks; carload lots.

Uses: Synthesis of various dyes, drugs, perfumes, flavors; antiseptics and fungicides; ore separations; chemical raw material, and plasticizer.

Shipping regulations: None.*

caprylic^a alcohol. See 1-octanol

caprylic aldehyde. See octanal.

caprylic bromide. See octyl bromide.

caprylic iodide. See octyl iodide.

capryl iodide. See octyl iodide.

capryloyl chloride. See octanoyl chloride

caprylyl acetate. See n-octyl acetate.

caprylyl chloride. A confusing name, which might mean the alkyl chloride, octyl chloride, $C_8H_{17}Cl$, or the acid chloride, octanoyl chloride, $C_7H_{15}COCl$. See octanoyl chloride.

caprylyl peroxide. See octyl peroxide for shipping regulations.

capsicin (capsicum oleoresin). An ether extract of *Capsicum frutescens*. Reddish-brown, thick liquid with sharp peppery taste. Chief active constituent is capsaicin (an alkaloid with the formula $C_{18}H_{27}O_3N$). Insoluble in water; soluble in alcohol and ether. Poisonous when undiluted

Grades: From domestic or African peppers

Containers: Drums.

Uses: Medicine; in vinegar, pickles, etc

capsicum (cayenne pepper; African pepper; chillies; bird pepper; red pepper).

Derivation: Dried ripe fruit of *Capsicum frutescens*; *Capsicum annuum* or the Louisiana sport pepper.

Habitat: Southern India; cultivated extensively in the tropics

Grades: According to place of origin; N. F. XI.

Containers: Bags

Uses: Medicine; condiment, as an adulterant for ginger, especially in ginger ale.

Shipping regulations: None.*

capsicum oleoresin. See capsaicin.

"Captan." ¹⁸³ Trademark for a gas odorant built on a mercaptan base. Clear liquid, lighter than water, similar in odor to butyl mercaptan.

Use: To add odor to odorless gases both for safety and for the detection of leaks.

-ctan (N-trichloromethylmercapto-4-cyclohexene-1,2-dicarboximide; N-trichloromethylthio-tetrahydrophthalimide) $C_9H_5O_2NSCl_3$.

Properties: White to cream powder; odor, pungent; m. p. 158-164°C; sp. gr. 1.5.

Practically insoluble in water; partially soluble in acetone, benzene and toluene; slightly soluble in ethylene dichloride and chloroform.

Containers: 50-lb fiber drums; 5-lb bags.

Uses: Seed treatment; fungicide in paints, plastics, leather, and fabrics.

Caution: Avoid contamination of feed and foodstuffs. Avoid inhalation of dust or spray mist. Avoid prolonged or repeated contact with skin. (USDA Pesticides regulation; MCA warning label.)

"Captan 50-W." ¹ Trade name for 50% wettable powder formulation containing captan (q. v.).

"Captax." ⁶⁹ Trade name for a proprietary product, mercaptobenzothiazole.

$C_6H_5NC(S)SH$.

Properties: Yellow; odor distinct; sp. gr. 1.42; non-toxic; m. p. 170-175°C. Insoluble in water, gasoline; soluble in dilute caustic, alcohol, acetone, benzene, and chloroform.

Use: Accelerator of vulcanization in tire stocks, inner tubes, wire insulation, footwear, clothing, drug sundries,

caput mortuum. See iron oxide reds.

caramel (sugar coloring; burnt sugar)

Properties: Dark-brown, deliquescent

powder or thick liquid; bitter taste; burnt

sugar odor; sp. gr (approx.) 1.35

Soluble in water and dilute alcohol.

Derivation: Obtained by carefully heating sugar, adding small quantities of sodium carbonate during the heating.

Grades: Technical; N. F. XI; also sold in solution.

Containers: 5-gal cans; barrels; drums.

Uses: Coloring foods, confectionery, sweetmeats, vinegar, liqueurs, malt

beverages; tobacco flavoring; medicine

Shipping regulations: None *

caramiphen hydrochloride (1-phenylcyclopentanecarboxylic acid 2-diethylaminoethyl ester hydrochloride; diethylaminoethyl 1-phenylcyclopentane-1-carboxylate hydrochloride) $C_{16}H_{25}(C_2H_5)_2CO_2(CH_2)_2N(C_2H_5)_2 \cdot HCl$

Properties: Crystals; m p 145-146°C.

Slightly soluble in water; soluble in alcohol.

Grade: N. N. D

Use: Medicine.

carat. A unit of weight for jewels equal to 200 mg; also used to denote the proportion of gold in an alloy, e. g., 24 carat is pure gold while 18 carat is 75% gold.

caraway (carum; caraway seed).

Derivation: Dried ripe fruit of *Carum carvi*.

Habitat: Europe; central and western Asia; cultivated in England, Russia and United States.

Grades: Danish; Dutch; Polish; N. F. XI.

Containers: Boxes; bags.

Uses: Medicine; flavoring; liqueurs; condiment.

• Shipping regulations: None.*

caraway oil (caraway-seed oil; carui oil).

Properties: Colorless or pale yellow, thin

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

liquid; characteristic odor; mild, spicy taste. Slightly soluble in water; soluble in alcohol. Sp. gr. 0.900-0.910 (25/25°C); b.p. 175-230°C; optical rotation +70° to +80°; refractive index 1.4840-1.4880 (20°C).

Chief known constituents: Carvone and dextro-limonene. Carvone content: 50 to 60%.

Derivation: Distilled from dried ripe fruit of *Carum carvi*.

Method of purification: Rectification.

Grades: Technical; N. F. XI.

Containers: Bottles; 25-lb tins; 10-, 55-gal drums.

Uses: Medicine; flavoring; manufacture of liqueurs; perfuming soaps.

Shipping regulations: None.*

caraway seed. See caraway.

caraway-seed oil. See caraway oil.

carbamol (carbamylcholine chloride; choline chloride carbamate) $\text{NH}_2\text{COOCH}_2\text{CH}_2\text{N}(\text{CH}_3)_3\text{Cl}$.

Properties: White or faintly yellow crystals or as crystalline powder, odorless, or with faint amine odor, and hygroscopic. Soluble in water and alcohol; almost insoluble in chloroform and ether. M.p. 201-205°C (with decomposition).

Grade: U. S. P. XVI.

Use: Medicine.

"Carbamate." ⁵⁵ Trade name for insecticides with the active ingredient ferbam (q. v.). Used on fruits, vegetables, tobacco and flowers.

carbamide. See urea.

carbamide peroxide. See urea peroxide.

carbamide phosphoric acid (urea phosphoric acid) $\text{CO}(\text{NH}_2)_2 \cdot \text{H}_3\text{PO}_4$.

Properties: White rhombic crystals. Very soluble in water and alcohol.

Containers: 350-lb drums

Uses: Catalyst for acid-setting resins; flameproofing compositions; cleaning compounds; general acidulant

carbamidine carbonate. See guanidine carbonate.

para-carbamidobenzenearsonic acid. See carbarsone.

carbamite. See sym-diethyldiphenylurea.

carbamyarsanilic acid. See carbarsone.

carbamylcholine chloride. See carbamol.

carbamyldiazine hydrochloride. See semicarbazide hydrochloride.

carbamylmethylcholine chloride. See bethanechol chloride.

carbamyurea. See biuret.

carbanil. See phenyl isocyanate.

carbanilide. See diphenylurea.

carbanion. A negatively charged organic ion such as H_3C^- , R_3C^- , having one more

electron than the corresponding free radical. Carbanions are short-lived but important intermediates in base-catalyzed polymerization and alkylation reactions. See, carbenium ion.

"Carbansol." ²⁴³ Trademark for vat pigments

"Carbanthrene." ²⁴³ Trademark for anthraquinone vat dyes.

carbapatite. See apatite.

Carba process. Method of making solid carbon dioxide by cooling the gas without added pressure being applied.

carbarsone (para-ureidobenzenearsonic acid; para-carbamidobenzenearsonic acid; carbamylarsanilic acid) $\text{NH}_2\text{CONHC}_6\text{H}_4\text{AsO}(\text{OH})_2$.

Properties: White, almost odorless powder with slightly acid taste. M.p. 174°C. Slightly soluble in water and alcohol; very slightly soluble in chloroform and ether; soluble in solutions of alkali hydroxides and carbonates. Saturated solution is acid to litmus.

Derivation: By coupling sodium arsanilate with potassium cyanate.

Grade: U. S. P. XVI.

Use: Medicine

"Carbasols." ²²³ Proprietary products consisting of natural resin esters condensed with modifying agents of the polyhydric alcohol-polybasic acid type.

Types: Available in wide variation as to physical properties such as color, softening point, and acid number.

Uses: Cellulose-ester lacquers; oleoresinous varnishes; printing ink vehicles.

carbazole (dibenzopyrrole; diphenylenimine) $(\text{C}_6\text{H}_4)_2\text{NH}$ (tricyclic).

Properties: White crystals with characteristic odor; m.p. 244-246°C; b.p. 352-354°C; soluble in alcohol and ether; insoluble in water

Derivation: (a) From crude anthracene cake by selective solution of the phenanthrene with crude solvent naphtha, removal of the anthracene by conversion into a sulfonic derivative and extraction by means of water (b) Synthetically, from ortho-aminodiphenyl.

Grades: Technical, 97%

Containers: Barrels; fiber drums.

Uses: Manufacture of dyes; reagent; explosives; insecticides; lubricants; rubber antioxidants; as odor inhibitor in detergents.

Shipping regulations: None.*

carbazotic acid. See picric acid

carbene. A positive or negative ion involving two-valent carbon and paired electrons, as in H_2C^+ , R_2C^+ or R_2C^{++} . Different from methylene free radicals in that the latter have unpaired electrons. All these substances have only brief transitory existence and so are difficult or impossible to collect as such, but have important functions as intermediates in chemical reactions. See, for example, dichlorocarbene.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

carbetapentane citrate [2-(diethylaminoethoxy) ethyl 1-phenylcyclopentyl-1-carboxylate citrate] $C_{20}H_{31}NO_5 \cdot C_6H_8O_7$.

Properties: White, odorless, crystalline powder. Melting range 90-95°C. Freely soluble in water, slightly soluble in alcohol; practically insoluble in ether.

Grade: N F. XI.

Use: Medicine.

2-carbethoxycyclopentanone (ethyl cyclopentanone-2-carboxylate; ethyl 2-oxocyclopentanecarboxylate) $OC_5H_7COOC_2H_5$.

Properties: Colorless liquid with characteristic ester odor; b. p. 122-124°C (25 mm), flash point 19°F; refractive index 1.451 (25°C); density 1.0976 (0°C); soluble in equimolecular amounts of dilute alcohol.

Containers: Glass bottles; 5-gal cans; 50-gal drums.

Uses: Chemical intermediate; pharmaceutical intermediate.

Caution! Avoid inhalation of vapors and contact with skin.

beta-carbethoxyethyltriethoxysilane

$C_2H_5OOC(CH_2)_2Si(OC_2H_5)_3$.

Properties: Colorless liquid B p. 246°C.

Use: Intermediate.

N-carbethoxypiperazine $C_7H_{14}N_2O_2$.

Properties: A colorless, somewhat viscous liquid; slight characteristic odor; b. p. 116-117°C (12 mm), 237°C (760 mm); refractive index 1.4756 (25°C).

Miscible with water and common organic solvents.

Containers: 55-gal drums.

Use: Chemical intermediate.

beta-carbethoxypropylmethyldiethoxysilane

$C_2H_5OOC(C_3H_7)CH_2Si(OC_2H_5)_2$.

Properties: Colorless liquid B p. 228°C.

Use: Intermediate.

carbide. See calcium carbide.

"Carbindone." ²⁰⁶ Brand name for a type of sulfur black dye used for textile printing.

carbinol.

1. A synonym for methyl alcohol, CH_3OH .

2. Hence, any compound of similar structure retaining the COH radical, and in which hydrocarbon radicals may be substituted for the hydrogens originally attached to the carbon. Thus isopropyl alcohol $(CH_3)_2CHOH$, and benzyl alcohol, $C_6H_5CH_2OH$, may be named dimethyl carbinol and phenyl carbinol respectively.

carboxamine maleate

$ClC_6H_4CH(C_2H_4N)OCH_2CH_2N(CH_3)_2 \cdot C_4H_4O_4$.

2-[para-Chloro-alpha-(2-dimethyl-aminoethoxy)benzyl]pyridine maleate.

Properties: White, odorless, bitter crystalline powder; m. p. 116-121°C. Very soluble in water; freely soluble in alcohol and chloroform; very slightly soluble in ether; pH (1% solution) 4.6-5.1.

Grade: N F. XI.

Use: Medicine.

"Carbitol." ²¹⁴ Trademark for mono- and dialkyl ethers of diethylene glycol and their derivatives.

butyl "Carbitol"

See diethylene glycol monobutyl ether.

butyl "Carbitol" acetate

See diethylene glycol monobutyl ether acetate.

"Carbitol" acetate

See diethylene glycol monoethyl ether acetate.

"Carbitol" solvent

See diethylene glycol monoethyl ether.

dibutyl "Carbitol"

See diethylene glycol dibutyl ether.

diethyl "Carbitol"

See diethylene glycol diethyl ether.

n-hexyl "Carbitol"

See diethylene glycol monohexyl ether.

methyl "Carbitol"

See diethylene glycol monomethyl ether.

carbobenzoxychloride. See benzyl chloro-carbonate.

"Carbocell." ²¹⁴ Brand name for a proprietary product. Amorphous carbon (99% carbon) (no foreign bond) with controlled pore size and permeability characteristics. Chemically inert except in strong oxidizing conditions. Free from thermal shock fracture. Available in tubes or rods up to 6 3/4 in dia x 36 in long, and plates 12 in. x 12 in. Machinable; resistivity 0.007-0.008 ohm/cu in. Permeability 15-200 gals water/sq ft/minute at 5 lbs differential depending on grade.

Uses: Filtration; diffusion; steam sparging; anode; cathode.

carbodiimide. See cyanamide (1).

"Carbo-Dur." ¹⁸⁴ Trademark for a hard, granular fast-wetting activated carbon.

"Carbofrax." ²⁸⁰ Trademark for refractory products composed principally of silicon carbide. Available as bonded refractories and cements.

Bonded Refractories

Properties: High refractoriness, high thermal conductivity, resistance to spalling, resistance to mechanical abrasion and resistance to oxidation. Contain 85% or more silicon carbide. The thermal conductivity is a straight line between 105.5 at 1100°F and 112.5 at 2900°F, the values being in Btu/sq ft/in thickness/°F temperature difference/hr. The porosity is about 13% and permeability very low.

Uses: Bricks and special shapes for fuel-bed sections of boiler furnace walls, for retorts, piers, combustion chamber linings, combustion arches; tile used in hearths, muffle walls, retorts, still settings, etc.; protection tubes for platinum couples and as "targets" in tube or block shapes for the newer types of optical and radiation pyrometers.

Refractory Cements

Vary in recommended temperature range for use and in texture.

Uses: Monolithic linings and patching; mortar for laying up "Carbofrax" brick; industrial applications such as forge and boiler furnaces, and crucible melting furnaces.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

carbohydase. An enzyme whose catalytic activity is directed toward the digestion or conversion of carbohydrates. Illustrations are amylase; invertase; maltase (q. v.).

carbohydrates. The class of compounds of carbon, hydrogen, and oxygen in which the latter elements are in the same proportions as in water, or in nearly these proportions. A more rigorous definition is that carbohydrates are aldehyde alcohols or ketone alcohols or compounds that on hydrolysis produce aldehyde or ketone alcohols. The best examples are the crystalline, soluble, sweet, relatively low molecular weight sugars, and the amorphous, tasteless and relatively insoluble high molecular weight starches and cellulose. Specific examples are sucrose $C_{12}H_{22}O_{11}$ and starch $(C_6H_{10}O_5)_x$.

"Carbo-Korez." ⁴¹ Trade name for a carbon-filled, synthetic-resin, acid-proof cement of the phenol-formaldehyde type used as a mortar cement where temperatures do not exceed 360°F. Especially good for high concentrations of sulfuric acid.

"Carbolac." ²⁷⁵ Trade name for series of channel carbon blacks for high grade enamels, lacquers and plastics Available as:

"Carbolac 1." High color channel black.

"Carbolac 2." Standard high color channel black.

"Carbolac 46." High color channel black.

"Carbolan." ²⁰⁶ Brand name of proprietary line of acid dyestuffs giving results of extremely high resistance to milling and very good fastness to light. They are also used for printing on animal fibers

carbolfuchsin (Ziehl's stain). A staining solution of fuchsin in alcohol and aqueous phenol used in the study of micro-organisms.

carbolic acid. See phenol.

carbolic oil (middle oil). Comprises the fraction having a boiling range of about 190-250°C obtained from distillation of coal tar, and containing naphthalene, phenol, and cresols

2-carbomethoxy-1-methylvinyl dimethyl phosphate. See "Phosdrin."

carbomycin. An antibiotic isolated from products of *Streptomyces halstedii* when grown in suitable media by deep culture method. It inhibits growth of certain gram-positive bacteria such as staphylococci, pneumococci and hemolytic streptococci.

Properties: White, odorless, bitter powder; m. p. 195-220°C (dec). Freely soluble in chloroform; very slightly soluble in water; slightly soluble in alcohol and ether.

Stable when protected from moisture; pH (saturated solution) 5.5-8.0.

Grade: N. N. D.

Use: Medicine.

Shipping regulations: None.*

carbon C. Non-metallic element (atomic weight 12; atomic number 6, group IV of periodic system) existing in two crystalline allotropic forms (diamond and graphite) and numerous amorphous forms of varying purity (charcoal, coke, carbon black, lampblack, and activated carbon). Isotopic carbon of atomic weight 13 and 14 also exists, and is of increasing importance as a tracer element (see carbon 14). Carbon is a constituent of all organic compounds and it also occurs in combined form in many inorganic substances (carbon dioxide of the air, limestone, etc.).

Properties: Black in varying degrees; other properties vary greatly with the form under consideration. Sp. gr. of amorphous form usually about 2, but may be less due to admixture with air or other materials. Graphite has sp. gr. 2.25, diamond 3.5. Carbon forms almost innumerable compounds; about half a million have been identified and very many more are undoubtedly possible. Most of these are made indirectly since carbon reacts very slowly with most materials, except for its tendency toward oxidation, which becomes noticeable in air at from 350 to 700°C depending on the form. Even at incandescence, oxidation in air is relatively slow. Carbon does not melt at ordinary temperatures. It sublimes above 3500°C, and the boiling point is about 4200°C. Thermal conductivity is high compared with other non-metals; graphite has thermal conductivity higher than many metals, and also has appreciable electrical conductivity. The thermal coefficient of expansion of carbon is 0.000001 to 0.000004 per °C. The specific heat varies from 0.16 at ordinary temperatures to 0.40 at 1500°C. In the form of ungraphitized structural or formed carbon, the tensile strength is 400 to 1000 psi, and the compressive strength usually about 2000 psi (but may be as high as 10,000 psi). Carbon is insoluble in common solvents, but soluble in some molten metals from which it crystallizes out as graphite.

For uses and further information, see the various specific forms of carbon.

carbon 14 (radiocarbon). Radioactive carbon of mass number 14.

Properties: Half-life, 5720 years; radiation, beta; radiotoxicity, moderately hazardous.

Derivation: The n, p reaction on N-14, usually by nuclear reactor irradiation of calcium nitrate.

Forms available: From the primary source as solid barium carbonate. Secondary suppliers market chemical compounds synthesized from the barium carbonate, including hydrocarbons, organic acids, alcohols, ketones, amino acids, sugars, steroids, and synthetic intermediates, labeled overall, or in specific positions in the molecule.

Uses: As a radiation source in thickness gauges used to measure thin plastic films;

* See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

C-14 is used extensively as a research tool and has aided in the study of such problems as catalytic petroleum processes; the role of carbon black in rubber; the function, distribution and elimination of drugs and pharmaceuticals in animals; immunization; the toxic effects of some common chemicals; photosynthesis; the mechanism of action of fumigants and insecticides; plant and animal nutrition and utilization of proteins, fats, etc; the mechanism of fermentation; thermal and photochemical exchange reactions; the diffusion of carbon in graphite; the mechanism of aging in steel; the diffusion of carbon in steel; flotation studies; etc

Shipping regulations: Class D poison, radioactive material. Blue label *

carbonado. See diamond.

Carbonate Remover. ²⁸ Fine, white, free-flowing powder. Slightly soluble in water. Used to remove carbonates from cyanide plating solutions.

2,3-carbonato-1-propanol. See glycerin carbonate.

carbon bisulfide. See carbon disulfide

carbon black. Finely divided forms of carbon made by the incomplete combustion or thermal decomposition of natural gas or liquid hydrocarbons. The principal types, according to the method of production, are channel black, furnace black, and thermal black. See also under these names. Channel black is characterized by lower pH, higher volatile content, small particle size, and less chainlike structure between the particles; it is suitable for use in reinforcing natural rubber. Thermal black consists of relatively coarse particles and is used principally as a pigment. Furnace black produced from natural gas has an intermediate particle size while that produced from oil can be made in a wide range of controlled particle sizes and is particularly suitable for reinforcing synthetic rubber. Furnace blacks are now the most widely used. See also acetylene black and lamp black.

Properties: Black, amorphous powder. Sp. gr. 1.8-2.1; b.p. 4200°C. Insoluble in all solvents.

Containers: Multiwall paper bags; lined barrels; hopper cars.

Uses: Rubber and inks comprise the largest of many uses.

Shipping regulations: None. *

carbon, combined. As used in metallurgical discussions, carbon which has combined chemically with iron to form cementite, as distinct from graphitic carbon in iron or steel. See also pearlite; ferrite.

Carbon cycle.

1. The progress of carbon from the air (carbon dioxide) to plants by photosynthesis (sugar and starches) then through the metabolism of animals to decomposition products which ultimately return it to the

atmosphere in the form of carbon dioxide.

2. One of the processes by which the sun and other self-luminous astronomical bodies are thought to derive their energy. The net process is the combination of four hydrogen atoms to form helium. One mechanism, called the carbon cycle, involves successive additions of hydrogen atoms, followed by beta decay, to an initial carbon-12 atom, until a final step is reached in which the new nucleus breaks down to a helium atom and a carbon-12 is regenerated. The carbon thus functions as a catalyst for the process. At the temperatures prevailing in the sun all atoms are stripped of their electrons and the reaction is between the nuclei of the atoms, a thermonuclear reaction. Symbolically, the set of reactions is written

carbon, decolorizing. Activated carbon, bone black, or other form of carbon having large surface area due to fine state of subdivision or porous character, so that it has capacity for removing colored, odoriferous and other substances from air, gas, or solution

carbon, deodorizing. See carbon, decolorizing

carbon dichloride. See perchloroethylene

carbon dioxide (carbonic acid; carbonic anhydride) CO₂

Properties: Colorless, odorless gas or heavy, volatile, colorless liquid, or white, snow-like solid. See dry ice. Gas: sp. gr. 1.53 (air = 1); liquid: sp. gr. (-37°C) 1.101; specific volume 8.76 cu ft/lb (70°F); solid: sp. gr. (-79°C) 1.56; m.p. (5.2 atm) -56.6°C; sublimates -78.5°C. Soluble in water

Derivation: (a) Combustion of coal, coke or natural gas and decomposition of natural carbonates (lime and cement plants). Carbon dioxide is absorbed from the flue or kiln gases by sodium carbonate solutions or ethanolamines. (b) Fermentation of carbohydrates. (c) Action of acid on marble, limestone, or dolomite. (d) From natural springs or wells.

Grades: Technical; U.S.P. XVI; commercial, 99.5%; bone dry, 99.8%

Containers: Solid: 50-lb blocks in insulated boxes. Liquid: steel cylinders; tank cars and trucks

Uses (in approximate order of volume):

Refrigeration of foods; carbonated beverages; industrial refrigeration; chemical intermediate (carbonates, urea, salicylic acid, etc.); fire extinguishers; inert atmospheres (welding); medicine. Recent uses are in wind tunnels, and to inject, as a saturated water solution, into the ground to force oil to the surface.

Warning! (solid) Extremely cold (109°F below zero). Causes severe burns. Liberates heavy gas which may cause suffocation. MCA warning label.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Shipping regulations: Gas and liquid: non-flammable gas; green gas label.*

carbon dioxide snow. See dry ice.

carbon dioxide, solidified. See dry ice.

carbon disulfide (carbon bisulfide) CS_2 .

Properties: Clear, colorless or faintly yellow, flammable liquid; almost odorless when pure; the commercial article has a strong disagreeable odor; poisonous. Sp gr. 1.260 at 25/25°C; b p 46.3°C; freezing point -111°C; wt/gal 10.48 lbs (25°C), refractive index 1.6232 (25°C); flash point -22°F; ignition point under some conditions as low as 100°C. Soluble in alcohol, benzene, and ether; slightly soluble in water.

Typical specifications: Carbon disulfide not less than 99.99%; boiling range within 1°C, free from objectionable foreign odor.

Derivation: (a) Reaction of natural gas or petroleum fractions with sulfur. (b) By heating sulfur and carbon (in the form of coal or coke) in either a direct-fired or an electric furnace and condensing the carbon disulfide vapors.

Method of purification: Treatment with lead acetate followed by lime water with subsequent distillation.

Impurities: Sulfur compounds.

Grades: 99.99%.

Containers: 5-, 10-, 55-gal drums; tank cars, 7,000-, 8,000-, 10,000-gals.

Uses: In viscose rayon; cellophane, manufacture of carbon tetrachloride and flotation agents; veterinary medicine; solvent for fats, resins, rubber, waxes, sulfur, and other chemical products, varnishes; lacquers; paint and varnish removers, rubber, textiles, fumigant; matches, preservative; pesticides.

Danger: Extremely flammable. Vapor harmful. Highly volatile. MCA warning label.

Shipping regulations: Flammable liquid. Red label. Cannot be shipped by express.*

carbon fluorides (CF_x), C_4F . Solid nonconductive materials formed on the carbon anodes during electrolysis of molten potassium fluoride-hydrogen fluoride mixtures to yield elemental fluorine. C_4F is unstable at 60°C and higher temperatures. (CF_x) forms only at higher temperatures.

carbon, gas (retort carbon; retort graphite, metallic carbon; glance coal).

Carbon, in a very dense form, found deposited in the upper parts of retorts used in coal-gas manufacture.

Uses: Manufacture of arc and battery carbons, dry cells.

carbon, graphitic. As used in discussions of metallurgy of iron and steel, practically pure carbon which forms in pig iron during the cooling process, because the absorbing power of iron for carbon decreases as its temperature falls. It exists in the iron in the form of tiny flakes which are distributed throughout the mass. Graphitic carbon gives pig iron the grayish-black appearance so often seen. The tendency of graphitic

carbon is to weaken the metal, while combined carbon (q.v.) up to the limit of about 0.90% strengthens it. See also pearlite; cementite; ferrite.

carbon hexachloride. See hexachloroethane.

carbonic acid. Actually H_2CO_3 , but customarily used as a synonym for the anhydride, carbon dioxide.

carbonic acid, diphenyl ester. See diphenyl carbonate.

carbonic anhydrase. An enzyme present in red blood cells which catalyzes the production of carbon dioxide and water from carbonic acid.

Use: Biochemical research.

carbonic anhydride. See carbon dioxide.

carbonium ion. A positively charged organic ion such as H_3C^+ , H_2RC^+ , R_3C^+ , $\text{RC}^+=\text{O}$, etc., having one less electron than the corresponding free radical and acting in subsequent chemical reactions as though the positive charge was localized on the carbon atom. Such ions can exist only when corresponding negative ions are also present, existence being demonstrated by electrical conductivity experiments. An electron-deficient carbon atom is extremely reactive and has only a transitory existence in most cases, but many organic rearrangement and replacement reactions are effectively explained in terms of a carbonium ion intermediate, including acid-catalyzed polymerization of propylene and other olefins. In this case propylene and hydrogen ion form a carbonium ion as follows:

The latter then combines with another molecule of $\text{H}_3\text{C}-\text{HC}=\text{CH}_2$ to start chain growth.

The difference between a carbonium ion, a free radical and a carbanion may be illustrated as follows:

carbonium ion free radical carbanion

carbonization of coal. Heating bituminous coal out of contact with air to obtain coke and the many valuable by-products, gaseous, liquid and solid. Low temperature carbonization (400-750°C) yields small quantities of gaseous products but large amounts of coal tar and liquids. Higher temperatures result in an increased ratio of gases to liquids. Some of the basic by-products are ammonia, fuel gas, light oil, and coal tar. These are sources of many of the most important materials of the chemical industry.

carbonizing assistants. Materials for increasing the efficiency of dilute acid baths used

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

for "carbonizing" wool Carbonizing removes vegetable matter such as burrs from raw wool or reclaims wool fibers from mixed rags and waste by destroying cellulosic materials Most wetting-out agents and emulsifiers unaffected by acids assist carbonization by increasing penetration

carbon, metallic. See carbon, gas.

carbon, mineral. See graphite

carbon monoxide CO

Properties: Colorless gas, exceedingly faint, metallic odor and taste; highly poisonous, inducing asphyxiation, 0.2% in air is poisonous and 0.43% will induce asphyxiation Burns with a violet flame Mixtures of carbon monoxide and air in certain proportions are flammable

Constants: Sp. gr 0.96716; b p -190°C ; solidification point -199°C ; specific volume 13.8 cu ft/lb (70°F)

Derivation: (a) Obtained almost pure by introducing a mixture of oxygen and carbon dioxide in contact with incandescent graphite, coke or anthracite (b) Action of steam on hot coke or coal (water gas) (c) By-product in chemical reactions (d) Combustion of organic compounds with limited amount of oxygen

Absorbed by carbon, some metals and by a solution of cuprous chloride in hydrochloric acid or ammonia

Grades: Commercial (98%), C P (99.5%)

Containers: Cylinders

Uses: Chemical (methanol, ethylene, organic synthesis), fuels (gaseous), metallurgy (special steels, reducing oxides, nickel refining), zinc white pigments.

Shipping regulations: Flammable gas Red gas label *

"Carbonox." ²³⁶ Brand name for a proprietary product An organic humic acid material used for treatment of drilling mud to reduce viscosity and gel strength Also used to prepare emulsion muds characterized by low filtration rates, stability, and easy maintenance

Containers: Multiwall paper bag containing 50 lbs

carbon oxybromide. See bromophosgene

carbon oxychloride. See phosgene

carbon oxycyanide. See carbonyl cyanide

carbon oxyfluoride. See carbonyl fluoride

carbon, retort. See carbon, gas

carbon tetrachloride (tetrachloromethane; perchloromethane) CCl_4

Properties: Colorless liquid; peculiar odor, yielding heavy vapors; non-flammable, poisonous Sp. gr 1.585 ($25/4^{\circ}\text{C}$); b p 76.74°C ; freezing point -23.0°C ; refractive index 1.4607 at 20°C ; vapor pressure 9.3 mm (20°C); wt/gal 13.22 lbs (25°C); flash point, none; fire point, none Miscible with alcohol, ether, chloroform, benzene, solvent naphtha, and most of the fixed and volatile oils; very slightly soluble

in water.

Typical specifications: Carbon tetrachloride not less than 99.5%; volatility practically complete; residual odor, none; boiling range within 1°C

Derivation: (a) By the interaction of carbon disulfide and chlorine in presence of a catalyzer (iron); (b) chlorination of methane or higher hydrocarbons at $250-400^{\circ}\text{C}$

Method of purification: Treatment with caustic alkali solution to remove sulfur chloride, followed by rectification

Grades: Technical; C P, N F XI; electronic

Containers: 5-, 10-, 55-gal drums; tank cars

Uses (in approximate order of volume): Refrigerants and propellants, especially the chlorofluorohydrocarbons; metal degreasing; grain fumigants and insecticides; fire extinguishers; dry cleaning solvents; chlorinating organic compounds; general solvent, anthelmintic, in production of semiconductors

Danger: Hazardous vapor and liquid; may be fatal if inhaled or swallowed MCA warning label

Shipping regulations: None *

carbon trichloride. See hexachloroethane

carbonyl. The divalent organic radical CO

Also used as a general term for metal compounds containing the CO group (i.e. $\text{Ni}(\text{CO})_4$, nickel carbonyl)

N, N'-carbonylbis(4-methoxymetanilic acid)

disodium salt $[\text{C}_6\text{H}_4(\text{OCH}_3)(\text{SO}_3\text{Na})\text{NH}]_2\text{CO}$.

Properties: Gray paste; solids approx 70%

Grades: Technical

Use: Intermediate

carbonyl bromide. See bromophosgene

carbonyl chloride. See phosgene

carbonyl cyanide (carbon oxycyanide) $\text{CO}(\text{CN})_2$

Properties: Colorless liquid Unstable in the presence of water Sp. gr 1.124 at 20°C ; b p 65.5°C (740 mm) Very poisonous

Derivation: From diisocyanatoacetone

Grades: Technical

Uses: Organic synthesis; suggested military poison gas

carbonyl fluoride (fluoroformyl fluoride; carbon oxyfluoride) COF_2

Properties: Colorless gas Unstable in the presence of water B p -83°C , sp. gr 1.139 (-114°C); m p. -114°C Very poisonous

Derivation: Action of silver fluoride on carbon monoxide

Grades: Technical

Uses: Organic synthesis; suggested military poison gas

carbonyl iron. See iron pentacarbonyl

carbonyl iron powder. Elementary iron in powdered form, 99.6-99.9% pure Fe. Particle

size is usually 1 to 20 microns, according to type of powder supplied.

Derivation: By treating crude iron with carbon monoxide, under heat and pressure,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

and subsequently heating the iron pentacarbonyl vapor obtained.

Containers: 1-, 5-lb tin; 25-lb pkg; 200-lb drum.

Uses: High frequency cores in electronics; magnetic fluids; alloying agents; catalysts; pharmaceuticals; powder metallurgy

Carbortam.³³⁷ A ferrotitanium containing also carbon, silicon, boron and aluminum; m.p. 2650°F; used to deoxidize and harden steel

"Carborundum."²⁸⁰ A trademark used on abrasives and refractories of silicon carbide, fused alumina and other materials. Properties: For silicon carbide — Crystal-line form ranges from small to massive crystals in the hexagonal system, the crystals varying from transparent to opaque with colors from pale green to deep blue or black; hardness of 9.17 in Mohs' scale; sp. gr from 3.06-3.20; crushes into hard sharp abrasive granules; not affected by acids; slowly oxidizes at temperatures above 1000°C, good heat conductor; highly refractory. For fused alumina — See properties under the trademark "Alumina". Uses: Abrasive grains and powders for cutting, grinding and polishing; valve-grinding compounds; grinding wheels, stones; bones, rubbing bricks; coated abrasive products; tiles; antislip tiles and treads; refractory grains, tiles; bricks and blocks; grinding and polishing machines

carbosand. Fine sand that has been treated with an organic solution and roasted in order to produce a material that can be sprayed onto oil slicks and aid in sinking such slicks, thereby destroying the fire hazard occasioned by the presence of oil on water

"Carbose."²⁰³ Trademark for a technical grade of sodium carboxymethylcellulose (Sodium CMC, NaCMC, CMC). Properties: Free-flowing, white to pale cream, odorless powder; packed density, 42 lb/cu ft. Grades: "Carbose" D, "Carbose" I, "Carbose" IM, "Carbose" MX, and "Carbose" VL, differ chiefly in viscosity.

Containers: Bags and leverpak drums

Uses: Detergency promoter, binder and adhesive, film former, drilling mud additive, textile and laundry sizing, surface and beater application in paper industry

Hazards: Finely ground combustible material; do not allow accumulation of suspended and deposited dust

"Carboseal."²¹⁴ Trademark for proprietary hygroscopic liquid compositions for joint sealing

Properties: Clear, amber hygroscopic liquid; initial b.p. 280°F, water solubility (20°C) complete; sp. gr. 1.017 (60°F); wt/gal 9.19 lb (20°C).

Containers: 1-, 5-gal cans, 55-gal drums (8.5, 40, 490 lb net wt); tank cars.

Uses: Swelling and moistening agent for jute and other packing in cast-iron gas mains, to correct joint leakage and lay dust

"Carbo-Sour." A proprietary product consisting of highly soluble fluorine compounds.

Properties: White, dustless granules; highly soluble in water. Neutralizing value 30.2 oz sodium bicarbonate per lb

Containers: 150-lb and 300-lb net fiber drums

Uses: Laundry sour, especially when high solubility is desired.

Fire hazard: None.

Shipping regulations: None *

"Carbo-Vitrobond."⁴¹ Trade name for a carbon-filled, sulfur-based compound for use as a hot-pour, acid-proof cement where temperatures do not exceed 200°F. Has excellent resistance to hydrofluoric and nitric acids.

"Carbowax."²¹⁴ Trademark for polyethylene glycols and methoxypolyethylene glycols.

"Carbowax" polyethylene glycols are available in molecular weights ranging from 200 to 20,000

Properties: Water white liquids to hard waxy solids; water soluble; good lubricity; heat stable; inert to many chemical agents; do not hydrolyze or deteriorate

Uses: Water-soluble lubricants in rubber fabricating, textile processing, and metal forming, ointment bases for drugs and cosmetics; solvents for dyes, resins, proteins; plasticizers and dispersants for casein and gelatine compositions, glues, zein, and cork.

"Carbowax" methoxypolyethylene glycols are available in molecular weights of 350, 550, and 750. They are similar to polyethylene glycols of comparable weight and are designed for the manufacture of nonionic surface active agents through the preparation of their mono-fatty esters

carbox fuel cells. See fuel cells

"Carboxide."²¹⁴ Trademark for proprietary fumigant mixture of ethylene oxide and carbon dioxide.

Properties: Colorless gas. Composition not less than 90% carbon dioxide, not more than 10% ethylene oxide; residue not more than 0.1% by wt; vapor pressure not more than 725 psig (70°F)

Containers: 30-, 60-lb cylinders (net wt)

Uses: Fumigant and sterilizing agent to eliminate insects and bacteria. Particularly desirable as fumigants for foodstuffs, tobacco, cigars, furs, garments, rugs, furniture, mohair and woolen goods. Also exhibits valuable properties of ethylene oxide for controlling development of mold spores and thermophilic bacteria

carboxybenzene. See benzoic acid

carboxyhemoglobin. Hemoglobin which has combined with carbon monoxide rather than oxygen, thus rendering it unable to transport oxygen. The affinity of hemoglobin for carbon monoxide is 200 times greater than that for oxygen, thus explaining the great toxicity of carbon monoxide

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

carboxylase. A decarboxylase enzyme found in plant tissues which acts upon pyruvic acid, producing acetaldehyde and carbon dioxide

Use: Biochemical research

carboxylic. Term for the COOH group, the radical characteristic of all organic acids

carboxymethylcellulose. See sodium carboxymethylcellulose

carboxymethylmercaptosuccinic acid
 $\text{HOOCCH}_2\text{SCH}(\text{COOH})\text{CH}_2(\text{COOH})$ A heavy-metal chelate

Properties: White powder, melting range 136-138°C Water solubility, 147 g/100 g at 25°C, ethanol solubility, 76 g/100 g at 25°C

carboxymethylpyridinium chloride hydrazide.
 See Girard's "P" reagent

carboxymethyltrimethyl ammonium chloride hydrazide. See Girard's "T" reagent

carboxypeptidase. A proteolytic enzyme found in the pancreas which catalyzes the hydrolysis of native food proteins It acts upon polypeptides producing simpler peptides and amino acids

Use: Biochemical research

4-carboxyresorcinol. See beta-resorcylic acid

6-carboxyuracil. See orotic acid

carbromal. See bromodiethylacetylurea

carburetted water gas. A city gas consisting of water gas in which the heating value (Btu) is increased and luminous quality (candle power) conferred by the addition of hydrocarbon gases and vapors obtained by high-temperature cracking of residual oils from petroleum refining operations A typical composition: Illuminants, 13.3%, carbon monoxide, 30.4%, hydrogen, 37.7%, methane, 10.0%; ethane, 3.2%, carbon dioxide, 3.0%, oxygen, 0.4%, nitrogen, 2.1%, Btu/cu ft, 543.0; candle power, 22.1

carbutamide. See 1-butyl-3-sulfamylurea

carcinogens. Substances which cause cancerous growths in living tissues Among known carcinogens are 9,10-dimethyl-1,2-benzanthracene, 20-methylcholanthrene, benzo[a]pyrene (3,4-benzpyrene), found in coal, cigarette, and other tars All are polynuclear hydrocarbons. Among other compounds thought to be carcinogens are urethane; the nitrogen mustards (these two types may both induce and inhibit tumors); some azo dyes (e.g., ortho-aminoazotoluene, 4-dimethylaminoazobenzene); beryllium, cobalt, selenium and nickel compounds; chromates; excess amounts of some hormones

Camom oil.

Properties: Colorless or pale-yellow essential oil; strongly aromatic, camphoraceous odor and taste Sp. gr. 0.917-0.947 (25/25°C), refractive index 1.460; optical rotation +22° to +44° in 100 mm

tube at 25°C Insoluble in water, soluble in alcohol and ether Keep well closed, cool, and protected from light

Chief known constituents: Terpinene, dipentene, limonene, cineol, borneol

Derivation: Distilled from the seeds of *Elettaria cardamomum* from Malabar and Ceylon.

Method of purification: Rectification

Grades: Technical; N F XI

Containers: Tins; glass bottles.

Uses: Flavoring; liqueurs; medicine.

Shipping regulations: None *

cardamom seed.

Derivation: Dried, nearly-ripe fruit of *Elettaria cardamomum*

Habitat: Malabar, cultivated in India and Ceylon

Grades: Bleached; decorticated, green; N F XI

Containers: Bags; cases

Uses: Medicine, condiment, source of perfume extracts

Shipping regulations: None *

"Cardanol." ¹⁵⁸ A mixture of 3-pentadecenyl and less saturated C₁₅ phenols, as, C₆H₄OH C₁₅H₂₇

Properties: Amber liquid, boiling range 180-230°C (1 mm), soluble in oils, waxes, and all organic solvents; insoluble in water, glycerine, and aqueous alkalis

Uses: Aldehyde-reactive plasticizer for phenol-aldehyde resins, particularly for laminating purposes

"Cardanol Bis-Phenol." ¹⁵⁸ Stated to be 1,8-di(hydroxyphenyl) pentadecane

C₆H₄OH·C₁₅H₃₀·C₆H₄OH

Properties: Brown viscous liquid (10,000 cps at 25°C)

Uses: Base for epoxy resins; base for synthetic resins of phenol-formaldehyde type useful as wire enamel

"Cardanol" Ethers. ¹⁵⁸ A mixture of ethyl ethers of 3-pentadecenyl and less saturated C₁₅ phenols, as, C₆H₄OC₂H₅·C₁₅H₂₇.

Properties: Light amber, low-viscosity liquid, boiling range 175-200°C (1 mm), pour point, -52°C

Uses: Low-temperature plasticizer for GR-S rubber

"Cardilate." ³⁰¹ Trademark for erythrol tetranitrate (q.v.)

"Cardio-Green." ³⁴⁸ Trademark for indocyanine green, a diagnostic dye used in medicine

"Cardolite" Brand Epoxy Resin Flexibilizer NC-513. ¹⁵⁸ A fluid resin designed for use as a chemically-bound flexibilizer for epoxy resins

Properties: Clear, deep amber liquid Viscosity, 100 cps maximum at 25°C; epoxide equivalent of 475 to 575; specific gravity 0.960 to 0.975 at 25°C, open cup flash point 445°F

Containers: Quart, 1-gal, 5-gal, and 55-gal drums

Uses: It is non-extractable and is co-reactive

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

with epoxies. Reduces viscosity and improves solubility and resistance of epoxies to thermal and mechanical shock without adversely affecting strength, corrosion resistance, electrical or aging properties.

"Cardolite" Brand Friction Components. ¹⁵⁸

Components based upon a phenolic-type liquid found in the fibrous outer shell of the cashew nut. (See cashew nutshell liquid) These materials are produced in the form of friction-fortifying particles, and binding resins in liquid or powdered form.

Containers: 55-gal drums

Uses: The resins are used in the formulation of brake linings, brake blocks, clutch facings and other friction units which have high heat resistance, and outstanding friction and wear characteristics.

"Cardolite" Brand Friction Fortifying Particles are used as additives to an asbestos-resin-filler matrix to stabilize and control the coefficient of friction, wear, noise and high temperature performance

"Cardolite" Brand CNSL Liquid Binding Resins are heat-convertible polymers. Used to bond together the asbestos fillers and friction modifying particles, these resins provide a friction surface with relatively constant properties over a wide temperature range.

"Cardolite" Brand CNSL Powdered Binding Resins are heat convertible internally flexibilized resins for enhancing high temperature and friction characteristics of friction elements

"Cardolite" Brand Polymeric Intermediates are used to prepare resins for coatings, saturating resins, binder resins, etc., where thermal stability, impact resistance and chemical resistance are needed.

"Cardosol" Brand Resin. ¹⁵⁸ A water soluble ketone formaldehyde condensate which can be gelled and cured by alkali or heat

Containers: 5-gal pails; 55-gal drums
Use: Primarily used in conjunction with starch to provide water resistant adhesives for box board coatings, for glass fibers and as a ceramic binder.

carica papaya. See papaya

"Caricide." ⁵⁷ Trademark for diethylcarbamazine.

caritol. See carotene

carmania gum (Syrian gum) A tragacanth gum (q. v.) exuded from thorny shrubs of *Astragalus* in Syria

"Carmethose." ³⁰⁵ Trademark for sodium carboxymethylcellulose, U S P Used in medicine.

carmine (coccinellin) An aluminum lake of the pigment from cochineal (q. v.) Bright red pieces, easily powdered Soluble in alkali solutions, borax; insoluble in dilute acids; slightly soluble in hot water
Grades: Technical

Containers: Tins.

Uses: Dyes, inks, indicator in chemical analysis; coloring food materials, medicines, etc.

Shipping regulations: None.*

carminic acid (cochinilin) $C_{22}H_{20}O_{13}$, a tricyclic compound The essential constituent of carmine

Properties: Dark, purplish-brown mass or bright-red powder M. p., decomposes at 136°C; pH 4.8 yellow; pH 6.2 violet Soluble in water, alcohol, alkali hydroxide solutions; insoluble in ether, benzene, chloroform.

Derivation: By extraction from the insects, *Coccus cacti* (cochineal)

Method of purification: Crystallization

Grades: Technical

Containers: Glass bottles

Uses: Stain in microscopy; indicator in analytical chemistry; coloring proprietary medicines; pigment for fine oil colors; color photography; dyeing

Shipping regulations: None*

carallite $KCl MgCl_2 \cdot 6H_2O$ or $KMgCl_3 \cdot 6H_2O$

Properties: A natural hydrated double chloride of potassium and magnesium. White, brownish and reddish; streak, white; shining, greasy luster; strongly phosphorescent; bitter taste; deliquescent. Sp. gr. 1.62; hardness 1.

Occurrence: Germany; Alsace; New Mexico.

Use: A chief commercial source of manufactured potash salts

"Carnation." ⁴⁵ Trademark for white mineral oil, technical grade.

Properties: Sp. gr. 0.835-0.845 (60°F); Saybolt viscosity 65-75 (100°F); odorless and tasteless

Uses: Cosmetic preparations; shell egg preservation, further organic synthesis

carnauba wax (Brazil wax) One of the hardest and most expensive of the commercial waxes.

Properties: Hard, amorphous, light yellow to dark greenish brown brittle lumps; peculiar, agreeable odor. Sp. gr. 0.995 (15/15°C); m.p. 84-86°C; acid number 2-9; iodine number 13.5. Soluble in ether, boiling alcohol and alkalies; insoluble in water.

Derivation: An exudation from leaves of the wax palm, *Copernicia cerifera* (Brazil)

Grades: No. 1 yellow; No. 2 N.C.; No. 2 regular; No. 3 N.C.; No. 3 chalky, powdered

Containers: Bags; boxes

Uses: Substitute for beeswax; shoe polishes; candles; leather finishes; varnishes, electric insulating compositions; furniture and floor polishes; phonograph records; carbon paper coating; waterproofing.

Shipping regulations: None*

cornelian (cornelian) A clear pale to deep red chalcedony (q. v.).

carnosine (beta-alanylhistidine; ignotine) $C_9H_{14}N_4O_3$. An amino acid occurring in

* See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

muscle of many animals and man. It is found naturally in the L(+)-form.

Properties: M. p. 246-250°C (dec.); soluble in water. Nitrate: crystals; m. p. 222°C (dec.); soluble in water. Hydrochloride: crystals; m. p. 245°C (dec.); soluble in water. D(-)-carnosine: crystals; m. p. 260°.

Use: Biochemical research

carnotite $K_2(UO_2)_2(VO_4)_2 \cdot 3H_2O$. A natural hydrated vanadate of uranium and potassium, usually found in sandstones and other sedimentary rocks.

Properties: Color bright yellow to lemon yellow, sometimes greenish yellow; luster dull or earthy, pearly or silky when coarsely crystalline. Soluble in acids. Radioactive. Usually occurs as a powder or in fine-grained aggregates.

Occurrence: Colorado, Utah, Arizona, New Mexico, South Dakota; Australia; Belgian Congo; U. S. S. R.

Use: Important ore of uranium; source of radium.

Shipping regulations: Poison, radioactive material. Red or blue label.*

Carnot's reagent. A reagent for the determination of potassium. It is an alcoholic solution of sodium bismuth thiosulfate, made from sodium thiosulfate and bismuth subnitrate.

"Carnube Wax." ³⁵⁴ A synthetic wax substitute for carnauba wax. It can be used to replace up to 75% of carnauba wax in bright-drying wax emulsions. M. p. 80-82°C, acid no. 78-80.

carob seed (carob bean, carob-tree bean, St. John's bread, algarroba bean, locust bean).

Derivation: From the tree *Ceratonia siliqua*. Seeds and pod contain a sweet pulp rich in sugar and gums.

Containers: Bales.

Use: As fodder, source of carob-seed gum.

carob-seed gum (locust-bean gum).

Properties: In powdered form, nearly pure white. Swells partially in cold water, but attains greater viscosity when heated. Insoluble in most organic solvents.

Typical specification: 12-14% moisture, acid insoluble ash 0.7-1.5%; protein content 5-6%.

Containers: Bags.

Derivation: Extracted from carob seeds.

Uses: As emulsifying agent in ice cream and cosmetic cream manufacture; in textile manufacturing as sizing and finishes, and as a substitute for tragacanth gum; pharmaceuticals; paint industry. See also locust kernel.

"Carolate." ⁴¹⁵ Trade name for a self-emulsifying spermaceti-amide. A soft wax; bland odor and taste; pH of 1% solution 9.5.

Containers: 25-lb corrugated cartons.

Uses: Vehicle for cosmetics and pharmaceuticals.

"C-4" Aromatic Solvent. ¹¹ Trade name for a clear alkylated aromatic hydrocarbon used as a medium-high-boiling (160-185°C) aromatic solvent for coating compositions and for processing purposes.

carony bark. See angostura.

Caro's acid (peroxysulfuric acid; persulfuric acid) H_2SO_5 or $HOSO_2OOH$.

Properties: White crystals; m. p. 45°C (decomposes). Is reported to have exploded spontaneously, and on addition of organic matter.

Derivation: Action of hydrogen peroxide on concentrated sulfuric acid; action of 40% sulfuric acid on potassium persulfate.

Use: See Caro's reagent.

Caro's reagent. A pasty mass of great oxidizing power (see Caro's acid). Used in testing aniline, pyridine, and alkaloids.

carotene (carotin, caritol, provitamin A) $C_{40}H_{56}$. A precursor of vitamin A occurring naturally in plants. It consists of 3 isomers; about 15% alpha, 85% beta, and 0.1% gamma. Carotene is a hydrocarbon member of a large class of pigments called carotenoids. It has the same basic molecular structure as vitamin A and is transformed to the vitamin in the animal liver.

Properties: Ruby-red crystals, easily oxidized on contact with air; m. p. (alpha) 188°C, (beta) 184°C, (gamma) 178°C; insoluble in water; slightly soluble in alcohol and ether; soluble in chloroform, benzene, and oils.

Source: Occurs as an orange-yellow pigment in plant and animal tissue, particularly in butter, eggs, sweet potatoes, alfalfa, barley, clover, rye, and wheat. The proportion is very small, only 10 to 40 mg of carotene per pound of fresh material.

Derivation: By extraction from carrots and palm oil concentrates; by a chromatographic process from alfalfa. beta-Carotene is also made by a microbial fermentation process from corn and soybean oil.

Grades: According to U. S. P. units of vitamin A. Sold as pure crystals or solutions in various oils.

Uses: Feed additive, pharmaceuticals; coloring and enriching margarine and dairy products.

carotenoids. A class of pigments which occurs in many vegetable oils and in some animal fats. They range in color mostly from yellow to deep red. They include the four hydrocarbons lycopene, alpha-, beta-, and gamma-carotene, and various derivatives.

Properties (general): Crystalline solids; soluble in fats and oils; insoluble in water, high melting, stable to alkali but unstable to acids and to oxidizing agents; color easily destroyed by hydrogenation or by oxidation; some are optically active.

carotin. See carotene.

carpaine $C_{14}H_{25}NO_2$.

Properties: White crystalline alkaloid.

*See "I. C. C. Shipping Regulations," page xiii. *

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Soluble in alcohol and ether; slightly soluble in water. M.p. 121°C; b.p. 215-235°C.

Derivation: By extraction from the leaves of *Carica papaya*.

carraine hydrochloride $C_{14}H_{25}NO_2 \cdot HCl$.

Properties: White crystals; soluble in water, alcohol, and ether; m.p. 225°C (dec).

carrageen. See *chondrus*.

carrageenan (formerly *carrageenin*). The gelatinous extract of a seaweed called *carrageen*, *Chondrus crispus* (q.v.) or Irish moss. It is a complex carbohydrate made up of galactose, dextrose, and levulose residues and small quantities of pentosan or methylpentosan.

Properties: A water-soluble colloid, refined and dried to a free-flowing powder. Adsorbs water rapidly, dissolves readily in warm water, gels on cooling. A 3% solution forms a soft gel with m.p. 27-30°C, a 5% solution forms a firm gel with m.p. 40-41°C. There are two forms. One, extracted by cold water, gives a viscous solution in water. The other, extracted by hot water, gels on cooling.

Derivation: Extraction from the plants by hot water, filtering, concentrating the filtrate, and precipitating the carrageenan with alcohol.

Uses: In bacteriological cultures, in medicine; in foods as an emulsifier and stabilizer, and in general, as a protective colloid.

carrageenin. See *carrageenan*.

"**Carrene 16**," ⁵⁴ Trademark for a solution of lithium bromide in water and used in absorption refrigeration machines.

"**Carrene 500**," ⁵⁴ Trademark for an azeotropic mixture of 73.8% dichlorodifluoromethane and 26.2% unsymmetrical difluoroethane boiling at -28°F and used as a refrigerant.

carrier. As used in atomic tracer procedures, a substance which when added to a minute quantity (trace) of a like or similar substance will carry the trace with it through a chemical or physical process. Carriers make possible the study of the chemical behavior of radioactive substances formed in such small quantities that it would not be possible otherwise to observe their characteristic reactions.

carrot oil.

Properties: A light-yellow volatile oil having a spicy odor. Sp. gr. 0.870-0.944; optical rotation -8 to -37°; refractive index 1.482-1.491.

Chief known constituents: Carotene, pinene, limonene, palmitic acid, butyric or isobutyric acid.

Derivation: Distillation of the seeds of *Daucus carota*.

Uses: Liqueur and other flavors; to a small extent, perfumery.

carthamic acid. See *carthamin*.

carthamin (carthamic acid; safflor carmine; safflor red) $C_{21}H_{22}O_{11}$.

Properties: Dark-red powder with green luster. Slightly soluble in water; soluble in alcohol; insoluble in ether; solutions rapidly decompose.

Derivation: A glucoside coloring matter from *Carthamus tinctorius*.

carthamus (safflower; thistle saffron; American saffron; dyer's saffron; false saffron; bastard saffron). Florets of *Carthamus tinctorius*.

Properties: Red color, mixed with yellow; peculiar slightly aromatic odor.

Habitat: Levant and Orient; cultivated extensively in Europe and America.

Grades: Technical.

Containers: Bales.

Uses: Medicine; coloring cosmetics, liqueurs, butter, sweetmeats and various food products; dyeing artificial flowers; paints.

Shipping regulations: None.*

"**Cartrax**," ²⁹⁹ Trademark for a combination drug containing hydroxyzine hydrochloride and pentaerythritol tetranitrate. Used in medicine.

carui oil. See *caraway oil*.

carum. See *caraway*.

"**Carum**," ⁵¹ Trademark for grease-type lubricants prepared for use in chemical, food and similar processing industries where insolubility in the material being processed is essential. Intended for valves and pumps handling such materials.

carvacrol (isopropyl-ortho-cresol; 2-hydroxy-para-cymene) $(CH_3)_2CHC_6H_3(CH_3)(OH)$. An alcohol.

Properties: Thick, colorless oil; thymol odor; sp. gr. 0.976 (20/4°C); b.p. 237°C; m.p. 0°C; refractive index 1.523 (20°C). Insoluble in water; soluble in alcohol, ether, and alkalis.

Derivation: (a) From oil of *origanum*, from *thyme*, and *summer savory*; (b) also from *para-cymene* by sulfonation, followed by alkali fusion.

Uses: Perfumes; fungicides; disinfectant.

Shipping regulations: None.*

carvol. See *carvone*.

carvone (carvol) $C_{10}H_{14}O$. A quinone similar in general structure to *carvacrol*.

Properties: Pale-yellowish or colorless liquid; fine caraway-like odor. Sp. gr. 0.960; b.p. 230°C; refractive index (n_D¹⁸/D) 1.4999. Soluble in alcohol, ether and chloroform; insoluble in water.

Derivation: From *caraway*, *dill*, *spearmint* oils.

Method of purification: Rectification.

Grades: Technical.

Containers: Tins; 1-, 5-lb glass bottles.

Uses: Medicine; flavoring; liqueurs; perfumery.

Shipping regulations: None.*

caryophyllin (oleanoic acid) $C_{30}H_{48}O_3$. Not to be confused with *caryophyllene*, a

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

sesquiterpene, $C_{15}H_{24}$.

Properties: White, odorless, silky needles; m.p. 310°C . Insoluble in water; soluble in alcohol and ether.

Derivation: From clove oil.

caryophyllus (clove). Dried flower buds of *Eugenia caryophyllus* having a strong fragrant, spicy odor.

Habitat: Malacca Islands; Zanzibar, Sumatra; South America; West Indies, etc.

Grades: Technical; N. F. XI; also as from Madagascar or Zanzibar.

Containers: Boxes; bags.

Uses: Medicine; manufacture of clove oil, eugenol, chocolate; in baking.

Shipping regulations: None.*

caryophyllus oil. See clove oil.

Casale system. One of the older processes for synthesis of ammonia from nitrogen and hydrogen gases with a promoted iron oxide catalyst. Characterized by use of high pressure (600-750 atmospheres), 500°C temperature, presence of ammonia (from recycle gas) in converter feed gas so as to slow down initial reaction rate and heat production. Conversion is about 40% per pass and the high pressure permits condensing the ammonia formed by passing the converted gas through water-cooled condensers.

cascade. A process or apparatus, usually in separation or purification, in which materials are passed through a multiplicity of identical or similar relatively simple operations, in order to multiply the separation or other effect that is achieved in a single simple operation. An outstanding example is the Oak Ridge diffusion plant for separating uranium isotopes by passing uranium fluoride mixtures through an extended series of diffusion cells, each of which causes a slight enrichment of the desired isotope. An ordinary bubble plate distillation tower is a much more frequently encountered example.

cascade particle. See fundamental particle.

"Cascamite." ⁶⁵ Trademark for a powdered urea-formaldehyde resin glue; water-resistant, moldproof, stainfree.

cascara sagrada bark (sacred bark; chittim bark; chittim bark, Persian bark; bearberry bark; bearwood).

Derivation: Bark of *Rhamnus purshiana*.

Habitat: West coast of the United States.

Properties: The bark loses its emetic properties on being kept for one year. Odor distinct, taste bitter, and slightly acrid.

Grades: Technical; U. S. P. XVI.

Containers: Bales; multiwall paper sacks.

Use: Medicine.

Shipping regulations: None.*

cascarilla (eleuthera bark; sweet-wood bark; eluteria bark).

Derivation: Bark of *Croton eluteria*.

Habitat: West Indies.

Use: Medicine; sometimes added to smoking tobacco for flavor.

"Casco." ⁶⁵ Trademark for a series of adhesives based on casein, seedmeal and soya proteins, furnished in dry powder form. For gluing wood and paper in a wide variety of applications.

"Cascola." ⁶⁵ Trademark for a series of casein and dextrin type adhesives for carton sealing, paper laminating, tube winding and various packaging applications.

"Cascolac." ⁶⁵ Trademark for a series of viscous, liquid, casein-based adhesives for general purpose paper gluing, packaging, label bonding, over-coating.

"Cascoloid." ⁶⁵ Trademark for a series of casein base binders, emulsifiers, stabilizers, and thickeners for emulsion paints and coatings.

"Cascophen." ⁶⁵ Trademark for a series of resorcinol, phenol-resorcinol, and phenolic resins in liquid and powder form. Used for waterproof wood adhesives, wet strength resins for paper, molding applications.

"Casco Resin." ⁶⁵ Trademark for a series of liquid urea-formaldehyde resins, used in wood gluing operations, in wet-strength paper and in paper lamination to fortify starch compounds.

"Cascorez." ⁶⁵ Trademark for a series of liquid and powdered polyvinyl adhesives for bonding wood, paper, fabric and other porous and semi-porous materials.

case hardening. A process of hardening a ferrous alloy so that the surface layer or "case" is made substantially harder than the interior or "core."

case-hardening compounds. Materials used to impart a hard surface to steel while the interior remains soft and tough. This is accomplished by heating the steel out of contact with air while packed in carbonaceous material, cooling it to black heat, reheating to a high temperature, and quenching. The compounds used are usually wood charcoal with sodium, potassium, or barium carbonates, cyanides, etc. Shipping regulations: For mixtures containing cyanides, poison label.*

casein. The principal protein in milk (3% casein) and the main ingredient of cheese. It is a phosphoprotein (about 0.85% phosphorus and 0.76% sulfur) consisting of about 15 amino acids and has a molecular weight ranging from 75,000 to 375,000. Properties (pure casein): White, tasteless, odorless, amorphous solid; sp. gr. 1.25-1.31; hygroscopic; stable when kept dry but deteriorates rapidly when damp. Soluble in dilute alkalies and concentrated acids; almost insoluble in water; precipitates from weak acid solutions.

Derivation: Acid casein: warm skim milk is acidified with dilute acid, the whey drawn off, the curd washed, pressed, ground and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

dried. Rennet casein or paracasein: warm skim milk is treated with rennet extract. The curd contains combined calcium and calcium phosphate.

Grades: Acid precipitated (domestic edible, imported inedible); paracasein.

Uses: Paracasein, principally for plastics (see casein plastics); acid-precipitated, for paper coatings; glues; paints; adhesives; textile sizing; foods and feeds.

Shipping regulations: None.*

casein, acid-precipitated. See casein.

casein glue. See glue.

casein paints. Coatings in which casein replaces the ordinary drying oils, or is used as an emulsifying agent in emulsion and latex paints. Both types may be thinned with water.

casein plastic.

Properties: A very tough, nonflammable, thermoplastic or thermosetting material. It is readily colored, molded, and polished but has poor water resistance and dimensional stability.

Uses: Buttons, buckles, and novelty items which do not require dimensional stability.

casein, rennet. See casein.

casein-sodium (sodium caseinate).

Properties: White, coarse powder. Odorless, tasteless. Contains 65% proteins. Soluble in water (usually with turbidity).

Derivation: By dissolving casein in sodium hydroxide and evaporating.

Grades: Edible.

Uses: Medicine; foods; as emulsifier and stabilizer.

cashew gum (anacardium gum). The exudation from the bark of the cashew-nut tree, *Anacardium occidentale*. Hard, yellowish-brown gum, partly soluble in water. Used for inks, insecticides, pharmaceuticals, mucilage tanning agent, natural varnishes, bookbinders' gum.

cashew nut oil (acajou nut oil). The oil obtained from the edible kernel of *Anacardium occidentale*. Similar to almond or olive oil.

cashew nutshell liquid (cashew nutshell oil).

The liquid or oil obtained from the spongy layer between the inner and outer shells of the nut of *Anacardium occidentale*. It is a by-product of the edible cashew-nut industry. A similar liquid is obtained from the semecarpus, or oriental cashew nut. The raw liquid contains about 90% anacardic acid, $C_{22}H_{32}O_3$, and a blistering compound containing sulfur. It is used as a vesicant and ant repellent. Most of the liquid used in commerce has been heated or treated with chemicals to make it safe to handle. The principal ingredient is then cardanol, a meta-phenol. The liquid is non-drying, but can be made drying by proper treatment. It polymerizes on heating and forms condensation products with aldehydes.

Containers: 10-lb tins; steel drums.

Uses: Varnishes and impregnating materials which are oil- and water-resistant, artificial rubber, plasticizers, germicides and insecticides, coloring materials and indelible inks, lubricants, and preservatives.

cassava starch.

Derivation: From cassava or manioc root, of the genus *Manihot*. By heating the damp starch in shallow pans, the granules burst and adhere, forming irregularly shaped, translucent kernels, known as tapioca.

Grades: Technical.

Containers: Burlap bags; wooden barrels.

Uses: Foodstuffs; laundry starches; adhesives; fuel alcohol; textile size.

Shipping regulations: None.*

Cassel brown. See Van Dyke brown.

Cassel earth. See Van Dyke brown.

Cassel green. See barium manganate.

Cassella's acid. See 2-naphthol-7-sulfonic acid; 2-naphthylamine-4,8-disulfonic acid.

Cassella's F acid. See 2-naphthylamine-7-sulfonic acid.

cassia bark. See cinnamon, cassia.

cassia buds. The dried unripe fruit of various species of *Cinnamomum*, with a cinnamon flavor and resembling small cloves. Not to be confused with cassia fistula.

cassia fistula (purging cassia, drumstick, Indian laburnum; pudding pipe; pudding stick; cassia pods).

Derivation: Dried fruits of *Cathartocarpus fistula*.

Habitat: Upper Egypt and East India; cultivated in tropical America and Africa.

Grades: Technical.

Containers: Bags.

Use: Medicine.

cassia oil (Chinese cinnamon oil; cinnamon, cassia oil, cinnamon oil, U.S.P. XVI).

Properties: Yellow or brownish limpid liquid; cinnamon-like odor; burning and intensively sweet taste, darkens and thickens on exposure to air; sp. gr. 1.045 to 1.063; optical rotation $+1^\circ$ to -1° ; b.p. 240-260°C; refractive index 1.607-1.618; soluble in ether and chloroform; soluble in alcohol, acetic acid.

Chief known constituents: Cinnamic aldehyde (90-95%); cinnamyl acetate, methoxycinnamic aldehyde, phenyl propyl acetate, salicylic aldehyde, coumarin, and benzaldehyde.

Derivation: Distilled from leaves and twigs of *Cinnamomum cassia*.

Adulteration: Synthetic cinnamic aldehyde, kerosene, rosin, and benzyl acetate.

Grades: U.S.P. XVI; redistilled; technical; lead free.

Containers: Bottles; tins; cans.

Uses: Flavoring; perfumery; medicine; soaps; tanning leather.

Shipping regulations: None.*

cassia pods. See cassia fistula.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

cassia pulp. Black viscous sweet mass composed of hydroxymethylantraquinones, gum, tannin, albuminoids, and 60% sugar. Derived from cassia fistula pods. Used as medicine.

cassie oil. A floral absolute obtained by volatile solvent extraction. There are two types:

Cassie ancienne: Derived from *Acacia farnesiana*.

Cassie romaine: Derived from *Acacia cavenia*.

Use: Perfumery.

cassiterite (tinstone, wood tin, stream tin)

SnO_2 . Natural tin dioxide, usually found with igneous rocks.

Properties: Color brown, black, yellow, white, luster adamantine or dull submetallic; streak white, hardness 6-7; sp. gr. 6.8-7.1.

Occurrence: Malaya, Bolivia; Indonesia; Belgian Congo, Nigeria.

Use: Principal ore of tin.

"Castan."⁵¹ Trademark for lubricants for open bearings or bearings with large clearances from which leakage or oil throwing should be prevented. Not suitable where moisture is present.

castanha oil (Brazil-nut oil).

Properties: Pale-yellow, odorless, fixed oil. Soluble in ether, carbon disulfide, and benzene; insoluble in water. Sp. gr. 0.9180; m.p. 0.4°C; saponification value 193; iodine number 106, refractive index (n_D²⁵) 1.4643.

Derivation: From the Brazil-nut *Bertholletia excelsa*.

Grades: Technical.

Containers: Tins, iron drums.

Uses: Soap; food; illumination.

Shipping regulations: None.*

cast iron. Any iron-carbon alloy that contains more than 1.7% carbon, and usually between 2 and 4.0%. Such iron usually contains 0.1 or 0.2% sulfur, 0.5-3% silicon, 0.5-1% manganese and up to 1% phosphorus. Cannot be shaped by hammering, rolling or pressing.

cast iron, alloy. Cast iron containing chromium, copper, molybdenum, nickel, or other steel-alloying elements in amounts from 0.1-5% for the purpose of improving strength and wear corrosion, or scaling resistance.

cast iron, gray. Cast iron with gray fracture and with its carbon largely in the uncombined state. The most common form of cast iron, easily melted and machined, relatively soft and tough. Properties depend upon composition, rate of cooling, and heat treatment.

cast iron, malleable. White cast iron that has been annealed after solidification in order to reduce carbon content and produce a product similar in many ways to mild steel.

cast iron, white. A cast iron with silvery surfaces where broken, low silicon content, and all its carbon chemically combined with iron, produced by sudden chilling of the molten iron. Very hard, brittle, and cannot be machined. Produced as an intermediate stage in making malleable cast iron and as a thin outer layer on the surface of gray cast iron.

Castner cell. (1) A mercury-cathode cell for the production of caustic soda and chlorine from brine. It consists of a rectangular concrete box separated into compartments by partitions that extend nearly to the bottom. A layer of mercury on the bottom serves as a seal between the compartments as well as the cathode. In operation, the cell is given a rocking motion, permitting the mercury to flow back and forth between the electrolysis compartment, where a sodium amalgam is formed, and the decomposition compartment, where the amalgam reacts with water to form sodium hydroxide. (2) An electrolytic cell for the production of sodium metal, hydrogen, and oxygen from fused sodium hydroxide. It has largely been superseded by the Downs cell for the production of sodium.

"Castolast H-W."⁴⁴⁶ Trade name for a 93% high alumina castable cement bonded with low iron calcium aluminate cement. Shipped dry; with water addition, develops and maintains high strength, through 3200°F. Resistant to abrasion and impact.

Uses: Petrochemical unit liner; burner blocks and other high temperature applications. Can be cast, trowelled or applied with an air placement gun.

castor (castoreum).

Derivation: Dried preputial follicles with their secretions of the common beaver (Castor fiber). Solid unctuous masses contained in pairs of sacs, each about 2 in. in length. Characteristic irritating odor. Contains 40-70% resin.

Grades: Canadian or American, Russian.

Containers: Cans.

Uses: Medicine; perfume fixative.

A synthetic castor is also marketed.

castor bean. See ricinus; castor oil; castor bean oil meal.

castor bean oil meal (castor cake; castor pomace). The residue from extraction of oil from the castor bean (ricinus). The normal product contains 29.5% crude protein, 35.8% crude fiber; 13.2% nitrogen-free extract and 1.0% crude fat. The total digestible nutrients approximate 25%. The ash content of 7.5% is high in potash and phosphate.

Containers: Bag or bulk.

Uses: As animal feeds after removal of toxic ingredients or as fertilizer.

Shipping regulations: None.*

castor cake. See castor bean oil meal.

*See "I. C. C. Shipping Regulations," page xiii.
Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Castordag." ⁴⁶ Trademark for a concentrated colloidal dispersion of pure electric-furnace graphite in castor oil.

Properties: Liquid consistency; solids content 10%; average particle size 1 micron; maximum particle size 10 microns; sp. gr. 1.037; flash point 271°C; completely miscible with castor oil, alcohol.

Uses: Assembly lubricant for mechanical parts; formulation of hydraulic fluids.

castoreum. See castor.

castor meal. See castor bean oil meal.

castor oil (ricinus oil).

Properties: Pale-yellowish or almost colorless, transparent, viscid liquid, faint, mild odor and usually nauseating taste. It is a non-drying oil. Sp. gr. 0.960-0.970; saponification value 178; iodine value 85; solidifies at -10°C. Soluble in alcohol, ether, benzene, chloroform and carbon disulfide.

Derivation: From the seeds of the castor bean, *Ricinus communis*. They are cold pressed for the first grade of medicinal oil and hot pressed for the common qualities, about 40% of the oil content of the bean being obtained. Residual oil in the cake is obtained by solvent extraction.

Chief constituent: Ricinolein (glyceride of ricinoleic acid).

Grades: U.S.P. XVI; No. 1; No. 3; refined.

Containers: Drums; tanks.

Uses: Medicine; hydraulic fluids; high-grade lubricant; leather preservative; textiles (cotton dyeing, preparation of sulfonated oils, Turkey red oil); electric insulating compositions; toilet creams and hair dressings; special soaps; rubber compounding, plasticizer manufacture, production of sebacic acid, source of ricinoleate compounds.

See also castor oil, cracked; castor oil, dehydrated; blown oils.

Shipping regulations: None.*

castor oil, acetylated. See glyceryl triacetylricinoleate.

castor oil acid. See ricinoleic acid.

castor oil, blown. See blown oils.

castor oil, cracked. Product obtained on heating castor oil out of contact with air. Treatment of the cracked distillate forms a number of intermediates for the production of synthetic perfumes and flavors. Cracking products which have been identified are oenanthol (with benzaldehyde has a jasmine odor) and undecylenic acid (forms gamma undecalactone which gives a peach odor on further decomposition).

castor oil, dehydrated (DCO). A castor oil from which about 5% of the chemically combined water has been removed, and which, as a result, has drying properties similar to those of tung oil. Though it does not dry as rapidly as tung oil, its pale color and elasticity are desirable properties. It also increases the rate of drying

of linseed oil. Dehydration is carried out commercially by heating the oil in the presence of catalysts, such as sulfuric and phosphoric acids, clays, and metallic oxides. The commercial product is offered in a wide range of viscosities and analytical constants. Used in paints and lacquers; alkyd resins.

castor oil, hydrogenated. Principally glyceryl tri-12-hydroxystearate (q.v.).

castor oil plant. See ricinus.

castor oil, soluble. See Turkey red oil.

castor oil, sulfonated. See Turkey red oil.

castor pomace. See castor bean oil meal.

"Castorwax." ²⁰² Trademark for hydrogenated castor oil, the triglyceride of 12-hydroxystearic acid, obtained by controlled hydrogenation of pure castor oil.

Properties: A white, hard, brittle synthetic wax; m.p. 85°C; sp. gr. 0.990 (25°C); acid value 2; iodine value 3; saponification value 180; insoluble in most organic solvents at room temperature and compatible with ethyl cellulose, cellulose acetate butyrate, polyethylene (up to 25%), polymethacrylate, rosin, shellac, abietyl alcohol, natural and synthetic rubbers, insect and vegetable waxes.

Uses: In potting compounds, gasket and impregnating compositions, and wax blends where increase in grease and solvent resistance, hardness and melting point is desired; and as a blending agent and viscosity reducer in hot melts.

"Castrolite." ¹⁵⁹ Proprietary product. Sulfonated castor oil, made by improved process of manufacture.

Grades: "Castrolite" 50%; "Castrolite" 75%.

Uses: As a softener and finishing oil for textiles; penetrant and leveling agent in dyeing. In cosmetics, shampoo oils, etc. (as a base oil); as a plasticizer; as an emulsifying agent for dispersing perfume and essential oils.

"Castung." ²⁰² Trademark for dehydrated castor oil, a synthetic drying oil produced by chemical removal of the hydroxyl groups from castor oil to form additional double bonds. Available in several viscosities.

Uses: Non-yellowing drying oil for alkyds, paints and varnishes, for putty and calking compounds, for linoleum and oilcloth, and for modifying tall oil in coatings applications.

catalase. An oxidizing enzyme occurring in blood and tissues, which decomposes hydrogen peroxide. It can be isolated from animal tissue or molds and is used in food preservation (removing oxygen in packaged foods) and in decomposing residual hydrogen peroxide in bleaching and oxidizing processes.

"Catalin." ³⁵³ Brand name for a proprietary product. Phenol-formaldehyde resin. Forms available: Rods, bars, tubes, sheets,

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

castings; is furnished in a wide range of colors; also colorless; nonflammable.

Uses: Buttons, buckles, toilet articles, radio cabinets; imitation jewelry, miscellaneous molded articles.

catalysis. A change in the rate of a chemical reaction caused by the presence of a small quantity of a substance (the catalyst) which remains unchanged in amount after the reaction is completed.

catalyst. A substance whose presence increases the rate of a chemical reaction. In some cases the catalyst functions by being consumed and regenerated, in other cases the catalyst seems not to enter the reaction and functions by virtue of surface characteristics of some kind. A negative catalyst (inhibitor, retarder) slows down a chemical reaction. Many common catalysts are powdered metals or other metallic compounds. Any kind of substance (solid, liquid, or gas) may be a catalyst, but only certain particular substances are catalysts for particular reactions. Thus finely powdered nickel is a catalyst to speed up the combination of hydrogen with liquid fats to produce solid fats. Gas masks for carbon monoxide atmospheres depend upon a metal oxide catalyst to speed up the oxidation of the monoxide to dioxide and so make the air safe to breathe. Vitamins and enzymes are organic catalysts of chemical processes in the body.

"Catalyst 1707." ⁵⁵ Trade name for a metal oxide type dehydrogenation catalyst. Bulk density 67 lbs. cu ft (approx).

Containers: 100-lb bags, 400-lb drums.

Use: Catalyst for butadiene and styrene production.

catalytic reforming. Reforming (q. v.) in the presence of a catalyst.

"Catanac" SP. ⁵⁷ Trademark for stearamidopropyl dimethyl-beta-hydroxyethyl-ammonium dihydrogen phosphate. $[C_{17}H_{35}CONHCH_2CH_2CH_2N(CH_3)_2CH_2CH_2OH]-H_2PO_4$.

Properties: A tan waxy solid softening at 50°C. Has antistatic and surface active properties. Supplied as a 35% solution in an isopropyl alcohol water mixture. Light yellow liquid, not hygroscopic, flash point (open cup) less than 80°F.

Uses:

1. Antistatic for textiles, plastics, surface coatings, glass, wax polishes. Can be applied either by incorporation into molding compositions, or applied to surfaces.
2. Detergent in acid media, hard water, salt water. Also used as emulsifier, dispersing agent, rewetting and stripping agent, and mold lubricant.

cataphoresis. Usually identical with electrophoresis (q. v.). The term originally implied migration of a suspended particle in an electric field to the cathode only, but

has received the more general meaning with increased knowledge of colloid chemistry.

catechol. See pyrocatechol.

catenane. A compound with interlocking rings, which are not chemically bonded, but which cannot be separated without breaking at least one valence bond. The model would resemble the links of a chain.

cathode. The negative terminal of an electrical cell, or vacuum tube, or other electrical device. In a vacuum tube, the cathode is the source of free electrons necessary for carrying the current. In electroplating baths, positively charged metallic ions travel toward the cathode.

cation. An ion having a positive charge. Cations in a liquid subjected to electric potential collect at the negative pole or cathode.

cation exchange. See ion exchange.

"Cation Exchange Resin Cleaner #1112." ²¹⁰ Cleaner especially developed for use in case of cation exchange resin fouling.

cationic reagents (for flotation). Surface-active substances which have the active constituent in the positive ion. Used to flocculate and collect minerals that are not flocculated by the reagents such as oleic acid or soaps, in which the surface active ingredient is the negative ion. Reagents used are chiefly the quaternary ammonium compounds, e. g., cetyl trimethyl ammonium bromide.

catlinite (pipestone). A fine-grained silicate mineral related to pyrophyllite which is easily compressible, has high surface friction, and is used for gaskets in very high pressure work.

"Cato." ⁵³ Trademark for a cationic derivative of starch, available in ungelatinized or gelatinized (cold water soluble) form. Used in manufacture of paper, warp sizing, etc.

cat's eye. A variety of natural silica or quartz (q. v.) used as a gem. Also a variety of chrysoberyl (q. v.).

caustic. (1) When used alone, the term usually alludes to caustic soda, sodium hydroxide (q. v.). (2) More generally, a strong base. (3) A class, or group, name given to certain chemicals and pharmaceutical products to indicate, or describe, their physiological effect. Caustics are products (such as sodium hydroxide, silver nitrate and the like) used for their corroding or disintegrating action on the skin and flesh. Their employment tends to cause a burning sensation and the destruction of living tissue.

caustic alcohol. See sodium ethylate.

caustic arsenic chloride. See arsenic trichloride.

caustic baryta. See barium hydroxide.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

causticized ash. Combinations of soda ash and caustic soda in definite proportions marketed for purposes where an alkali is needed ranging in causticity between the two materials. Causticized ash is usually designated by its caustic soda content and the range of standard marketed products embraces 7%, 10%, 15%, 25%, 36%, 45%, and 67% of caustic soda.

Shipping regulations: None.*

caustic lime. See calcium hydroxide.

caustic, lunar. See silver nitrate, fused.

caustic potash. See potassium hydroxide.

caustic soda. See sodium hydroxide.

caustic Vienna (Vienna paste). A mixture of equal parts of potash and lime. Grayish-white, deliquescent powder or lumps.

caustic, white. See sodium hydroxide.

"CA V2B." Brand name for a hardenable corrosion-resisting non-galling alloy of the 19% chromium, 9% nickel type which contains in addition 2% copper, 3% molybdenum, 2.75% silicon and a small amount of beryllium. Machined in quenched annealed condition and precipitation hardened by 900°F heat treatment. Used for valve discs and plugs, bearing sleeves, gears and other bearing parts.

cave. See hot cell.

cavitation. The formation of a hole in a liquid just behind a rapidly moving propeller blade or other rapidly moving object.

cayenne pepper. See capsicum.

"Cazar." ⁵¹ Trademark for greenish black, lime-base greases of high quality, having high-viscosity mineral oil base and soft, smooth texture. Outstanding in adhesiveness and water resistance and well suited for use in cold weather.

Cb. Symbol for columbium, an obsolete name for niobium.

CBM. Abbreviation for chlorobromomethane (see bromochloromethane); also for constant boiling mixture. See azeotropic mixture.

CBW. Abbreviation for chemical biological weaponry.

cc. Abbreviation for cubic centimeter.

CC black. Abbreviation for conducting channel black. See channel black.

"CCC." ⁴⁰² Trademark for a series of refined, pulverized high-calcium limestone products. Uses: Whiting in calking compounds; filler or extenders in rubber, paints, ceramics, cements, etc.

"CCC-Diluent." ⁴⁰² Trade name for a surface-treated pulverized limestone used as a conditioner and extender in pesticidal dust formulations.

"CCC" Trace Mineral Premix. ⁴⁰² Proprietary product for livestock and poultry feed formulation.

Cd. Symbol for cadmium.

"CDB-59." ⁵⁵ Trademark for potassium dichloroisocyanurate (q.v.).

"CDB-60." ⁵⁵ Trademark for sodium dichloroisocyanurate (q.v.).

"CDB-70." ⁵⁵ Trademark for dichloroisocyanuric acid (q.v.).

"CDB-85." ⁵⁵ Trademark for trichloroisocyanuric acid (q.v.).

CDP. Abbreviation for cytidine diphosphate. See cytidine phosphates.

Ce. Symbol for cerium.

"Cebicure." ¹²³ Trademark for ascorbic acid for meat curing.

"Cebione." ¹²³ Crystalline vitamin C, ascorbic acid (q.v.).

"Cebitate." ¹²³ Trademark for sodium ascorbate for meat curing.

"Cedambrette." ¹⁴² Trade name for a mixture of natural and synthetics simulating cedarwood concentrates; used in perfumery for its woody note.

cedar camphor. See cedrol.

cedar gum.

Properties: Pale yellow to red or brownish tears. Swells greatly in water forming clear jellies.

Derivation: From *Cedrela odorata* or red cedar found in American tropics and West Indies.

Uses: Mucilage; cosmetics; pharmaceuticals. Shipping regulations: None.*

cedar leaf oil. True cedar leaf oil is distilled from the leaves of *Juniperus virginiana*. The name has also been used as a synonym for thuja oil (q.v.) (from *Thuja occidentalis*). The properties of the two oils as described here are quite different.

Properties: Colorless liquid, sp. gr. 0.870-0.890; optical rotation +55° to 65° (20°C); soluble in alcohol and ether.

Chief constituents: Limonene, cadinene, borneol, and bornyl esters.

Containers: Cans; drums.

Uses: Medicine; microscopy, perfume.

cedarwood oil.

Properties: Volatile oil, colorless, pale yellow or greenish-yellow; mild, agreeable, persistent odor. Somewhat viscid and occasionally studded with cedar camphor crystals. Poisonous! Two principal varieties are known, designated here as (a) and (b).

Derivation: (1) Distilled from the wood of *Juniperus virginiana*. Probably represented by (a). (2) Collected as a by-product from drying kilns in lead-pencil manufacture. Probably represented by (b).

Chief constituents: Cedrol, cedrene.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Constants: (a) Sp. gr. 0.945-0.960 (15°C); optical rotation -27° to -45°; refractive index (n_{20/D}) 1.5020-1.5070; acid value up to about 1; ester value up to 6.5, after acetylation 26-42. (b) Sp. gr. 0.940-0.944 (15°C); optical rotation -40° to -46°22', saponification value 2-4; ester value after acetylation 14-18.

Solubility in alcohol: (a) 1 vol in 10-20 vols of 90% alcohol, up to 6 vols of 95% alcohol, soluble in benzyl benzoate, fixed oils, mineral oil; insoluble in propylene glycol, glycerin; (b) in 5-6 vols of 95% alcohol.

Containers: Bottles; tins; drums.

Uses: Medicine; perfumery; perfuming soap; insecticide; sanitary supplies; microscopy work.

cedarwood oil, Texas.

Properties: Colorless to yellow; slightly viscous liquid; fragrant odor; sp. gr. 0.950-0.960 (15°C), optical rotation -35° to -50°; refractive index (n_{20/D}) 1.5040-1.5070; soluble in all proportions of 95% alcohol, benzyl benzoate, mineral oil, fixed oils; insoluble in propylene glycol, glycerin.

Derivation: Steam distillation of chopped and ground wood of *Juniperus Mexicana*.

Method of purification: Rectification.

Containers: Glass, aluminum, or tin-lined vessels.

Uses: Soaps; sanitary supplies, polishes.

"Cedrene," ³⁴² Trademark for terpenes from cedarwood oil.

"Cedrenol," ³⁴² Trademark for crystalline alcohols from cedarwood oil.

"Cedrenone," ³⁴² Trademark for ketone-like aromatics from cedarwood oil.

cedrol (cedar camphor) C₁₅H₂₆O, a tertiary terpene alcohol.

Properties: Crystalline substance having cedarwood odor.

Constants: M. p. 81°C min. Soluble in 11 parts of 95% alcohol.

Uses: Perfumery, for woody and spicy notes, and for the perfuming of disinfectants.

cedryl acetate CH₃COOC₁₅H₂₅.

Properties: Colorless liquid, having a light cedar odor. Sp. gr. 0.975-0.995; refractive index 1.496-1.510. Soluble in one volume of 90% alcohol.

Use: Perfumery.

"Cefro," ⁴⁰ Trademark for rat, rabbit and mouse repellents containing ethyl-2,3,4,5-tetrachlorotetrahydro-2-furoate as the active ingredient. Available as a 5% emulsion in poly(vinyl acetate) and as a 40% granular formulation.

Properties (typical): Dark brown liquid with a fruity odor; insoluble in water; soluble in ethanol, acetone, benzene, hexane and ethyl acetate. Sp. gr. (20°C) 1.480; b. p. (0.1 mm) 83-85°C; refractive index (25°C) 1.493.

Derivation: Chlorination of ethyl 2-furoate.

"Celanese CL," ³⁵² Trademark for a series of polyvinyl acetate emulsions. Available as:

"Celanese CL" 102: Fine particle size, water resistant homopolymer emulsion.

Uses: Paints, adhesive and paper coating specialties.

"Celanese CL" 202: Fine particle size, water resistant copolymer emulsion.

"Celanese CL" 203: Vinyl-acrylic copolymer emulsion.

Use: Improve durability of paints.

"Celanese CL" 204: Vinyl copolymer emulsion.

Uses: Improving scrub resistance and durability in paints.

"Celanese Solvent," ³⁵² Trademark for a series of special solvents. Available as:

"Celanese Solvent" 203: Replacement for normal butyl alcohol in nitrocellulose lacquers, alkyd resin formulations and thinners; distillation range 115-120°C; flash point 100°F (open cup).

"Celanese Solvent" 601: Replacement for methyl ethyl ketone in vinyl and nitrocellulose applications; distillation range 74-84°C, flash point 10°F (open cup).

"Celanese Solvent" 901H: Replacement for butanol and methyl isobutyl carbinol in lacquers and brake fluids, distillation range 125-155°C, flash point 120°F (open cup).

"Celanthrene," ²⁸ Trademark for a group of anthraquinone dyes designed especially for dyeing acetate and also suitable for application to nylon.

"Celcon," ⁴²¹ Trademark for a highly crystalline acetal copolymer based on trioxane. See acetal resins.

"Celcure," ⁷⁷ Trademark for acid cupric chromate, a wood preservative composed principally of copper sulfate, sodium dichromate and chromic or acetic acid.

celery fruits oil. See celery seed oil.

celery seed oil (celery fruits oil).

Properties: Limpid, greenish-yellow or colorless oil, characteristic odor, celery taste, sp. gr. 0.9236 (15°C), optical rotation +60° to +82°; refractive index 1.478-1.486; acid value up to 4; ester value 16-45, after acetylation 43-52, saponification value 178.1. Slightly soluble in water; soluble in alcohol, ether and chloroform.

Chief known constituents: Limonene, phenols, sedanolide, sedanoic acid.

Derivation: Distilled from the seeds of *Apium graveolens*.

Containers: Bottles.

Uses: Flavoring; medicine.

celestial blue. Applied loosely to any of a number of iron blue pigments, usually containing considerable extender such as barytes.

celestite SrSO₄. Natural strontium sulfate, usually found in sedimentary rocks.

Properties: Colorless, white, pale blue, or red; luster vitreous to pearly. Resembles

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

barite (q.v.). Sp. gr. 3.95; hardness 3-3.5.

Occurrence: United States; Canada; Europe; Mexico.

Containers: Railroad cars.

Uses: Strontium chemicals; oil-well drilling mud; sugar refining; ceramics.

"Celite." ²⁴⁷ Trademark for diatomaceous earth and a line of products processed therefrom.

Properties: Color, white to pale brownish white, depending on grade and processing, calcined grades being pink to buff; sp. gr. 0.24-0.34; porous, capable of absorbing 300-400% water by weight; poor conductor of heat, sound, and electricity; resistant to acids except hydrofluoric, slowly soluble in hot alkali.

Typical analysis (ignited basis): Silica 92.7%; alumina 3.8%; ferric oxide 1.4%; lime and magnesia 1.0%; potash and soda 0.9%.

Occurrence: Lompoc, California.

Grades: Numerous types available depending on use.

Uses: Filtering; fillers; absorbent; abrasive in glass and metal polishing; catalyst carrier; ingredient in cements, flame-proofing agents, and other products.

"Celite" Filter Aids. ²⁴⁷ Trade name for products made from "Celite" diatomaceous earth.

Grades and Uses:

"Celite" Analytical Filter Aid: For rapid removal of gummy, gelatinous, flocculent or semi-colloidal precipitates, and in purification of valuable chemicals and biologicals.

Filter-Cel: For clarity in liquids containing exceptionally small or colloidal suspended solids.

Filter-Cel Laboratory Standard: A calibrating filter aid used in making filtration comparisons.

Hyflo Super-Cel: Specially processed to give a flow rate five times faster than Filter-Cel.

Sorbo-Cel: For removing emulsified oil from contaminated waters in order to return an oil-free water for boiler feed or other process use.

Standard Super-Cel: Finely divided, heat-treated product for liquids containing moderately finely divided suspended matter.

No. 503: Fast filter aid for liquids with

large amounts of coarse insoluble matter.

No. 505: Calcined, approximating Filter-Cel in performance, for special purposes.

No. 512: Flow rate about midway between Standard Super-Cel and Hyflo Super-Cel.

No. 521: For clarification of distilled spirits, liquors, cordials and tannin-bearing liquids in general, and where reaction may develop between iron and the liquid to be clarified.

No. 535: High flow rate and good clarity for filtering viscous and semi-viscous liquids.

No. 545: Highly porous with peak flow rate for clarifying viscous materials.

"Celite" Mineral Fillers. ²⁴⁷ Trade name for several grades of "Celite" powders.

Standard Grades	Average Particle Size in Microns
Snow Floss	1-2
Super Floss	2-4
Celite FC	4-6
Celite SSC	6-8
Celite HSC	7-9

Uses: In acetylene cylinders, adhesives, asphalts and pitches, battery boxes, catalyst carriers, cleansers and cleaners, crayons, decals, detergents, dyes, dynamite, coated fabrics, fertilizers, fuels, fumigants, gas purification, insecticides, insulating blocks, leather finishes, lens polishing, matches, mold wash, mold lubricant, paints and varnishes, papers, printing inks, plastics, polishes, polishing cloths, soaps, sound records, sponge rubber, seed coatings, and ultramarine blue.

"Celite" Preformed Catalyst Carriers. ²⁴⁷

Trade name for thermally stable catalyst carriers made of "Celite," available in different hardnesses and porosities, and in a complete line of shapes including aggregates in granular form, extruded pellets and spherical types.

"Celkate." ²⁴⁷ Trademark for finely divided hydrated synthetic magnesium silicates having high absorption properties; light tan in color; density 10-18 lb/cu ft; surface area 150-250 sq m/gram.

Grades: Available in various grades for purifying of petroleum base solvents, chemical and drug solutions, and for decolorizing of animal, fish, and vegetable oils.

Uses: As a filter agent to remove solids and selectively remove such solubles as color matter and free fatty acids; as an absorptive carrier of liquids; and as a conditioning agent to improve flow properties of dry powders.

cell. See electrolytic cell; dry cell; storage battery; fuel cells.

"Cellitazol." ³⁰⁷ Brand name of proprietary line of developed acetate dyestuffs. Used for the dyeing of acetate fibers. Characterized by good fastness to light, very good fastness to washing, etc.

"Celliton." ³⁰⁷ Brand name of proprietary line of disperse dyestuffs characterized by good fastness to light, washing, etc. Used for dyeing and printing acetate fibers.

cellobiose $C_{12}H_{22}O_{11}$. The product of the partial hydrolysis of cellulose, composed of two D-glucose molecules.

Properties: Colorless crystals; m.p. 225°C (dec); soluble in water; slightly soluble in alcohol; nearly insoluble in ether; insoluble in acetone.

Use: Bacteriology.

"Cellofax" WLD. ²⁰⁶ Brand name for a proprietary water-soluble cellulose derivative forming mucilages similar to starches and gums, but possessing the advantages

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

that its solution does not ferment or develop a mold and that it has superior binding powers on pigment fillers.

- **Uses:** In place of starch as a sizing agent for cotton and rayon; as a finishing agent for cotton, linen and rayon piece goods; in conjunction with the usual mucilages and gums for seasoning in the leather industry.

celloidin (celluidine; photoxylin). A form of pyroxylin (see nitrocellulose).

Properties: Slightly milky, white, transparent, tough gelatinous tablets, chips, or shreds. Soluble in a mixture of equal parts of alcohol and ether. Usually supplied immersed in water.

Derivation: A very pure nitrocellulose obtained by precipitation from an ether-alcohol solution of collodion cotton.

Grades: Technical.

Containers: Wooden kegs; bags.

Uses: Imbedding sections in microscopy; electrochemistry; photography; galvanoplastics; medicine.

Fire hazard: Dangerous.

Shipping regulations: Flammable solid. Yellow label.*

- "**Cellolyn**." ²⁶⁶ Trademark for a series of synthetic resins especially designed for lacquers.

cellophane (see also acetate film). Film produced from wood pulp by the viscose process. It is transparent, strong, flexible, and highly resistant to grease, oil, and air. The base cellulose film is modified by softeners, flame-resisting materials and dyes; also by coating with other materials, to give a balanced combination of properties. Heat sealing and moisture-proof grades, among others, are available.

Kinds: Basic film types include plain (non-moistureproof) and moistureproof. Several modifications of the moistureproof variety are made to provide various degrees of moistureproofness, heat sealing properties and water resistant characteristics.

Available forms: Supplied in rolls and cut-to-size sheets.

Use: As a wrapper or protective package for fabricated articles and industrial applications.

- "**Cellosize**." ²¹⁴ Trademark for hydroxyethyl cellulose.

Properties: Snow-white, free-flowing powder; soluble in water. Upon drying solutions produce clear, colorless, odorless, and tasteless films which possess good heat and light stabilities, are readily soluble in water and insoluble in most organic solvents.

Viscosity types: WP-09 (5% aqueous soln), 70-110 cps; WP-3 (5% aqueous soln), 275-325 cps; WP-40 (5% aqueous soln), 4000 cps; WP-300 (5% aqueous soln), 30,000 cps; WP-4400 (2% aqueous soln); WP-15,000 (2% aqueous soln).

Containers: 4- and 8-lb Fiberpak containers; 40- and 125-lb Leverpak drums.

Uses: Protective colloid for emulsion polymerization; thickener for synthetic latices; warp size for cellulose acetate, rayon, and cotton; pigment suspending agent for liquid powders, leg make-up, shampoos, and creams; oil-impermeable coating for paper and fiber containers; carriers for pigments and colors in dyestuff pastes for textile printing; with added glyoxal for water-resistant films.

- "**Cellosolve**." ²¹⁴ Trademark for mono- and dialkyl ethers of ethylene glycol and their derivatives.

butyl "Cellosolve"

See ethylene glycol monobutyl ether.

butyl "Cellosolve" acetate

See ethylene glycol monobutyl ether acetate.

"Cellosolve" acetate

See ethylene glycol monoethyl ether acetate.

"Cellosolve" solvent

See ethylene glycol monoethyl ether.

dibutyl "Cellosolve"

See ethylene glycol dibutyl ether.

n-hexyl "Cellosolve"

See ethylene glycol monohexyl ether.

methyl "Cellosolve"

See ethylene glycol monomethyl ether.

methyl "Cellosolve" acetate

See ethylene glycol monomethyl ether acetate.

phenyl "Cellosolve"

See ethylene glycol monophenyl ether.

cell, standard. An electrolytic cell characterized by production of an electromotive force which is closely reproducible if suitable precautions are observed. The standard Weston cadmium-mercury cell produces an emf of 1.0183 volts at 20°C and is used as a primary international standard.

- "**Celluflex**" ²³. ³⁵² Trademark for alkyl epoxy-stearate. Used as a low-temperature plasticizer and stabilizer for polyvinyl chloride and certain other polymers.

- "**Celluflex**" ¹¹². ³⁵² Trademark for cresyldiphenyl phosphate (q.v.). Used for flame-resistance in vinyl formulations.

- "**Celluflex**" ¹⁷⁹. ³⁵² Trademark for tricresyl phosphate, available as:

"Celluflex" 179A: Low specific gravity; low ortho content.

Uses: Flame-resistant plasticizer.

"Celluflex" 179C: General purpose grade.

Uses: Adhesive in air filters; coatings; films.

"Celluflex" 179 EG: Electrical grade.

Use: Insulation industry.

- "**Celluflex**" ^{CEF}. ³⁵² Trademark for tris(beta-chloroethyl) phosphate.

Properties: Clear, transparent liquid; sp.gr. 1.425 (20/20°C).

Use: Flame-retardant plasticizer.

- "**Celluflex**" ^{FR-2}. ³⁵² Trademark for tris(dichloropropyl) phosphate.

Properties: Clear transparent liquid; sp.gr. 1.513 (20/20°C).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Use: Flame retardant for plastics and coatings.

Shipping regulations: None.*

"Celluflex" TPP. ³⁵² Trademark for triphenyl phosphate (q.v.). Used as plasticizer in cellulose acetate and phenolic plastics.

"Celluguard." ³⁵² Trademark for a water-glycol fire-resistant hydraulic fluid.

cellulidine. See celloidin.

cellulase. A white and almost odorless enzyme capable of hydrolyzing and depolymerizing cellulosic polysaccharides of high molecular weight, including cellulose itself, into smaller fragments. It can be obtained from the fungus, *Aspergillus niger*.

Uses: Medicine, to aid in digestion of bulky materials; septic systems; brewing; extraction of essential oils.

"Celluloid." ³⁵² Proprietary product consisting essentially of a solid solution of cellulose nitrate and camphor or other plasticizer with or without the presence of pigments and coloring matter. Available in form of sheets, 20 in. x 50 in. x 0.005 in. to over 1 in., cylindrical and profile rods in 60 in. lengths of various diameters, tubes in 60 in. lengths 0.020 in. minimum wall thickness, various diameters, films in continuous rolls in standard widths of 21 in. and 42 in. in thickness 0.003 in. to 0.010 in. Special sizes on request.

Properties: Clear and colored, transparent, translucent, and opaque in all shades, unlimited mottled and variegated effects, sp. gr. 1.35-1.60; tensile strength 5,000-10,000 psi; elongation 10-40%; Brinnell hardness 5-11 using 2.5 mm ball and 10 kg load; impact strength (Izod) 3.0-6.0 ft lbs/in of notch; ignition temperature 320-380°F, molding temperature 185-250°F; refractive index 1.5; dielectric strength for a 1/8 in. sheet, 250-500 volts/mil at 60 cycles; dielectric constant 6.7-7.3 at 60 cycles. Soluble in organic solvents such as alcohols, ketones, and esters, insoluble in hydrocarbons, mineral oils, and mineral acids of low concentration at normal temperature; decomposed by alkalis and strong acids.

Workability: Fabricated by molding, dry and wet swedging, machine operations such as blanking, drilling, sawing, turning, milling, etc.

Containers: Wooden cases and cardboard containers.

Uses: Fabricated into innumerable articles such as toilet ware, fountain pens, toilet-seat covers, mathematical instruments, buttons, tool handles, advertising novelties, watch and clock crystals, toys, motion picture camera and x-ray films; bandages for surgery; rubber substitute in dentistry.

Fire hazard: Dangerous.

Shipping regulations: Flammable solid.

Yellow label for express shipments.*

cellulose ($C_6H_{10}O_5$)_n. Cellulose is the preponderant and essential constituent of all

vegetable tissues and fibers. (See anhydroglucose.) It is the basis of the textile and paper-making industries. Pure cellulose is most readily obtained from cotton by treatment with dilute alkalis and acids and thorough washing. The cellulose obtained in this manner is a white substance, sp.gr. about 1.45, retaining the form of the cotton fibers. Cellulose dissolves in Schweitzer's reagent (q.v.). When nitrated, it yields nitrocellulose (guncotton) used as such and in the manufacture of smokeless powders, collodion, "Celluloid," pyroxylin lacquers, and miscellaneous products. Cellulose with acetic anhydride and glacial acetic acid forms cellulose acetate (q.v.). With alkali and carbon disulfide, cellulose xanthate is formed and this is then converted to viscose rayon. Three forms of cellulose exist:

alpha-cellulose. alpha-Cellulose is taken as the fraction that can be filtered out of a mixture consisting of the fibrous material and sodium hydroxide solution (7.3%) of maximum dissolving power, after the fibers have previously been swelled with sodium hydroxide solution (17.5%). After separation, the alpha-cellulose is determined either by drying and weighing, or volumetrically by oxidation with potassium dichromate.

beta-cellulose. beta-Cellulose is taken as that fraction that precipitates at room temperature (15-35°C) after the filtrate has been acidified and is determined by the volumetric method.

gamma-cellulose. gamma-Cellulose is taken as the fraction that remains in solution after removing beta-cellulose, and is determined by the volumetric method.

The method of separating alpha-cellulose from the other two fractions is intended primarily for papers made from rags or chemical wood fibers. (ASTM definition, for alpha-, beta-, and gamma-cellulose; ASTM D-588-42.)

alpha-Cellulose has been suggested as a component of high energy rocket fuels. See also wood pulp.

cellulose acetate (CA). A cellulose resin in which the cellulose is not completely esterified by acetic acid. See acetate process.

Properties: White flakes or powder; may be transparent, translucent, opaque, in sheet or film form. A thermoplastic resin, softening about 60-97°C and melting about 260°C. Sp.gr. 1.27-1.34; soluble in acetone, ethyl acetate, cyclohexanol, nitropropane, ethylene dichloride. As a plastic, it is notable for its toughness, high impact strength, low flammability, and ease of fabrication. It is subject to dimensional change due to cold flow, heat, or moisture absorption (1-7%).

Derivation: By acetylation and partial hydrolysis of cellulose. See acetate process.

Grades: Filtered and unfiltered. See "Tenite," "Plastacele," and "Lumarith" for

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

details regarding commercially available products. See also acetate (2); cellulose triacetate.

Containers: Fiber cartons or drums, multi-wall paper sacks.

Uses: Manufacture of acetate fiber, lacquers, protective coating solutions, photographic film, transparent sheeting, thermoplastic molding composition, artificial leather.

Fire hazard: Relatively nonflammable compared with nitrocellulose which it has displaced in many applications for this specific reason.

Shipping regulations: None.*

cellulose acetate butyrate (CAB; cellulose acetobutyrate).

Properties: White flakes or granules, similar to cellulose acetate, and similarly convertible into plastic films, sheets, molded objects, etc.; sp. gr. 1.2; other properties may be varied at will according to proportions of acetate and butyrate, as well as by various conditions of manufacturing. Soluble in ketones, organic acetates, lactates, methylene, ethylene, and propylene chlorides and higher boiling solvents.

Derivation: By the reaction of purified cellulose with acetic and butyric anhydrides in the presence of sulfuric acid as catalyst and glacial acetic acid as solvent. The ratio of acetic and butyric components may be varied over a wide range.

Grades: According to butyryl content, as 17, 27, 38, 50%.

Containers: Fiber cartons and drums.

Uses: Manufacture of thermoplastic molding composition, photographic film, lacquers, protective coating solutions, protective strip coatings, etc.

Fire hazard: About the same as newsprint.

Shipping regulations: None.*

cellulose acetate propionate. Very similar to cellulose acetate butyrate but made with propionic anhydride instead of butyric anhydride.

cellulose-acetate rayon. Incorrect name for acetate. See acetate (2).

cellulose acetobutyrate. See cellulose acetate butyrate.

cellulose gum. A purified grade of sodium carboxymethylcellulose (q.v.).

cellulose, hydrated (hydrocellulose).

Cellulose that has been caused to react with water (about 8-12%), forming a gelatinous mass.

Derivation: By mechanical pulverization and agitation with water, by the action of strong salt solutions, alkalies, or acids.

Use: In the manufacture of paper, vulcanized fiber, mercerized cotton, viscose rayon.

cellulose nitrate. See nitrocellulose.

cellulose nitrate sheeting.

Properties: Semirigid thermoplastic sheets, in a variety of colors, transparent, translucent and opaque, including mottles, and

shell and pearl effects. Thicknesses 0.005 in. and upward; sheet size 20 x 50 in. Several compositions are designed to meet requirements of different uses. Resistant to wear, hydrocarbons, dilute acids, dilute alkalies. Not resistant to ketones, esters, lower alcohols, glycol ethers, strong alkalies, strong oxidizing acids. Easily machined, cemented and finished. Discolored by prolonged exposure to sunlight. Degraded by temperatures above 240°F. Highly flammable.

Uses: Eyeglass frames; covering of toilet seats; hamper tops, etc., covering of shoe heels, table-tennis balls; index tabs.

See also nitrocellulose.

cellulose, oxidized (cellulosic acid). Derivative of cotton cellulose produced by treatment with nitrogen dioxide. Is soluble in alkali but may be made to retain original form of the cellulose and much of its tensile strength. May also be powdered. The material is a copolymer of anhydroglucose and anhydroglucuronic acid, or on further oxidation may consist of polyanhydroglucuronic acid.

Properties: Slight charred odor; acid taste; soluble in aqueous organic bases, in dilute alkali, and in ammonium hydroxide, forming salts and esters. It is insoluble in water, acids, and common organic solvents. It slowly degrades at room temperatures and should be kept cool.

Grades: U.S.P. XVI, technical.

Containers: Glass bottles; fiber cans.

Uses: Surgery and medicine; ion-exchange medium; thickening agent.

Shipping regulations: None.*

cellulose propionate. Similar to cellulose acetate. See "Forticel."

cellulose sponge. A sponge of regenerated cellulose, highly absorbent, soft and resilient when wet, long-lasting. It will not scratch, can be sterilized by boiling and is not affected by ordinary cleaning compounds. The pores vary in size from coarse pore (the size of a pea) to fine pore (the size of a pinhead).

Use: Used commercially for many purposes, such as washing automobiles and trucks, walls and painted surfaces, windows, etc.; in the home for washing dishes, general cleaning, and in the bath; fine-pore sponge used in photographic laboratories.

cellulose sponge yarn. Cotton yarn core covered with cellulose sponge. Wound on ball multiple-end warps. Available in two diameters: A-31 (approximately 1/4 in.) and B-20 (approximately 1/8 in.), in buff and green.

Use: For making wet mops and weaving into cloths, pads, etc.

cellulose triacetate. A cellulose resin in which the cellulose is completely esterified by acetic acid. See acetate process.

Properties: White flakes; sp. gr. 1.2; soluble in chloroform, methylene chloride,

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

tetrachloroethane.

Derivation: By the reaction of purified cellulose with acetic anhydride in the presence of sulfuric acid as catalyst and glacial acetic acid as solvent, followed by very slight hydrolysis.

Grade: Flake.

Containers: Fiber cartons or drums.

Use: Protective coatings resistant to most solvents; textile fibers; base for magnetic tape.

Fire hazard: About the same as newsprint.

Shipping regulations: None.*

cellulose xanthate. A stage in the manufacture of viscose rayon. See viscose process. The xanthate has the composition ROCSSH, in which R represents the combining cellulose radical.

cellulosic acid. See cellulose, oxidized.

cellulosics. Resins made from cellulose. See preceding articles (cellulose acetate, etc.), cellophane, ethylcellulose, methylcellulose, nitrocellulose, sodium carboxymethylcellulose.

"Cellulube." ³⁵² Trademark for a series of functional fluids (phosphate esters) combining fire-resistance and lubricating qualities. Available in controlled viscosities for industrial hydraulic and lubricant applications.

"Cellutherm." ³⁵² Trade name for a series of synthetic lubricants based on trimethylolpropane esters. Available as:

"Cellutherm" 2505-A: High temperature lubricant for aircraft gas turbine engines operating at a bulk fluid temperature of 400°F.

"Cellutherm" 2712-B: Lubricating oil for aircraft gas turbine engines operating at bulk fluid temperature of 300°F.

"Celogen." ²⁴⁸ Trade name for para, para'-oxybis(benzenesulfonyl hydrazide), $\text{H}_2\text{NNHSO}_2\text{C}_6\text{H}_4\text{OC}_6\text{H}_4\text{SO}_2\text{NHNH}_2$, a nitrogen blowing agent for sponge rubber and expanded plastics.

Properties: Fine white crystalline powder, odorless; sp. gr. 1.52; decomposition range, 130-160°C; soluble in acetone; moderately soluble in ethanol and polyalkylene glycols; insoluble in benzene, ethylene dichloride, gasoline, and water; nonblooming; nondiscoloring; nonstaining; good storage stability under normal conditions of temperature; should be kept away from hot steam pipes, free flames, direct sunlight and similar sources of heat.

Uses: Used alone to produce a fine uniform cell structure in natural rubber, GR-S, neoprene, butyl and nitrile rubbers such as "Paracril." Also functions as an auxiliary with sodium bicarbonate to even out the irregularities in performance of the latter. Used alone for making expanded plastics especially expanded polyvinyl chloride from plastisols of "Marvinol" and similar products.

"CelogenAZ." ²⁴⁸ Trade name for azodicarbonamide, a nonstaining, nondiscoloring, odorless nitrogen blowing agent for sponge rubber and expanded plastics.

Properties: A fine yellow powder; sp. gr. 1.63; decomposition temperature 196°C in air, lower with use of promoters (see B-I-K); decomposition products are white; soluble in dimethylformamide, diethylene glycol (warm); insoluble in benzene, acetone, water and ethylene dichloride.

Uses: Produces a fine cellular structure in natural, SBR, neoprene and nitrile rubbers; produces blown vinyl products from plastisols of "Marvinol" and similar products, as well as blown products of polyethylene and polypropylene.

"Celontin." ³³⁰ Trademark for methsuximide. N-methyl-alpha-methyl-alpha-phenyl succinimide $\text{C}_{12}\text{H}_{13}\text{NO}_2$.

Properties: White to off-white crystalline powder. Soluble in alcohol and ether. Melting range 51-55°C.

Use: Medicine.

"Celoron." ²⁸¹ Trademark for macerated canvas or paper-based industrial laminated or molded plastics.

Properties: Color, golden mottled brown or black; sp. gr. 1.35; high impact strength; unaffected by rapid temperature changes; resistant to heat, oil, water, and many chemicals; may be used continuously at 225-250°F.

Forms: Sheets; cut pieces; blanks; rings; molded parts.

Uses: Timing gears for automobile industry; electrical insulation; structural parts.

"Celotex." ³⁵¹ Trademark for structural building and insulation board produced in large sheets. Made from bagasse (sugarcane fiber) and treated to be resistant to fungi, termites, and water penetration. Also available in tile and plank form, as plaster-base lath, sheathing and roof insulation. The name also covers roofing products, gypsum plasters, mineral wool, and hardboard.

"Cemad." ⁵⁷ Trademark for a cement additive for the prevention of loss of fluid.

cement, aluminous (high alumina cement).

A hydraulic-setting cement which contains at least 30 to 35% alumina (in contrast to Portland cement, which contains less than 5%). Aluminous cement attains its maximum strength more rapidly than Portland cement. It is also more resistant to solutions of sulfates. It exists in two modifications, sintered and fused.

Sintered types contain alumina up to 43% and a large proportion of iron oxide (up to 12.5%) which imparts a black color to the cements. They have a fusion point of about 2450°F and are represented by "Lumnite" and "Ciment Fondu." Fused types contain up to 52% alumina but only about 1% iron oxide, have a fusion point

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

up to about 2683°F and a higher total compression and tensile strength. They are represented by "Rolandshuette" (q. v.).

cementation. A process in which steel or iron objects are coated with another metal by immersing them in a powder of the second metal and heating to a temperature below the melting point of any of the metals concerned. Zinc, chromium, aluminum, and silicon are applied to iron or steel in this fashion.

cemented carbides (sintered carbides).

Abrasive materials consisting of carbides of such metals as tungsten or tantalum bound together by a low-melting metal, usually cobalt. They are valuable for their hardness and durability, and are used in machining metals, plastics, porcelain, etc.

cement, chemical resisting. Portland cement that is somewhat more resistant to chemical action than the regular grade because of high tetracalcium aluminoferrate and low tricalcium aluminate content, and also because of additives such as water glass, calcium soaps, or other materials.

cement, H. E. S. See cement, high early strength.

cement, high alumina. See cement, aluminous.

cement, high early strength (cement, H. E. S.).

A variety of Portland cement made from raw materials having a high lime-to-silica ratio. Contains a higher proportion of tricalcium silicate and hardens more quickly and with the evolution of more heat than regular Portland cement.

cement, hydraulic. See cement, aluminous and cement, Portland.

cementite Fe_3C . A carbide of iron formed in the manufacture of pig iron and steel. It is composed of 93.33% iron and 6.67% carbon. It is very hard and brittle and will scratch glass and feldspar, but not quartz. It is about two-thirds as magnetic as pure iron under an exciting current. It occurs in ordinary steels of more than 0.85% carbon and takes its name from cement steel, made by the cementation process, which contains a great deal of this carbide. See also ferrite, pearlite; carbon, combined; carbon, graphitic.

cement, low heat. A variety of Portland cement having higher tetracalcium aluminoferrate and dicalcium silicate content and less of tricalcium silicate and tricalcium aluminate than usual. The cement sets with the evolution of much less heat.

cement, Portland (cement, hydraulic). Very finely divided gray powder composed of compounds of lime, alumina, silica and iron oxide as tetracalcium aluminoferrate ($4\text{CaO} \cdot \text{Al}_2\text{O}_3 \cdot \text{Fe}_2\text{O}_3$), tricalcium aluminate ($3\text{CaO} \cdot \text{Al}_2\text{O}_3$), tricalcium silicate ($3\text{CaO} \cdot \text{SiO}_2$), and dicalcium silicate ($2\text{CaO} \cdot \text{SiO}_2$). These are

abbreviated respectively as C_4AF , C_3A , C_3S and C_2S . Small amounts of magnesia, sodium, potassium, and sulfur are also present in combined form. The mixture has the property of hardening slowly when mixed into a paste with water. Hardening does not require air, and will occur under water. Portland cement is made by heating a powdered mixture of carefully chosen clay and limestone to incipient fusion, and then grinding the resulting clinker to a fine powder. A small portion of gypsum is usually added prior to or during the final grinding. There are five main types as regards usage:

Type I. In general construction where no special properties are required.

Type II. Moderate heat-of-hardening cement, for use in general construction exposed to moderate exposure to sulfate-bearing water or other chemicals or where moderate heat of hydration is desirable.

Type III. High early strength (H. E. S.) cement for use where high early strength is required.

Type IV. Low heat cement for use when a low heat of hydration is required.

Type V. Chemical resisting cements for use when high sulfate or chemical resistance is required.

See descriptions of Types III, IV, and V in preceding articles. See also cement, aluminous.

Containers: Multiwall paper sacks.

cement, pyroxylin. Mixtures containing cellulose nitrate, plasticizers and solvents which cause cellulose nitrate plastics to adhere to other bodies.

Shipping regulations: Flammable liquid. Red label may be required.*

cement rock. Argillaceous limestone used in the manufacture of Portland cement. Contains lime, silica, and alumina in varying proportions, and usually more or less magnesia.

cement, rubber. General term for solution of rubber in a hydrocarbon (such as gasoline or benzene).

Uses: As binder to hold materials in position until sewing or clamping is accomplished; as permanent bonds; as vulcanized seals; in shoe manufacturing; in automotive manufacture, as a sound deadener; adhesive for paper, and for repairing tires and tubes.

Shipping regulations: Flammable liquid. Red label may be required.*

"Centifoliol." ¹⁸⁸ Trademark for a replacement for otto of rose and rose absolute.

Uses: Perfume and cosmetic compositions.

centigrade. The scale for measuring temperature in which 100° is the boiling point of water at standard atmospheric pressure, and 0° is the freezing point of water. A temperature given in centigrade degrees may be converted to the corresponding Fahrenheit temperature by the following

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

operation. Multiply the degrees centigrade by 1.8, and add 32 to the product. A temperature given in Fahrenheit degrees is converted to the corresponding centigrade temperature by subtracting 32 from the Fahrenheit temperature, and multiplying the remainder by 5/9. See absolute temperature for conversion of centigrade temperature to absolute or Kelvin scale.

centigrade heat unit. See *chu*.

centipoise. One one-hundredth of a poise.

A poise is the unit of viscosity expressed as one dyne per second per square centimeter.

centistoke. One one-hundredth of a stoke. A stoke is equal to the viscosity in poises times the density of the fluid in grams per cubic centimeter.

"Century." ¹⁸⁹ Trademark for a line of fatty acids, including stearic, oleic, polymerized, and mixed fatty acids.

"Century" 1210. Single pressed stearic acid.

"Century" 1220. Double pressed stearic acid.

"Century" 1230. Triple pressed stearic acid.

"Century" 1240. Supra (U.S.P.) stearic acid.

Uses: Buffing compounds; candles; cosmetics, crayons, emulsifiers; waxes; lubricating greases; shaving creams; metallic soaps; esters; paper coating; rubber compounding; pharmaceuticals; textile finishes.

"Century" 1005. Low titer redolene (oleic acid).

"Century" 1010. Redolene (oleic acid).

"Century" 1020. White (U.S.P.) oleic acid.

"Century" 1030. Low titer white (U.S.P.) oleic acid.

"Century" 1050. L.P. white (U.S.P.) oleic acid.

Uses: Textile soaps; esters; liquid soaps; waxes; emulsifiers; cosmetics, pharmaceuticals; polishes; plasticizers; lubricating oils; rubber compounding.

"Century" 1475. Mixed fatty acid; approximate composition C_{14} 10%, C_{16} 14%, C_{18} 24%, C_{20} 2%, polybasic acids 50%.

"Century" D-75. Polymerized fatty acid; a dicarboxylic acid, consisting of a mixture of dimer, trimer, and high molecular weight acids. Used in protective coatings, corrosion inhibitors; as a lube additive, and for bodying alkyds.

"Century" D-85. Polymerized fatty acid.

"Century" CD. Light colored mixed fatty acid containing short and long chain acids. Used in soaps, shampoos, dry cleaning compounds; alkyds; esters; lubricants.

"Century" 1480. Mixed fatty acid containing short and long chain acids.

"Century" 480. Mixed saturated fatty acids. Used in special esters, soaps, metallic stearates and lubricants.

"Century" 1405. Distilled tallow fatty acid, used in lubricants, esters, polishes, textile finishes, soap.

"Century" Hydrex. ¹⁸⁹ Trade name for hydrogenated fatty acid products, including stearic acid, fish oil fatty acid, and tallow

glyceride.

"Century" Hydrex 440. Hydrogenated stearic acid.

"Century" Hydrex 450. Hydrogenated stearic acid.

"Century" Hydrex 460. High quality hydrogenated stearic acid.

"Century" Hydrex 53. Hydrogenated fish oil fatty acid.

"Century" Hydrex 360. Hydrogenated tallow glyceride.

Uses: Buffing compounds; rubber compounding; candles; lubricating greases; crayons; emulsifiers; paper coatings; plasticizers; cosmetics; metallic stearates; textile finishes; polishes.

"Cenwax A." ¹⁸⁹ Trade name for a hard, amorphous solid with practically no taste or odor, containing over 85% of 12-hydroxystearic acid.

Uses: Lubricants where good stability and water resistance are required, as in soaps, cosmetics, textile chemicals and insulation.

"Cenwax G." ¹⁸⁹ Trade name for hydrogenated castor oil; principally the glyceride of 12-hydroxystearic acid.

Properties: Hard, wax-like solid; m.p. approximately 190°F; practically tasteless and odorless. Solid form: white to light-cream color; liquid form: colorless to light-straw color.

Uses: Lubricating grease where stability and water resistance are most important.

cephaeis. See *specac*.

cephalin. (kephalin). A group of phosphatides associated with lecithins found in brain tissue, nerve tissue, and egg yolk.

Properties: Yellowish, amorphous substance, characteristic odor and taste; insoluble in water and acetone; soluble in chloroform and ether; slightly soluble in alcohol.

Use: Medicine.

cera alba. See *beeswax*, bleached.

cera flava. See *beeswax*.

ceramics. Used in this dictionary to mean the ceramics industry, that is, the technology of producing fired clay and porcelain articles, their glazes, pigments, and modifiers. For the structural materials used in ceramics, see *refractories*. The two terms are often confused.

"Ceramol." ⁴⁰⁰ Trade name for a blend of cetyl and stearyl alcohols and higher alcohol sulfates. Melts from 50-60°C; acid number 1.0 max; saponification value 3 max; iodine number 5 max; acetyl value 185-195. Not alkaline to phenolphthalein.

Uses: Emulsifier for cosmetic creams, ointments, and lipsticks.

cerargyrite (chlorargyrite) $AgCl$. Natural silver chloride found in the oxidized zone of silver deposits.

Properties: Colorless, gray, yellowish, brownish; becomes violet brown or purple on exposure to light; luster resinous to adamantine; hornlike; can be cut with a

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

knife; sp. gr. 5.55; hardness 2.5.
Occurrence: Europe; South America;
Colorado, Arizona, New Mexico, California.

Use: Ore of silver.
See also bromyrite.

"Ceratak," ¹²⁸ Brand name for a grade of petroleum microcrystalline wax.

Properties: Color, amber; m.p. 155 or 165°F min.

Containers: 10-lb slabs, 8/carton or 168/pallet; 350-lb drums; tank cars.

Uses: Coating and laminating paper, foil, and board, impregnating and waterproofing fabrics.

"Ceraweld," ¹²⁸ Brand name for a grade of petroleum microcrystalline wax.

Properties: Color, brown or amber, m.p. 155°F min.

Containers: 10-lb slabs, 8/carton or 168/pallet; 350-lb drums; tank cars.

Uses: Coating and laminating paper, foil, and board; impregnating and waterproofing fabrics.

"Cercor," ²⁰ Trademark for honeycomb ceramic articles. A wide variety of ceramic materials can be utilized to produce articles having surface areas of 1000-2000 square feet per cubic foot of material and with a specific gravity of less than one.

cerebroside. A group of compounds found in brain and nervous tissue. Upon hydrolysis they yield a fatty acid, sphingosine, and a sugar, usually galactose.

"Ceres," ³⁰⁷ Trademark for a line of dyestuffs. Used for the coloring of wax, stearin, candles, etc.

"Ceresan" (2%). ²⁸ Trademark for a seed disinfectant containing 2% ethyl mercuric chloride.

Containers: 1 1/2-lb cans and 75-lb drums.

Use: For treatment of cotton, peanuts, and pea seeds to control seed-borne diseases and to reduce seed decay and check damping-off; as a short soak treatment for basal rot of narcissus bulbs.

"Ceresan" 75. ²⁸ Trademark for liquid mercurial seed disinfectant. Active ingredients: ethyl mercuric 2,3-dihydroxypropylmercaptide and ethyl mercuric acetate. Colors seed red. "Ceresan" 100 and 200 are higher strength.

Containers: 1-, 5-, 30- and 55-gal drums.

Use: Control of certain seed-borne diseases, and to reduce losses from seed decay and damping-off of wheat, oats, barley, rye, sorghum, rice, flax and cotton.

"Ceresan" M. ²⁸ Trademark for seed disinfectant containing ethyl mercuric para-toluene sulfonamide.

Containers: 14-oz cans; 3-lb cans; 40- and 100-lb drums.

Use: As a dust or as a slurry treatment for the same disease control and crop seed uses as the "Ceresan" 75. Also sugar beet seed and control of snow mold of wheat.

"Ceresan" (New Improved). ²⁸ Trademark for a seed disinfectant containing 5% ethyl mercuric phosphate.

Containers: 1-lb and 100-lb drums.

Use: Dip treatment for gladiolus corms.

Also used as a dust treatment for the same purposes as "Ceresan" M.

ceresin wax (purified ozocerite; earth wax; mineral wax; cerosin; cerin).

Properties: White or yellow waxy cake;

white is odorless; yellow has a slight odor.

Sp. gr. 0.92-0.94; m.p. 68-72°C. Soluble in alcohol, benzene, chloroform, naphtha; insoluble in water.

Derivation: Purification of ozocerite by treatment with concentrated sulfuric acid and filtration through animal charcoal.

Grades: White; yellow.

Containers: Bags; cartons.

Uses: Candles; sizing; substitute for white wax; bottles for hydrofluoric acid; electric insulations; shoe and leather polishes; impregnating and preserving agent; lubricating compounds; wood fillers; floor polishes, antifouling paints; sizing and glossing paper; waxed papers; cosmetics; ointments and other pharmaceutical preparations; acid-proof coating for electrotypers' plates; matrix compositions; in admixture with rosin and sulfur for making printing forms; waterproofing textile fabrics.

Shipping regulations: None.*

"Ceresit," ⁷⁶ Trademark for a line of water repellents for concrete, floor hardeners, masonry repair materials and allied protective products.

ceria. See ceric oxide, also rare earths.

ceric ammonium nitrate (cerium-ammonium nitrate; ammonium hexanitratocerate)
Ce(NO3)4 \cdot 2NH4NO3

Properties: Small prismatic, yellow crystals. Soluble in water and alcohol, almost insoluble in concentrated nitric acid; soluble in other concentrated acids.

Derivation: By electrolytic oxidation of cerous nitrate in nitric acid solution, and subsequently mixing solutions of cerium nitrate and ammonium nitrate, followed by crystallization.

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden kegs; tins.

Uses: Analytical chemistry; oxidant for organic compounds; scavenger in the manufacture of azides.

Fire hazard: Dangerous.

Shipping regulations: Oxidizing material. Yellow label.*

ceric ammonium sulfate

Ce(SO4)2 \cdot 3(NH4)2SO4 \cdot 2H2O

Properties: Yellow crystals, soluble in water and in acids.

Grades: Technical.

Containers: Bottles; fiber drums.

ceric hydroxide (ceric oxide, hydrated; cerium hydrate).

Properties: Whitish powder when pure.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

The dry powder is best described as a hydrated oxide containing 85-90% ceric oxide. Soluble in concentrated mineral acids; insoluble in water.

Derivation: By treating a solution of a ceric salt with strong alkali. Reagent grade is prepared by adding a saturated solution of ceric ammonium nitrate to an excess of ammonium hydroxide.

Grades: Commercial; high purity.

Containers: Cans; bottles; fiber drums.

Uses: As a source of ceric sulfate; production of cerium salts; opacifier in glasses and enamels (imparts yellow color); production of shielding glass.

ceric oxide (cerium dioxide; cerium oxide; ceria) CeO_2 .

Properties: Pale yellow, heavy powder (white when pure). Commercial article is brown. Sp.gr. 7.65; m.p. 2600°C. Soluble in sulfuric acid; insoluble in water and dilute acids; requires reducing agent with acid to dissolve the anhydrous oxide.

Derivation: By decomposing cerium nitrate by heat.

Impurities: Other rare-earth metal oxides.

Grades: Technical; high purity (99.8%).

Containers: Bottles; cans; fiber drums.

Uses: Ceramics; x-ray investigations; polishing glass; an optical sensitizer in photosensitive glass; a stabilizer to prevent browning of glass in radiation shields; opacifier in enamels.

Shipping regulations: None.*

ceric oxide, hydrated. See ceric hydroxide.

ceric sulfate (cerium sulfate) $\text{Ce}(\text{SO}_4)_2 \cdot 4\text{H}_2\text{O}$.

Properties: White or reddish-yellow crystals; sp.gr. 3.91; soluble in water (decomposes), soluble in dilute sulfuric acid.

Derivation: By the action of sulfuric acid on cerium carbonate.

Method of purification: Crystallization.

Grades: Technical; reagent.

Containers: Boxes; glass bottles.

Uses: Dyeing and printing textiles; analytical reagent; waterproofing; mildewproofing.

Shipping regulations: None.*

cerin. See ceresin wax.

cerinic acid. See cerotic acid.

cerite. One of the rare-earth minerals (q.v.).

It is a hydrated silicate and contains from 60-70% of cerium and its allies, together with smaller amounts of iron, calcium and the yttrium earths. Color, between clove-brown and cherry-red to gray.

Constants: Sp.gr. 4.86; hardness 5.5.

Occurrence: Sweden.

cerium Ce. Rare-earth element; atomic number 58.

Properties: Gray, ductile, malleable metal; tarnishes in moist air, sp.gr. 6.78; m.p. 804°C; b.p. 2900°C; soluble in acids; decomposes water.

Occurrence: See rare-earth minerals.

Derivation: (a) Reduction of the chloride by calcium powder; (b) electrolysis of the fused chloride (see misch metal); (c) by-

product from thorium nitrate production known as cerium residue is treated electrolytically with production of crude cerium metal containing also lanthanum and didymium.

Grades: Granules; ingots; rods (high purity).

Uses: Cerium salts; cerium-iron pyrophoric alloys; ignition devices; military signaling; illuminant in photography; reducing agent (scavenger in metallurgical work); catalyst in synthesis of ammonia; alloys for jet engines; solid state devices; rocket propellants.

See also misch metal.

Shipping regulations: None.*

cerium-ammonium nitrate. See ceric ammonium nitrate.

cerium carbonate. See cerous carbonate.

cerium chloride. See cerous chloride.

cerium dioxide. See ceric oxide.

cerium hydrate. See ceric hydroxide or cerous hydroxide.

cerium naphthenate.

Properties: Extremely rubbery material.

Very difficult to dry. Very insoluble unless small quantities of organic stabilizers are used which make it easier to dissolve and form free-flowing solutions.

Derivation: By saponifying naphthenic acids and treating the sodium naphthenate formed with a suitable cerium salt.

Grades: The commercial product is not a pure one in the strictest sense of the term as the cerium salt used in making the naphthenate is a mixture of rare earths; e.g., lanthanum, neodymium, praseodymium, etc. However, these elements all have very similar properties and their presence has produced no noticeable detrimental effects in its commercial applications.

Uses: Inks (drier, improving water-resisting properties, preventing undue ink-absorption by paper, reducing emulsifying tendencies); waterproofing rope, sails and canvas products; paints and varnishes (drier, waterproofing agent); waterproofing agent for general purposes.

cerium nitrate. See cerous nitrate.

cerium oxalate. See cerous oxalate.

cerium oxide. See ceric oxide.

cerium sulfate. See ceric sulfate; cerous sulfate.

cermets. Refractory compositions made by bonding grains of ceramics, metal carbides, nitrides, etc. with metal. They combine the strength and toughness of the metal with the temperature resistance of the ceramic material and are intended for use in rocket motors, gas turbines, turbojet engines, and nuclear reactor mechanisms operating continuously at temperatures as high as 1800°F and, for short periods, as high as 4000°F. Niobium, tantalum, titanium, and zirconium, which wet both

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ceramics and metals, are employed as brazing agents to bond the grains to the matrix. Cermets are made by powder metallurgy techniques in which a powdered mixture of refractory, metal, and brazing agent is molded to the desired form and subjected to high temperature and pressure. Typical cermets contain nickel with lead silicate; chromium with aluminum silicate; tungsten with beryllium and aluminum oxides; molybdenum with calcium and aluminum oxides.

"Cer-O-Cillin." ³²⁷ Trademark for penicillin "O," allylmercaptomethyl penicillin, an antibiotic obtained from cultures of *Penicillium chrysogenum*.

Use: Medicine; the antibacterial spectrum is similar to penicillin G, less likely to cause allergic reactions.

cerosin. See ceresin wax.

cerotic acid (hexacosanoic acid, cerinic acid) $\text{CH}_3(\text{CH}_2)_{24}\text{COOH}$. An acid obtained from beeswax, carnauba wax or Chinese wax. Properties: White odorless crystals or powder; sp. gr. 0.8198 (100/4°C); m. p. 87.7°C; refractive index 1.4301 (100°C). Insoluble in water; soluble in alcohol, benzene, ether, acetone.

cerotin. See ceryl alcohol.

cerous carbonate (cerium carbonate) $\text{Ce}_2(\text{CO}_3)_3 \cdot 5\text{H}_2\text{O}$. Properties: White powder; soluble in mineral acids (dilute); insoluble in water. Derivation: By adding an alkali carbonate to a solution of a cerous salt.

cerous chloride (cerium chloride) $\text{CeCl}_3 \cdot x\text{H}_2\text{O}$. Properties: White crystals; deliquescent; sp. gr. 3.88 (anhydrous); m. p. 848°C (anhydrous). Soluble in water, alcohol, and acids. Derivation: By the action of hydrochloric acid on cerium carbonate or hydroxide. Method of purification: Crystallization. Grades: Technical and purified or reagent. Containers: Kegs; fiber drums. Uses: Incandescent gas mantles, spectrography; preparation of cerium metal. Shipping regulations: None.*

cerous fluoride $\text{CeF}_3 \cdot x\text{H}_2\text{O}$. Properties: Off-white powder, insoluble in water and acids. Derivation: By treating cerous oxalate with hydrofluoric acid. Grades: Technical. Containers: Fiber drums. Uses: In arc carbons to increase their brilliance; preparation of cerium metal. Shipping regulations: None.*

cerous hydroxide (cerium hydrate). Approximate formula $\text{Ce}(\text{OH})_3$. Properties: White gelatinous precipitate; yellow, brown or pink when impurities are present. Soluble in acids; insoluble in water and alkali. Derivation: Chief source is monazite sand.

Grades: Pure; crude.

Use: Pure form: To produce cerium salts, impart yellow color to glass and as an opacifying agent in glazes and enamels. Crude form: In the flaming arc lamp.

cerous nitrate (cerium nitrate) $\text{Ce}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$. Properties: Colorless crystals; deliquescent. Soluble in water and alcohol. Constants: M. p., loses $3\text{H}_2\text{O}$ at 150°C; b. p., decomposes at 200°C. Derivation: By the action of nitric acid on cerous carbonate. Method of purification: Crystallization. Grades: Technical and purified. Containers: Wooden barrels; fiber drums. Uses: Incandescent gas mantles; medicine; reagent. Shipping regulations: Oxidizing material. Yellow label.*

cerous oxalate (cerium oxalate) $\text{Ce}_2(\text{C}_2\text{O}_4)_3 \cdot 9\text{H}_2\text{O}$. Properties: Yellowish-white, odorless, tasteless, crystalline powder; decomposes upon heating; soluble in dilute sulfuric and hydrochloric acids; very slightly soluble in water; insoluble in oxalic acid solution, alkalies, alcohol and ether. Derivation: By extraction from monazite sand with oxalic acid, or with hydrochloric acid and conversion into the oxalate, followed by crystallization. Method of purification: Recrystallization. Grades: Pure; the commercial article consists of a complex mixture of oxalates of cerium, lanthanum and didymium, being more or less a by-product in the manufacture of thorium salts. Containers: 5-, 25-lb boxes; 100-lb kegs, 200-lb barrels; multiwall paper sacks. Uses: Medicine; isolation of the metals of the cerium group. Shipping regulations: None.*

cerous sulfate (cerium sulfate) $\text{Ce}_2(\text{SO}_4)_3 \cdot x\text{H}_2\text{O}$. Properties: White crystals or powder; soluble in water and in acids. M. p. 630°C (dehydrated); sp. gr. 2.886. Derivation: Reagent grade is prepared by reducing a solution of ceric sulfate in sulfuric acid with hydrogen peroxide. Grades: Technical and purified (reagent). Uses: Developing agent for aniline black.

"Cerox." ⁸⁸ Trademark for optical grade cerium oxide, approximately 90% purity. Used in glass polishing.

ceroxylol $\text{C}_{20}\text{H}_{32}\text{O}$. An amaroïd obtained from the wax of *Ceroxylon andicola*, the wax-palm tree of South America. Properties: White needles; m. p. greater than 100°C. Soluble in alcohol, ether, fatty oils.

"Cerrobaze." ⁶⁰ Trademark for the eutectic alloy of bismuth and lead. M. p. 255°F. Shrinks slightly after solidifying, later expands. Uses: Proof casting forging dies; master patterns; mandrels for electroforming;

*See "I. C. C. Shipping Regulations," page xiii. Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

heat transfer medium in autoclaves; liquid seal in bright annealing and nitriding furnaces; molds for plastics; fusible foundry cores; filler for bending large diameter tubing, preventing wrinkles.

"Cerroband." ⁶⁰ Trademark for the eutectic alloy of bismuth, lead, tin and cadmium, m.p. 158°F. Expands during and after solidification.

Uses: As filler in thin walled tubing, prevents wrinkles in bending, melts out in hot water; assembly, checking, drilling, spotting fixtures in aircraft and automotive tooling; anchoring medium in precision machining jet engine components (buckets and blades).

"Cerrocast." ⁶⁰ Trademark for a non-eutectic alloy of bismuth and tin. Melting range 281-338°F. Exhibits negligible volume change during and after solidification.

Uses: Soft metal dies for "lost wax" patterns; engraving machine patterns; split jaw chucks; molds for plastics, mandrels for electroforming.

"Cerrodent." ⁶⁰ Trademark for a bismuth alloy, pouring about 200°F, for dental casting models.

"Cerroflows." ⁶⁰ Trademark for bismuth alloys containing high percentages of indium. Ultra-low melting temperatures make them useful in prosthetic development, dental models, proof casting, anchorage and support of delicate work pieces during machining.

"Cerromatrix." ⁶⁰ Trademark for a bismuth alloy with melting range 217-440°F, pouring at 250°F, expanding during and after solidification.

Uses: In die making to anchor punches; fastening bearings, bushings, and non-moving parts in machinery; nests in drill jigs and dial feeding stations; sheet metal forming dies, etc.

"Cerro-safe." ⁶⁰ Trademark for a bismuth, lead, tin, and cadmium alloy with melting range 158-190°F. Shrinks 15 minutes after solidification, then expands.

Uses: Accurate duplicate patterns; proof casting cavities, such as gun chambers, bullet molds; toy castings and hobby models, sprayed-on protective coating on wood patterns and core boxes.

"Cerro-seal-35." ⁶⁰ Trademark for an indium-tin alloy with m.p. near 250°F. Has characteristic of adhering to glass, mica, glazed ceramics, and quartz. Bonds to metals when used as regular solder.

"Cerrotru." ⁶⁰ Trademark for a non-shrinking bismuth, tin eutectic alloy, m.p. 281°F.

Uses: Anchoring shafts in Alnico rotors, forming blocks in stretch presses; engraving machining models; special jaws in tangent tube bending; soft metal dies in "lost wax" process, mandrels in electro-forming; molds by "dip" casting.

cerulean blue. A light blue pigment essentially cobaltous stannate $\text{CoO} \cdot n(\text{SnO}_2)$.

ceruse. See lead carbonate, basic.

cerussite PbCO_3 . Natural lead carbonate, found in the upper zone of lead deposits. Properties: Colorless, white, gray; luster adamantine; hardness 3-3.5; sp.gr. 6.55. Effervesces in nitric acid. Occurrence: Colorado, Arizona, New Mexico, Idaho; Australia; Europe. Uses: An ore of lead.

ceryl alcohol (cerotin) $\text{C}_{26}\text{H}_{54}\text{O}$. An alcohol obtained from Chinese wax (q.v.).

Properties: Colorless crystals; m.p. 79°C; insoluble in water; soluble in alcohol and ether.

ceryl cerotate $\text{C}_{52}\text{H}_{104}\text{O}_2$. The chief constituent of Chinese wax (q.v.). Colorless crystals with m.p. 84°C.

cesium Cs. One of the alkali group of elements, highest in the electromotive series (except the unstable francium); atomic number 55. Properties: Silver-white, soft ductile metal; decomposes water, setting free hydrogen which ignites. Must be kept immersed in naphtha or kerosine. Sp.gr. 1.90; m.p. 28°C; b.p. 690°C. Soluble in acids and alcohol.

Derivation: By thermochemical reduction of cesium chloride with calcium.

Grades: Technical.

Containers: Glass bottles.

Uses: Photo-electric cells; radio tubes; as a "getter" in vacuum tubes. Has been suggested for: ion propulsion systems; plasma for thermoelectric conversion; heat transfer fluid in power generators; grain refining agent in metal.

Fire hazard: Dangerous.

Shipping regulations: Flammable solid. Yellow label.*

cesium 137. Radioactive cesium of mass number 137.

Properties: Half-life 30 years; radiation, beta; radiotoxicity, moderately hazardous. The beta decay of Cs-137 produces barium 137, which in turn is radioactive, emitting a 0.662 mev gamma ray with a 2.6 minute half-life. Most applications of Cs-137 depend on the fact that any Cs-137 preparation has an equivalent amount of the gamma-emitting Ba-137 daughter.

Shipping regulations: Class D poison, radioactive material. Red label.*

cesium alum. See cesium aluminum sulfate.

cesium aluminum sulfate (cesium alum) $\text{CsAl}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$.

Properties: Colorless crystals; sp.gr. 2.0215; m.p. 117°C; soluble in water; insoluble in alcohol.

Derivation: By adding a solution of cesium sulfate to a solution of potassium alum, concentrating and crystallizing.

Method of purification: Recrystallization. Grades: Pure.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Containers: Glass bottles; tins.

Use: Mineral waters.

Shipping regulations: None.*

cesium ammonium bromide (ammonium-cesium bromide) $\text{CsBr} \cdot \text{NH}_4\text{Br}$.

Properties: White, crystalline powder; soluble in water.

Use: Medicine.

cesium antimonide. Used as a high-purity binary semiconductor.

cesium arsenide. Used as a high-purity binary semiconductor.

cesium bromide CsBr .

Properties: Colorless crystalline powder; sp. gr. 4.44; m.p. 636°C; b.p. 1300°C; soluble in water; slightly soluble in alcohol.

Grades: Technical; single pure crystals.

Use: Medicine; crystals for infrared spectroscopy; scintillation.

cesium carbonate Cs_2CO_3 .

Properties: White, deliquescent, crystalline powder; b.p., decomposes at 610°C. Soluble in water, alcohol, and ether.

Derivation: By passing carbon dioxide into a solution of cesium oxide and subsequent crystallization.

Grades: Pure.

Containers: Glass bottles.

Uses: Brewing, manufacture of mineral waters.

Shipping regulations: None.*

cesium chloride CsCl .

Properties: Colorless crystals; sp. gr. 3.972; m.p. 646°C; sublimes at 1290°C. Soluble in water and alcohol.

Derivation: By the action of hydrochloric acid on cesium oxide and crystallization.

Method of purification: Recrystallization.

Grades: Pure.

Containers: Glass bottles, tins.

Uses: Medicine; brewing; manufacturing mineral waters; evacuation of radio tubes (positive ions supplied at surface of filament).

Shipping regulations: None.*

cesium dichromate $\text{Cs}_2\text{Cr}_2\text{O}_7$.

Properties: Reddish-white crystals. Soluble in water.

cesium dioxide Cs_2O_2 .

Properties: Yellow needles; sp. gr. 4.25; m.p. 400°C; soluble in water and acids.

Grades: Technical; pure.

Use: Cesium salts.

cesium disulfate (acid cesium sulfate) CsHSO_4 .

Properties: Colorless, rhombic prisms; sp. gr. 3.352; soluble in water.

cesium hydrate. See cesium hydroxide.

cesium hydroxide (cesium hydrate) CsOH .

Properties: Colorless or yellowish, fused, crystalline mass. Strong alkaline reaction. Hygroscopic. Caution! Keep well stoppered. Sp. gr. 3.675; m.p. 272.3°C. Soluble in alcohol and hot water.

cesium iodide CsI .

Properties: Colorless, crystalline powder; deliquescent. Sp. gr. 4.510; m.p. 621°C; b.p. 1280°C; soluble in alcohol and water.

Grades: Technical; single pure crystals.

Uses: Crystals for infrared spectroscopy; scintillation.

cesium nitrate CsNO_3 .

Properties: Glittering, crystalline powder; saltpeter taste; sp. gr. 3.687; m.p. 414°C; b.p. (decomposes); soluble in water and acetone; slightly soluble in alcohol.

Derivation: By the action of nitric acid on cesium oxide and crystallization.

Method of purification: Recrystallization.

Grades: Pure.

Containers: Tins; glass bottles.

Use: Cesium salts.

Fire hazard: Dangerous.

Shipping regulations: Oxidizing material.

Yellow label.*

cesium oxide Cs_2O .

Properties: Orange-red crystals; sp. gr. 4.36; m.p. decomposes 360-400°C; very soluble in water, soluble in acids.

Grades: Technical, pure.

Use: Cesium salts.

cesium oxides. See cesium oxide; cesium dioxide; cesium trioxide; cesium tetroxide.

cesium peroxide See cesium tetroxide.

cesium phosphide. Used as a high-purity binary semiconductor.

cesium-rubidium-ammonium bromide (rubidium-cesium-ammonium bromide; ammonium-cesium-rubidium bromide) $\text{CsBr} \cdot \text{RbBr} \cdot 6\text{NH}_4\text{Br}$.

Properties: White, crystalline powder; soluble in water.

cesium-rubidium bromide (rubidium-cesium bromide) $\text{CsBr} \cdot \text{RbBr}$.

Properties: White, crystalline powder; soluble in water; insoluble in alcohol.

Use: Medicine.

cesium-rubidium chloride (rubidium-cesium chloride) $\text{CsCl} \cdot \text{RbCl}$.

Properties: Colorless, crystalline powder; soluble in water; insoluble in alcohol.

Use: Medicine.

cesium silicate Cs_2SiO_3 .

Properties: Yellow, crystalline powder; insoluble in water.

Derivation: By the interaction of a cesium salt and sodium silicate.

cesium sulfate Cs_2SO_4 .

Properties: Colorless crystals; soluble in water; insoluble in alcohol. Sp. gr. 4.2434; m.p. 1010°C.

Derivation: By the action of sulfuric acid on cesium carbonate.

Method of purification: Crystallization.

Grades: Pure.

Containers: Kegs.

Uses: Brewing; mineral waters.

Shipping regulations: None.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

cesium sulfate, acid. See cesium disulfate.

cesium tetroxide (cesium peroxide) Cs_2O_4 .

Properties: Yellow crystals; sp. gr. 3.77; m.p. 600°C; decomposes in water to CsOH ; soluble in acids.

Grades: Technical; pure.

Use: Cesium salts.

cesium trioxide Cs_2O_3 .

Properties: Chocolate-brown crystals; sp. gr. 4.25 (0°C); m.p. 400°C; decomposes in water; soluble in acids.

Grades: Technical; pure.

Use: Cesium salts.

"CET." ³²⁸ Brand name for a water-soluble cellulose-reactive modified urea-formaldehyde condensate used as a stabilization medium for cellulosic fabrics. It is an acid curing reactant, so dyed cloth should be neutral or slightly acid prior to finishing.

cetaceum. See spermaceti.

cetalkonium chloride (cetyl dimethylbenzylammonium chloride)

$\text{C}_{16}\text{H}_{33}\text{N}(\text{CH}_3)_2\text{C}_{16}\text{H}_{33}\text{Cl}$. A quaternary ammonium germicide.

Properties: Colorless, odorless, crystalline powder; m.p. 58-60°C. Soluble in water to form colorless, odorless solution having pH 7.2. Compatible with alkalies and antihistaminics. Soluble in alcohol, acetone, esters, carbon tetrachloride.

Containers: $\frac{1}{4}$ -lb, 1-lb, 5-lb, 25-lb containers.

Uses: Medicine; germicide; fungicide; surface active agent.

cetane. See hexadecane.

cetane number. A rating for Diesel fuel comparable to the octane number rating for gasoline. It is the percentage of cetane ($\text{C}_{16}\text{H}_{34}$) which must be mixed with alpha-methyl naphthalene to give the same ignition performance, under standard conditions, as the fuel in question.

"Cetavlon." ²⁰⁷ Trademark for cetrinide, a mixture of dodecyl-, tetradecyl-, and hexadecyl-trimethylammonium bromides. A cationic detergent and bactericide used for skin sterilization and treatment of wounds and burns.

cetene. See 1-hexadecene.

cetin (cetyl palmitate; palmitic acid, cetyl ester) $\text{C}_{15}\text{H}_{31}\text{COOC}_{16}\text{H}_{33}$.

Properties: White crystalline wax-like substance. Chief constituent of commercial purified spermaceti. M.p. 50°C; b.p. 360°C; sp. gr. 0.832; refractive index (n 70/D) 1.4398. Soluble in alcohol and ether; insoluble in water.

Derivation: By solution from spermaceti.

Grades: Technical.

Containers: Wooden boxes.

Uses: Base for ointments, cerates, and emulsions; manufacture of candles, soaps, etc.

Shipping regulations: None.*

"Cetol." ⁴³⁰ Trade name for cetyl dimethyl benzyl ammonium chloride. F.D.A. approved for internal use; used in cough preparations.

"Cetone Alpha." ²²⁷ Trademark for a very highly refined alpha-isomethylionone. Properties: Slightly yellow liquid; sp. gr. 0.925-0.929 (25/25°C); refractive index 1.500-1.5010 (20°C); flash point (Tag closed cup) 217°F; clearly soluble in 5 parts 70% alcohol.

Occurrence: Not found in nature.

Uses: Floral perfumes, particularly of a violet character.

cetraria (Iceland moss).

Properties: Gray fibrous bundles. Makes a gelatinous solution after being boiled in water.

Chief constituents: Cetraric acid, licheno-stearic acid, fumaric acid and lichenine.

Derivation: The thallus of *Cetraria islandica*; habitat: North America; Europe; Japan.

Uses: Gelling and sizing agent in textiles, cosmetics, foods.

cetyl alcohol (alcohol C-16; cetylic alcohol; 1-hexadecanol; normal primary hexadecyl alcohol; palmityl alcohol) $\text{C}_{16}\text{H}_{33}\text{OH}$. A fatty alcohol.

Properties: White, odorless, tasteless crystals; sp. gr. 0.8176 (49.5°C); m.p. 49.3°C, b.p. 344°C, refractive index (n 79/D) 1.4283; soluble in alcohol and ether; insoluble in water.

Derivation: By saponifying spermaceti with caustic alkali; reduction of palmitic acid.

Method of purification: Crystallization; distillation.

Grades: Technical; cosmetic; N. F. XI.

Containers: Tins; cartons; drums; bags; steam-coiled tank cars.

Uses: Medicine; perfumery; emulsifier; cosmetics; base for making sulfonated fatty alcohols; to retard evaporation of water, when spread as a film on reservoirs, or sprayed on growing plants.

Shipping regulations: None.*

cetyl bromide $\text{C}_{16}\text{H}_{33}\text{Br}$.

Properties: Dark yellow liquid. Freezing point 15°C; b.p. 186-197°C (10 mm); sp. gr. 0.991 (25/25°C); lb/gal 8.25 (25°C); refractive index 1.460 (n 25/D); flash point 350°F. Soluble in ether; very slightly soluble in water, methanol.

Use: Synthesis.

cetyldimethylbenzylammonium chloride.

See cetalkonium chloride.

cetyldimethylethylammonium bromide

$\text{C}_{16}\text{H}_{33}(\text{CH}_3)_2\text{C}_2\text{H}_5\text{NBr}$. A quaternary ammonium salt (q. v.).

Properties: Paste.

Uses: Disinfectant; deodorant; germicide; fungicide; detergents.

cetyldimethylethylammonium chloride

$\text{C}_{16}\text{H}_{33}(\text{CH}_3)_2\text{C}_2\text{H}_5\text{NCl}$. A quaternary ammonium salt (q. v.).

cetylic acid. See palmitic acid.

* See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

cetylic alcohol. See cetyl alcohol.

cetyl mercaptan (hexadecyl mercaptan)
 $C_{16}H_{33}SH$.

Properties: M.p. 18°C; b.p. 185-190°C (7 mm); sp. gr. 0.8474 (20/4°C); refractive index 1.4638 (n_D 20/D).

Grades: 95% (min.) purity.

Uses: Intermediates; synthetic rubber processing.

cetyl palmitate. See cetin.

cetyl pyridinium bromide $C_{16}H_{33}C_5H_5NBr$.

Properties: Cream colored waxy solid.

Soluble in acetone, ethanol and chloroform.

Uses: Surface active agent; germicide.

cetylpyridinium chloride. The monohydrate of the quaternary salt of pyridine and cetyl chloride; $C_{16}H_{33}C_5H_5NCl \cdot H_2O$.

Properties: White powder with slight odor.

M.p. 77-83°. Very soluble in alcohol, chloroform and water; very slightly soluble in benzene and ether; pH (1% soln) 6.0-7.0.

Grades: Technical, U.S.P. XVI.

Use: Medicine.

cetyltrimethylammonium bromide (hexadecyltrimethylammonium bromide)

$C_{16}H_{33}(CH_3)_3NBr$. A quaternary ammonium salt.

Properties: White powder, soluble in water, alcohol and chloroform.

Grade: Technical.

Uses: Surface active agent; germicide.

cetyltrimethylammonium chloride

$C_{16}H_{33}(CH_3)_3NCl$. A quaternary ammonium salt.

cevadilla. See sabadilla.

cevadilline. See veratrine.

cevadine. See veratrine.

"**Cevalin.**" ¹⁰⁰ Trademark for ascorbic acid, U.S.P.

cevine. See veratrine.

Ceylon gelatin. See agar-agar.

Ceylon isinglass. See agar-agar.

Cf. Symbol for californium.

CF. Abbreviation for citrovorum factor. See folic acid.

CF black. Abbreviation for conducting furnace black. See furnace black.

CFE. Abbreviation for chlorotrifluoroethylene. Also used for polychlorotrifluoroethylene resins.

"**CH-100.**" ²⁴⁴ Trademark for a product consisting of a caustic soda base combined with other alkalies, surface active agents, and sequestering agents.

Properties: Light cream-colored, flaked, mechanical mixtures; soluble in water; total Na_2O , 70.2%.

Uses: To prevent liming and rust staining of bottles and mechanical parts of soaker and "hydro" bottle washers in breweries and creameries. General deactivation of

metal impurities.

chabazite $CaAl_2Si_4O_{12} \cdot 6H_2O$. Essentially a natural hydrous calcium aluminum silicate, usually containing some sodium and potassium. One of the zeolites (q.v.).

Properties: Color white, reddish, yellow, brown; luster vitreous; sp. gr. 2.1; hardness 4-5.

Occurrence: New Jersey, Colorado, Oregon; Europe.

chain reaction. A reaction between particles (atoms, molecules, or nuclei), in which one of the product particles of one reacting set is a reactant in the next set. The reaction between hydrogen and oxygen to produce water is a reaction of this kind, as are many polymerization reactions. More recently the term has had frequent use in reference to a type of nuclear reaction, fission, which is initiated by neutrons and is propagated by neutrons. When a U-235 nucleus absorbs a neutron, it splits or fissions with a great deal of energy, as well as emitting, on the average, about $2\frac{1}{2}$ more neutrons, which may in turn be absorbed in other U-235 nuclei to propagate the reaction. In any given set of conditions of a fissioning system, neutrons may be lost through the walls, as well as captured by structural materials, or by the U-235 itself in a non-fission mode. When the conditions are such that exactly one neutron causes fission of a nucleus from each set of neutrons produced in the previous fission, the system is said to be critical, and the geometrical size of the system and the mass of fissionable material in the system are called, respectively, the critical size and critical mass. Control of either the neutron leakage or non-fission capture allows the adjustment of this ratio of the number of fissions in one generation of neutrons to the number in the previous generation. If the ratio is greater or less than one, the system is super- or sub-critical and the rate of energy production rises or falls exponentially.

chalcantite (blue vitriol, natural)

$CuSO_4 \cdot 5H_2O$. Natural hydrous copper sulfate, occurring in the oxidized portions of some copper deposits.

Properties: Color deep azure blue, luster vitreous, soluble in water; sp. gr. 2.2; hardness 2.5.

Occurrence: Chile.

Use: Copper ore.

chalcadony. A microcrystalline form of native silica or quartz (q.v.).

Properties: Color variable; luster waxy; sp. gr. 2.6-2.65; hardness 6.5-7.

Varieties include carnelian, chrysoprase, agate, bloodstone, and onyx.

Use: Ornamental material.

chalcocite (copper glance) Cu_2S . Natural cuprous sulfide, occurring with other copper minerals.

Properties: Color lead gray, tarnishing dull

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

black; luster metallic; sectile; sp. gr. 5.5-5.8; hardness 2.5-3.

Occurrence: Montana, Arizona, Utah, Nevada; Alaska; Chile; Mexico; Europe.

Use: Important ore of copper.

chalcogenides. See chalcogens.

chalcogens. The chemically related elements oxygen, sulfur, selenium, tellurium and polonium. The binary compounds are referred to as chalcogenides.

chalcopyrite (copper pyrites, yellow copper) CuFeS_2 . Natural copper-iron sulfide, found in metallic veins and igneous rocks.

Properties: Color brass yellow, frequently tarnished bronze or iridescent; luster metallic; streak greenish black; sp. gr. 4.1-4.3; hardness 3.5-4. May carry gold or silver or mechanically intermixed pyrite.

Occurrence: Montana, Utah, Arizona, Tennessee; Europe; Chile; Canada.

Use: Important ore of copper.

chalk. (See also whitening.) A natural calcium carbonate composed of the calcareous remains of minute marine organisms. It varies in composition, properties and appearance ranging in color from snow-white through dull-white or grayish and from soft, incoherent and porous to hard and crystalline. It may contain up to 99% calcium carbonate in the form of calcite (q.v.) with silica, quartz, feldspar, zircon, rutile and other minerals as impurities. Phosphatic chalk contains up to 45% calcium phosphate. Glauconitic chalk is an admixture with grains of glauconite. Red chalk contains iron hydroxide.

chalk, cliffstone. One of the English chalks. It is much harder than ordinary chalks and is used to prepare a special grade of whitening, known as cliffstone Paris white.

chalk, drop. See chalk, prepared.

chalk, French. A variety of soapstone or steatite. See talc.

chalking. A natural process by which protective coatings develop a loose, powdery surface formed from the film. Chalking of paint films results from decomposition of the binder, principally through the action of ultraviolet rays. Although usually considered undesirable, chalking may be used advantageously in white exterior house paints as a means of shedding soil.

chalk, precipitated (calcium carbonate, precipitated). (See calcium carbonate for distinction from whitening and other chalks.)

Properties: Fine, white microcrystalline powder, the U.S.P. XVI grade containing not less than 98.0% calcium carbonate. Odorless, tasteless and stable in air. M.p., decomposes at 825°C with evolution of carbon dioxide. Density about 2.7. Soluble (with effervescence) in dilute acetic, hydrochloric, and nitric acids; practically insoluble in water; insoluble in alcohol.

Derivation: (a) By adding a boiling solution of calcium chloride to a boiling solution of sodium carbonate. (b) By passing carbon dioxide through milk of lime.

Grades: Technical; U.S.P. XVI.

Containers: Fiber cans; tins; glass bottles; multiwall paper sacks.

Uses: Medicine (antacid); dentifrices; baking powder; organic synthesis. For industrial uses see whitening.

chalk, prepared (drop chalk; calcium carbonate, prepared). (See calcium carbonate for distinction from whitening and other chalks.)

Properties: A very fine, white to grayish-white, amorphous powder, often formed in "conical drops." The N.F. XI grade contains not less than 97% calcium carbonate. Odorless, tasteless and stable in air. M.p., decomposes at 825°C with evolution of carbon dioxide. Soluble (with effervescence) in dilute acetic, hydrochloric and nitric acids; practically insoluble in water; insoluble in alcohol.

Derivation: By grinding some form of native calcium carbonate to a fine powder, agitating with water, allowing the coarser particles to settle, decanting the suspension and allowing the fine particles to settle slowly.

Grades: N.F. XI.

Containers: Fiber cans; tins; glass bottles; multiwall paper sacks.

Uses: Medicine (antacid); tooth powders; calcimine; polishing powders; silicate cements. For other uses, see whitening and chalk, precipitated.

chalybite. See siderite.

chamber acid. Sulfuric acid (q.v.) made by the chamber process.

chamber process. A process for manufacturing sulfuric acid from sulfur dioxide, air, and steam in the presence of nitrogen oxides as catalysts. The reaction takes place within large lead-lined chambers where the sulfuric acid-water mixture settles out as a fine mist.

The chamber process product is 50-55° Bé (60-70% H_2SO_4), which is suitable for manufacture of superphosphate fertilizers. The product can be concentrated to 93% H_2SO_4 .

chamomile oil, German (camomile oil; also called Hungarian chamomile oil.)

Properties: Viscous essential oil of deep-blue color, which by exposure to light and air turns into green and brown, characteristic odor, bitter, aromatic taste. Soluble in 95% alcohol, usually with separation of paraffin.

Constants: sp. gr. 0.922 to 0.956; acid value 9 to 50; ester value 3 to 33, after acetylation 117 to 155.

Adulterants: Cedar-wood oil, which reduces the congealing point. Unadulterated oils become viscous at 15°C and butyrous at 0°C.

Derivation: Distilled from the flower heads of *Matricaria chamomilla*.

Uses: Flavoring; medicine.

Shipping regulations: None.*

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

chamomile oil, Hungarian. See chamomile oil, German.

chamomile oil, Roman. (camomile oil, anthemidis oil).

Properties: Soluble in 6 to 10 vols of 70% alcohol; in 1 to 2 vols of 80% alcohol (occasionally with separation of paraffin).

Constants: Sp.gr. 0.905 to 0.918 at 15°C, optical rotation -2° $30'$ to $+3^{\circ}$, refractive index 1.442 to 1.457, acid value 1.5 to 14, ester value 214 to 317.

Chief known constituents: Esters of butyric, angelic and tiglic acids.

Derivation: Distilled from the flower heads of *Anthemis nobilis*.

Uses: Medicine; flavoring.

Shipping regulations: None.*

champaca oil. Fragrant fruity oil distilled from fresh flowers of *Michelia champaca* or *M. congifolia*, growing in the Philippines, Java and northern India. A leaf oil is also made. Small amounts are used in perfumery.

channel black. Carbon black made by impingement of a luminous natural-gas flame against an iron plate from which it is scraped at frequent intervals.

Properties vary widely but the material has an unusually fine state of subdivision and great surface area.

Grades: Conducting channel black (CC), hard processing (HPC); medium processing (MPC); easy processing (EPC)

Containers: Multiwall paper sacks.

Chief uses are as a reinforcing agent in rubber tires and as a pigment in printers' ink. Also used in other inks, and in paints, polishes, phonograph records, carbon paper, crayons, typewriter ribbons, pyrotechnic compositions, and insulating material. Also in case-hardening and crucible steel operations.

Shipping regulations: None.*

channel process. Method for making carbon black. See channel black.

charcoal. See also active carbon.

Derivation: A product of the destructive distillation of wood.

Grades: Technical, in lumps, powdered, briquettes.

Containers: Barrels; multiwall paper sacks.

Uses: Chemical (precipitant in the cyanide process, precipitant of iodine and lead salts from their solutions, catalyst, calcium carbide); decolorizing and filtering medium, absorbent in recovery of volatile solvents, gas absorbent, component of ordinary gunpowder and other explosives; fuel; poultry farming; arc light electrodes, decolorizing and purifying oils; artificial leather (solvent recovery); brewing (deodorant), metallurgy; heat insulating compositions; crayons; gasoline from casing-head gas; pharmaceutical preparations; plastics (solvent recovery); refrigeration (gas absorbent); sugar (decolorizing).

Fire hazard: Dangerous; ignites spontaneously when freshly calcined and exposed

to air or when wet; hazardous when freshly ground and tightly packed.

Shipping regulations: Flammable solid. Yellow label.*

charcoal, animal. See animal black; blood charcoal; bone black; ivory black.

charcoal, bone. See bone black.

charcoal, mineral. See fusain.

charcoal, vegetable. See vegetable black; active carbon.

Charles' law. The volume of a sample of gas varies directly with the absolute or Kelvin temperature if the pressure remains constant.

Charlton white. See lithopone.

chars. See under specific charcoal or black.

chaulmoogra oil. (gynocardia oil; hydnocarpus oil).

Properties: Brownish-yellow oil or soft fat; characteristic odor; somewhat acrid taste.

Soluble in ether, chloroform, benzene, solvent naphtha, sparingly soluble in cold alcohol; almost entirely soluble in hot alcohol, carbon disulfide.

Chief constituents: Glycerides of chaulmoogric and hydnocarpic acids.

Constants: Sp.gr. 0.940, saponification value 198 to 213, iodine value 96 to 104; acid value 21 to 27.

Derivation: Expressed from the seeds of *Taraktogenos kurzii* or *Hydnocarpus anthelminticus* or *wightianus*.

Method of purification: Rectification.

Grades: Technical.

Containers: Tins, cases.

Use: Medicine (thought to have been useful in leprosy).

Shipping regulations: None.*

chaulmoogric acid (hydnocarpyl acetic acid) $\text{CH}_2\text{CH}_2\text{CHCHCH}(\text{CH}_2)_2\text{COOH}$. A cyclic fatty acid.

Properties: Colorless shiny leaflets; m.p. 68.5°C ; soluble in ether, chloroform, and ethyl acetate.

Source: Chaulmoogra oil.

Use: Medicine, biochemical research.

chavicol methyl ether. See estragole.

checkerberry. See gaultheria.

"Cheelox." ³⁰⁷ Trademark for a series of organic chelating and sequestering agents, consisting of polycarboxylic acid derivatives of amines or polyamines or their salts, as, for example, ethylenediamine-tetraacetic acid. Some types were formerly sold as "Nullapon."

chelate. See also sequestration. The type of compound or chemical union in which a central atom (most frequently a metal) is joined to others in the same molecule by both ordinary and coordinate valence forces. Thus in copper quinolinolate, a useful fungicide, the central copper atom is joined to two oxygen atoms by ordinary valence forces and to two nitrogen atoms by

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

coordinate valences. Such linkages result in the formation of one or more heterocyclic rings in which the metal atom is part of the ring.

The metals in such compounds are usually not detectable by ordinary qualitative tests, and the formation of the properly chosen chelate compounds often serves as a sensitive test for metal ions in solution. Chelate formation is also applied practically in recovery or removal of traces of metal ions in industrial and biological processes.

chemical machining process.

1. The process of forming a three-dimensional photographic image within a piece of photosensitive glass, then dissolving it to leave a pattern whose shape is almost precisely complementary to that of the photographic image.

2. The phrase chemical machining is also applied to the use of etching or other types of chemical action to bring metal parts to desired dimensions with close tolerances.

chemical milling. See chemical machining process (2).

chemical red. A fine red pigment consisting, essentially, of red iron oxide. See also iron oxide reds and hematite, red.

chemical stoneware (brick, chemical). A clay pottery product which is widely employed to resist acids and alkalis. It is used for utensils, pipes, stopcocks, pumps, etc. Typical physical properties are as follows: Sp. gr. 2.2, hardness, scleroscope 100; ultimate tensile strength 2000 psi, ultimate compression strength 80,000 psi; modulus of rupture 5000 psi, modulus of elasticity 8×10^6 psi, sp. ht. 0.2; thermal conductivity 0.833 Btu/hr/sq. ft.; linear thermal expansion 2×10^{-6} per °F; H₂O absorption 0.4%.

Stoneware is made from special clays free from lime and iron, low in sand content, with low fire shrinkage, having the capacity of burning to a very dense body at low temperatures, and having sufficient plasticity to permit turning in a potter's wheel.

"Chemigum." ²⁶⁵ Trademark for a series of butadiene-acrylonitrile elastomers used for their exceptional resistance to oils and aromatic fuels. They are also known for their ease of processing and uniform high quality.

Properties: Characterized by low compression set, water absorption, and brittle point; high strength and elasticity when correctly compounded and vulcanized. Raw rubber has excellent bin aging characteristics and a mild, pleasant odor.

Uses: Gasoline hose; fuel cell interliners; oil resistant shoe soles; oil resistant automotive parts; hard packing compounds molded and extruded goods; abrasion resistant belt covers; friction compounds; gasket stocks; adhesives.

"Chemigum Latexes." ²⁶⁵ Trademark for a series of butadiene-acrylonitrile latexes possessing outstanding oil and solvent resistance characteristics. They are film forming and exhibit excellent adhesion and binding strength, mechanical stability, and ion tolerance.

Uses: Beater impregnation of paper; carpet backings; binders for nonwoven fabrics; adhesives; leather finishes; paper coatings.

chemiluminescence. The emission of absorbed energy (as light) due to a chemical reaction of the components of the system. It is normally considered to be an oxidation due to oxygen alone or to a compound which readily decomposes to form oxygen. An example is the oxidation of luminol in alcoholic solution. See luminescence.

"Chemipen." ⁴¹² Trademark for phenethicillin.

chemisorption. Chemisorption or chemical adsorption depends on chemical bond formation between the adsorbent and adsorbate, but in distinction from a chemical reaction, takes place only in a monolayer on the surface of the adsorbent as, for example, the adsorption of oxygen on a reactive iron catalyst. Chemisorption is thought to be essential in many catalytic reactions.

chemonite (copper arsenite, ammoniacal).

A wood-preservative solution prescribed by Federal Specification TT-W-549 to contain copper hydroxide, Cu(OH)₂, 1.84%; arsenic trioxide, As₂O₃, 1.3%; ammonia, NH₃, 2.8%, acetic acid, 0.05%; water, as necessary to 100.0%.

"Chem-Rite A-22." ⁷² Trade name for chromate conversion coating for aluminum. Composed of hexavalent chromium compounds and inorganic activators. Produces light to iridescent gold color film on aluminum surface which increases corrosion resistance and provides base for paint and other organic coatings. Available for spray or brush coatings.

Containers: 1- and 5-gal packages; 55-gal drums.

"Chem-Rite C-55, Z-33." ⁷² Trade name for a single dip process for producing clear chromate coating on cadmium plated parts. Composed of hexavalent chromium compounds and inorganic activators. Z-33 is similar but for zinc plated parts.

"Chemtite." ³³³ Trade name for plating-rack enamels and stop-off coatings to prevent deposition of metal on the coated portion of articles to be plated.

chenopodium oil (wormseed oil, American; goosefoot oil).

Properties: Colorless or yellowish oil; characteristic penetrating, disagreeable odor; pungent, bitterish, burning taste. Soluble in 3 to 10 vols of 70% alcohol (inferior and adulterated oils do not yield a clear solution).

Chief known constituents: Ascaridole, C₁₀H₁₆O₂; para-cymene; l-limonene.

* See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Constants: Sp. gr. (good commercial oils) 0.965 to 0.990; (inferior oils), 0.93 to 0.965 (15°C); optical rotation -4° to -8° 50'; refractive index 1.4740-1.4790 (20°C).

Derivation: Distilled from the seeds and leaves of *Chenopodium ambrosioides* anthelminticum.

Containers: Cans.

Use: Medicine.

Shipping regulations: None.*

chenopodium oil, Levant. See wormseed oil, Levant.

cherry-bark oil, wild. An essential oil distilled from the bark of *Prunus virginiana*, Mill. It resembles oil of bitter almonds and consists largely of benzaldehyde and hydrocyanic acid.

Constants: Sp. gr. 1.045 to 1.050.

Uses: Medicine, aromatic beverages.

Shipping regulations: None.*

cherry bay. See cherry laurel leaves.

cherry juice. Liquid expressed from fresh ripe fruit of *Prunus cerasus*.

Properties: Clear liquid with aromatic, characteristic odor and sour taste. Affected by light. Color is red to reddish-orange. Sp. gr. 1.045-1.075; refractive index 1.3500; pH 3.0-4.0.

Grade: U.S.P. XVI.

Use: Flavoring agent for medicines.

cherry laurel leaves (English laurel, cherry bay). Fresh leaves of *Prunus laurocerasus*.

Habitat: Southeastern Europe, southwestern Asia.

Use: Flavoring agent similar to bitter almond, especially in the form of the water.

cherry-laurel oil.

Properties: Pale yellow liquid closely resembling oil of bitter almonds in its properties but distinguishable from it by its slightly different odor. Very poisonous! Hydrocyanic acid content 0.4 to 3.6% (rarely up to 8% and more).

Solubility in alcohol: In 2.5 to 4 vols of 60% alcohol (diminishing with age), in 1 to 2 vols of 70% alcohol.

Chief known constituents: Benzaldehyde, hydrocyanic acid, benzaldehyde cyanhydrin.

Constants: Sp. gr. 1.050-1.066 (occasionally) 1.0457 (15°C), optical rotation, usually inactive, but occasionally active $+0^{\circ}12'$ to $-0^{\circ}46'$; refractive index 1.540 to 1.543; acid value 1.6-2.8.

Derivation: By macerating the leaves of *Prunus laurocerasus*, L. with water and then distilling with steam.

Contents: Bottles.

Uses: Flavoring; liqueurs.

Shipping regulations: None.*

chert. A fine-grained variety of native silica or quartz (q.v.). Similar to flint, but usually light in color. Fracture conchoidal, luster dull.

Chesney process. Method for producing magnesium metal and other magnesium

products from sea water by precipitation with dolomitic lime as the means of separating the relatively small quantity of magnesium from the large volume of sea water.

chessyllite. See azurite.

chi acid. See anthraquinone-1,8-disulfonic acid.

Chicago acid. See 8-amino-1-naphthol-5,7-disulfonic acid.

chicory root. Root of the plant *Cichorium intybus*.

Habitat: Cultivated in Europe.

Use: Substitute or adulterant for coffee; also used to impart flavor to coffee.

Chile niter. See caliche.

Chile nitrate. See caliche.

Chile saltpeter. See caliche.

chillies. See capsicum.

China bark. See quillaja.

China clay. See kaolin.

chinaldine. See quinaldine.

China oil. See Peru balsam.

China orange. See orange peel, sweet.

chinaphthol. See quinnaphthol.

China-wood oil. See tung oil.

Chinese bean oil. See soybean oil.

Chinese blistering flies. See cantharides.

Chinese blue. See iron blues.

Chinese cinnamon. See cinnamon, cassia.

Chinese cinnamon oil. See cassia oil.

Chinese gelatin. See agar-agar.

Chinese isinglass. See agar-agar.

Chinese oil. See Peru balsam.

Chinese red. See chrome red.

Chinese rhubarb. See rhubarb.

Chinese tree wax. See Chinese wax.

Chinese vermilion. A name for red mercuric sulfide.

Chinese wax (insect wax, Chinese tree wax; vegetable spermaceti).

Properties: White to yellowish-white solid; nearly odorless and tasteless. Must not be confused with Japan wax (q.v.). Soluble in alcohol, chloroform, benzene, and naphtha. Insoluble in water.

Chief constituent: Ceryl cerotate.

Constants: Sp. gr. 0.970, m.p. 80-83°C; iodine number 1.4, saponification number 80-93.

Derivation: Secreted by an insect *Coccus ceriferus*. The wax is deposited on the branches of some trees and is removed by hand and then melted in boiling water to remove dirt, bark, etc.

Method of purification: Filtration.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Grades: Crude.
Containers: Burlap bags; wooden barrels; multiwall paper sacks.
Uses: Fine candles; coating interior and exterior of vegetable-tallow candles; medicine; paper size; furniture, leather, and shoe polishes; treating cotton fabrics.
Caution: Combustible.
Shipping regulations: None.*

Chinese white. See zinc oxide.

Chinese wood oil. See tung oil.

chinic acid. See quinic acid.

chinidine. See quinidine.

chliniofon. Mixture of 7-iodo-8-hydroxyquinoline-5-sulfonic acid ($C_9H_6NIO_4S$), its sodium salt, and sodium bicarbonate. Contains from 26.5-29.0% iodine.

Properties: Canary yellow powder with very slight odor; effervesces when moistened with water. Has bitter taste but leaves sweetish after-taste. Soluble in water; insoluble in alcohol, ether and chloroform.

Grade: N. F. XI.

Use: Medicine.

chinoidine. See quinoidine.

chinoline. See quinoline.

chinone. See quinone.

"Chip-Cal." ¹⁴⁷ Trademark for low-lime calcium arsenate. Available in granular (48% tricalcium arsenate) and powder (85% tricalcium arsenate) form.
Containers: (granular) 18-, 36-lb bags; (powder) 50-lb bags.

"Chipcote." ¹⁴⁷ Trademark for series of organic mercury seed treatments based on methyl mercury nitrile. Available as "Chipcote 25", a concentrate for use in slurry treaters and "Chipcote 75" for use undiluted in mist type and ready-mix treaters.

Containers: 5-, 30- and 55-gal drums.

Uses: Small grains, flax and cotton.

"Chip-Kil." ¹⁴⁷ Brand name for a general purpose insecticide consisting of toxaphene, DDT and methyl parathion. "Chip-Kil S" contains strobane rather than toxaphene.
Containers: 5-, 30- and 55-gal drums.

chip sulfide. See sodium sulfide.

chitin. A glucosamine polysaccharide. The horny substance which is the principal constituent of the shells of crabs, lobsters, and beetles. It is also found in some fungi and bacteria.

Properties: White, amorphous, semitransparent mass; insoluble in the common solvents, soluble in concentrated hydrochloric, nitric, and sulfuric acids.

Use: Biological research.

chitinase.

Derivation: An enzyme from the puff ball, *Calvatia gigantea*.

Uses: Destroys fungi, such as black mold

(*Aspergillus niger*), by breaking down chitin in cell walls.

chittem bark. See cascara sagrada bark.

chittim bark. See cascara sagrada bark.

chloanthite ($(Ni,Co)As_2$). A natural nickel-cobalt arsenide, with nickel in excess of cobalt. Grades into smaltite (q.v.) and skutterudite, and has similar properties.

chlor-. See, preferably, chloro-.

chloracetic acid. See chloroacetic acid.

chloracetone. See chloroacetone.

chloracetophenone. See chloroacetophenone.

chloracetyl chloride. See chloroacetyl chloride.

chloral (trichloroacetic aldehyde) CCl_3CHO .

Properties: Colorless, mobile, oily liquid; penetrating odor.

Constants: Sp. gr. 1.5121; m. p. $-57.5^\circ C$; b. p. $97.7^\circ C$; vapor pressure 35 mm ($20^\circ C$); index of refraction ($n_{20/D}$) 1.4557; flash point $167^\circ F$; latent heat of vaporization 97.1 Btu/lb.

Soluble in alcohol, ether and chloroform; combines with water forming chloral hydrate.

Derivation: (a) By the chlorination of ethyl alcohol, addition of sulfuric acid, and subsequent distillation; (b) by the chlorination of acetaldehyde.

Method of purification: Rectification.

Grades: Technical.

Containers: 5-, 55-gal iron drums; glass bottles; tankcars.

Danger: Extremely hazardous liquid and vapor. Inhalation may cause delayed fatal lung injury. MCA warning label.

Uses: Organic synthesis, chloral hydrate; manufacture of DDT; and in liniments.

Shipping regulations: None.*

chloralamide. See chloral formamide.

chloral formamide (chloralamide; formamidated chloral) $CCl_3CHOHNHOCH$.

Properties: Colorless, lustrous crystals; odorless; slightly bitter taste. Soluble in water (hydrolyzes at $60^\circ C$), alcohol, ether and glycerol.

Constants: M. p. $114-115^\circ C$, decomposes at higher temperatures.

Derivation: Interaction of formamide and anhydrous chloral.

Containers: Amber-colored bottles.

Use: Medicine.

Shipping regulations: None.*

chloral hydrate ("knockout drops"; trichloroacetic aldehyde, hydrated) $CCl_3CH(OH)_2$.

Properties: Transparent, colorless crystals; aromatic, penetrating, slightly acid odor and slightly bitter, caustic taste; poisonous! Slowly volatilizes when exposed to air. Soluble in water, alcohol, chloroform, and ether; also soluble in olive oil and turpentine oil.

Constants: Sp. gr. 1.901; m. p. $52^\circ C$; b. p. $97.5^\circ C$.

Derivation: By the action of $1/3$ of its volume

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

of water on chloral.

Method of purification: Crystallization.

Grades: Technical; U.S.P. XVI.

• Containers: 20-, 40-lb bottles; jars.

Uses: Medicine; liniments.

Shipping regulations: None.*

chloral hydrate antipyrine (antipyrine chloral hydrate; hypnal) $C_{11}H_{12}N_2OCl_3CH(OH)_2$.

Properties: Colorless crystals; moderately soluble in water; soluble in alcohol; m.p. 67°C.

Derivation: By mixing antipyrine with hydrated chloral and crystallizing.

Use: Medicine.

chloralimide CCl_3CHNH .

Properties: Colorless, long crystalline needles; odorless. Not to be confused with chloral formamide (q.v.). Soluble in alcohol, ether, chloroform and oils; insoluble in water; m.p. 150-155°C.

Derivation: Heating chloral formamide on steam bath.

Use: Medicine.

Shipping regulations: None.*

chlorambucil (4-{para[bis(2-chloroethyl)-amino]phenyl} butyric acid) $(ClC_2H_4)_2NC_6H_4(CH_2)_3COOH$. A nitrogen mustard derivative.

Properties: Flattened needles; melts at 64-66°C. Soluble in ether.

Grade: N.N.D.

Use: Medicine.

chloramine

1. NH_2Cl . A colorless, unstable, pungent liquid; soluble in water, decomposes (slowly in dilute solution) to form nitrogen, hydrochloric acid, and ammonium chloride. Chloramine is an intermediate in the Raschig process for hydrazine (q.v.).
2. Also used as a synonym for chloramine-T.

chloramine-B. $C_6H_5SO_2NClNa$ (sodium benzenesulfonchloramine).

Properties: White powder with faint chlorine odor; soluble in water.

chloramine-T (sodium para-toluenesulfonchloramine) $CH_3C_6H_4SO_2NNaCl \cdot 3H_2O$. See also dichloramine-T.

Properties: White or slightly yellow crystals or crystalline powder. Contains not less than 11.5 nor more than 13% active chlorine. Slight odor of chlorine. Decomposes slowly in air, liberating chlorine. Not to be confused with NH_2Cl , which is also termed chloramine. Toxic if introduced in blood stream. Soluble in water; more soluble in boiling water; insoluble in benzene, chloroform, ether; decomposed by alcohol.

Derivation: By the action of ammonia on toluene-para-sulfonic chloride under pressure. The toluene para-sulfonamide produced is subjected to the action of sodium hypochlorite in the presence of an alkali and the chloramine produced by crystallization.

Purification: Crystallization.

Use: Medicine.

Shipping regulations: None.*

chloramphenicol

$NO_2C_6H_4CH(OH)CH(CH_2OH)NHCOCHCl_2$
D(-)Threo-1-(para-nitrophenyl)-2-dichloroacetamido-1,3-propanediol. An antibiotic derived from *Streptomyces venezuelae* or by organic synthesis. Effective against certain gram-negative organisms and rickettsia. It is now used mainly in treatment of typhoid and other diseases caused by organisms resistant to other antibiotics but controlled by chloramphenicol. It was the first substance of natural origin shown to contain aromatic nitro group.

Properties: Fine, white to grayish-white or yellowish-white, needlelike crystals or elongated plates. Bitter to taste, neutral to litmus, and reasonably stable in neutral or slightly acid solutions. M.p. 149-153°C, alcoholic solution is dextrorotatory while ethyl acetate solution is levorotatory. Very slightly soluble in water, freely soluble in alcohol, propylene glycol, acetone and ethyl acetate.

Derivation: Biological, by aerobic fermentation on wheat gluten medium. The filtrate is extracted with amyl acetate and purified by vacuum evaporation and crystallization. Synthetic, by a multistep batch process starting with para-nitro-bromoacetophenone.

Grade: U.S.P. XVI.

Use: Medicine, feed supplement.

chloramphenicol palmitate

$C_{27}H_{42}Cl_2N_2O_6$. An antibiotic.

Properties: Fine, white, unctuous, crystalline powder; m.p. 86-92°C; faint odor; bland, mild taste. Insoluble in water; very slightly soluble in solvent hexane. Soluble in ether, acetone, chloroform; sparingly soluble in alcohol.

Grade: U.S.P. XVI.

Use: Medicine.

chloranil (tetrachloroquinone; tetrachloro-para-benzoquinone) $C_6Cl_4O_2$.

Properties: Yellow leaflets; m.p. 290°C; soluble in alcohol, ether, and benzene; insoluble in water.

Derivation: From phenol, para-chlorophenol, or para-phenylenediamine by treatment with potassium chlorate and hydrochloric acid.

Grades: Technical.

Containers: Iron drums.

Uses: Agricultural fungicide; dye intermediate; electrodes for pH measurements.

Caution: Avoid contact with skin. MCA warning label.

Shipping regulations: None.*

chloranthrene yellow. See flavanthrene.

chlorapatite. See apatite.

chlorargyrite. See cerargyrite.

[†]**Chlorasol**.²¹⁴ Trademark for a proprietary fumigant composition: 70.3% ethylene dichloride, 29.7% carbon tetrachloride

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

by weight.

Properties: Boiling range (760 mm) 75-78°C; sp. gr. 1.334-1.339 (20/20°C); 11.11 lb/gal (20°C); no flash.

Containers: 1-gal can; 5-, 55-gal drums; tankcars up to 10,000 gal.

Uses: A fumigant for meal, grain and clothes moths; grain weevils; grain, flour, and carpet beetles; the rice weevil; and book lice; as well as their larvae and eggs. Non-flammable under ordinary conditions of use; penetrates stored grain, rolled rugs, upholstered furniture, cartons, sacks, and stacked material.

chloraucic acid. See gold chloride.

"Chlorax." ¹⁴⁷ Trademark for a weed and grass killer composed of sodium chlorate and sodium metaborate. Does not create fire hazard.

Containers: Dry: 4-lb cans; 50-lb bags; liquid: 5- and 55-gal drums.

Uses: To kill deep-rooted perennials and annual weeds and grasses.

"Chlorazol." ²⁰⁶ Brand name of line of direct dyes for cotton, silk, rayon, leather and paper.

chlorazotic acid. See aqua regia.

chlorbenside (para-chlorobenzyl para-chlorophenyl sulfide) $\text{ClC}_6\text{H}_4\text{CH}_2\text{SC}_6\text{H}_4\text{Cl}$. An agricultural toxicant used specifically as a miticide. Accepted as a generic name by Ent. Soc.

Properties: Crystals with almond-like odor (technical grades); m.p. 75-76°C; insoluble in water; soluble in most organic solvents; resistant to acid and alkaline hydrolysis.

Grade: Technical.

Use: Miticide for control of eggs and larvae of red spider mites.

Warning! May be irritating to skin.

chlorbenzene. See chlorobenzene.

chlorbenzol. See chlorobenzene.

chlor- compounds. See chloro- compounds.

chlorcyclizine hydrochloride

$\text{ClC}_6\text{H}_4\text{CH}(\text{C}_6\text{H}_5)\text{C}_4\text{H}_8\text{N}_2\text{CH}_3 \cdot 2\text{HCl}$.

1-(para-Chloro-alpha-phenylbenzyl)-4-methylpiperazine dihydrochloride, an antihistaminic.

Properties: White, odorless, crystalline solid with bitter taste; m.p. 222-227°C; very soluble in water; soluble in chloroform and alcohol; practically insoluble in benzene and ether. Solutions acid to litmus; pH (1 in 100 solution) 4.8-5.5.

Grade: U.S.P. XVI.

Use: Medicine.

chlordan(e) $\text{C}_{10}\text{H}_6\text{Cl}_4$ (1,2,4,5,6,7,8,8-octa-chloro-4,7-methano-3a,4,7,7a-tetrahydroindane). Chlordan has been accepted as a generic name by Ent. Soc.

Typical specification: Colorless, odorless, viscous liquid; sp. gr. 1.57-1.67 (60/60°F); viscosity SSU 100 seconds (38°C); organic chlorine 64-67% by wt, purity 98%; b.p.

175°C (2 mm); refractive index (n_D²⁵)

1.56-1.57; soluble in many organic solvents; insoluble in water; miscible in deodorized kerosene; decomposes in weak alkalis.

Grades: Technical and pure.

Containers: Aluminum, aluminum-clad or in high-bake phenolic enamel-lined metal containers; 20-, 45-lb pails; 5-, 55-gal drums.

Uses: Insecticide; in oil emulsions, dusts and dispersible liquids; effective against aphids, squash bug, mosquito larvae, house fly, roaches.

Caution! Harmful if swallowed; absorbed through skin. MCA warning label.

chlordiazepoxide hydrochloride (7-chloro-2-methylamino-5-phenyl-3H-1,4-benzodiazepine 4-oxide hydrochloride)

$\text{C}_{16}\text{H}_{14}\text{ClN}_3\text{O} \cdot \text{HCl}$.

Properties: Crystals; m.p. 212-218°C; soluble in water; sparingly soluble in alcohol; insoluble in ether and chloroform.

Use: Medicine.

"Chlorea." ¹⁴⁷ Trademark for a non-selective weed and grass killer formulated with sodium chlorate and 3(para-chlorophenyl)-1,1-dimethylurea. Used for control of weeds and grass around buildings, telephone poles, parking areas, etc. Does not create fire hazard.

Containers: 50-lb bags.

chlorendic acid (hexachloroendomethylene-tetrahydrophthalic acid) $\text{C}_6\text{H}_4\text{Cl}_4\text{O}_4$. 1,4,5,6,7,7-Hexachlorobicyclo-(2,2,1)-5-heptene-2,3-dicarboxylic acid.

Properties: Fine, white, free-flowing crystals. M.p. 208-210°C (sealed tube); loses water about 200°C. Forms a crystalline monohydrate. Very soluble in alcohol; slightly soluble in water, benzene, and carbon tetrachloride. Stable chlorine over 54% by weight.

Derivation: Hydrolysis of chlorendic anhydride.

Grades: Technical.

Containers: 50-, 250-lb fiber drums.

Uses: Fire-resistant polyester resins and paints; plasticizers, intermediate for dyes, fungicides, and insecticides.

chlorendic anhydride (hexachloroendomethylenetetrahydrophthalic anhydride)

$\text{C}_6\text{H}_2\text{Cl}_4\text{O}_3$. 1,4,5,6,7,7-Hexachlorobicyclo-(2,2,1)-5-heptene-2,3-dicarboxylic anhydride.

Properties: Fine, white, free-flowing crystals. M.p. 239-240°C; sp. gr. 1.73.

Readily soluble in acetone, benzene, toluene; slightly soluble in water, n-hexane, and carbon tetrachloride.

Derivation: By Diels-Alder reaction of maleic anhydride and hexachloropentadiene.

Grades: Technical.

Containers: 40-, 250-lb steel drums.

Uses: Flame-resistant polyester resins; hardening epoxy resins; chemical intermediate.

"Chloretone." ³³⁰ Trademark for chlorobutanol.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

"Chlorex." ²¹⁴ Trademark for 2,2'-dichloro-ethyl ether (q. v.).

"Chlorextol." ¹¹⁶ Trademark for a synthetic, non-flammable, non-sludging insulating liquid of high dielectric strength; can be used in place of oil if desired.

chlorhydrins. See chlorohydrins.

chlorhydrol. Aluminum chlorohydroxide complex $[Al_2(OH)_5Cl]$; pH 3.9-4.6. Freely soluble in water, solution stable.

chloride of lime. See chlorinated lime.

chloridizing. Heating in the presence of chlorine, as a step in the recovery of certain metals from their oxides or other compounds.

"Chlorimets." ⁴⁷ A series of nickel-base cast alloys.

"Chlorimet" 2 contains 32% molybdenum, 3% iron max, 1% silicon and 0.10% carbon. Resistant to all concentrations of boiling hydrochloric acid, sulfuric acid concentrations between 30 and 93% at 80°C and phosphoric acid at very high temperatures. Shows resistance to other acids, bases and salts except those of a highly oxidizing nature.

"Chlorimet" 3 contains 18% molybdenum, 18% chromium, 3% iron max, 1.0% silicon and 0.07% carbon. Resistant to sulfuric acid concentrations up to 10% at boiling and all concentrations at moderate temperatures, hydrochloric acid and moist chlorine at intermediate temperatures and phosphoric acid at high temperatures. It also shows resistance to acetic, certain nitric acid solutions, hydrofluoric acid, bleach solutions, sodium and ammonium hydroxides and most other acids, bases and salts, particularly under oxidizing conditions.

chlorinated camphene. See toxaphene.

chlorinated isocyanuric acids. See dichloro- or trichloroisocyanuric acid, and potassium or sodium dichloroisocyanurate. Used as dry bleaches.

chlorinated lime (chloride of lime; bleaching powder); approximately $CaCl_2 \cdot 4H_2O$. Properties. White powder; chlorine odor; m. p. (dec), decomposes in water, acids. Derivation: By conducting chlorine into a box-like structure containing slaked lime spread upon perforated shelves. Grades: 35-37% active chlorine; technical. Containers: 10-lb cans; 58-, 100-, 130-, 300-, 325-, 453-, 800-lb steel drums; 415-lb wooden barrels.

Uses: Textile bleaching and numerous bleaching applications; organic synthesis; deodorizer, disinfectant.

Caution: Not combustible but evolves chlorine and at higher temperatures oxygen. With acids or moisture evolves chlorine freely at ordinary temperatures.

Shipping regulations: Dry, containing more than 8.80% available oxygen (39% available chlorine), oxidizing material. Yellow

label.*

See also calcium hypochlorite.

chlorinated naphthalene. See chloronaphthalene.

chlorinated paraffin (chlorococane). Light yellow to light amber liquid produced by chlorinating a paraffin oil. Typical average formula: $C_{24}H_{43.1}Cl_{4.9}$. Used as solvent for dichloramine-T, as a high pressure lubricant, and for fire-proofing textiles.

Paraffin wax which has been chlorinated is also called chlorinated paraffin.

Grades: 40%; 70%.

Containers: Drums.

chlorinated para red. A modification of para red that contains some chlorine. Much lighter than para or toluidine red and has excellent brilliancy but poorer heat resistance.

chlorinated polyether. See "Penton."

chlorinated polyolefins. See chlorinated rubber.

chlorinated polypropylene. A film-forming polymer used in coatings, inks, adhesives and paper coatings.

chlorinated rubbers (chlorinated polyolefins). Natural rubber, or more often, polyolefins, to which fairly large amounts of chlorine are added (up to 65% or more) in order to modify the properties of the elastomer. Some examples are: "Parlon," a chlorinated natural rubber, "Hypalon," a polyethylene, "Parlon P," an isotactic polypropylene, and "Butyl HT," a butyl rubber copolymer.

chlorinated soda. See Javelle water.

chlorinated tar camphor. See chloronaphthalenes.

chlorinated trisodium phosphate. See chlorinated TSP.

chlorinated TSP (chlorinated trisodium phosphate) $4(Na_3PO_4 \cdot 11H_2O) \cdot NaOCl$. Active ingredients 3.25% min sodium hypochlorite and 91.75% min trisodium phosphate dodecahydrate. Inert ingredient less than 5% NaCl.

Properties: White crystalline water-soluble material stable under normal storage conditions. In solution has the properties of both trisodium phosphate and sodium hypochlorite.

Derivation: By reacting sodium phosphate, caustic soda and sodium hypochlorite.

Containers: Bags; drums; and bulk.

Uses: Cleaner and bactericide in dairies, food plants; dish washing compounds and scouring powders.

chlorine Cl. Element of atomic number 17; group VII of the periodic table.

Properties: Heavy, greenish-yellow gas, two and one-half times as heavy as air; or, clear amber liquid, one and one-half times as heavy as water; pungent, irritating odor. Caution! Poison! Soluble in water and alkalis.

Constants:

Gas: Liquefaction point 6 to 8 atm

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

(ordinary temperatures) or -34.1°C (760 mm); critical temperature 144°C ; specific heat $0.115 \text{ cal/g/}^{\circ}\text{C}$ (15°C). Liquid: Sp. gr. 1.4685 (0°C); b.p. -34.5°C , m.p. -101°C ; vapor tension 6.62 atm (20°C); coefficient of expansion 0.00212 (20°C); latent heat of vaporization 68.8 cal/g (-34.1°C); liquid-gas ratio: 1 liter of liquid = 456.8 liters of gas (0°C and 760 mm); specific heat $0.226 \text{ cal/g/}^{\circ}\text{C}$ ($0-24^{\circ}\text{C}$); heat of fusion 22.9 cal/g (-102°C); specific volume 5.4 cu ft/lb (70°F).

Derivation: Principally, by the electrolysis of sodium chloride brine in diaphragm cells or mercury cathode cells (q.v.). Chlorine is released at the positive electrode. Economically there is interest in the production of chlorine without the attendant sodium hydroxide. This is attained by the electrolysis of fused chlorides (sodium, potassium, lithium, or magnesium) and by the several chemical processes, the more important of which are: (a) the reaction of sodium chloride and nitric acid, (b) the oxidation of hydrogen chloride with air by means of ferric oxide-potassium chloride catalyst, and (c) the electrolysis of cupric chloride solution. In the latter process, the cupric chloride is regenerated with air and hydrochloric acid so that the over-all result is the oxidation of hydrochloric acid.

Grades: Technical (both gas and liquid), pure (99.5% min).

Containers: 100-, 150-lb steel cylinders, single unit tank cars of 30,000 lbs; multi-unit tank cars of 15 one-ton units (for liquid).

Uses (in approximate order of volume):

Manufacture of chemicals which do not contain chlorine (ethylene glycol, tetraethyl lead, ethylene oxide); manufacture of chlorine-containing chemicals, broken down further as: (a) solvents (trichloroethylene, perchloroethylene, methylene chloride), (b) pesticides and herbicides (DDT, benzene hexachloride, toxaphene), (c) plastics and fibers (vinyl chloride, vinylidene chloride, "Kel-F"), (d) refrigerants and propellants ("Freons," "Gectrons," methyl chloride), pulp and paper; water and sewage treatment, textile bleaching; degassing of aluminum melts.

Danger: Hazardous liquid and gas under pressure; avoid breathing air containing gas; avoid contact with skin or eyes. MCA warning label.

Shipping regulations: Nonflammable gas. Green label.*

chlorine 36. Radioactive chlorine of mass number 36. Half-life about 440,000 years; radiation, beta; radiotoxicity, moderately hazardous.

Derivation: Separated from various isotopes produced during the pile irradiation of potassium chloride.

Forms available: As hydrochloric acid solution and as solid potassium chloride.

Uses: As a tracer in studying the salt water corrosion of metals, especially steel; the

reaction mechanisms of chlorinated hydrocarbons; the location and flow of salt waters in porous media; etc.

Shipping regulations: Class D poison, radioactive material. Blue label.*

chlorine-bromide. See bromine-chloride.

chlorine dioxide ClO_2 .

Properties: Dangerous! Explosive. Red-yellow gas; b.p. 10°C ; very reactive, unstable. Soluble and decomposed in water. Dissolves in alkalis forming a mixture of chlorite and chlorate.

Derivation: Usually made at point of consumption from sodium chlorate, sulfuric acid and methanol, or from sodium chlorate and sulfur dioxide. Concentration of gas is limited to 10% to reduce explosion hazard.

Grades: Sold as hydrate, in frozen form.

Uses: Bleaching wood pulp, fats, oils and flour, bleaching and removing tastes and odors from water supplies and in swimming pools; odor control; maturing flour.

Shipping regulations (frozen hydrate): Oxidizing material. Yellow label. Not accepted for express.*

chlorine trifluoride ClF_3 .

Properties: Nearly colorless gas or pale green liquid. B.p. 11.3°C ; f.p. -83°C . Extremely reactive, comparable to fluorine. Reactions with organic compounds and with water take place with explosive violence.

Derivation: By reaction of chlorine and fluorine at 280°C and condensation of the product at -80°C . Obtained 99.0% pure.

Containers: Steel cylinders.

Uses: Incendiary; fluorinations; cutting oil well tubes; oxidizer in propellants.

Shipping regulations: Corrosive liquid. White label.*

chlorine water. A clear yellowish liquid, deteriorates on exposure to air and light. Made by saturating water with approximately 0.4% chlorine.

Use: Deodorizer, disinfectant, and also used medicinally.

chloriodized oil. Chlorinated and iodized vegetable oil. Contains 26.0-28.0% iodine in organic combination.

Properties: Pale yellow, viscous, oily liquid with faint, bland taste. Practically insoluble in water, slightly soluble in alcohol, freely soluble in benzene, chloroform and ether.

Derivation: Formed by chemical addition of iodine monochloride to oil.

Grade: U.S.P. XVI.

Use: Medicine.

chlorisondamine chloride $\text{C}_{14}\text{H}_{20}\text{Cl}_4\text{N}_2$.

4, 5, 6, 7-Tetrachloro-2-(2-dimethylaminoethyl) isondoline dimethylchloride. A quaternary ammonium compound.

Properties: Crystals; decompose $258-265^{\circ}\text{C}$. Soluble in water and alcohol.

Grade: N.N.D.

Use: Medicine.

"Chlor Kil." ⁵⁵ Brand name for chlordane-based insecticides.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

chlormerodrin ([3-chloromercuri]-2-methoxy-propyl]urea)
 $\text{ClHgCH}_2\text{CH}(\text{OCH}_3)\text{CH}_2\text{NHCONH}_2$.

Properties: White, odorless powder with bitter metallic taste. Very soluble in sodium hydroxide; very slightly soluble in chloroform; slightly soluble in alcohol, methanol, and water. Stable to light and air; pH (0.5% solution) 4, 3-5.0.

Grade: N. N. D.

Use: Medicine.

chlormethazanone $\text{C}_{11}\text{H}_{12}\text{ClNO}_3\text{S}$. 2-(4-Chlorophenyl)-3-methyl-4-meta-thiazanone-1-dioxide.

Properties: Crystals; m.p. 117°C , insoluble in water; slightly soluble in alcohol.

Use: Medicine.

chloroacetaldehyde ClCH_2CHO .

Properties (of 40% aqueous solution): Clear, colorless liquid with pungent odor. Boiling range $90-100^\circ\text{C}$, f.p. -16.3°C , sp. gr. 1.19 (25/25°C), refractive index 1.397 (25°C), wt./gal 9.9 lb (25°C). Soluble in water, acetone, methanol. At concentrations in water above 50% it forms an insoluble hemihydrate.

Uses: Chemical intermediate, fungicide, debarking logs or trees.

chloroacetaldehyde dimethyl acetal. See dimethyl chloroacetal.

chloroacetic acid (chloroacetic acid; monochloroacetic acid) CH_2ClCOOH .

Properties: Colorless to light-brownish crystals, very deliquescent and caustic to the skin.

Constants: Sp. gr. 1.370 (70°C), crystallizing point, alpha form, $61.0-61.7^\circ\text{C}$, beta form, 55.5 to 56.5°C ; gamma form, 50°C . The commercial material melts at 61 to 63°C , boiling range 186 to 191°C . Soluble in water, alcohol and ether.

Derivation: By the action of chlorine on acetic acid in the presence of acetic anhydride, phosphorus, or sulfur.

Grades: Technical, medicinal; reagent. Containers: Drums.

Uses: Herbicide, production of carboxymethylcellulose, ethyl chloroacetate, glycine, synthetic caffeine, sarcosine, vitamins, EDTA, 2,4-D.

Shipping regulations: Corrosive liquid. White label. (Legal label name monochloroacetic acid.)*

chloroacetic anhydride (chloroethanoic anhydride) $(\text{ClCH}_2\text{CO})_2\text{O}$.

Properties: Colorless to slightly yellow crystals with pungent odor; m.p. $51-55^\circ\text{C}$, soluble in chloroform and ether; hydrolyzes with water to chloroacetic acid.

Use: Intermediate.

ortho-chloroacetoacetanilide

$\text{CH}_3\text{COCH}_2\text{CONHC}_6\text{H}_4\text{Cl}$.

Properties: White, crystalline solid. Resembles ethyl acetoacetate in chemical reactivity.

Constants: M.p. 107°C , vapor pressure 0.1 mm (20°C); flash point, none. Insoluble

in water.

Typical specifications: Density 35 lbs/cu ft; m.p. 103 to 106°C .

Grades: Technical.

Containers: Fiber cartons. Net content 4, 20, 175 lbs.

Uses: Organic synthesis, dyestuffs.

chloroacetone (monochloroacetone; 1-chloro-2-propanone; chloracetone; chlorinated acetone) $\text{CH}_3\text{COCH}_2\text{Cl}$.

Properties: Colorless liquid; pungent irritating odor. Sp. gr. 1.162; b.p. 119°C ; m.p. -44.5°C . Soluble in alcohol, ether and chloroform and water.

Derivation: By the chlorination of acetone. Method of purification: Rectification.

Grades: Technical.

Containers: Iron drums.

Toxicity: Strong irritant.

Uses: Couplers for color photography; enzyme inactivator; insecticides; perfumes; antioxidant intermediate; medicine; organic synthesis.

Shipping regulations: Stabilized: poison, Class C, tear gas label, unstabilized: not accepted.*

chloroacetonitrile (chloroethane nitrile)

ClCH_2CN .

Properties: Sp. gr. 1.2020-1.2035 (25/25°C), refractive index 1.4210-1.4240 (n 25/D), soluble in hydrocarbons, alcohols, insoluble in water.

Uses: Fumigant, intermediate.

chloroacetophenone (chloroacetophenone, phenacylchloride; phenylchloromethylketone) $\text{C}_6\text{H}_5\text{COCH}_2\text{Cl}$. Two forms exist, designated as omega and para.

Properties: White crystals, m.p. (omega) 59°C , (para) 20°C , b.p. (omega) 245°C , (para) 236°C , soluble in alcohol and ether, insoluble in water.

Derivation: Action of chloroacetylchloride on benzene in presence of aluminum chloride.

Method of purification: Distillation and recrystallization.

Grades: C.P., technical.

Containers: Glass bottles.

Use: War gas (lachrymator).

Shipping regulations: Class C poison, tear gas label. Legal label name: chloroacetophenone.*

chloroacetyl chloride (chloroacetyl chloride)

CH_2ClCOCl .

Properties: Water-white liquid, pungent odor.

Constants: Sp. gr. 1.495 (0°C); b.p. 105 to 110°C , decomposes in water.

Derivation: (a) By the action of chlorine on acetyl chloride in sunlight. (b) By dropping phosphorus trichloride on chloroacetic acid.

Method of purification: Distillation.

Containers: Glass bottles, carboys.

Uses: Preparation of chloroacetophenone (tear gas), chemical intermediate.

Shipping regulations: Corrosive liquid; white label.*

chloroacetylurethane $\text{ClCH}_2\text{CONHCOOC}_2\text{H}_5$.

Properties: Crystals; soluble in alcohol;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

sparingly soluble in water. M.p. 129°C.
Derivation: By interaction of sodium urethane and ethyl chloroacetate.

chloroacrolein $\text{H}_2\text{C}:\text{CClCHO}$.

Properties: Colorless liquid. Caution!
Very irritant!

Constants: Sp.gr. 1.205 at 15°C; b.p. 29 to 31°C (17 mm Hg).

Derivation: Chlorination of acrolein.

chloroamino- See aminochloro-.

para-chloro-ortho-aminophenol. See 2-amino-4-chlorophenol.

2-chloro-4-tert-amylphenol

$\text{C}_9\text{H}_{11}\text{Cl}$

Properties: Sp.gr. 1.11 (20°C); boiling range 253-265°C, color, water-white, odor aromatic. Flash point 225°F.

meta-chloroaniline (meta-aminochlorobenzene) $\text{ClC}_6\text{H}_4\text{NH}_2$.

Properties: Colorless to light amber liquid; tends to darken during storage. Boiling range 228-231°C; f.p. -10.6°C.

Grades: Technical.

Containers: 525-lb drums, tankcars.

Uses: Intermediate for azo dyes and pigments; pharmaceuticals; insecticides; agricultural chemicals.

Caution! Toxic! Avoid breathing vapors or contact with skin.

Shipping regulations: Poison, class B.
Poison label.*

ortho-chloroaniline (ortho-aminochlorobenzene) $\text{ClC}_6\text{H}_4\text{NH}_2$.

Properties: Amber liquid; amine odor; darkens on exposure to air. Distillation range 208-210°C; f.p. -2.3°C; sp.gr. 1.213 (20/4°C), refractive index 1.5896 (n_D 20/D). Miscible with alcohol and ether, insoluble in water.

Grades: Technical.

Containers: 550-lb drums; tankcars.

Use: Dye intermediate; standards for colorimetric apparatus, manufacture of petroleum solvents and fungicides.

Caution! Toxic! Avoid breathing vapor or contact with skin.

Shipping regulations: Poison, class B.
Poison label.*

para-chloroaniline (para-aminochlorobenzene) $\text{ClC}_6\text{H}_4\text{NH}_2$.

Properties: White or pale yellow solid.
M.p. 69.5°C; distilling range 229-233°C.

Grades: Technical.

Containers: 500-lb drums.

Use: Dye intermediate; pharmaceuticals; agricultural chemicals.

Caution! Toxic! Avoid breathing vapor or contact with skin.

Shipping regulations: Poison, class B.
Poison label.*

4-chloroaniline-3-sulfonic acid

$\text{HSO}_3\text{C}_6\text{H}_3\text{ClNH}_2$.

Properties: White to light-grey powder.

Containers: Fiber kegs; polythene-lined steel drums.

Use: Intermediate.

2-chloroanthraquinone $\text{C}_{14}\text{H}_7\text{ClO}_2$.

Properties: Resemble in general those of anthraquinone and 2-methylanthraquinone.

M.p. 208-211°C. Insoluble in water; soluble in hot benzene.

Derivation: Prepared by condensing phthalic anhydride and chlorobenzene in the presence of anhydrous aluminum chloride to form para-chlorobenzoylbenzoic acid. Ring closure of the intermediate acid is brought about by heating in sulfuric acid solution.

Containers: Similar to those used for anthraquinone and 2-methylanthraquinone.

Use: Starting material for certain vat dyes.

Shipping regulations: None.*

chloroazodin $\text{H}_2\text{NC}(\text{NCl})\text{NNC}(\text{NCl})\text{NH}_2$.

alpha, alpha'-Azobis(chloroformamidine).

Properties: Bright yellow needles or flakes; faint odor of chlorine; slightly burning taste; sparingly soluble in alcohol; very slightly soluble in water; slightly soluble in glycerol and in glyceryl triacetate; very slightly soluble in chloroform. Solutions in glycerol and alcohol decompose rapidly on warming; all solutions decompose on exposure to light. Decomposes explosively at about 155°C; decomposition accelerated by contact with metals.

Use: Medicine.

chloroazotic acid. See aqua regia.

chlorobenzal. See benzyl dichloride.

ortho-chlorobenzaldehyde $\text{C}_6\text{H}_4\text{CHOCl}$.

Properties: Colorless to yellowish liquid; boiling range (typical) first drop 209°C, 50% 210.8°C, dry 215°C; f.p. 8.0°C (min); sp.gr. 1.240-1.245 (25/15°C). Soluble in alcohol, ether and acetone. Insoluble in water.

Containers: Glass carboys; 500-lb drums.

Uses: An intermediate in the preparation of triphenyl methane and related dyes, and for the synthesis of many organic chemicals such as pharmaceuticals and medicinals.

para-chlorobenzaldehyde $\text{C}_6\text{H}_4\text{CHOCl}$.

Properties: Colorless to yellowish powder; boiling range (typical) first drop 210°C, 50% 214°C; dry 220°C; f.p. 43°C (min). Soluble in alcohol, ether, and acetone; slightly soluble in toluene, insoluble in water and heptane.

Containers: 500-lb fiber drums.

Uses: An intermediate in the preparation of triphenyl methane and related dyes, and for the synthesis of organic chemicals such as pharmaceuticals and medicinals.

3-chloro-4-benzamido-6-methylaniline

$\text{ClC}_6\text{H}_2\text{NH}_2\text{CH}_3(\text{NHCOC}_6\text{H}_5)$.

Properties: White solid; m.p. 198-199°C.

Uses: Azotic dyes; pigments.

chlorobenzanthrone $\text{C}_{17}\text{H}_9\text{ClO}$.

Properties: All isomers. Yellow needles.

Soluble in alcohol, benzene, toluene, acetic acid, etc.

Derivation: (a) From benzanthrone in acetic acid solution by treatment with chlorine.

(b) From benzanthrone in water suspension

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

by treatment with chlorine.

Method of purification: Crystallization from acetic acid.

chlorobenzene (chlorobenzol; chlorbenzene, chlorbenzol, phenyl chloride) C_6H_5Cl .

Properties: Clear, colorless, mobile, volatile, flammable liquid. Almond-like odor. Said to be mildly narcotic and is reputed to be less toxic than benzene. Sp. gr. 1.105 (25/25°C), b. p. 131.6°C, f. p. -45°C; wt/gal 9.19 lbs (25°C), refractive index 1.5216 (25°C), flash point 29°C; fire point 36°C, heat of vaporization 77.6 cal/g (b. p.), specific heat 0.30 cal/g/°C, dielectric constant 5.53 (1000 cycle), specific resistivity 7.8×10^9 ohms/cm. Miscible with most organic solvents, insoluble in water.

Typical specification: Boiling range within 1°C of b. p. 131.6°C (760 mm).

Derivation: (a) By passing dry chlorine into benzene to which a small aluminum-mercury couple is added as a carrier. (b) By passing chlorine into benzene in the presence of molybdenum chloride.

Grades: Technical.

Containers: 5-, 10-, 55-gal drums, tank cars.

Uses: Solvent for ethylcellulose, resins, paints, varnishes, lacquers, solvent mixtures; synthesis of phenol, DDT, aniline, picric acid, chloro- and nitrochlorobenzenes, intermediates, sulfur dyestuffs, military poison gases, drugs, perfumes, heat transfer medium, solvent in production of rubber, resins, drugs, perfumes and paints, carrier in dyeing synthetic fibers.

Warning! Vapor harmful. Keep away from heat and open flame. MCA warning label.

Shipping regulations: None.*

para-chlorobenzenesulfonamide

$C_6H_4SO_2NH_2$.

Properties: White, odorless powder, m. p. 145-148°C, soluble in alcohol.

Grade: 98-99% purity.

Use: Intermediate for pharmaceuticals and resins.

para-chlorobenzenesulfonic acid-para-chlorophenyl ester. See para-chlorophenyl para-chlorobenzene sulfonate.

1-(para-chlorobenzenesulfonyl)-3-propylurea. See chlorpropamide.

para-chlorobenzenethiol. See para-chlorothiophenol.

para-chlorobenzhydrol (para-chlorobenzohydrol) $ClC_6H_4C(C_6H_5)HOH$.

Properties: White to off-white, crystalline powder, m. p. 57-61°C, insoluble in water, soluble in ether, alcohol, and benzene.

Grade: 95% pure.

Containers: Steel drums.

Use: Organic synthesis.

para-chlorobenzhydryl chloride

$ClC_6H_4C(C_6H_5)HCl$.

Properties: A water-white to light straw colored liquid, refractive index 1.600

(20°C); b. p. 145°C (3 mm).

para-chlorobenzohydrol. See para-chlorobenzhydrol.

ortho-chlorobenzoic acid ClC_6H_4COOH .

Properties: Nearly white, coarse powder.

Soluble in alcohol and ether; insoluble in water and toluene. M. p. 137°C.

Grades: Assay 97-98.5% (dry basis).

Containers: Wooden barrels (100 lbs); fiber drums.

Uses: Intermediate for the preparation of dyes, fungicides, pharmaceuticals and other organic chemicals.

para-chlorobenzoic acid ClC_6H_4COOH .

Properties: Nearly white coarse powder; m. p. 238°C, soluble in methanol, absolute alcohol, and ether, insoluble in water, 95% alcohol, and toluene.

Grade: Assay 97-98.5% (dry basis).

Containers: 100-lb wooden barrels, fiber drums.

Uses: Intermediate for the preparation of dyes, fungicides, pharmaceuticals and other organic chemicals.

chlorobenzol. See chlorobenzene.

para-chlorobenzophenone $ClC_6H_4COC_6H_5$.

Properties: White to off-white crystalline powder, m. p. 73-78°C, b. p. 332°C, soluble in acetone, benzene, carbon tetrachloride; ether and hot alcohol. Insoluble in water.

Grades: 93% pure.

Containers: Fiber drums.

Use: Intermediate.

ortho-chlorobenzotrichloride $ClC_6H_4CCl_3$.

Properties: Colorless liquid or solid. M. p. 29.37°C, b. p. 264.3°C, sp. gr. 1.5131 (25/4°C), refractive index (n_D 20/D) 1.5836. Soluble in alcohol, ether, and acetone, decomposes in water.

Containers: 125-lb glass carboys.

Uses: As an intermediate in the manufacture of pharmaceuticals, dyes, and other organic chemicals.

para-chlorobenzotrichloride $ClC_6H_4CCl_3$.

Properties: Water-white liquid, boiling range (typical) first drop 248°C, 50% 252°C, dry 257°C, f. p. (approx.) 3.8°C; sp. gr. 1.480-1.490 (25/25°C). Soluble in alcohol, ether, and acetone. Insoluble in water.

Containers: Glass carboys.

Uses: As an intermediate in the manufacture of pharmaceuticals, dyes, and other organic chemicals.

meta-chlorobenzotrifluoride $ClC_6H_4CF_3$.

Properties: Water-white aromatic liquid, b. p. 138°C (760 mm), freezing point -56°C, refractive index 1.446 (n_D 20/D), flash point 50°C (closed cup), sp. gr. 1.351 (15.5/15.5°C).

Containers: 55-gal steel drums.

Uses: Intermediate in dyes and pharmaceuticals, dielectrics, insecticides.

ortho-chlorobenzotrifluoride (ortho-chlorotrifluoromethylbenzene; ortho-chloro-

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

alpha, alpha, alpha-trifluorotoluene)
 $\text{ClC}_6\text{H}_4\text{CF}_3$.

Properties: Colorless liquid with aromatic odor, sp. gr. 1.379 (15.5/15.5°C); refractive index 1.456 (20°C); b. p. 152°C; f. p. -7.4°C; flash point (closed cup) 59°C; wt/gal 11.50 lb (15.5°C); vapor pressure 150 mm (100°C), 710 mm (150°C), viscosity 0.44 cps (210°F), 0.89 cps (100°F).
 Containers: 55-gal steel drums.
 Uses: Dye intermediate, chemical intermediate, solvent and dielectric fluid.

para-chlorobenzotrifluoride (para-chloro-trifluoromethylbenzene; para-chloro-alpha, alpha, alpha-trifluorotoluene)
 $\text{ClC}_6\text{H}_4\text{CF}_3$.

Typical specifications: Water-white liquid; aromatic odor, b. p. 139.3°C; f. p. -36°C; refractive index (n_{20/D}) 1.446, flash point (closed cup) 47°C, sp. gr. (15.5/15.5°C) 1.353; wt/gal 11.28 lbs (15.5°C); vapor pressure 29 mm (50°C), 220 mm (100°C), viscosity

°F	Centipoise	Centistoke
100	0.675	0.511
210	0.392	0.319

Containers: 55-gal steel drums.
 Uses: Same as ortho-chlorobenzotrifluoride.

5-chloro-2-benzoxazolinone. See chlorzoxazone.

ortho-chlorobenzoyl chloride $\text{ClC}_6\text{H}_4\text{COCl}$.
 Properties: Colorless liquid, boiling range (typical) first drop 227°C, 50% 232°C, dry 239°C, f. p. -4 to -6°C, sp. gr. 1.374 to 1.376 (25/15°C). Soluble in alcohol, ether, and acetone. Insoluble in water.
 Grades: Technical.
 Containers: Glass carboys.
 Use: An intermediate in the manufacture of pharmaceuticals, dyes, and other organic chemicals.

para-chlorobenzoyl chloride $\text{ClC}_6\text{H}_4\text{COCl}$.
 Properties: Colorless liquid, boiling range (typical) first drop 225°C, 50% 227°C, dry 233°C, f. p. 10-12°C; sp. gr. 1.364-1.367 (25/15°C). Soluble in alcohol, ether, and acetone. Insoluble in water.
 Containers: Glass carboys.
 Use: An intermediate in the manufacture of pharmaceuticals, dyes, and other organic chemicals.

para-chlorobenzoyl peroxide.
 Shipping regulations: Oxidizing material.
 Yellow label.*

ortho-chlorobenzyl chloride $\text{ClC}_6\text{H}_4\text{CH}_2\text{Cl}$.
 Properties: Colorless liquid, boiling range (typical) first drop 216°C, 50% 217.5°C, dry 222°C, f. p. below -30°C, sp. gr. 1.270-1.280 (25/15°C). Soluble in alcohol, ether, and acetone; insoluble in water.
 Containers: Glass carboys.
 Use: An intermediate for the preparation of organic chemicals, pharmaceuticals and dyes.

para-chlorobenzyl chloride $\text{ClC}_6\text{H}_4\text{CH}_2\text{Cl}$.
 Properties: Colorless liquid or solid; f. p. 25-27°C; boiling range 218-230°C, sp. gr. 1.250-1.260; soluble in most organic solvents, insoluble in water.
 Derivation: Chlorination of benzyl chloride, using iodine as the catalyst.
 Containers: Glass carboys.
 Grades: Technical.
 Use: Intermediate for organic chemicals, pharmaceuticals and dyes.

para-chlorobenzyl para-chlorophenyl sulfide.
 See chlorbenside.

2-(para-chlorobenzyl)pyridine
 (2-(4-chlorobenzyl)pyridine)
 $\text{ClC}_6\text{H}_4\text{CH}_2\text{C}_5\text{H}_4\text{N}$.
 Properties: Liquid; b. p. 310.5°C (760 mm); freezing point 8.4°C; sp. gr. 1.168 (25°C); refractive index 1.5865 (n_{20/D}); insoluble in water.
 Use: Organic synthesis.

chlorobromo-. See bromochloro-.

2-chlorobutadiene-1,3. See chloroprene.

1-chlorobutane. See n-butyl chloride.

chlorobutanol (trichloro-tert-butyl alcohol, 1,1,1-trichloro-2-methyl-2-propanol; acetone chloroform) $\text{Cl}_3\text{CC}(\text{CH}_3)_2\text{OH}$.
 Properties: Colorless to white crystals with characteristic odor and taste. Soluble in alcohol and glycerol; slightly soluble in water; readily soluble in ether, chloroform, and volatile oils. M. p. (anhydrous form) 97°C; m. p. (hemihydrate) 78°C; b. p. 167°C; sublimes easily.
 Derivation: By action of potassium hydroxide on a solution of chloroform and acetone.
 Grade: U.S.P. XVI.
 Uses: Medicine; plasticizer for cellulose esters and ethers; preservative.

chlorocarbon. A compound of carbon and chlorine, or of carbon, hydrogen, and chlorine, such as carbon tetrachloride, chloroform, tetrachloroethylene, etc.

chlorochromic anhydride. See chromyl chloride.

chlorocosane. See chlorinated paraffin.

3-chlorocoumarin.
 Properties: Slightly yellow crystalline solid.
 Freezing point, 118°C.
 Grades: Technical.
 Use: Tin plating solutions.

para-chloro-meta-cresol. Probably 4-chloro-3-methylphenol (OH group = 1), but also used by some authorities to refer to the 6-chloro-3-methylphenol. This is a prime example of poor nomenclature, since the exact compound referred to depends on whether the chlorine is considered to be para to the methyl or to the hydroxy group.

4-chloro-meta-cresol. See 4-chloro-3-methylphenol.

5-chloro-2-cyanoacetophenone.
 Constants: M. p. 276-277°C.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: From a cyclic halogen compound by heating with copper cyanide in the presence of amines.

chlorodifluoroacetic acid $\text{CClF}_2\cdot\text{COOH}$.

Properties: Colorless liquid; b.p. 122°C , f.p. 23°C . Completely soluble in water, miscible with most organic solvents. Very strong acid.

Uses: Catalyst, particularly for esterification and condensation reactions.

1,1,1-chlorodifluoroethane (1,1,1-difluorochloroethane) CH_3CClF_2 .

Properties: Colorless, nearly odorless gas. B.p. -9.2°C , m.p. -130.8°C ; sp. gr. 1.194 (-9°C). Insoluble in water.

Grades: Technical.

Containers: Cylinders.

Uses: Refrigerant, solvent.

Shipping regulations: Flammable gas. Red gas label.*

chlorodifluoromethane (difluorochloromethane, fluorocarbon 22) CHClF_2 .

Properties: Colorless, nearly odorless gas. B.p. -40.8°C , freezing point -160°C , critical pressure 48.7 atm.

Grades: Technical.

Containers: Drums; cylinders.

Uses: Aerosol propellant, refrigerant, air conditioning, to make tetrafluoroethylene.

Shipping regulations: Nonflammable gas. Green label.*

2-chloro-1,4-dihydroxybenzene. See chlorohydroquinone.

2-chloro-10-(3-dimethylaminopropyl) phenothiazine. See chlorpromazine.

1-chloro-2,4-dinitrobenzene (dinitrochlorobenzene; dinitrochlorobenzol) $\text{C}_6\text{H}_3(\text{NO}_2)_2\text{Cl}$.

Properties: Pale yellow needles, soluble in alcohol, insoluble in water, sp. gr. 1.69; m.p. $27-53^\circ\text{C}$, b.p. 315°C .

Derivation: By the chlorination of dinitrobenzene.

Grades: Technical, fused.

Containers: Drums, tankcars.

Uses: Dyes, organic synthesis.

Shipping regulations: Poison, class B. Poison label. Legal label name is dinitrochlorobenzol.*

4-chlorodiphenyl sulfone. See para-chlorophenyl phenyl sulfone.

chloroethane. See ethyl chloride.

chloroethane nitrile. See chloroacetonitrile.

chloroethanoic anhydride. See chloroacetic anhydride.

chloroethene. See vinyl chloride.

beta-chloroethyl acetate $\text{CH}_2\text{ClCH}_2\text{OOCCH}_3$.

Properties: Colorless liquid, sp. gr. 1.152 ($25/25^\circ\text{C}$), b.p. 145°C ; freezing point -26°C . Soluble in alcohol, ether; slightly soluble in water.

Derivation: By subjecting vinyl acetate to the action of hydrogen chloride gas.

2-chloroethyl alcohol. See ethylene chlorohydrin.

beta-chloroethylchloroformate

Properties: Colorless liquid. Decomposed by alkaline solutions and hot water. Insoluble in cold water. Caution! Very irritant!

Constants: Sp. gr. 1.3825 (20°C); b.p. 152.5°C (752 mm).

Derivation: By bubbling gaseous phosgene into ethylene chlorohydrin at 0°C .

beta-chloroethyl chlorosulfonate

Properties: Chloropicrin-like odor. Caution! Very irritant! Darkens on long storage and decomposes with evolution of hydrogen chloride. B.p. 101°C (23 mm).

Derivation: Interaction of sulfonyl chloride and glycol chlorohydrin. Also from action of sulfur trioxide on ethylene chloride below 45°C .

Grades: Technical.

chloroethylene. See vinyl chloride.

chloroform (trichloromethane) CHCl_3 .

Properties: Clear, colorless, highly refractive, heavy, volatile liquid; characteristic odor, nonflammable; burning sweet taste. Keep from light. Miscible with alcohol, ether, benzene, solvent naphtha, fixed and volatile oils, slightly soluble in water.

Constants: Sp. gr. 1.485 ($20/20^\circ\text{C}$), b.p. 61.2°C , freezing point -63.5°C , wt/gal 12.29 lbs (25°C), refractive index 1.4422 (25°C), flash point none.

Derivation: (a) By the reaction of chlorinated lime with acetone, acetaldehyde, or ethyl alcohol; (b) byproduct from the chlorination of methane.

Method of purification. Extraction with concentrated sulfuric acid and rectification.

Grades: Technical, C.P.; U.S.P. XVI. Containers: Bottles; tins, drums; 8000- and 10,000-gal tank cars.

Uses (in approximate order of volume):

Extraction and purification of penicillin and other antibiotics, intermediate for refrigerants and propellants and resins, dyes and drugs, anesthetic, general solvent, fumigant, insecticides.

Warning! Vapor harmful. Avoid prolonged or repeated breathing of vapor. MCA warning label.

Shipping regulations: None.*

chloroformoxime ClHCNOH .

Properties: Needles. Odor resembles that of hydrocyanic acid. Stable at 0°C , unstable at normal temperature. Small quantities volatilize. Large quantities decompose. Aqueous solutions slowly decompose. Soluble in water, alcohol, ether, benzene; slightly soluble in carbon disulfide.

Derivation: Interaction of hydrochloric acid and sodium fulminate (sodium isocyanate).

Use: Organic synthesis.

chloroformyl chloride. See phosgene.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

chloroguanide hydrochloride $C_{11}H_{16}ClN_5 \cdot HCl$.
1-(para-Chlorophenyl)-5-isopropylbiguanide hydrochloride.

Properties: Crystals with bitter taste. M. p. 248-252°C. Soluble in alcohol; slightly soluble in water; insoluble in chloroform and ether; pH of saturated aqueous solution 5.8-6.3.

Use: Medicine.

chlorohydric acid. See hydrochloric acid.

chlorohydrin (alpha-chlorohydrin; 3-chloropropane-1,2-diol; glyceryl alpha-chlorohydrin) $CH_2OHCHOHCH_2Cl$.

Properties: Colorless liquid. Unstable; hygroscopic. The commercial grade is a mixture of the two isomers, alpha and beta, of which alpha is in a greater proportion.

Constants: Sp. gr. 1.326 (18°C); b. p. 213°C; boiling range 213-228°C (decomposes); wt/gal 11.012 lbs; freezing point -40°C, viscosity 2.388 poise (20°C). Miscible with some organic solvents and water; immiscible with oils.

Derivation: By passing hydrochloric acid gas into glycerol containing 2% acetic acid.

Grades: Technical.

Containers: Iron drums.

Uses: Solvent for acetylcellulose, glyceryl phthalate, resins, partial solvent for gums, solvent (60% water) for cellulose acetate; intermediate in organic synthesis, explosive.

chlorohydrins (chlorhydrins). See chlorohydrin, dichlorohydrin; ethylene chlorohydrin, epichlorohydrin; propylene chlorohydrin.

chlorohydroquinone (2-chloro-1,4-dihydroxybenzene; 2,5-dihydroxychlorobenzene [$Cl=1$]) $ClC_6H_3(OH)_2$.

Properties: White to light-tan fine crystals, m. p. 100°C, b. p. 263°C. Very soluble in water and alcohol, slightly soluble in ether.

Grades: Photographic, commercial.

Containers: Bottles; fiber drums.

Uses: Photographic developer; organic intermediate; dyestuffs; bactericide.

Shipping regulations: None.*

chlorohydroxybenzenes. See chlorophenols.

5-chloro-2-hydroxybenzophenone

$C_6H_5COC_6H_4OHCl$.

Properties: Yellow crystals; nearly odorless; m. p. 93-95°C; soluble in alcohol, ethyl acetate, methyl ethyl ketone; insoluble in water.

Use: Light absorber, best at 320-380μ.

4-chloro-1-hydroxy-3,5-dimethylbenzene.

Probably the so-called para-chloro-metaxyleneol (q. v.).

3-chloro-4-beta-hydroxyethylaminophenylmethyl sulfone.

Constants: M. p. 79-80°C.

2-chloro-4-(hydroxymercuri) phenol. See hydroxymercurichlorophenol.

4-chloro-1-hydroxy-3-methylbenzene.

See 4-chloro-3-methylphenol.

6-chloro-3-hydroxytoluene. See 4-chloro-3-methylphenol.

5-chloro-7-iodo-8-quinolinol. See iodochlorohydroxyquinoline.

chloro-IPC (isopropyl-N-(3-chlorophenyl) carbamate; chloroisopropyl-N-phenylcarbamate, C-IPC) $C_6H_4ClNHCOOC_3H_7$.

Properties: Light tan powder; m. p. 41.4°C; vapor pressure (149°C) 2 mm; sp. gr. 1.18 (30°C); very slightly soluble in water.

Containers: 60-, 250-, 450-lb drums; for solution: 55-gal drums; tank cars.

Use: Pre-emergence herbicides; prevents sprouting of potatoes.

Caution! Harmful if swallowed. MCA warning label.

chloroisopropyl alcohol. See propylene chlorohydrin.

6-chloro-4-isopropyl-1-methyl-3-phenol.

See chlorothymol.

chloroisopropyl-N-phenylcarbamate.

See chloro-IPC.

chloromaleic anhydride C_4HClO_3 .

Properties: Yellow liquid, sp. gr. 1.5; m. p. 10-15°C; b. p. 192°C.

Uses: Catalyst for epoxy resins; organic intermediate.

1-[3-(chloromercuri)-2-methoxypropyl] urea

See chlormerodrin.

ortho-chloromercuriphenol. See ortho-hydroxyphenylmercuric chloride.

chloromethane. See methyl chloride.

chloromethapyrilene citrate. See chlorothen citrate.

3-chloro-4-methylaminophenylmethylsulfone.

Constants: M. p. 130°C.

3-chloro-2-methylaniline. See 2-amino-6-chlorotoluene.

3-chloro-4-methylaniline. 4-amino-2-chlorotoluene.

5-chloro-2-methylaniline. See 2-amino-4-chlorotoluene.

2-chloro-1-methylbenzene. See ortho-chlorotoluene.

3-chloro-1-methylbenzene. See meta-chlorotoluene.

4-chloro-1-methylbenzene. See para-chlorotoluene.

chloromethylchloroformate $ClCOOCH_2Cl$.

Properties: Mobile, colorless liquid.

Penetrating, irritating odor. Hydrolyzed by hot and cold water. Decomposed by alkalis. Caution! Very irritant!

Constants: Sp. gr. 1.465 at 15°C; b. p. 106.5-107°C; vapor density 4.5 (air=1); vapor tension 5.6 mm (20°C). Soluble in most organic solvents.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

chloromethylchlorosulfonate $\text{ClCH}_2\text{OCISO}_2$.

Properties: Colorless liquid. Caution!

Very irritant!

Constants: Sp. gr. 1.63; b. p. 49-50°C (14 mm).

Derivation: By longtime boiling of chlorosulfonic acid with chloromethylchloroformate; also from paraformaldehyde and chlorosulfonic acid.

Grades: Technical.

1-chloromethylethylbenzene. See ethylbenzyl chlorides.**alpha-chloromethylnaphthalene** (1-chloromethylnaphthalene) $\text{C}_{10}\text{H}_7\text{CH}_2\text{Cl}$.

Properties: Colorless to greenish-yellow liquid with sharp pungent odor, sp. gr. 1.182 (25/25°C), coagulation point 19.8°C, insoluble in water, soluble in usual organic solvents. Is very reactive.

Use: A lachrymator; intermediate.

4-chloro-3-methylphenol (4-chloro-1-hydroxy-3-methylbenzene; 6-chloro-3-hydroxy-toluene; 4-chloro-meta-cresol, so-called para-chloro-meta-cresol) $\text{C}_6\text{H}_3\text{CH}_3\text{OHCl}$.

Properties: White or slightly pink crystals with phenolic odor; m. p. 64-66°C, volatile with steam, solubility 1:250 in water at 25°C, soluble in alkalis, organic solvents, fats and oils.

Uses: External germicide; preservative for glues, gums, paints, inks, textile and leather goods.

chloromethylphosphonic acid $\text{ClCH}_2\text{PO}(\text{OH})_2$.

Properties: White hygroscopic solid; m. p. 85-95°C.

Uses: Intermediate for flameproofing agents, resins, lubricants, additives, plasticizers.

chloromethylphosphonic dichloride $\text{ClCH}_2\text{POCl}_2$.Properties: Water-white to light straw liquid, highly reactive. Sp. gr. 1.638 (25°C), refractive index 1.4960-1.4970 (n_{25}^D).

Uses: Intermediate for flameproofing agents, resins, lubricants, additives, and plasticizers.

Caution! Highly reactive; vapor irritates eyes and lungs. Do not breathe vapor, dust, or spray mist.

"Chloromycetin." ³³⁰ Trademark for chloramphenicol.

chloronaphthalene (chlorinated tar camphor, chlorinated naphthalene). A group name for the products of the chlorination of naphthalene. According to the degree of chlorination the physical state varies from a thin, mobile liquid to a crystalline, amorphous wax. See following entries.

Caution! Avoid repeated contact with skin and inhalation of fumes or dust. MCA warning label.

chloronaphthalene oils.

Properties: Almost colorless, thin, mobile liquids. They leave no deposit when heated. These oils are: (1) free of moisture and will not absorb moisture, (2) neutral, and non-corrosive to metals,

(3) high in dielectric strength, (4) poor supporters of combustion, (5) miscible with asphalt, wax, pitch, etc.

Constants: Sp. gr. 1.20-1.25 (68°F); liquid down to -25°F, congealing point -33°F; flash point (approx.) 350°F; volatile at 212°F (and slightly so at normal temperatures); b. p. 480-550°F; specific heat 0.282 (between 86 and 140°F).

Soluble in practically all organic solvent liquids and oils (the best are carbon tetrachloride and benzene); insoluble in caustic alkaline solutions and acid solutions except those which are powerful oxidizers.

Derivation: By chlorinating naphthalene.

Grades: Technical.

Containers: 55-gal steel drums; tank cars.

Uses: Plasticizers, carbon softener and remover, heat-transfer medium; solvent (for rubber, aniline and other dyes, mineral and vegetable oils, varnish gums and resins, waxes); fire-proofing agent.

Caution: Avoid repeated contact with skin. Avoid repeated inhalation of fumes and dust. MCA warning label.

Shipping regulations: None.*

chloronaphthalene waxes.

Properties: Crystalline, amorphous, synthetic wax. Produced in translucent, black, light, and varied colors. These waxes are: (1) free of moisture and will not absorb moisture, (2) neutral, and non-corrosive to metals, (3) high in dielectric strength and have an extraordinary specific inductive capacity, (4) non-supporters of combustion, (5) able to melt to a liquid of low viscosity.

Constants: Sp. gr. 1.40-1.7 (300°F), m. p. 190-265°F, b. p. 550-700°F.

Soluble in many organic solvent liquids and oils (when heated together), insoluble in caustic alkaline solutions and acid solutions except those which are powerful oxidizers.

Derivation: By chlorinating naphthalene.

Grades: Technical.

Containers: 130-lb drums.

Uses: Condenser impregnation; moisture-, flame-, acid-, insect-proofing of wood, fabric and other fibrous bodies, moisture- and flame-proofing covered wire and cable, solvent (for rubber, aniline and other dyes, mineral and vegetable oils, varnish gums and resins, and other waxes when mixed in the molten state).

Caution: Avoid repeated contact with skin.

Avoid repeated inhalation of fumes and dust. MCA warning label.

Shipping regulations: None.*

5-chloro-2-beta-naphthylaminophenylmethyl sulfone.

Constants: M. p. 172-173°C.

alpha-chloro-meta-nitroacetophenone $\text{NO}_2\text{C}_6\text{H}_4\text{COCH}_2\text{Cl}$.

Properties: Off-white, free-flowing granules, approx. m. p. 95-100°C, soluble in chlorinated solvents; insoluble in water.

Uses: Bacteriostat and fungistat in cutting oils, water systems, paint, plastics, textiles; chemical intermediate.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

4-chloro-2-nitro-5-aminobenzonitrile.

Constants: M.p. 213-214°C.

Derivation: From a cyclic halogen compound by heating with copper cyanide in the presence of amines.

2-chloro-4-nitroaniline (ortho-chloro-para-nitroaniline) $C_6H_3NO_2NH_2Cl$.

Properties: Yellow needles. Soluble in alcohol, benzene, ether; slightly soluble in water and strong acids. M.p. 107°C.

Derivation: (a) From 1,2-dichloro-4-nitrobenzene by heating with alcoholic ammonia. (b) From the chlorination of para-nitroaniline in acid solution.

Method of purification: Recrystallization.

Grades: Technical, as paste or powder.

Containers: Up to 225-lb barrels.

Use: As intermediate in the manufacture of dyes.

Shipping regulations: None.*

meta-chloronitrobenzene $C_6H_4ClNO_2$.

Properties: Yellowish crystals; sp. gr. 1.534; m.p. 44°C; b.p. 236°C; soluble in most organic solvents, insoluble in water.

Derivation: By chlorinating nitrobenzene in the presence of iodine and recrystallizing.

Grades: Technical.

Containers: Drums.

Use: Intermediate.

Caution: Do not inhale dust, or vapors when heated.

Shipping regulations: Poison, class B.

Poison label.*

ortho-chloronitrobenzene $C_6H_4ClNO_2$.

Properties: Yellow liquid, sp. gr. 1.368, b.p. 245.5°C; m.p. 32.5°C, soluble in alcohol and benzene; insoluble in water.

Derivation: By nitrating chlorobenzene and purifying by rectification.

Grades: Technical.

Containers: Drums, tank cars.

Uses: Intermediate, especially for dyes.

Caution: Do not inhale vapors.

Shipping regulations: Poison, class B.

Poison label.*

para-chloronitrobenzene $C_6H_4ClNO_2$.

Properties: Yellowish crystals, sp. gr. 1.520; m.p. 83°C; b.p. 242°C; soluble in organic solvents; insoluble in water.

Derivation: Nitration of chlorobenzene and recrystallization.

Grades: Technical.

Containers: Drums.

Use: Intermediate, especially for dyes.

Caution: Do not inhale dust, or vapors when heated.

Shipping regulations: Poison, class B.

Poison label.*

2-chloro-5-nitrobenzene sulfonamide

$ClNO_2C_6H_3SO_2NH_2$.

Properties: Greyish-white solid. Insoluble in water, soluble in benzene.

Uses: Dye and pharmaceutical intermediates.

6-chloro-3-nitrobenzenesulfonic acid, sodium salt $NaSO_3C_6H_3NO_2Cl$.

Properties: Off-white moist crystals.

Use: Intermediate.

4-chloro-3-nitrobenzoic acid $ClC_6H_3NO_2COOH$.

Properties: Light gray or white powder.

Use: Intermediate.

chloronitrobenzols. See chloronitrobenzenes.

4-chloro-3-nitrobenzotrifluoride (para-chloro-meta-nitrotrifluorotoluene) $C_6H_3CF_3NO_2Cl$.

Properties: Thin, oily liquid; sp. gr. 1.542 (15.5/15.5°C); m.p. -7.5°C; refractive index (n_D²⁰) 1.491; b.p. 222°C; soluble in organic solvents; insoluble in water.

Grade: 97.5%.

Use: Intermediate for dyestuffs; agricultural chemicals; pharmaceuticals.

4-chloro-2-nitrophenol $ClC_6H_3(NO_2)OH$.

Yellow powder; m.p. 86°C. Used as a dye intermediate.

4-chloro-2-nitrophenol, sodium salt

$ClC_6H_3NO_2ONa$.

Properties: Red needle crystals, with one molecule of water of crystallization.

Soluble in hot water.

Derivation: Nitration of para-dichlorobenzene followed by hydrolysis.

Method of purification: Recrystallization.

Grades: 90% anhydrous sodium salt, containing 80% base.

Uses: Dye intermediate; manufacture of 2-amino-4-chlorophenol.

4-chloro-2-nitrotoluene $ClNO_2C_6H_3CH_3$.

Solid, m.p. 35-37°C; used as an intermediate.

Containers: Drums.

6-chloro-2-nitrotoluene $ClNO_2C_6H_3CH_3$.

A solid; used as an intermediate.

Containers: Drums.

para-chloro-meta-nitrotrifluorotoluene.

See 4-chloro-3-nitrobenzotrifluoride.

chloronitrous acid. See aqua regia.

chloropentafluoroethane.

Shipping regulations: Nonflammable gas.

Green label.*

1-chloropentane. See n-amyl chloride.

chlorophenol.

Strictly the term applies to the three isomeric monochlorophenols (see ortho-, meta-, and para-chlorophenol), but the term may also be used for any of the isomers of di-, tri-, tetra-, and up to pentachlorophenol. These are discussed under separate entries.

meta-chlorophenol (3-chloro-1-hydroxybenzene) C_6H_4OHCl .

Properties: White crystals with odor similar to phenol, discolors on exposure to air; sp. gr. 1.245; m.p. 33°C; b.p. 214°C.

Soluble in alcohol, ether and aqueous alkali, slightly soluble in water.

Derivation: From meta-chloroaniline through the diazonium salt.

Use: Intermediate in organic synthesis.

Danger! Rapidly absorbed through the skin.

Causes severe burns. Avoid breathing

vapor. Do not take internally. MCA

warning label.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

ortho-chlorophenol (2-chloro-1-hydroxy-benzene) C_6H_4OHCl .

Properties: Colorless to yellow brown liquid with unpleasant penetrating odor. Slightly soluble in water; soluble in alcohol, ether, and aqueous sodium hydroxide. Volatile with steam. B.p. 175°C; freezing point 7°C; sp.gr. 1.265 (15.5°C).

Derivation: Chlorination of phenol.

Use: Organic synthesis such as manufacturing dyes.

Danger! Rapidly absorbed through skin. Causes severe burns. Avoid breathing vapor. Do not take internally. MCA warning label.

para-chlorophenol (4-chloro-1-hydroxy-benzene) C_6H_4OHCl .

Properties: White crystals (yellow or pink when impure) with unpleasant penetrating odor. Very slightly soluble in water; soluble in benzene, alcohol, and ether. Volatile with steam; b.p. 217°C; m.p. 42-43°C; sp.gr. 1.306; refractive index (n_{40/D}) 1.5579. A 1% solution is acid to litmus.

Derivation: Direct chlorination of phenol, from chloroaniline through the diazonium salt.

Grades: N. F. XI, technical.

Containers: 55-gal drums.

Uses: Intermediate in synthesis of dyes and drugs; denaturant for alcohol, selective solvent in refining mineral oils; medicine (local).

Danger! Rapidly absorbed through skin. Causes severe burns. Avoid breathing vapor. Do not take internally. MCA warning label.

para-chlorophenol sulfide. White, almost odorless powder. Insoluble in water; soluble in alcohol, oils, and organic solvents. Used as mildewicide and preservative for paper, wood and cloth.

chlorophenothane. See DDT.

para-chlorophenyl para-chlorobenzenesulfonate (para-chlorobenzenesulfonic acid para-chlorophenyl ester) $(C_6H_4Cl)OSO_2(C_6H_4Cl)$.

Properties: Crystals from benzene. M.p. 86.5-86.8°C. Practically insoluble in water. Toxicity low to animals.

Use: Insecticide and acaricide.

Hazard: May cause skin irritations. MCA warning label.

3-(para-chlorophenyl)-1,1-dimethylurea (monuron; CMU) $C_6H_4ClNHCON(CH_3)_2$.

Properties: White, crystalline, odorless solid. Very low solubility in water and hydrocarbon solvents. Stable toward oxidation and moisture. Solubility 230 ppm at 25°C in water and in No. 3 diesel oil. Decomposes at 185°C.

Use: Weed killer; pre-emergence herbicide.

Caution: Avoid breathing dust or mist. Avoid contact with skin, eyes and clothing.

U.S.D.A. Pesticides regulation label.

3-(para-chlorophenyl)-5-methylrhodanine

$C_{10}H_6ClNOS_2$. A fungicide and disinfectant

used in seed treatment and nematode control.

chloro-ortho-phenylphenol (chloro-2-phenylphenol) $C_6H_3(OH)ClC_6H_5$.

Properties: Clear, colorless to straw colored, viscous liquid with faint characteristic odor; sp.gr. 1.228 (20/4°C); freezing point less than -20°C; boiling range 5-95% 146-158.7°C (5 mm); flash point 134°C; readily soluble in most organic solvents.

Composition: 80% 4-Chloro-2-phenylphenol; 20% 6-chloro-2-phenylphenol.

Use: Fungicide.

para-chlorophenyl phenyl sulfone (4-chloro-diphenyl sulfone) $ClC_6H_4SO_2C_6H_5$.

Properties: Dimorphic crystals; slight aromatic odor; tasteless; insoluble in water; soluble in most organic solvents. Relatively stable to acids and alkalis. Toxicity relatively low in animals.

Use: Acaricide (toxic to most grapes and pears).

chlorophenyltrichlorosilane $ClC_6H_4SiCl_3$. A mixture of isomers.

Properties: Colorless to pale yellow liquid. B.p. 230°C; sp.gr. 1.439 (25/25°C); refractive index (n_{20/D}) 1.5414; flash point (Cleveland open cup) 255°F. Readily hydrolyzed by moisture, with the liberation of hydrochloric acid.

Derivation: By Grignard reaction of silicon tetrachloride and chlorophenylmagnesium chloride.

Grades: Technical.

Use: Intermediate for silicones.

4-chlorophthalic acid $C_6H_3Cl(COOH)_2$.

Properties: Colorless crystals; m.p. 150°C; decomposes on further heating, soluble in alcohol and ether, insoluble in water.

Derivation: By the chlorination of phthalic acid.

chlorophyll. See chlorophyll.

chlorophyll (chlorophyl, leaf green; chromule).

The green plant pigment that is involved in the process of photosynthesis; it is present in two forms, chlorophyll a and chlorophyll b, both of which are magnesium complex salts of phytol esters of porphinderivatives, and are related in structure to hemin, the red pigment of blood. Chlorophyll a has recently been synthesized by two different routes.

Properties:

Chlorophyll a: $C_{55}H_{72}MgN_4O_5$. Waxy blue-black microcrystals, usually aggregates of thin, lancet-like leaflets; m.p. 117-120°C. Freely soluble in ether, ethanol, acetone, chloroform, carbon disulfide, benzene; sparingly soluble in cold methanol; insoluble in petroleum ether. The alcoholic solution is blue-green with a deep-red fluorescence.

Chlorophyll b: $C_{55}H_{70}MgN_4O_6$. Waxy blue-black microcrystals. Sinters between 86 and 92°C. Sparingly soluble in petroleum ether, ligroin; freely soluble in absolute alcohol, ether. Ether solution has a

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

brilliant green color. Solutions with other organic solvents are usually green to yellow-green with red fluorescence.

Derivation: Alcoholic extraction of green plants; isolation by chromatography.

Grades: Aqueous, alcoholic or oil solutions; the water solutions are prepared by saponification of the oil-soluble chlorophyll.

Containers: Glass bottles.

Uses: Non-poisonous coloring agent for soaps, oils, fats, waxes, liquors, confectionery, preserves; cosmetics, perfumes; source of phytol; dye for leather, sensitizer for color film; antiknock agent; accelerator in vulcanizing of rubber; deodorizers; medicine (topical).

chlorophyllin. Product resulting from the controlled action of alcoholic potassium or sodium hydroxide on alcoholic leaf extracts. The methyl and phytol groups are replaced by alkali but the magnesium is not replaced. Useful in food coloring, dyes, and medicine.

chloropicrin (chlorpicrin; nitrotrichloromethane; trichloronitromethane, nitrochloroform) CCl_3NO_2 .

Properties: Pure product slightly oily, colorless, refractive liquid. Relatively stable; not decomposed by water or mineral acids. Caution! Very irritant! Protect eyes! Sp. gr. 1.692 (0°C), b.p. 112°C (760 mm); m.p. -69.2°C; coefficient of expansion 0.00102 (0°C), sp. ht. 0.235 (15-35°C), latent ht. of evaporation 59 calories; vapor density 5.69, vapor tension 16.91 mm Hg (20°C); volatility 184 mg/liter (20°C). Soluble in alcohol, benzene, carbon disulfide, slightly soluble in ether; insoluble in water.

Derivation: (a) Action of picric acid on calcium hypochlorite. (b) Nitric acid of chlorinated hydrocarbons.

Grades: Commercial.

Containers: Metal drums.

Uses: Military poison gas; organic synthesis, dyestuffs (crystal violet), fumigant preparations; fungicides, insecticides; rat exterminator.

Danger! Poisonous if inhaled. MCA warning label.

Shipping regulations: Poison, class B; poison label. Legal label name chlorpicrin.*

6-chloropiperonyl ester chrysanthemum monocarboxylic acid. See barthrin.

chloroplatinic acid (platinic chloride)

Properties: Red-brown crystals. Soluble in water, alcohol and ether.

Constants: Sp. gr. 2.431, m.p. 60°C.

Derivation: By solution of platinum in aqua regia, evaporation and crystallization.

Containers: Glass bottles.

Uses: Electroplating; platinizing pumice and the like for catalysts; etching zinc for printing; platinum mirrors; indelible ink; ceramics (producing fine color effects on high-grade porcelain); microscopy.

chloroprene (2-chloro-butadiene-1,3)

Properties: Colorless liquid; b.p. 59.4°C; sp. gr. 0.9583 (20/20°C); soluble in alcohol; slightly soluble in water.

Derivation: (a) By treatment of vinyl acetylene with cold hydrochloric acid; (b) from C_4 petroleum fractions.

Grades: Pure, 95% min.

Containers: Cylinders; tank trucks.

Use: The monomer from which neoprene synthetic rubber is made.

chloroprocaine hydrochloride

(beta-diethylaminoethyl 2-chloro-4-amino-benzoate hydrochloride)

Grade: N. N. D.

Use: Medicine.

chloroprocaine penicillin O. See penicillin.

3-chloropropene-1,2-diol. See chlorohydrin.

1-chloro-2-propanol. See propylene chlorohydrin.

1-chloro-2-propanone. See chloroacetone.

3-chloropropene. See allyl chloride.

2-chloropropionic acid (alpha-chloropropionic acid) $\text{CH}_3\text{CHClCOOH}$.

Properties: Sp. gr. 1.260-1.268 (20°C);

b.p. 183-187°C. Soluble in water.

Use: Intermediate in weed killers.

3-chloropropionic acid (beta-chloropropionic acid) $\text{CH}_2\text{ClCH}_2\text{COOH}$.

Properties: Crystals; m.p. 41°C; b.p. 200°C, soluble in water, alcohol, chloroform.

Use: Intermediate.

3-chloropropionitrile $\text{ClCH}_2\text{CH}_2\text{CN}$.

Properties: Colorless liquid, m.p. -51°C; flash point (closed cup) 168°F; refractive index (n_{25/D}) 1.4341, sp. gr. 1.1363 (25°C), b.p. 176°C (dec.). Miscible with acetone, benzene, carbon tetrachloride, alcohol, and ether.

Uses: Organic intermediate.

alpha-chloropropylene. See allyl chloride.

chloropropylene oxide. See epichlorohydrin.

3-chloro-1-propyne. See propargyl chloride.

6-chloroquinoline $\text{C}_9\text{H}_5\text{N}(\text{CH}_3)\text{Cl}$.

Properties: Brownish-black oily crystalline mass.

Grade: Technical.

Use: Intermediate.

chloroquine

7-Chloro-4-(4-diethylamino-1-methyl-butylamino)quinoline.

Properties: M.p. 87°C.

Derivation: From meta-chloroaniline and diethyl oxalacetate or diethyl malonate.

Use: Medicine. Usually dispensed as the phosphate (q.v.).

chloroquine diphosphate. See chloroquine phosphate.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

chloroquine phosphate (chloroquine diphosphate) $C_{15}H_{24}ClN_3 \cdot 2H_3PO_4$. 7-Chloro-4-(4-diethylamino-1-methylbutylamino)quinoline diphosphate.

Properties: White, crystalline powder. Odorless, has bitter taste, affected by light. Freely soluble in water; almost insoluble in alcohol, chloroform and ether, solution has pH about 4.5. Exists in two forms: usual form melts 193-195°C, other form melts 215-218°C.

Grade: U.S.P. XVI.

Use: Medicine.

5-chlorosalicylanilide $ClC_6H_4OHCONHC_6H_5$.

Properties: White crystals; slightly soluble in water, soluble in alcohol, ether, chloroform and benzene.

Use: Intermediate for pharmaceuticals, dyes, pesticides.

5-chlorosalicylic acid $ClC_6H_4OHCOOH$.

Properties: White crystals, slightly soluble in water, soluble in alcohol, ether, chloroform and benzene.

Use: Intermediate for pharmaceuticals, dyes, pesticides.

N-chlorosuccinimide (NCS) $\overline{COCH_2CH_2CONCl}$.

Physical properties: White crystalline powder; m.p. 148-149°C, soluble in water, sparingly soluble in chloroform and carbon tetrachloride.

Uses: Chlorinating agent, disinfectant for swimming pools, and bactericide.

chlorosulfonic acid $ClSO_2OH$.

Properties: Colorless to light yellow, fuming, very corrosive liquid; pungent odor, sp. gr. 1.76-1.77 (20/20°C), m.p. -80°C, b.p. 151°C.

Derivation: By treating sulfur trioxide or fuming sulfuric acid with hydrochloric acid.

Grades: Technical.

Containers: 170-lb carboys, 1600-lb drums, 8000-gal tank cars.

Uses: Organic preparations, especially saccharin; military poison gas.

Danger: Causes severe burns. MCA warning label.

Shipping regulations: Corrosive liquid. White label.*

4-chlorosulfonylbenzoic acid $ClSO_2C_6H_4COOH$.

Properties: Light tan powder, soluble in benzene, slightly soluble in ether.

Use: Intermediate.

chlorosulfuric acid. See sulfuryl chloride.

chlorotetracycline. See chlortetracycline.

chlorotetrafluoroethane.

Shipping regulations: Nonflammable gas. Green label.*

chlorothen citrate (chloromethapyriline citrate) $C_{14}H_{18}ClN_3S \cdot C_6H_8O_7$. N, N-Dimethyl-N'-(2-pyridyl)-N'-(5-chloro-2-thenyl)ethylenediamine citrate.

$ClC_6H_4SCH_2N(C_2H_5N)CH_2CH_2N(CH_3)_2 \cdot C_6H_7O_7$.

Properties: White, practically odorless crystalline powder. Slightly soluble in alcohol and water, practically insoluble in

chloroform, ether and benzene. 1% solution is clear and colorless. pH (1% solution) 3.9-4.1. Melts at 112-116°, on further heating solidifies and remelts at 125-140° (dec).

Grade: N.F. XI.

Use: Medicine.

"Chlorothene." ²³³ Trademark for inhibited 1,1,1-trichloroethane (q.v.).

Typical specifications: Colorless liquid; b.p. 73-84°C, sp. gr. 1.319 (25/25°C), refractive index 1.435 (25°C); freezing point -50°C.

Use: Industrial solvent.

chlorothiazide (6-chloro-7-sulfamyl-1,2,4-benzothiadiazine-1,1-dioxide) $C_7H_6ClN_3O_4S_2$.

Properties: White or practically white odorless crystalline powder. Crystals decompose 342.5-343°C. Slightly soluble in water, soluble in alkaline aqueous solutions with decomposition upon standing or heating; slightly soluble in methanol and pyridine, insoluble in ether, benzene, chloroform.

Grade: U.S.P. XVI.

Uses: Medicine.

chlorothiazide sodium $C_7H_5ClN_3O_4S_2Na$.

Properties: Crystalline powder. Soluble in water.

Grade: N.N.D.

Use: Medicine.

para-chlorothiophenol (para-chlorobenzene-thiol) ClC_6H_4SH .

Properties: Moist white to cream crystals, m.p. 52-55°C, b.p. 205-207°C. Soluble in most organic solvents.

Containers: Casks.

Uses: Oil additives, agricultural chemicals, plasticizers, rubber chemical, dyes, wetting agents and stabilizers.

chlorothymol (6-chloro-4-isopropyl-1-methyl-3-phenol) $CH_3C_6H_2(OH)(C_3H_7)Cl$.

Properties: White crystals or crystalline granular powder, characteristic odor, aromatic, pungent taste, becomes discolored with age, affected by light; m.p. 59-61°C. Soluble in benzene, chloroform, dilute caustic soda, alcohol, insoluble in water.

Derivation: Action of sulfuryl chloride on thymol in a solution of carbon tetrachloride.

Grades: N.F. XI.

Use: Bactericide.

alpha-chlorotoluene. See benzyl chloride.

meta-chlorotoluene. (3-chloro-1-methylbenzene) $CH_3C_6H_4Cl$.

Properties: Colorless liquid, sp. gr. 1.07218 (20/4°C); b.p. 161.6°C; f.p. -48.0°C.

Derivation: Diazotization of meta-toluidine followed by treating with cuprous chloride. Caution! Vapor harmful. MCA warning label.

Uses: Solvent, intermediate.

ortho-chlorotoluene (2-chloro-1-methylbenzene) $CH_3C_6H_4Cl$.

Properties: Colorless liquid. B.p. 159.2°C; m.p. -35.1°C; sp. gr. 1.0776 (25/4°C),

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

refractive index (n_D²⁰) 1.5268. Miscible with alcohol, acetone, ether, benzene, carbon tetrachloride, and n-heptane; slightly soluble in water.

Derivation: By catalytic chlorination of toluene.

Containers: 45-, 100-, 115-lb carboys, 425-, 450-, 475-lb drums.

Caution! Vapor harmful. MCA warning label.

Uses: As a solvent and intermediate for organic chemicals and dyes.

para-chlorotoluene (4-chloro-1-methylbenzene) $\text{CH}_3\text{C}_6\text{H}_4\text{Cl}$.

Properties: Colorless liquid; boiling range (typical) first drop 162°C, 50% 162.4°C, dry 166°C, f.p. approx. 6.5°C, sp.gr. 1.065-1.067 (25/15°C), refractive index 1.5184 (22°C). Soluble in alcohol, ether, acetone, benzene, and chloroform. Insoluble in water.

Containers: Glass carboys or 425- or 450-lb iron drums.

Caution: Vapor harmful. MCA warning label.

Uses: As a solvent and intermediate for organic chemicals and dyes.

2-chlorotoluene-4-sulfonic acid (ortho-chlorotoluene-para-sulfonic acid) $\text{CH}_3\text{C}_6\text{H}_3(\text{SO}_3\text{H})\text{Cl}$.

Properties: White glistening plates. Soluble in hot water.

Derivation: Chlorination of toluene-para-sulfonic acid.

Method of purification: Recrystallization from water.

2-chloro-para-toluidine. See 4-amino-2-chlorotoluene.

4-chloro-ortho-toluidine. See 2-amino-4-chlorotoluene.

6-chloro-ortho-toluidine. See 2-amino-6-chlorotoluene.

4-chloro-ortho-toluidine hydrochloride.

Shipping regulations: Poison, class B. Poison label.*

2-chloro-5-toluidine-4-sulfonic acid (6-chloro-meta-toluidine-4-sulfonic acid) $\text{CH}_3\text{C}_6\text{H}_2(\text{NH}_2)(\text{SO}_3\text{H})\text{Cl}$.

Properties: Fine white crystals. Soluble in dilute caustic solution.

Derivation: From ortho-chlorotoluene-para-sulfonic acid by nitration and subsequent reduction.

Method of purification: Recrystallization of its sodium salt.

Containers: Fiber kegs; lined steel drums. Use: Intermediate.

5-chloro-2-para-toluidinephenylmethylsulfone. Constants: M.p. 136 to 137°C.

chlorotrianisene (tri-para-anisylchloroethylene) $(\text{CH}_3\text{OC}_6\text{H}_5)_2\text{CCCl}(\text{C}_6\text{H}_5\text{OCH}_3)$. A synthetic nonsteroid estrogen.

Properties: White, odorless, crystalline powder. M.p. 115-117°C. Freely soluble in acetone, benzene and chloroform; slightly soluble in ether; very slightly soluble in alcohol and water.

Grade: N. F. XI.

Use: Medicine.

chlorotrifluoroethylene (CFE; trifluorochloroethylene) ClFC_2F_3 .

Properties: Colorless gas with faint ethereal odor; b.p. -27.9°C; m.p. -157.5°C, sp.gr. (liquid) (20°C) 1.305; critical temperature 107°C; critical pressure 39.0 atm; specific volume 3.3 cu ft/lb.

Derivation: From trichlorotrifluoroethane and zinc.

Grades: Technical, 99.0%.

Containers: Cylinders, tank cars, tank trucks. Shipped with inhibitor.

Uses: Polymerization to colorless oils, greases and waxes (see chlorotrifluoroethylene resins); also as a refrigerant (see "Freon 13").

Caution: Relatively toxic gas.

Shipping regulations: Flammable gas. Red label. Legal label name: trifluorochloroethylene.*

chlorotrifluoroethylene resins. Polymers of chlorotrifluoroethylene characterized by a high degree of chemical inertness. Virtually unaffected by inorganic acid, alkalies, oxidizing agents, and most organic solvents. For typical commercially available material see "Halon"; "Kel-F"; fluorothene.

chlorotrifluoromethane (trifluorochloromethane) CClF_3 .

Properties: Colorless, non-toxic, nonflammable, non-corrosive liquid with an ethereal odor, b.p. -81.4°C.

Containers: Cylinders.

Uses: Refrigerant; hardening of metals; pharmaceutical processing.

Shipping regulations: Nonflammable gas; green label.*

ortho-chlorotrifluoromethylbenzene. See ortho-chlorobenzotrifluoride.

para-chlorotrifluoromethylbenzene. See para-chlorobenzotrifluoride.

ortho-chloro-alpha, alpha, alpha-trifluorotoluene. See ortho-chlorobenzotrifluoride.

para-chloro-alpha, alpha, alpha-trifluorotoluene. See para-chlorobenzotrifluoride.

chlorovinylarsinedichloride. See beta-chlorovinyl-dichloroarsine.

beta-chlorovinyl-dichloroarsine (dichloro(2-chlorovinyl)arsine; chlorovinylarsinedichloride, lewisite). Two isomers, probably cis and trans, are known. $\text{ClCH}:\text{CHAsCl}_2$.

Properties: Colorless liquid when pure. Impurities influence a color change ranging from violet to brown. Geranium-like odor. Decomposed by water and alkalies. Caution! Very irritant! Soluble in alcohol, benzene, and ether; slightly soluble in water. Sp.gr. 1.8855 (20°C); b.p. 190°C (decomposes), also 164.8°C; m.p. (given variously) -18.2 to +0.1°C; sp. vol. 0.5302 (20°C); vapor density 7.2; vapor tension 0.394 mm (20°C); volatility 2300 mg/cu m (20°C); latent heat of vaporization 57.9; coefficient of thermal expansion

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

0.00094 (0 to 50°C). Inactivated by bleaching powder. Antidote is BAL.

Derivation: Condensation of arsenic trichloride with acetylene in the presence of aluminum or copper or mercury chloride. The mixed arsines are separated by fractionating.

Grades: Technical.

Use: Military poison gas; skin blistering agent.

Shipping regulations: Poison, class A by freight, not accepted by express! Poison gas label. Legal label name: lowisite.

beta-chlorovinylmethylchloroarsine

CICH:CHAsCICH₃.

Properties: Liquid; decomposed by water.

Caution: Very irritant! B.p. 112-115°C (10 mm).

Derivation: Interaction of acetylene and methylchloroarsine in the presence of aluminum chloride.

"Chlorowax." ²⁴⁴ Trademark for a series of liquid and resinous chlorinated paraffins containing from 40% to 70% chlorine by weight. They are odorless, nontoxic, non-flammable, and insoluble in water. Available in Grades LV, 40, 50, and 70.

"Chlorowax" 70-S is a heat stabilized form of "Chlorowax" 70, a powdered resin.

Typical properties: Sp.gr. (25/25°C), color (Tag-Union Colorimeter), viscosity (Gardner tubes, poises at 25°C), respectively:

Grade LV: 1.13; 1.0, 5,
Grade 40: 1.15; 1.25; 25,
Grade 50: 1.26; 1.25, 125,
Grade 70: 1.65, 1.25, m.p. (Ball and Ring) 100°C.

Containers: "Chlorowax" LV, 40, and 50 in 50-lb and 525-lb steel drums. "Chlorowax" 70 and 70-S in 50-lb and 250-lb fiber drums.

Uses: The liquid grades, being of low volatility, are used extensively as plasticizers in paints, synthetic rubbers, and plastics. The resinous grades are used as modifiers to add moisture, chemical, and flame resistance to many paints, synthetic rubbers, and plastics.

para-chloro-meta-xenol (probably 4-chloro-1-hydroxy-3,5-dimethyl benzene)

C₆H₃(CH₃)₂OHCl. Crystals with phenolic odor.

Uses: Germicide, fungistat; preservative. See also para-chloro-meta-cresol.

chlorpheniramine maleate (chlorprophenpyridamine maleate) C₁₆H₁₉ClN₂·C₄H₄O₄. 1-(para-Chlorophenyl)-1-(2-pyridyl)-3-dimethylaminopropane maleate.

Properties: White odorless crystals. M.p. 130-135°C. Slightly soluble in ether; soluble in alcohol, chloroform, and water. pH (1% solution) about 4.8.

Grade: U.S.P. XVI.

Use: Medicine.

chlorphenol red (dichlorosulfonphthalein) An acid-base indicator, showing color change from yellow to red over the pH range 4.8 to 6.4.

chlorphenoxamine

CH₃(C₆H₅)C(C₆H₄Cl)OC₂H₄N(CH₃)₂·HCl. beta-Dimethylaminoethyl(para-chloro-alpha-methylbenzhydryl) ether hydrochloride.

Properties: Crystals; m.p. 128°C; soluble in water.

Use: Medicine (antihistaminic).

chlorpicrin. See chloropicrin.

chlorpromazine (2-chloro-10-(3-dimethylaminopropyl)phenothiazine) C₁₇H₁₉ClN₂S.

Properties: Oily liquid; amine odor, alkaline reaction; b.p. 200-205°C, (0.8 mm).

Grade: N.N.D.

Use: Medicine.

chlorpromazine hydrochloride C₁₇H₁₉ClN₂S·HCl.

Properties: White or slightly creamy white, odorless, crystalline powder. Darkens on prolonged exposure to light. Solutions acid to litmus. Soluble in water, alcohol, chloroform. Insoluble in ether and benzene. M.p. 195-198°C.

Grade: U.S.P. XVI.

Use: Medicine.

chlorpropamide 1-(para-chlorobenzenesulfonyl)-3-propylurea.

C₉H₇NHCONHSO₂C₆H₄Cl.

Properties: Crystals, m.p. 127-129°C, soluble in water, alcohol, chloroform.

Use: Medicine.

chlorprophenpyridamine maleate. See chlorpheniramine maleate.

chlorquinaldol (5,7-dichloro-8-hydroxyquinaldine; 5,7-dichloro-2-methyl-8-quinolinol) CH₃C₉H₇N(OH)Cl₂.

Properties: Yellow, crystalline, tasteless powder with a pleasant medicinal odor; m.p. 114°C; soluble in alcohol, chloroform, insoluble in water.

Grade: N.N.D.

Use: Medicine (bactericide and fungicide).

chlortetracycline (CTC; chlorotetracycline)

C₂₂H₂₃ClN₂O₈. An antibiotic produced by the growth of *Streptomyces aureofaciens* in submerged cultures. It has a wide antimicrobial spectrum including many gram-positive and gram-negative bacteria, rickettsiae and several viruses. Its chemical structure is that of a modified naphthacene molecule. It is relatively non-toxic.

Properties: Golden-yellow crystals. M.p. 168-169°. Slightly soluble in water; very soluble in aqueous solutions above pH 8.5, freely soluble in the "Cellosolves," dioxane and "Carbitol", slightly soluble in methanol, ethanol, butanol, acetone, ethyl acetate, and benzene, insoluble in ether and petroleum ether.

Derivation: By submerged aerobic fermentation, filtration, solvent extraction, and crystallization.

Use: Medicine (usually as hydrochloride); feed supplement; preservative for raw fish.

chlortetracycline hydrochloride

C₂₂H₂₃ClN₂O₈·HCl.

Properties: Odorless, yellow, crystalline

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

powder with bitter taste. Stable in air but affected by light. Soluble in solutions of alkali hydroxides and carbonates; practically insoluble in acetone, chloroform, dioxane and ether. pH (1 in 200 solution) 2.3-3.3.

Grade: N. F. XI.

Use: Medicine.

"Chlor-Trimeton Maleate." ³²¹ Brand name of chlorpheniramine maleate.

chlorzoxazone (5-chloro-2-benzoxazolinone)

$C_7H_4ClNO_2$. Derivative of zoxazolamine.

Grades: N. N. D.

Use: Medicine.

chocolate. The product formed by roasting and grinding fermented dried cacao beans (q. v.). Chocolate contains about 55% cocoa butter, some starch, traces of theobromine and tannin. Milk chocolate contains 30 to 35% cocoa butter, 12% milk solids and also added sugar.

chocolate fat. Cacao butter (q. v.) is the true chocolate fat and the highest-grade chocolates contain it exclusively. Substitutes are used, to a greater or less degree, in the lower-grade chocolates. These substitutes usually consist of vegetable fats, such as palm-nut or coconut stearin.

chocolate varnish. An alcoholic solution of gum benzoin and an edible resin. It may be used for hardening chocolate, thus preventing its turning white.

cholaic acid. See taurocholic acid.

cholecalciferol. See 7-dehydrocholesterol, activated.

choleic acids. A loose term applied to the complexes formed by deoxycholic acid (a bile acid) with fatty acids or other lipids, and with a variety of other compounds, including such aromatics as phenol and naphthalene. These complexes are similar to, and have been suggestive of, the complexes used in separation processes, such as the urea adducts, for large scale purification.

beta-cholestanol. See dihydrocholesterol.

5-cholesten-3 beta -ol. See cholesterol.

cholesterin. See cholesterol.

cholesterol (cholesterin; 5-cholesten-3 beta-ol) $C_{27}H_{45}OH$. The most common animal sterol, a monounsaturated, secondary alcohol of the cyclopentenophenanthrene system. Present in animals in part as the free sterol, and in part esterified with higher fatty acids. The primary precursor in biosynthesis appears to be acetic acid or sodium acetate. Cholesterol itself in the animal system is the precursor of bile acids, steroid hormones and provitamin D_3 . Cholesterol is a universal tissue constituent and is the subject of widespread research, partly because of its role as a suspect in atherosclerosis.

Properties: White, or faintly yellow, almost

odorless, pearly granules or crystals; affected by light; m. p. 148.5°C; b. p. 360°C (dec); sp. gr. 1.067 (20/4°C); levorotatory; specific rotation (25°C) -34 to -38°; insoluble in water; slightly soluble in alcohol; soluble in the usual fat solvents, vegetable oils and aqueous solutions of bile salts.

Source: Prepared from beef spinal cord by petroleum ether extraction of the non-saponifiable matter; purification by repeated bromination.

Grades: Technical, U. S. P. XVI.

Containers: 1- and 5-lb glass bottles.

Uses: Medicine; emulsifying agent in cosmetic and pharmaceutical products; textile, leather and ink industries.

cholesterol pitch. See stearin and fatty-acid pitches.

cholic acid $C_{24}H_{40}O_5$. The most abundant bile acid. In bile it is conjugated with the amino acids glycine and taurine as glycocholic acid and taurocholic acid, respectively, and does not occur free.

Properties: The monohydrate crystallizes in plates from dilute acetic acid; bitter taste with sweetish aftertaste; anhydrous form, m. p. 198°C. Not precipitated by digitonin. Soluble in glacial acetic acid, acetone, and alcohol; slightly soluble in chloroform; practically insoluble in water and benzene.

Derivation: From glycocholic and taurocholic acids in bile; organic synthesis.

Containers: Drums.

Use: Medicine; biochemical research; pharmaceutical intermediate.

choline (beta-hydroxyethyl-trimethylammonium hydroxide) $(CH_3)_3N(OH)CH_2CH_2OH$. Has been called vitamin B_4 . Known to be essential in the diet of rats, rabbits, chickens, and dogs. In man it is required for lecithin formation and can replace methionine in the diet. There is no evidence of disease in man due to choline deficiency. It acts as a dietary factor important in furnishing free methyl groups for trans-methylation; has a lipotropic function.

Properties: Colorless viscous liquid; caustic, bitter taste; soluble in water, formaldehyde and in absolute methyl and ethyl alcohols, insoluble in ether, petroleum ether, benzene, carbon disulfide, carbon tetrachloride, and toluene; a strong base; breaks down into trimethylamine and glycol when heated; decomposes ammonium salts; stable to heat in acid solution; extremely hygroscopic.

Source: Food source: egg yolk, kidney, liver, heart, seeds, vegetables and legumes. Commercial source: synthetic preparation from trimethylamine and ethylene chlorohydrin or ethylene oxide.

Units: Amounts are expressed in milligrams of choline.

Uses: Medicine, nutrition, feed supplement; suggested for epoxy resins.

Shipping regulations: None.*

Usually used as choline chloride (q. v.).

* See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

choline bitartrate ($C_5H_{14}NO \cdot C_4H_5O_6$).

Properties: White crystalline powder; odorless or faint trimethylamine-like odor; acid taste, hygroscopic; soluble in water and alcohol. Insoluble in ether, chloroform and benzene.

Grades: N. F. XI.

Use: Medicine.

choline chloride ($(CH_3)_3N(Cl)CH_2CH_2OH$). Same biological function as choline.

Properties: White crystals, salty, bitter taste, fishy odor, soluble in water and alcohol; insoluble in ether, petroleum ether, benzene, and carbon disulfide; stable to heat in acid solution; unstable in alkaline solution; extremely hygroscopic.

Source: Same as choline.

Units: Amounts are expressed in milligrams of choline.

Containers: Glass vials and bottles, 54-gal drums.

Grade: N. N. D.

Uses: Medicine, nutrition, animal feed supplement.

See also choline.

choline chloride carbamate. See carbachol.**choline dihydrogen citrate**

(CH_3)₃NC₂H₄OH · H₂C₆H₅O₇.

Properties: White, hygroscopic, crystalline, granular substance with acid taste; nearly odorless. M. p. 103-107.5°, freely soluble in water, very slightly soluble in alcohol; practically insoluble in benzene, chloroform, and ether. pH (25% solution) about 4.25.

Grade: N. F. XI.

Containers: Bottles, drums.

Use: Medicine.

choline gluconate

HOCH₂CH₂N(CH₃)₃OOO(CHOH)₄CH₂OH.

Properties: Straw colored, highly viscous mass. Amine-like odor and bitter taste. Soluble in water, sparingly soluble in alcohol, very slightly soluble in ether, practically insoluble in benzene and chloroform. pH (50% solution) 5.0-6.0.

Use: Medicine.

cholinesterase

1. (acetylcholinesterase). Enzyme specific for the hydrolysis of acetylcholine to acetic acid and choline in the body. It is found in the brain, nerve cells and red blood cells and is important in the mechanism of nerve action. See nerve gases.

Derivation: Prepared from bovine erythrocytes.

Uses: Biochemical experimentation; determination of phosphorus in insecticides and poisons.

2. "Pseudo" or nonspecific cholinesterase, prepared from horse serum. This esterase hydrolyzes other esters as well as choline esters. It is found in blood serum, pancreas and liver.

Both are commercially available.

choline succinate dichloride dihydrate. See succinylcholine chloride.**choline theophyllinate**. See oxtriphylline.

"Cholografin Methylglucamine." ⁴¹² Trademark for methylglucamine iodipamide (q.v.).

"Cholografin Sodium." ⁴¹² Trademark for sodium iodipamide (q.v.).

cholyglycine. See glycocholic acid.**cholytaurine**. See taurocholic acid.

Chondodendron tomentosum extract. Aqueous preparation containing constituents of crude curare which are therapeutically effective. Curare activity is due almost entirely to presence of tubocurarine.

Properties: The purified extract is a clear, colorless aqueous solution stable to light and heat.

Derivation: A desiccated curare is obtained from a heavy syrup of bark and stems of *Chondodendron tomentosum*.

Grade: N. N. D.

Use: Medicine.

chondroitin sulfuric acid. A major constituent of the cartilaginous tissue in the body. It is a high molecular weight conjugated protein.

Use: Biochemical research.

chondrus (carrageen, Irish moss, pig-wrack, pearl moss, killeen, rock-salt moss). Dried plant of sea weed *Chondrus crispus*, edible when clean, and useful for its mucilaginous or gelatinizing qualities.

Properties: Yellowish-white when powdered. Forms a sol in hot water, a gel in the presence of salts. Insoluble in organic solvents.

Habitat: Irish coast, New England.

Grades: Sun bleached, chemically bleached, natural, N. F. XI.

Containers: Bales (220 lb).

Uses: Foods (thickening or suspending agent), clarifying agent, soaps; sizes; leather dressing, pharmaceuticals and medicine.

chop nut. See physostigma.

chorionic gonadotropin (HCG). Isolated from blood and urine of pregnant women, evidence indicates that it is secreted by the placenta. It is a glycoprotein containing about 11% galactose and having a molecular weight of about 100,000.

Properties: Rods or needle-like crystals. Soluble in water and glycols. Relatively unstable in aqueous solution, stable in dry form.

Units: One international unit equals the activity of 0.1 mg of a standard preparation.

Grade: N. N. D.

Use: Medicine, veterinary medicine.

"Chromacyl." ²⁸ Trademark for a group of dyes that contain chromium in the dye molecule. Suitable for wool and nylon. These dyes are characterized by ease of application and good fastness.

chromated zinc chloride. See zinc chloride, chromated.

*See "I. C. C. Shipping Regulations," page xiii. -

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

chromate of soda. See sodium chromate or sodium chromate, tetrahydrate.

chromate red. See chrome red.

chromatography. (See also gas chromatography.) A method of separation based on selective adsorption. A solution of the substance or substances desired is allowed to flow slowly through a column of adsorbent. Different substances will pass with different speeds down the column and will eventually be separated into zones. The column core can then be pushed out and the zones of material cut apart, or the zones can be eluted by passing more solvent down the column and collecting it in small fractions.

Partition chromatography involves the selective solution of the desired material between two solvents. The final solvent, usually water, is used to wet the solid material packed in the column, and the first solvent containing the desired material is poured into the column as above.

Paper chromatography is a micro method. A drop of the liquid to be investigated is placed near one end of a strip of paper. This end is immersed in solvent, which travels down the paper and distributes the materials present in the original drop selectively. Comparison with known substances makes identification possible.

"Chromax Castings." ³⁵⁰ Ferrous alloys containing 20-30% nickel and 15-20% chromium.

chrome alum. See chromium potassium sulfate.

chrome ammonium alum. See chromium ammonium sulfate.

chrome cake. A green form of salt cake (sodium sulfate) containing small amount of chromium. A by-product of sodium dichromate manufacture used in the paper industry.

chrome dye. A mordant dye, most frequently one in which sodium dichromate has been used as the mordant.

chrome glue. See glue.

chrome greens. Paint pigments which are a mixed precipitate of chrome yellow and iron blue. By varying the proportions of yellow and blue a wide range of hues is produced. Chrome greens have excellent lightfastness and good opacity and they are used extensively for almost all types of paints and enamels. They cannot be used where an alkaline condition is present either in paint or on the surface to which a finish is applied. This is due to the sensitivity of both the yellow and the blue to alkali. Chrome greens are produced in what are termed the C. P. and reduced grades. C. P. indicates commercially pure greens that are free from extenders such as barytes, clay, whiting, etc., while the reduced greens contain a base, generally a combination of barytes and clay, the clay

being added to aid the suspending properties of the barytes. Chrome greens have the disadvantage of not being absolutely stable for color retention in the package when used in oil paints and enamels, due to the iron blue content. Iron blue is a highly oxidized iron ferrocyanide and in the presence of an oil that dries by oxidation the blue is partially deoxidized, which means that it loses some of its color or strength because of this chemical reaction. Thus, an aged chrome green paint, particularly a tint, may appear yellower in the package than when first made, but after it has been applied and allowed to dry, the shade will generally revert to nearly its original color. Chrome greens are widely used because of their brightness, opacity, lightfastness, excellent strength, and relatively low cost.

chrome-iron ore. See chromite.

"Chromekill 4A." ¹⁴² Trademark for a nearly neutral material composed of organic and inorganic reducing agents designed for the reduction of hexavalent chromium to trivalent chromium when it is present in small quantities in alkaline cleaning solutions and in electroplating baths.

"Chromel." ¹⁶⁶ Trade name for a series of nickel-chromium alloys. Available as follows:

- Grade A. Consists of 80% nickel, 20% chromium. Used for electric heating elements for temperature up to 2100°F.
- Grade AA. A modified 80-20 type nickel-chromium alloy for use in controlled atmosphere furnaces requiring optimum resistance to corrosion, carburization and oxidation for temperatures up to 2200°F.
- Grade C. Consists of 60% nickel, 16% chromium, balance mainly iron. For electric heating elements up to 1700°F; for rheostats and power resistor purposes.
- Grade D. Consists of 35% nickel, 18.5% chromium, balance mainly iron. For heating elements up to 1400°F.
- Grade R. A modified 80-20 type nickel-chromium alloy with high electrical resistivity and low temperature coefficient for use in precision resistors and potentiometers.

"Chromel-P." ¹⁶⁶ Trademark for an alloy of approximately 90% nickel and 10% chromium, with carefully controlled minor ingredients. It is chiefly used as the positive element in "Chrome-Alumel" thermocouples and lead wire.

chrome-molybdenum steel. A basic open-hearth or electric furnace steel with both chromium and molybdenum. A typical low alloy steel may contain 0.3-1.1% chromium and 0.15-0.3% molybdenum.

Molybdenum high speed steels are often chromium-molybdenum types, with tungsten and vanadium additions.

See also molybdenum steels.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

chrome-nickel steels. Usually basic open-hearth steel with chromium and nickel as the main alloying elements. Typical low alloy steel may contain nickel 0.45-1.75%. The 18.8 stainless steels (see steels, stainless) are the most common chrome-nickel steels.

chrome orange. See chrome red.

chrome oxide green (chromic oxide, hydrated).

A pigment consisting of chromic oxide (q. v.) and not to be confused with chrome green. It is made by burning sodium dichromate with a reducing agent. The pure grade consists of 99% Cr_2O_3 ; sp. gr. 5.20. Chrome oxide green is one of the most permanent and indestructible pigments available and is fast to strong alkali and acids. It is weaker tinctorially and less brilliant than chrome greens; has good opacity and low oil absorption. The range of shades obtainable is comparatively small. It is useful in lime-proof paints and finishes that are to be applied to cement surfaces. The hydrated chromium oxide (blue-green in color) is also used as a paint pigment.

Containers: Bags, barrels, fiber drums.

chrome potash alum. See chromium-potassium sulfate.

chrome red (Chinese red, American vermilion, Austrian cinnabar; Derby red, Persian red; Victoria red chromate red, chrome orange). A paint pigment consisting of basic lead chromate which corresponds to the formula $\text{PbCrO}_4 \cdot \text{PbO}$, with considerable variation in the proportions of the PbO and PbCrO_4 .

Properties: Light orange to red powder; color varies depending on the alkalinity. Good body, working well in oil, but is darkened by sulfur and hydrogen sulfide. Good lightfastness. Soluble in acids and alkalis. Insoluble in water.

Derivation: (a) By digesting white lead with potassium dichromate and caustic soda. (b) By boiling chrome yellow (q. v.) with caustic soda or calcium hydroxide. (c) By the precipitation process from lead acetate or nitrate and sodium dichromate.

Grades: Technical, C. P.

Uses: Usually wherever an orange pigment is desired, unless it is necessary for some special purpose to employ a different type to obtain better brilliancy, alkali-fastness, non-settling properties or to avoid the use of a lead pigment. The darker shades find application in the manufacture of rust-inhibitive paints, and are generally referred to as basic lead chromates.

Note: Chrome red can be imitated by coloring white lead, orange lead, or barytes with certain of the coal-tar dyes, e. g., eosine.

chrome steel. See steels, stainless; iron, stainless; and chromium iron alloys.

chrome tanning. Process for the treatment of animal hides using a tanning solution of

basic chromium sulfate, perhaps $\text{Cr}(\text{OH})\text{SO}_4$, with concentration and acidity carefully controlled. Chrome tanning has almost completely replaced vegetable tanning in the production of upper-shoe leather. Ammonium salts are usually added to the tanning bath to control the pH of the skins.

chrome-vanadium steels. Steel made by basic open-hearth or electric furnace, containing up to 1.1% chromium and 0.15% vanadium. Used for high-quality springs.

chrome yellows (primrose chrome; primrose yellow, pale chrome, middle chrome; deep chrome; lemon chrome; lemon yellow; permanent yellow; yellow ultramarine). Yellow paint pigments of lead chromate, PbCrO_4 .

Colors: A very light-greenish yellow to the lemon or light shade to a medium yellow. Medium yellow is about a normal lead chromate, containing 95% or more lead chromate, PbCrO_4 . The lighter hues contain varying amounts of coprecipitated lead chromate and lead sulfate. Chrome yellows are very bright yellows and considerable progress has been made in recent years in improving their lightfastness, although even the best chrome yellows darken to some degree on exposure to light. The chrome yellows are considerably brighter and are available in a much greater range of shades than the iron oxide yellows. Chrome yellows are not alkali fast and they will not withstand extremely high baking temperatures without discoloration. Chrome yellows are used in paints and enamels, also kalsomine, but not in casein paints or finishes that are to be applied to surfaces that are alkaline, such as cement or stucco. Being lead pigments, chrome yellows will blacken in the presence of sulfides.

chromic acetate (chromium acetate)

$\text{Cr}(\text{C}_2\text{H}_3\text{O}_2)_3 \cdot \text{H}_2\text{O}$.

Properties: Grayish-green powder or bluish-green, pasty mass. Soluble in water, insoluble in alcohol.

Derivation: By the action of acetic acid on chromium hydroxide. The solution is evaporated and crystallized.

Method of purification: Recrystallization.

Grades: Technical, paste; powder; C. P.; 7½% solution.

Containers: 1-lb bottles; wooden barrels; solution in drums.

Uses: Textile mordant; tanning.

Shipping regulations: None.*

chromic acid (chromium trioxide; chromic anhydride) CrO_3 . The name is in common use, although the true chromic acid, H_2CrO_4 , exists only in solution.

Properties: Dark-purplish red crystals; soluble in water and ether. It is deliquescent and destructive to animal or vegetable tissues. Sp. gr. 2.67-2.82; m. p. 196°C.

Caution: Should not be brought into intimate contact with organic substances or other

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

reducing agents, as serious explosions are likely to result.

Derivation: (a) Sulfuric acid is added to a solution of sodium dichromate and the product is crystallized out; (b) chromite is fused with soda ash and limestone and then treated with sulfuric acid; (c) electrolytic process.

Method of purification: Crystallization.

Grades: Technical; C. P.

Containers: 100-, 400-lb drums; bottles; tins.

Uses: Chemicals (chromates; oxidizing agent, catalysts); chromium plating; intermediate; medicine (caustic); process engraving; anodizing; ceramic glazes; colored glass, metal cleaning; inks, tanning; paints; rubber pigment; textile mordant.

Danger: Strong oxidant. Contact with other material may cause fire. May cause burns or external ulcers. MCA warning label.

Shipping regulations: Oxidizing material.

Yellow label.* Chromic acid solution;

Corrosive liquid; white label.*

chromic anhydride. See chromic acid.

chromic bromide (chromium bromide)

$\text{CrBr}_3 \cdot 6\text{H}_2\text{O}$.

Properties: Green crystals. Very hygroscopic. Soluble in alcohol and water.

Sp. gr. 5.4.

Grades: Technical.

chromic chloride (chromium chloride; chromium sesquichloride) (a) CrCl_3 or (b) $\text{CrCl}_3 \cdot 6\text{H}_2\text{O}$.

Properties: (a) Violet crystals. Sp. gr. 2.76; sublimes about 1300°C . Occurs in both soluble and insoluble forms; the latter dissolves easily in water in the presence of a trace of chromous chloride or stannous chloride.

(b) Greenish-black or violet deliquescent crystals depending on whether or not chlorine is coordinated with the chromium. Sp. gr. 2.76; m. p. 83 or 95°C . Very soluble in water, soluble in alcohol, insoluble in ether.

Derivation: (a) By passing chlorine over a mixture of chromic oxide and carbon. (b) By the action of hydrochloric acid on chromium hydroxide.

Grades: Technical, C. P.

Containers: 1-, 5-lb bottles, 450-lb wooden barrels or fiber drums.

Uses: Chromium salts; intermediates, textile mordant, chromium plating, catalyst for polymerizing olefins.

Shipping regulations: None.*

chromic chloride (basic) $\text{Cr}_5(\text{OH})_6\text{Cl}_4 \cdot 12\text{H}_2\text{O}$.

Properties: Sp. gr. 1.70. Readily soluble in water, methanol, ethanol and acetone.

Uses: Chromium compound intermediate; mordant in textile printing and dyeing; solvent tanning of leather.

chromic fluoride (chromium fluoride)

$\text{CrF}_3 \cdot 4\text{H}_2\text{O}$ or $\text{CrF}_3 \cdot 9\text{H}_2\text{O}$.

Properties: Fine, green crystalline powder. Soluble in water and acids; insoluble in

alcohol. Sp. gr. 3.78.

Derivation: By the interaction of chromium hydroxide and hydrofluoric acid.

Method of purification: Crystallization.

Grades: Technical; C. P.

Containers: 1-lb bottles; 400-lb wooden barrels.

Uses: Printing and dyeing wools; mothproofing woolen fabrics.

Shipping regulations: None.*

chromic formate $\text{Cr}(\text{OH})(\text{HCOO})_2$.

Properties: Dark green liquid. Sp. gr. (20°C) 1.237; wt./gal 10.3 lb.

Grade: Technical.

Containers: Bottles.

Uses: Tanning agent; textile mordant; synthesis.

chromic hydrate. See chromic hydroxide.

chromic hydroxide (chromic hydrate; chromium hydroxide; chromium hydrate) $\text{Cr}(\text{OH})_3$.

Properties: Green, gelatinous precipitate; decomposed to chromic oxide by heat. Insoluble in water; soluble in acids and strong alkalis.

Derivation: By adding a solution of ammonium hydroxide to the solution of a chromium salt.

Grades: Technical; C. P.

Containers: 1-lb bottles; wooden kegs; fiber containers.

Uses: Chromium salts and chromites; paint pigment.

Shipping regulations: None.*

chromic nitrate (chromium nitrate)

$\text{Cr}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$.

Properties: Purple crystals, soluble in alcohol and water. B. p. 125.5°C (dec); m. p. 37°C .

Derivation: By the action of nitric acid on chromium hydroxide.

Shipping regulations: Oxidizing material. Yellow label.*

chromic oxide (chromium oxide; chromium sesquioxide; green cinnabar) Cr_2O_3 .

Properties: Bright-green, crystalline powder, sp. gr. 5.04; m. p. 1990°C , insoluble in water, acids, and alkalis.

Derivation: (a) By heating chromium hydroxide; (b) by heating dry ammonium dichromate; (c) by heating sodium dichromate with sulfur and washing out the sodium sulfate.

Grades: Technical; C. P., 99%.

Containers: 1-lb bottles, 100-lb kegs; 300-lb barrels.

Uses: Metallurgy, paint pigment; ceramics, catalyst in organic synthesis.

Shipping regulations: None.*

See also chrome oxide green.

chromic oxide, hydrated. See chrome oxide green.

chromic phosphate (chromium phosphate;

Arnaudon's green, Plessy's green).

(a) $\text{CrPO}_4 \cdot 6\text{H}_2\text{O}$; (b) $\text{CrPO}_4 \cdot 4\text{H}_2\text{O}$.

Properties: (a) Violet crystals; (b) green crystals. Soluble in acids; insoluble in water.

*See "I. G. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: (a) By the interaction of solutions of chromium chloride and sodium phosphate; (b) by mixing cold solutions of chrome alum and disodium hydrogen phosphate. Violet amorphous powder (not the hexahydrate) is formed which becomes crystalline on contact with water. On boiling it is converted into green crystalline hydrate.

Grades: Technical.

Containers: Wooden kegs.

Use: Paint pigment.

Shipping regulations: None.*

chromic sulfate (chromium sulfate)

(a) $\text{Cr}_2(\text{SO}_4)_3$; (b) $\text{Cr}_2(\text{SO}_4)_3 \cdot 15\text{H}_2\text{O}$;

(c) $\text{Cr}_2(\text{SO}_4)_3 \cdot 18\text{H}_2\text{O}$.

Properties: (a) Violet or red powder; (b) dark-green amorphous scales; (c) violet cubes. Sp. gr. (a) 3.012; (b) 1.867; (c) 1.70. (a) Insoluble in water and acids; (b) soluble in water, (c) soluble in water and alcohol.

Derivation: By the action of sulfuric acid on chromium hydroxide, with subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical, C.P.

Containers: 5-, 10-, 25-lb tins, 500-lb barrels.

Uses: Textile industries, green paints and varnishes; green ink, ceramics (glazes, green effects), tanning.

Shipping regulations: None.*

chromic sulfate, basic. Form of chromic sulfate used in tanning hides. Produced by reducing sodium dichromate with an inexpensive reducing agent.

"Chromindigen." ³⁰⁷ Trademark of mordant dyestuff. Used for the dyeing of wool and characterized by excellent fastness to light and very good fastness to fulling.

chromite (chrome iron ore) FeCr_2O_4 . A natural oxide of ferrous iron and chromium, sometimes with magnesium and aluminum present. Usually found in magnesium- and iron-rich igneous rocks.

Properties: Color iron-black to brownish-black; streak dark brown; luster metallic to submetallic; sp. gr. 4.6, hardness 5.5.

Grades: Metallurgical, refractory, chemical.

Occurrence: California, Oregon; South Africa; Cuba; U. S. S. R., Rhodesia, Philippines, Turkey.

Uses: Only commercial source of chromium and its compounds; metallurgy (chrome steel and ferrochrome); refractories; pigments.

chromium Cr. Element of atomic number 24, of group VI of the periodic system.

Properties: Hard, brittle, steel-gray metal. Does not tarnish in air. Resists very strong oxidizing agents due to passivity. Sp. gr. 7.1; m. p. 1900°C, b. p. 2200°C, soluble in acids, except nitric; soluble in strong alkalies, insoluble in water.

Derivation: The only important commercial source of chromium is chromite,

$\text{FeO} \cdot \text{Cr}_2\text{O}_3$. American ore production is insignificant. Hence chromium is usually classed as "strategic" from the U. S. viewpoint. The metal is obtained by reducing the oxide by the thermite process using finely divided aluminum, reduction of chromite by carbon yields ferrochrome. Electrolytic chromium, made by electrolyzing chromium solutions, is a commercial product.

Forms available: Lumps, granules, powder; electroplates; high-carbon and low-carbon ferrochromium (about 70% Cr); high purity (99.97+%).

Uses: Stainless steels, chromium-plated ware, and many alloys characterized by high strength and corrosion resistance even at high temperatures; high purity grade used in nuclear energy and high temperature research.

chromium 51. Radioactive chromium of mass number 51.

Properties: Half-life 26.5 days; radiation, gamma and K.

Grade: N. N. D. (as radioactive $\text{Na}_2\text{Cr}^{51}\text{O}_4$).

Uses: Diagnosis of blood volume, blood cell life and cardiac output; etc.

Shipping regulations: Class D poison, radioactive material. Red label.*

chromium acetate. See chromic acetate.

chromium acetylacetonate

$[\text{CH}_3\text{COCH}(\text{CH}_3)\text{O}]_3\text{Cr}$.

Properties: Purple powder or red-violet crystals; m. p. 216°C, b. p. 340°C; insoluble in water, soluble in acetone and alcohol.

Derivation: Reaction of chromium chloride, acetylacetone and sodium carbonate.

Grades: Technical.

Use: Reduction of detonation of nitromethane.

chromium ammonium sulfate (ammonium chromium sulfate; chrome ammonium alum) $\text{CrNH}_4(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$.

Properties: Green powder or deep violet crystals. Soluble in water, slightly soluble in alcohol. The aqueous solution is violet when cold, green when hot.

Grades: Technical.

Uses: Mordant; tanning.

chromium borides. At least three have been described. CrB , CrB_2 , and Cr_3B_2 . They have high melting points, are very hard and corrosion-resistant, and may be suitable for use in jet and rocket engines.

Properties: CrB , may be crystalline; sp. gr. 6.2; m. p. 1550°C; Mohs hardness 8.5; resistivity 67 $\mu\text{-ohm cm}$ (20°C). CrB_2 , sp. gr. 5.15; m. p. 1850°C; hardness 2010 knoop; resists oxidation up to 1100°C. Cr_3B_2 , may be crystalline; sp. gr. 6.1; Mohs hardness 9+; resistivity 116 $\mu\text{-ohm cm}$ (20°C).

Uses: Metallurgical additives; high temperature electrical conductors; cermets; refractories; coatings resistant to attack by molten metals.

chromium carbide Cr_3C_2

Properties: Orthorhombic crystals; sp. gr.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

6.65; microhardness, 2700 kg/sq mm (load 50 g); m.p. 1700°C; resistivity 95μ-ohm cm (room temperature). Has about best oxidation resistance at high temperatures of all metal carbides.

Uses: As gage blocks and hot extrusion dies, in powder form, as spray coating material; as components for pumps and valves which are chemically corrosion-resistant.

chromium carbonate. See chromous carbonate.

chromium chloride. See chromic chloride.

chromium copper. A copper-chromium alloy containing 8-11% chromium. Used in the manufacture of hard steels for increasing elasticity.

chromium fluoride. See chromic fluoride.

chromium hydrate. See chromic hydroxide.

chromium hydroxide. See chromic hydroxide.

chromium-iron alloys. Chromium in iron (1) increases resistance to oxidation and corrosion, (2) increases hardenability, (3) adds some strength at high temperatures, (4) resists abrasion and wear (with high carbon).

Chromium is used to form useful steels containing from 1-30% chromium. In low carbon ranges alloys are ductile, with high-carbon, very hard. Chromium is the essential component of stainless irons and steels.

See steel, stainless; ferrochromium.

chromium manganese antimonide. Brittle gray compound that exhibits magnetic properties only when above a definite temperature. If the composition of the compound is deliberately changed slightly, the temperature needed is shifted.

chromium naphthenate

Properties: Dark-green liquid or violet powder.

Derivation: By addition of chromium salts to solution of sodium naphthenate and recovery of the precipitate.

Grades: 6% chromium.

Containers: 400-lbs (net) standard packages.

Use: Paints (anti-chalking agent).

chromium nitrate. See chromic nitrate.

chromium oxide. See chromic oxide.

chromium oxychloride. See chromyl chloride.

chromium phosphate. See chromic phosphate.

chromium plating. Chromium plating is the process by which a thin, bright surface layer of metallic chromium is electrodeposited, usually from chromic acid-sulfuric acid baths, for protective and decorative purposes. "Hard-chromium" plating refers to the electrodeposition of thicker, very hard, chromium layers for engineering applications.

chromium potassium sulfate (chrome alum, chrome potash alum) $\text{CrK}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$. Properties: Dark, violet-red crystals,

efflorescent; sp.gr. 1.813. Soluble in water.

Derivation: By reducing potassium dichromate in dilute sulfuric acid with sulfurous acid.

Grades: Technical; C.P.

Containers: 1-, 5-lb bottles; 25-lb boxes; 100-lb kegs; 432- to 520-lb barrels; 500-lb casks.

Uses: Tanning industry (chrome-tan liquors), textile industry (mordant); photography (fixing bath); ceramics.

Shipping regulations: None.*

chromium sesquichloride. See chromic chloride.

chromium sesquioxide. See chromic oxide.

chromium steel. See steel, stainless; iron, stainless; and chromium-iron alloys.

chromium sulfate. See chromic sulfate.

chromium trioxide. See chromic acid.

chromogen. See chromophore.

"**Chromogene.**"³⁰⁷ Trademark for mordant dyestuffs used on wool and leather. Characterized by very good fastness to light, fulling, etc.

"**Chromol.**"²⁴⁴ Trademark for a series of raw oils emulsified with a non-ionic emulsifier and therefore stable to alum and salt. Used in the leather industry. Containers: Non-returnable steel drums averaging 400-425 lbs net.

"**Chromolan.**"²⁴³ Trademark of metalized acid dyes.

chromophore. Chemical grouping which when present in an aromatic compound (the chromogen) gives color to the compound by causing a displacement of, or appearance of, absorbent bands in the visible spectrum. Dyes are sometimes classified on the basis of their chief chromophores, e.g., -NO, nitroso dyes; -NO₂, nitro dyes; -N=N-, azo dyes, etc.

"**Chromosorb.**"²⁴⁷ Trademark for a line of closely graded (screened) calcined or flux-calcined diatomite aggregates. Available with or without acid washing. Calcined types are inherently pink color (Chromosorb P); flux-calcined types white colored (Chromosorb W). Hydrophobic (silicone treated) grades also available. Choice of grades available dependent on desired mesh or pore size.

Containers: 454 g. Chromosorb P, 300 g. Chromosorb W in glass bottles.

Use: In vapor-phase gas chromatography.

chromous bromide (chromium bromide)

CrBr_2 .

Properties: White crystals, changes to yellow on heating. Oxidizes in moist air but stable in dry air. Sp.gr. 4.356; soluble in water (blue color).

***chromous carbonate** (chromium carbonate)

CrCO_3 .

Properties: Grayish-blue amorphous mass, sp.gr. 2.75. Soluble in mineral acids;

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

slightly soluble in water containing carbon dioxide; insoluble in alcohol.

chromous chloride CrCl_2 .

Properties: White, deliquescent needles, active reducing agent, very soluble in water.

Derivation: Reaction of the metal with anhydrous hydrogen chloride.

Grade: C.P.

Uses: Reducing agent, oxygen absorbent.

chromous oxalate $\text{CrC}_2\text{O}_4 \cdot \text{H}_2\text{O}$.

Properties: Yellow crystalline powder; soluble in water; active reducing agent.

Grades: C.P.

"Chromoxane." ³⁰⁷ Trademark of mordant dyestuffs. Used on wool, characterized by fairly good fastness to light, very good fastness to fulling, etc., and by relatively bright shade.

chromule. See chlorophyll.

chromyl chloride (chromium oxychloride, chlorochromic anhydride) CrO_2Cl_2 .

Properties: Mobile, dark red liquid. B.p. 116°C ; freezing point -96.5°C , sp. gr. 1.911. Fumes in air; reacts vigorously with water to form chromic acid, chromic chloride, hydrochloric acid, and chlorine. Miscible with carbon tetrachloride, tetrachloroethane, carbon disulfide.

Derivation: By heating sodium dichromate and sodium chloride with sulfuric acid.

Grades: Technical.

Containers: 400-g bottles; 85-, and 200-lb stainless steel drums.

Uses: Organic oxidations and chlorinations, solvent for chromic anhydride, chromium complexes and dyes.

Caution! Poison!

Shipping regulations: Corrosive liquid. White label.*

chrysamine G $\text{C}_{26}\text{H}_{16}\text{N}_4\text{O}_6\text{Na}_2$.

Properties: Yellowish-brown powder. Very sparingly soluble in water.

Derivation: By coupling diazotized benzidine with salicylic acid.

chrysamine R $\text{C}_{28}\text{H}_{20}\text{N}_4\text{O}_6\text{Na}_2$.

Properties: Yellowish-brown powder.

Very sparingly soluble in water.

Derivation: By coupling diazotized toluidine with salicylic acid.

chrysanthemum monocarboxylic acid. Occurs in the pyrethrin group of natural and synthetic insecticides (cinerin I, pyrethrin I, allethrin, barthrin, cyclothrin, ethythrins, and furethrin). It is 2,2-dimethyl-3-(2-methylpropenyl)cyclopropanecarboxylic acid.

chrysarobin.

Properties: Microcrystalline orange-yellow powder; slight odor or odorless; tasteless. Soluble in chloroform and benzene; slightly soluble in ether and alcohol; very slightly soluble in water.

Derivation: Extraction from araroba.

Grades: Technical; U.S.P. XVI.

Containers: 1-oz vials; 1/4-, 1-lb cartons,

5-, 10-, 50-lb cans.

Use: Medicine.

Caution: Causes dangerous inflammation if it enters the eye; irritating to mucous membranes.

Shipping regulations: None.*

chrysazin. See 1,8-dihydroxyanthraquinone.

chrysene (1,2-benzphenanthrene) $\text{C}_{18}\text{H}_{12}$ (a tetracyclic hydrocarbon).

Properties: Crystals, sp. gr. 1.274 ($20/4^\circ\text{C}$), m.p. 254°C ; b.p. 448°C ; sublimes easily in a vacuum. Slightly soluble in alcohol, ether, glacial acetic acid. Insoluble in water.

Derivation: Product of distillation of coal tar.

Use: Organic synthesis.

chrysoberyl BeAl_2O_4 or $\text{BeO} \cdot \text{Al}_2\text{O}_3$.

A natural beryllium aluminate containing 19.8% beryllia. Color, various shades of green, yellow or sometimes raspberry or columbine red. Vitreous luster. Is not attacked by acids, but is decomposed by fused alkalis. Infusible by blowpipe.

Constants: Sp. gr. 3.5-3.84, hardness 8.5.

Occurrence: United States (Connecticut, New York, Maine), Brazil; Ceylon, Russia, Ireland.

Use: Gem stone.

chrysocale. An alloy composed of a large proportion of copper with some zinc and lead.

chrysocola $\text{CuSiO}_3 \cdot 2\text{H}_2\text{O}$. A natural hydrous copper silicate, usually found in the oxidized portion of copper veins.

Properties: Color green, blue-green, brown, to black, streak white to pale blue; luster vitreous to earthy. Usually impure. Sp. gr. 2-2.4, hardness 2-4.

Occurrence: Arizona, New Mexico, Europe.

Uses: Minor ore of copper; gem stone.

chrysoidine (meta-diaminoazobenzene hydrochloride) $\text{C}_6\text{H}_5\text{NNC}_6\text{H}_3(\text{NH}_2)_2 \cdot \text{HCl}$.

Properties: Red-brown powder or large black shiny crystals with a green luster. Soluble in alcohol and water giving orange-brown solutions. Insoluble in ether, m.p. 117°C .

Uses: Chiefly for cotton and silk dyeing to obtain orange colors.

chrysolite. See olivine.

chrysophanic acid (1,8-dihydroxy-3-methylanthraquinone, chrysophanol) $\text{C}_{15}\text{H}_{10}\text{O}_4$.

Properties: Yellow crystals, m.p. 196°C , sublimes. Slightly soluble in water and cold alcohol, soluble in hot alcohol, chloroform and ether.

Source: Found in rhubarb root, cascara sagrada, senna leaves, goa powder.

Derivation: Oxidation of chrysarobin and other synthetic methods.

Use: Medicine.

chrysophanol. See chrysophanic acid.

chrysophenine. A bright yellow synthetic dye of the stilbene group, used in dyeing textiles and leather.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

chrysoprase. An apple green variety of chalcedony (q. v.).

chrysotile. An important variety of light green to yellow-brown serpentine asbestos with delicate and easily separated fibers and a silky luster. See asbestos.

chu. Abbreviation for centigrade heat unit. It is the amount of heat required to raise the temperature of one pound of water one centigrade degree from 15°C to 16°C. It is sometimes called a pcu (pound centigrade unit).

chymosin. See rennin.

chymotrypsins. Enzymes found in the intestine which catalyze the hydrolysis of various proteins (especially casein) and protein digestion products to form polypeptides and amino acids.

chymotrypsinogen. A crystallizable enzyme occurring in the pancreas, which gives rise to chymotrypsin (q. v.).

Use: Biochemical research.

CI. Abbreviation for "Colour Index," the semiofficial description of dyes arranged by numbers assigned according to chemical classes. The more recent edition of "Colour Index" uses a different set of numbers from that of the first edition. See under dyes for the later numbers. The first edition numbers are all in four figures or less, whereas the later edition uses five-figure numbers.

"Cicoil." ⁹⁰ Trade name of a raw, permanently liquid oiticica oil derived from the nuts of the Brazilian tree, *Licania rigida* Benth.

Properties: A drying oil replacement for tung oil. It is the glyceride of alpha-licanic acid (4-keto-9,11,13-octadecatrienoic acid). The keto groups in the acid radical give it unusual compatibility with lacquers, urea, melamine formol resins, vinyl resins and alkyls.

Constants: Viscosity (Gardner-Holdt) w-z (25°C), color (Gardner-Holdt), 9-11, heating test (ASTM), max. 17, sp. gr. 0.9770-0.9880 (20°C), refractive index 1.5090-1.5130 (25°C), acid value, max 4% F. F. A., saponification value, 186-193; unsaponifiable matter, 1.5%.

Uses: Paints, oleoresinous varnishes, synthetic varnishes, linoleum, core oils, water proofing compounds and lacquers.

"Cicoil Standoil." ⁹⁰ Trade name for "Cicoil" that has been heated to 230°C and held at that temperature for 15-20 min, then cooled. The viscosity is then about Z₄ (Gardner).

cigarette tar. The comparatively non-volatile residue from the burning of cigarette tobacco which appears in finely divided form in the smoke. Cigarette tar is known to contain minute traces of the highly aromatic ring compounds (especially benzo[a]-pyrene) found in coal tar which are supposed to cause cancer. See carcinogen.

"Ciment Fondu." An aluminous cement of the sintered type which originated in France. See cement, aluminous.

cimicifuga (black snake root; black cohosh; bugroot; bugbane; bugwort). Dried rhizome and roots of *Cimicifuga racemosa*.

Habitat: United States and Canada.

Grades: Technical.

Containers: Bales.

Use: Medicine.

Shipping regulations: None.*

cimicifugin (macrotin). An extract of resins and other bodies occurring in *Cimicifuga*. Yellowish-brown hygroscopic powder; soluble in alcohol.

cina. See santonica.

cincholepidine. See lepidine.

cinchona bark, calisaya. (Peruvian bark; calisaya bark; yellow cinchona bark; yellow calisaya bark; Jesuits' bark).

Derivation: Dried bark of *Cinchona calisaya* or other species of cinchona.

Habitat: South America; cultivated in Java, India, Jamaica, Ceylon, and West Africa.

Grades: Technical.

Containers: Bales; bags.

Use: Medicine.

Shipping regulations: None.*

cinchona bark, loxa. (loxa bark; crown bark; loxa bark; huanuco bark; cuenca bark).

Derivation: Bark of *Cinchona officinalis* and other species of cinchona.

Habitat: Loxa and other parts of Ecuador; cultivated in India.

cinchona bark, succirubra (red cinchona; red Peruvian bark, red bark; St. Ann's bark).

Derivation: Dried bark of *Cinchona succirubra* or of its hybrids.

Habitat: South America; cultivated in Japan, Java, India, and Western Africa.

Containers: Bags.

cinchonidine C₁₉H₂₂N₂O, an alkaloid.

Properties: White prisms or powders.

Odorless and bitter taste; protect from light. M. p. 210°C with decomposition; soluble in alcohol; slightly soluble in water and ether.

Derivation: By extraction of certain varieties of cinchona bark, and subsequent crystallization. The salts are formed by the action of the respective acid on the alkaloid.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Vials; 5-, 25-, 50-, 100-oz tins.

Use: Medicine.

Shipping regulations: None.*

cinchonidine bisulfate C₁₉H₂₂N₂O · H₂SO₄ · 5H₂O.

cinchonidine hydrochloride C₁₉H₂₂ · HCl · 2H₂O.

cinchonidine sulfate (C₁₉H₂₂N₂O)₂ · H₂SO₄ · 3H₂O.

cinchonine C₁₉H₂₂N₂O, an alkaloid.

Properties: White, shining prisms or needles;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

m.p. 264.3°C; slightly soluble in water, alcohol, and ether. Aqueous solution is dextrorotatory.

Derivation: By extraction of the bark of various species of cinchona and subsequent crystallization. The salts are formed by the action of the respective acid on the alkaloids.

Method of purification: Crystallization.

Grades: Technical.

Containers: 1-oz vials; 5-, 25-, 100-oz tins.

Use: Medicine.

Shipping regulations: None.*

cinchonine bisulfate $C_{19}H_{22}N_2O \cdot H_2SO_4 \cdot 4H_2O$.

cinchonine hydrochloride $C_{19}H_{22}N_2O \cdot HCl \cdot 2H_2O$.

cinchonine nitrate $C_{19}H_{22}N_2O \cdot HNO_3 \cdot \frac{1}{2}H_2O$.

cinchonine sulfate $(C_{19}H_{22}N_2O)_2 \cdot H_2SO_4 \cdot 2H_2O$.

cinchophen (phenylcinchoninic acid; 2-phenylquinoline-4-carboxylic acid) $C_9H_5N(C_6H_5)(COOH)$.

Properties: Colorless needles or white to yellowish-white powder, slightly bitter taste; faint odor resembling benzoic acid, affected by light, m.p. 213-216°C. Slightly soluble in ether and alcohol; very slightly soluble in chloroform, practically insoluble in water.

Derivation: By heating alcoholic solution of aniline, pyruvic acid, and benzaldehyde.

Containers: 25-, 100-lb drums.

Use: Medicine.

cinchotine. An alkaloid of cinchona. Produced by the oxidation of cinchonine.

cinder. See slag.

cinene. See dipentene.

cineol. See eucalyptol.

cinerin I $C_{20}H_{28}O_3$. One of the four primary active insecticidal principles of pyrethrum flowers. It is the 3-(2-butenyl)-4-methyl-2-oxo-3-cyclopenten-1-yl ester of chrysanthemum monocarboxylic acid. See also cinerin II, pyrethrin I and II.

Properties: A viscous liquid, quickly oxidized in air, b.p. 200°C (0.1 mm). Insoluble in water, soluble in organic solvents; incompatible with alkalies.

Use: Insecticide.

Shipping regulations: None.*

cinerin II $C_{21}H_{28}O_5$. One of the four primary active insecticidal principles of pyrethrum flowers. It is the 3-(2-butenyl)-4-methyl-2-oxo-3-cyclopenten-1-yl ester of chrysanthemumdicarboxylic acid monomethyl ester. See also cinerin I, pyrethrin I and II.

Properties: A viscous liquid, quickly oxidized in air; b.p. 200°C (0.1 mm). Insoluble in water, soluble in organic solvents.

Use: Insecticide.

Shipping regulations: None.*

cinnabar (natural vermilion, liver ore) HgS . A natural mercuric sulfide, found in veins

near recent volcanic rocks and hot springs.

Properties: Color cochineal red, scarlet, reddish brown to blackish; streak scarlet; luster adamantine to dull earthy when impure; sp.gr. 8.10; hardness 2.5. Soluble in aqua regia.

Occurrence: California, Nevada; Spain; Italy; Mexico, Yugoslavia.

Use: The only important ore of mercury.

cinnamaldehyde. See cinnamic aldehyde.

cinnamein. See benzyl cinnamate.

cinnamene. See styrene.

cinnamenol. See styrene.

cinnamic acid (beta-phenylacrylic acid; cinnamyllic acid) $C_6H_5CH:CHCOOH$.

Properties: White, crystalline scales; soluble in benzene, ether, acetone, glacial acetic acid, carbon disulfide, oils; insoluble in water.

Constants: Congealing point 133°C (min); b.p. 300°C, soluble in alcohol and ether; slightly soluble in water.

Derivation: By heating benzaldehyde with sodium acetate in presence of a dehydrating agent (acetic anhydride) or by heating benzyl chloride with sodium acetate in an autoclave. Occurs naturally in Peru and Tolu balsams and styrax.

Grades: Technical, refined.

Containers. 1-, 5-lb glass bottles; 1-, 5-, 10-lb cans.

Uses: Medicine, perfumes.

Shipping regulations: None.*

cinnamic alcohol (cinnamyl alcohol; phenylallylic alcohol, styrylic alcohol; 3-phenyl-2-propen-1-ol, styryl alcohol) $C_6H_5CH:CHCH_2OH$.

Properties: White needles or crystals; hyacinth-like odor. Soluble in 3 volumes of 50% alcohol.

Constants: Congealing point 33°C (min) (pure), as low as 24°C (tech.), b.p. 257°C.

Derivation: (a) From oil of cassia or oil of cinnamon. Occurs as an ester. (b) Reduction of cinnamic aldehyde.

Method of purification: Recrystallization.

Grades: Technical.

Containers 1-, 2-, 5-lb bottles; tin cans.

Uses: Perfumery, particularly for lilac and other floral scents.

Shipping regulations: None.*

cinnamic aldehyde (cinnamaldehyde, 3-phenylpropenal, cinnamyl aldehyde) $C_6H_5CH:CHCHO$.

Properties: Yellowish oil; cinnamon odor. Soluble in 5 volumes of 60% alcohol, very slightly soluble in water. Keep well stoppered.

Constants: Sp.gr. 1.048-1.052; refractive index 1.618-1.623; m.p. -8°C, b.p. 248°C.

Derivation: (a) From Ceylon and Chinese cinnamon oils. (b) By condensation of benzaldehyde and acetaldehyde.

Method of purification: Rectification.

Containers: 1-, 2-, 5-, 10-lb bottles; drums.

Uses: Flavors; spice perfumes.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

cinnamic ether. Incorrect name for ethyl cinnamate.

cinnamol. See styrene.

cinnamon (cinnamon, Saigon).

Derivation: Bark of *Cinnamomum loureirii*.

Habitat: Anam (Cochin China); cultivated in Java, Sumatra and South America.

Grades: Technical; N. F. XI.

Containers: Boxes.

Uses: Medicine, source of cinnamon oil; flavoring; condiment.

Shipping regulations: None.*

cinnamon, artificial. Mixture of 10-25 parts cinnamic aldehyde, one part eugenol applied to a mixture of pecan shell powder and powdered toasted wheat bran, wood flour, bark flour, or similar materials. The oily mixture is dissolved in alcohol and the solution applied to the carrier powder and the solvent allowed to evaporate. Sometimes very small proportions of oil of cassia or oil of cinnamon are also added to the oily mixture.

cinnamon bark oil. See cinnamon oil.

cinnamon, cassia (cinnamon; cassia bark; Chinese cinnamon).

Derivation: Bark of *Cinnamomum cassia*.

Habitat: Southern China and Anam.

Uses: Medicine; source of cassia oil, flavoring; condiment.

cinnamon, cassia oil. See cassia oil.

cinnamon, Ceylon.

Derivation: Inner bark of the shoots of *Cinnamomum zeylanicum*.

Habitat: Ceylon, Sumatra, and Borneo, cultivated in tropical Africa, America, and Asia.

Grades: Technical, N. F. XI.

Containers: Boxes, bags.

Uses: Medicine, source of cinnamon oil, flavoring, condiment.

Shipping regulations: None.*

cinnamon leaf oil.

Properties: Pale yellow liquid, with pungent cinnamon odor.

Grades: (a) Ceylon, (b) Seychelles.

Chief known constituents: (a) Eugenol 70-90%; cinnamic aldehyde, up to 6%; cinnamic alcohol, safrole, linalool, benzyl benzoate, (b) same constituents, with eugenol content from 75-95%.

Constants: (a) Sp. gr. 1.03-1.06; optical rotation $-1^{\circ} 30'$ to $+2^{\circ} 20'$; refractive index 1.525-1.540, (b) sp. gr. 1.02-1.06; optical rotation and refractive index, same as (a). Soluble in about 1.5 volumes of 70% alcohol, sometimes slightly opalescent.

Containers: Drums.

Derivation: Distilled from the leaves of *Cinnamomum zeylanicum* Nees.

Uses: Medicine, flavoring; perfumery.

cinnamon oil (cinnamon bark oil).

Properties: A light yellow volatile oil, having a spicy cinnamon odor, more delicate in the Ceylon variety.

Grades: (a) Ceylon; (b) Seychelles.

Chief known constituents: Cinnamic aldehyde (up to 70%); eugenol (up to 18%); phellandrene, benzaldehyde, linalool, and (for Seychelles variety) camphor.

Constants: Sp. gr. 1.014-1.040; refractive index 1.569-1.584; optical rotation, levo, up to -2° .

Derivation: Distilled from the bark of *Cinnamomum zeylanicum* Nees.

Containers: Bottles.

Uses: Medicine; flavoring; perfumery.

Shipping regulations: None.*

cinnamon oil, Chinese. See cassia oil.*

cinnamon oil, U.S.P. XVI. See cassia oil.

cinnamon, Saigon. See cinnamon.

cinnamon, white. See canella.

cinnamon wood. See sassafras bark.

cinnamoyl chloride $C_6H_5CH:CHCOCl$.

Properties: Yellow crystals; m. p. $35^{\circ}C$;

b. p. $170^{\circ}C$ (58 mm); sp. gr. 1.1617 ($45/4^{\circ}C$).

Use: Reagent for determination of water.

cinnamyl acetate $C_6H_5CH:CHCH_2OOCCH_3$.

Properties: Colorless liquid having a floral-spicy odor. Soluble in 4 volumes of 70% alcohol.

Constants: Sp. gr. 1.048-1.052; refractive index 1.539-1.542.

Use: Perfumery, as a fixative.

cinnamyl alcohol. See cinnamic alcohol.

cinnamyl aldehyde. See cinnamic aldehyde.

cinnamyl cinnamate (styracin) $C_9H_7O_2C_9H_7$.

Properties: Rectangular prismatic crystals; m. p. $40^{\circ}C$ (min). Soluble in alcohol, ether, benzene.

Derivation: Esterification of cinnamic acid with cinnamic alcohol.

Use: Perfumery.

cinnamylic acid. See cinnamic acid.

cinnamylic ether. Incorrect name for ethyl cinnamate.

"Cinnaryl." ²³³ Trademark for allyl cyclohexanepropionate used as food flavor and as a scent.

C-IPC. See chloro-IPC.

circa. Latin word for about or approximately, used here in describing properties.

Abbreviation: ca.

"Cirkal." ²⁴⁴ Trademark for an alkaline detergent. Highly alkaline, rapidly soluble, non-sudsing powder.

Uses: In-place cleaning in dairies and food plants.

Hazards: Concentrated alkali; can cause burns.

"Cirrasol." ²⁰⁶ Brand name of proprietary textile softening agents and fiber processing assistants.

cirtine (false topaz). A form of native silica or quartz (q. v.), light yellow in color.

The "Occidental topaz" or "Spanish topaz" of jewelers.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

cis-. A prefix denoting that one of two geometrical isomers (q.v.) in which certain atoms or groups are on the same side of a plane. See also *trans-*. In this dictionary, these prefixes are disregarded in the alphabetizing.

"**Cis-4**," ³⁰³ Trademark for a *cis*-1,4-polybutadiene synthetic rubber.

citraconic acid (methylmaleic acid)
 $\text{CH}_3\text{C}(\text{COOH})\text{:CH}(\text{COOH})$.

Properties: Hygroscopic colorless crystals. M.p. 91°C (dec), sp. gr. 1.62. Soluble in water, alcohol, ether; insoluble in benzene and petroleum ether.

Derivation: By carefully heating citric acid. Grades: Technical; C.P.

citraconic anhydride (methylmaleic anhydride)
 $\text{C}_5\text{H}_4\text{O}_3$.

Properties: Colorless liquid. M.p. 7-8°C, b.p. 213-214°C, sp. gr. 1.25 (15/4°C). Soluble in ether.

Grades: Reagent.

Containers: Sealed tubules.

Uses: Reagent for alkalies, alcohols, and amines.

citral (geranial; geranialdehyde, 3,7-dimethyl-2,6-octadienal)
 $(\text{CH}_3)_2\text{CCHCH}_2\text{CH}_2\text{C}(\text{CH}_3)\text{CHCHO}$. As found in commerce, a mixture of alpha and beta isomers.

Properties: Mobile pale yellow liquid having strong lemon odor, sp. gr. 0.891-0.897 (15°C), refractive index 1.4860-1.4900 (20°C), not optically active. Soluble in 5 volumes of 60% alcohol; soluble in all proportions of benzyl benzoate, diethyl phthalate, glycerin, propylene glycol, mineral oil, fixed oils, and 95% alcohol, insoluble in water.

Derivation: Principal constituent of lemon grass oil and can be isolated by fractional distillation. Obtained synthetically by oxidation of geraniol, nerol, or linalool by chromic acid.

Grades: Technical; pure.

Containers: Glass bottles, tins, (synthetic) drums.

Uses: Perfumes; flavoring agent, intermediate for other aromatics.

citric acid (2-hydroxy-1,2,3-propane-tricarboxylic acid)
 $\text{HOOCCH}_2\text{C}(\text{OH})(\text{COOH})\text{CH}_2\text{COOH}\cdot\text{H}_2\text{O}$. Also available in anhydrous form.

Properties: Colorless translucent crystals, or as a white granular to fine crystalline powder; odorless, strongly acid taste, hydrated form is efflorescent in dry air. Sp. gr. 1.542, m.p. 153°C (anhydrous form). Very soluble in water and alcohol; soluble in ether.

Occurrence: Widely in living cells, both animal and plant. See TCA cycle.

Derivation: By mold fermentation of carbohydrates, including deep fermentation; from lemon, lime, pineapple juice, molasses.

Grades: Both hydrous (hydrated) and anhydrous; technical, C.P.; U.S.P. XVI.

Containers: Various, including bags, cartons, barrels, drums.

Uses: Preparation of citrates, flavoring extracts, confections, soft drinks, effervescent salts; medicines; antioxidant in foods; sequestering agent, including water conditioning; cleaning and polishing agent for stainless steel and other metals; alkylid resins; mordant.

citric acid cycle. See TCA cycle.

citrine ointment (mercuric nitrate ointment).

A fatty ointment prepared from 7 parts mercury, 17 parts by weight of nitric acid and 76 parts of lard. When freshly made it has a greenish-yellow color but it becomes brown with age.

Containers: Jars and wooden tubs. Contact with all metal containers must be avoided.

Use: Pharmaceutical.

Shipping regulations: None.*

citrinin $\text{C}_{13}\text{H}_{14}\text{O}_5$. An antibiotic yellow pigment produced by *Penicillium citrinin* Thom and *Aspergillus niveus*; m.p. 170-171°C (decomposes). Yellow crystals, insoluble in water; soluble in alcohol, dioxane, dilute alkali solutions.

"**Citroflex-2**," ²⁹⁹ Trademark for triethyl citrate.

"**Citroflex-4**," ²⁹⁹ Trademark for tributyl citrate.

"**Citroflex A-2**," ²⁹⁹ Trademark for acetyl triethyl citrate.

"**Citroflex A-4**," ²⁹⁹ Trademark for acetyl tributyl citrate.

"**Citronel 'B' and 'C'**," ¹⁸⁸ Brand name for lemon oil substitutes for technical use.

citronellal $\text{C}_9\text{H}_{17}\text{CHO}$. 3,7-Dimethyloct-6(or 7)-enal. Has both *d*- and *l*-isomers. The *d*-isomer is described.

Properties: Colorless liquid having an intense lemon-like odor, sp. gr. 0.847-0.850; optical rotation +8° to +11°; b.p. 205°C, refractive index (*n*_{20/D}) 1.4566. Slightly soluble in water, soluble in alcohol and ether.

Derivation: From lemon, lemon grass, citronella oil and other oils.

Containers: Bottles, drums.

Uses: Soap perfumery, raw material for manufacture of hydroxycitronellal.

citronellal hydrate. See hydroxycitronellal.

citronella oil.

Properties: Light yellowish oil, with rather pungent, citrus-type odor. Soluble in 80% alcohol. Sp. gr. 0.887-0.906; refractive index 1.468-1.483, solutions are levorotatory.

Derivation: Steam-distilled from the grass of *Cymbopogon nardus*.

Grades: Ceylon; Java.

Containers: Tins; glass bottles.

*Uses: Medicine; insect repellent; perfumes for soaps and disinfectants; source for manufacture of citronellal, geraniol, and products derived therefrom.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

citronellol $C_9H_{17}CH_2OH$. A mixture of two structural isomers, 3,7-dimethyloct-6 (or 7)-enol.

Properties: Colorless liquid, having a somewhat rosy odor; sp. gr. 0.849-0.853; refractive index 1.456-1.458; optical rotation $-1^{\circ} 30'$ to $+1^{\circ} 30'$. Soluble in two or more volumes of 70% alcohol.

Occurrence: In oils of citronella, geranium, rose, savin and other essential oils.

Derivation: From the oils above, or by reduction of citronellal or geraniol.

Containers: Bottles; drums.

Use: Perfumery, for floral odors, mainly of the rose types.

citronellyl acetate (citronellyl acetic ether)
 $C_{10}H_{19}OOCCH_3$.

Properties: Colorless liquid. Odor somewhat like that of bergamot oil.

Constants: Sp. gr. 0.884-0.891; b. p. 119-121°C (15 mm); optical rotation usually slightly dextro, up to $+1^{\circ}$; refractive index 1.450-1.452. Soluble in 9 volumes of 70% alcohol.

Derivation: Action of acetic anhydride upon citronellol.

Grades: Technical.

Use: Perfumery.

citronellyl acetic ether. Incorrect name for citronellyl acetate.

citron yellow. See zinc yellow.

citrophen (para-phenetidine citrate)

$C_3H_5OH(COOH)_3 \cdot C_6H_4(OC_2H_5)_2NH_2$.

Properties: White crystalline powder.

M. p. 188°C. Slightly soluble in water.

citrovorum factor. See folic acid.

citrulline $NH_2CONH(CH_2)_3CHNH_2COOH$. An arginine derivative. It is an amino acid found in watermelon juice, in the L(+) form.

Properties: Crystals from methanol-water mixture; m. p. 222°C; soluble in water, insoluble in methanol and ethanol.

Use: Biochemical research.

citrullus colocynthis. See colocynth.

citrus aurantium. See orange peel, sweet, and orange peel, bitter.

citrus flavonoid compounds. See bioflavonoids.

civet (zibeth).

Derivation: Unctuous secretion from the civet cat, *Viverra civetta*, Zibetha.

Habitat: Asia, Malakka Islands; Ethiopia; and East Indies.

Properties: Yellow to brown. Semi-solid. Soluble in hot alcohol and ether, insoluble in water.

Grades: Technical (crude, refined, artificial).

Containers: Horns of variable size ranging from 20-40 ozs each; 1-, 2-, 4-, 8-oz jars.

Use: Perfumery (fixative).

Shipping regulations: None.*

civettal. See "Tetraquinone."

"Civona." ²⁸ Trademark for a hollow filament rayon fashion yarn. See rayon.

Cl. Symbol for chlorine.

clad metal. A special kind of combination in which two different metals are bonded by being rolled together with proper pressure, temperature and length of time. At the interface each metal diffuses sufficiently into the other to form an alloy and a permanent union.

clad steels. Composite materials consisting of a base of open-hearth steel that has a layer of pure nickel or nickel alloy bonded to it on one or on both sides. The plate is formed by pressure-welding in rolling mills at 2200°F. A solid solution of nickel and iron is formed at the junction. The physical properties of the cladding are very similar to those of the iron plate so that great stresses are not set up across the interface. Supplied with standard cladding, which may be 5, 10, 15, and 20% of the total metal thickness. Can be welded with arc or acetylene and can be obtained with different cladding on each side, if necessary.

clarain. One of the types of physical structure found in coal (see also fusain, durain, and vitrain). Clarain occurs as lustrous bands or striations, especially in bituminous coal. It is less friable than vitrain.

"Clarase." ²¹² Trademark for a product containing diastatic and proteolytic enzymes and, in addition, maltase, trypsin, rennet, erepsin, lipase, and hemolysin.

Properties: Dry, fine white powder, fully water-soluble, non-hazardous, non-flammable. Optimum pH for diastatic reaction 5.0-5.4, for protein solubilizing 7.0-7.5, for amino-acid liberating 6.2-6.6; optimum temperature 45°C.

Grade: For food products.

Containers: 1-, 5-, 10-, and 25-lb tin cans.

Uses: For starch conversions in the food industry; paste making; manufacturing of sizing materials; removal of colloidal starches from fruit juices.

"Clarite." ³⁰⁴ Trademark for a two part barium-cadmium organic vinyl stabilizer. **Properties:** ("Clarite A") soft white powder; sp. gr. 2.34; refractive index 1.56 max; ("Clarite B") clear straw colored liquid; sp. gr. 0.91; refractive index 1.45.

Containers: ("Clarite A") fiberboard drums containing 75 lbs. ("Clarite B") metal drums containing 35 lbs net.

Uses: Heat and light stabilizers for vinyl extrusions, flooring and molded products.

clary sage oil.

Properties: Pale-yellow to light-yellow liquid, with warm odor suggestive of ambergris.

Derivation: Obtained by distillation of *Salvia sclarea* L. A floral absolute, solid, is obtained by volatile solvent extraction from the same plant.

Containers: Bottles.

Use: Perfumery.

* See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

clathrate compounds. See inclusion complexes.

Claude synthetic ammonia process. A European-developed process for synthesizing ammonia from its elements, characterized by high pressure and temperature with high conversion and no recirculation. Hydrogen is separated from coke-oven gas by its failure to liquefy, and nitrogen is obtained from liquid air.

Claude system. A process for the production of liquid air in which the compressed gas is made to perform work in an expansion engine and thus cool itself.

clay. General term for a great variety of aluminum silicate-bearing rocks of various compositions and degrees of purity. They are plastic when wet, and harden when fired. Typical minerals comprising the major proportion of any clay are the following:

kaolinite

halloysite

montmorillonite

illite

Clay usually contains other minerals including quartz, calcite, limonite, gypsum, and muscovite. Clay is usually formed by the weathering or alteration of aluminum-bearing rocks, such as granite or other igneous rocks containing feldspar.

Clays are used as ceramic raw materials for white ware, stoneware, pottery, glazing, tile, bricks, terra cotta, fire brick, crucibles, retorts, mortars, factory molds, drainage pipe; in the manufacture of cement; as a filler for paper, paint, rubber, linoleum, oil cloth; well-drilling mud; filtering; decolorizing oils and other liquids; in abrasives, in medicine, and in insecticide dusts.

The more important varieties of clays include kaolin or china clay, ball clay, fire clay, stoneware clay, bentonite, fuller's earth, activated clays, dusting clays, bleaching clays, calcined clays, colloidal clays, enamel clays, and filler clays. Numerous other special clays are named according to their use, as papermakers' clay, rubbermakers' clay, and sagger clay.

Containers: Bags.

"Clearate." ⁴⁹ Tradename for a high grade soya lecithin. A surface-active substance and an effective anti-oxidant. Used to improve dispersion of ingredients in a mixture, as in manufacture of baked goods, confections, inks, cosmetics and paints.

cleavage. The ability of crystalline substances to split or break along definite planes. A crystal may cleave in one direction, as in mica; or in several directions, as in calcite, galena, or feldspar.

clemizole hydrochloride 1-para-Chlorobenzyl-2-pyrrolidylmethyl benzimidazole. Used in medicine as an antihistaminic.

"Clenesco." ⁴²⁸ Trademark for a line of cleaners for food plants and dairies. Contains one or more of the following: silicated alkali, complex phosphates, wetting agents, chromates, phosphated caustic, acids, solvents, chlorine, potassium soap, iodine, detergents, quaternary derivatives.

cleveite. A crystallized variety of uraninite (q.v.). It contains about 10% of the yttrium earths.

Cleve's acid. See 1-naphthylamine-6-sulfonic acid; or 1-naphthylamine-7-sulfonic acid; known also as Cleve's 1,6 acid and Cleve's 1,7 acid respectively.

cliffstone Paris white. A special grade of whiting (q.v.) made from a hard grade of English chalk.

"Climax Molybdenum." ⁶⁷ Trademark for molybdenum concentrate and molybdenum sulfide.

"Climelt." ⁶⁷ Trademark for molybdenum and tungsten metals and their respective alloys.

"Clipper Cleaner." ²⁴⁴ Trademark for a compound consisting of sodium carbonate as a base combined with complex phosphates and surface active agents.

Properties: Light cream, granular, dustless mechanical mix. Soluble in water, total Na_2O content 37.2-42.4%.

Containers: 40-lb (four 10-lb cans), 25-lb galvanized steel pails; 125-lb plywood drums; 325-lb wooden barrels.

Uses: Especially designed for creamery dairy barn cleaning, milking machines, etc, hand cleaning operations, tanks, vats.

"Clopane Hydrochloride." ¹⁰⁰ Trade name for cyclopentamine hydrochloride (N, alpha-dimethylcyclopentaneethylamine hydrochloride, cyclopentyl-2-methylaminopropane hydrochloride).

Properties: A white, odorless, crystalline powder with a mild characteristic odor and a bitter taste; m.p. 113-116°C; soluble in water (1:1), alcohol (1:1.8), benzene (1:23.8), chloroform (1:1.3); slightly soluble in ether, pH (1% solution) about 6.2.

Use: Medicine.

"Clorafin." ²⁶⁶ Trademark for a series of chlorinated paraffins.

"Clorafin 40." Straw color, viscous liquid; 40-44% chlorine, viscosity 25-40 poises at 25°C.

"Clorafin 40V." Straw color; viscous liquid, 40-44% chlorine, viscosity 3-5 poises at 25°C.

"Clorafin 42." Light brown; viscous liquid; 40-44% chlorine; viscosity 25-40 poises at 25°C.

"Clorafin 42S." Straw color; viscous liquid; 40-44% chlorine, viscosity 25-40 poises at 25°C.

"Clorafin 50." Yellow, viscous liquid; 48-52% chlorine, viscosity 350-525 poises at 25°C.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Uses: Components of flame-proofing compositions for fabrics; flameproof paints, and flameproof adhesives; chemical resistant coatings, paints, and inks. Treated wood has a greatly reduced moisture absorption.

"Clorgran." ¹⁴⁷ Brand name for free-flowing granular insecticides containing 5, 10 or 25% chlordan.

Containers: 5- and 50-lb bags.

Uses: For control of certain soil-inhabiting insects such as wireworms, and Japanese beetle grubs; crabgrass control.

closed-circuit grinding. A method of grinding or pulverizing in which the material that has not been sufficiently reduced in size is separated and returned for further grinding.

clove. See caryophyllus.

clove oil (caryophyllus oil).

Properties: A pale-yellow, thin liquid; darkens and thickens with age and exposure; strong aromatic odor, pungent and spicy taste. Soluble in ether and chloroform; soluble in 1 to 2 vols. and more of 70% alcohol, fresh, so-called extra-light oils in 2.5 to 3 vols. of 60% alcohol.

Chief known constituent: Eugenol (U.S.P. XVI specifies not less than 82%).

Constants: Sp. gr. 1.038-1.060, b. p. 250-260°C, refractive index 1.5270-1.5350; optical rotation to $-1^{\circ} 10'$.

Derivation: Distilled from cloves, the unexpanded flowers of *Eugenia aromatica* (*Eugenia caryophyllata*).

Method of purification: Rectification.

Grades: Technical, U.S.P. XVI.

Containers: 1-, 6-lb bottles; drums.

Uses: Medicine (local); flavoring; dentistry; perfumery, confectionery, soaps.

Shipping regulations: None.*

club-moss. See lycopodium.

Cm. Symbol for curium.

"CM." ²⁸ Trademark for a flame-retardant composition based on ammonium sulfamate and modified to prevent afterglow and to improve penetration.

Properties: Fine, white, granules; soluble in water, insoluble in dry cleaning solvents.

Containers: 50-lb fiber drums and 100-lb paper bags.

Use: Renewable type flame-retardant treatment for fabrics, paper, paper products, and other cellulosic materials.

CMC. See sodium carboxymethylcellulose.

CMP. Abbreviation for cytidine monophosphate. See cytidine phosphates.

CMU. Abbreviation for chlorophenyl-dimethylurea.

Co. Symbol for cobalt.

Co I. Abbreviation for coenzyme I. See nicotinamide adenine dinucleotide.

Co II. Abbreviation for coenzyme II. See nicotinamide adenine dinucleotide phosphate.

CoA. See coenzyme A.

coacervation. The salting out of a lyophilic sol into liquid droplets rather than into solid aggregates. The process is reversible and may be an intermediate stage in the coagulation of such sols.

"Coagulant Aid." ¹⁰⁸ A series of effective combinations of polyelectrolytes and other materials.

Containers: Bags; drums.

Uses: Aid in the clarification of water for municipal and industrial uses. •

coagulation (flocculation). The process of converting a finely divided or colloiddally dispersed suspension of a solid into particles of such size that reasonably rapid settling occurs. This is usually accomplished by adding the salt of a di- or tri-valent metal. Thus alum, aluminum sulfate, and ferric sulfate are commonly added in clarifying water from suspended impurities.

Coahran process. Recovery of acetic acid from pyroligneous acid by extracting with ether. It is an improved version of the Brewster process (q.v.), but is basically the same. It is often referred to as the Brewster process.

coal. A natural solid combustible material consisting of amorphous elemental carbon with various amounts of hydrocarbons, complex organic compounds and inorganic materials. Coal was formed from prehistoric plant life and now occurs in layers with other sedimentary rocks.

Coal is classified into ranks according to its heating value, expressed in Btu/lb, and its fixed carbon content.

Rank	Fixed Carbon	Btu/lb
Anthracite	86-98%	13,500-15,600
Low, Medium		
Volatile B-bituminous	69-86%	14,500-15,600
High Volatile Bituminous	46-69%	11,000-15,000
Subbituminous	46-60%	8,300-13,000
Lignite	46-60%	5,500- 8,300

Coal is most frequently specified in terms of its proximate analysis, giving the percentages of moisture, volatile combustible matter, fixed carbon, and ash. An ultimate analysis gives the percentages of the various elements present (C, H, O, N, and S). Coals are also described in terms of the petrographic constituents. Four distinct physical structures are recognized: clarain, durain, fusain, and vitrain (see also anthraxylon).

Coal has been surpassed by petroleum and natural gas as a source of energy in the U.S. It is an important source of chemical raw materials, which are obtained by destructive distillation, or coal liquefaction.

coal gas (bench gas; coke-oven gas). A mixture of gases produced by the destructive distillation of bituminous coal in highly heated fire-clay or silica retorts or in

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

by-product coke ovens. A typical gas analyzes 49.8% hydrogen, 29.5% methane, 4.0% illuminants, 8.5% carbon monoxide, 3.2% ethane, 1.6% carbon dioxide, 0.4% oxygen, 3.2% nitrogen. Candle power 16.6; Btu about 662 per cu ft.

Use: Domestic and industrial heating and lighting, source of coal tar, ammonia, benzene, toluene, xylene, and related materials.

Shipping regulations: Flammable gas, red gas label.*

coal, glance. See carbon, gas.

coal hydrogenation. See coal liquefaction.

coal liquefaction (coal hydrogenation). The conversion of coal into liquid hydrocarbons and related compounds by hydrogenation at elevated temperatures and pressures.

coal oil.

1. Kerosine made directly from crude petroleum (archaic).
2. The crude oil obtained by the destructive distillation of bituminous coal, or the distillate obtained from this crude oil, which may be used for illuminating purposes.

coal, soft. See bituminous coal.

coal tar.

Properties: A black, viscous liquid (or semi-solid), denser than water, with a characteristic naphthalene-like odor and a sharp burning taste, obtained in the destructive distillation of coal.

Soluble in ether, benzene, carbon disulfide, chloroform; partially soluble in alcohol, acetone, methanol, and benzene, only slightly soluble in water.

Grades: Crude; refined, U.S.P. XVI.

Containers: Tank-cars; barrels.

Uses: A major raw material for a great variety of dyes, drugs, and other organic chemicals. The most important single components, recovered by distillation and treatment with acids, alkalis and solvents, include benzene, toluene, xylene, phenol, naphthalene, anthracene, pyridine, carbazole, and phenanthrene. The crude or refined product or fractions thereof are also used for waterproofing, paints, pipe-coating, roads, roofing, insulation, as pesticides, and in medicine.

Shipping regulations: May be classed as flammable liquid. Red label.*

coal-tar, colorless. See anthrasol.

coal-tar dyes. Dyes produced from the coal-tar hydrocarbons or their derivatives such as benzene, toluene, xylene, naphthalene, anthracene, aniline, etc.

coal-tar naphtha. See naphtha, solvent.

coal-tar pitch. A dark brown to black amorphous residue left after coal tar is redistilled. It amounts to 50-60% of the usual grades of coal-tar. A solid, melting at 150°F, it is used as a thermoplastic, in roofing, road surfacing, in the Hall elec-

trolytic process for making aluminum.

coal-tar resins. See coumarone-indene resins.

coating clay. A high-grade, smooth, grit-free, white china clay for coating paper and textiles.

cobalamin. See vitamin B₁₂.

cobalamin concentrate (vitamin B₁₂ activity concentrate). The dried partially purified product resulting from the growth of selected *Streptomyces* cultures or other cobalamin-producing microorganisms. The commercial product may contain harmless diluents or stabilizing agents.

Properties: Pink to brown granules or fine powder, may be hygroscopic; solutions affected by light, pH (1:200 solution) 4.0-8.0.

Grades: N.F. XI.

Use. Medicine, nutrition.

cobalt Co. Element of atomic number 27, group VIII of the periodic system.

Properties: Steel-gray, slightly pinkish, shining, hard, ductile, somewhat malleable metal, magnetic. Sp.gr. 8.9, m.p. 1493°C, b.p. 3550°C. Soluble (slowly) in dilute hydrochloric and sulfuric acid, (readily) in nitric acid. Forms useful coordination compounds.

Occurrence: Not found native. Principal ores are arsenides, sulfides, oxides, silicates, with nickel or iron (smaltite, cobaltite, chloanthite, linnaeite, niccolite, pentlandite). Principal sources of ores: Canada, Belgian Congo, Rhodesia; North Africa.

Derivation: From ore concentrates by roasting followed (a) by thermal reduction by aluminum, or (b) by electrolytic reduction of solutions of metal, (c) by leaching, with either ammonia or acid in an autoclave under elevated temperatures and pressures and subsequent reduction by hydrogen.

Forms available: Rondels (1 in. x 3/4 in.), shot, anodes, 150 and finer mesh powder.

Containers: 500-lb kegs; drums.

Uses: Chemical (cobalt salts, catalyst, oxidizing agent), electroplating; ceramics; lamp filaments, catalyst in hydrogenation of oils, coloring glass, inks; paints and varnishes, colored signs, cermets. Principal use is in alloys, especially cobalt steels for permanent supermagnets and cobalt-chromium high-speed tool steels; cemented carbides. Cobalt alloys are used at high temperatures, as in jet engines.

Shipping regulations: None.*

cobalt 60. Radioactive cobalt of mass number 60. One of the most common radioisotopes. **Properties:** Half-life 5.3 years; radiation, beta and gamma, radiotoxicity, moderately hazardous. Cobalt 60 emits gamma rays which have about the same penetrating power as those from radium. However, radiocobalt is available in larger quantities and is cheaper than radium.

Derivation: Pile irradiation of cobalt oxide,

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Co_2O_3 , or of cobalt metal.

Forms available: Cobalt metal pellets or wire needles; cobaltous chloride in hydrochloric acid solution; solid cobaltic oxides; labeled compounds such as vitamin B_{12} .

Uses: Radiation therapy, such as the treatment of cancer; cobalt 60 is also used for radiographic testing of welds and castings; as a source of ions in gas-discharge devices; as the radiation source in liquid-level gages, for locating buried telephone and electrical conduits; as a source in portable radiation units, as a research aid in studying the permeability of porous media to flow of oil, the wearing quality of floor wax, the oil consumption in internal combustion engines, wool dyeing, etc.

Shipping regulations: Class D poison, radioactive material. Red label.*

cobalt acetate. See cobaltous acetate.

cobaltamines. Compounds containing the group $[\text{Co}(\text{NH}_3)_6]^{3+}$ or its derivatives in which some of the ammonia has been replaced by other groups or ions. The names hexammine, pentammine, etc., are used to indicate the number of ammonia groups present in any case.

Cobaltamines are prepared by adding excess ammonia to a cobaltous salt, exposing to air so that oxygen is absorbed and boiling so that oxidation of the cobalt occurs.

These compounds show none of the ordinary properties of cobalt. Different types of salts with various acid radicals are known. The ammonia in the amines may be replaced, molecule for molecule, by other nitrogen compounds such as hydroxylamine or ethylene diamine, or by water, or by ions such as hydroxyl, chloride, nitrate, etc., or by groups such as nitro (NO_2). See coordination compounds.

cobalt-ammonium sulfate. See cobaltous-ammonium sulfate.

cobalt arsenate. See cobaltous arsenate.

cobalt black. See cobaltic oxide.

cobalt bloom. See erythrite.

cobalt blue (Thénard's blue; cobalt ultramarine; King's blue, Leyden blue, azure blue).

Properties: Blue to green pigment of variable composition, consisting essentially of mixtures of cobalt oxide and alumina, approximating cobaltous aluminates, $\text{Co}(\text{AlO}_2)_2$. Commercial samples show wide variation in cobalt content, the range being from 19-30%. Cobalt blue is said to be the most durable of all blue pigments, being completely unaltered by the atmosphere and only slightly subject to the action of chemical reagents.

Derivation: By heating alumina with any of the following: (a) cobaltous oxide, or a material yielding this oxide on calcination, (b) cobalt phosphate, (c) cobalt arsenate. Greenish shades may be made by incorporating zinc oxide in the batches.

Grades: Technical (called genuine, to distinguish it from the imitation, which is ultramarine blue).

Containers: 250-lb barrels.

Uses: Pigments in oil or water; cosmetics (eye-shadows, grease paints).

cobalt blue, imitation. See ultramarine blue.

cobalt bromide. See cobaltous bromide.

cobalt carbide Co_2C . A catalyst used in the Fischer-Tropsch process; made by passing carbon monoxide over finely divided cobalt metal under regulated conditions.

cobalt carbonate. See cobaltous carbonate, basic.

cobalt chloride. See cobaltous chloride.

cobalt chromate. See cobaltous chromate.

cobalt chromate, basic. See cobaltous chromate.

cobalt disalicylal ethylenediamine. See salcomine.

cobalt 2-ethylhexoate (cobalt octoate). Probably the cobaltous salt of 2-ethylhexoic acid, $\text{C}_4\text{H}_9\text{CH}(\text{C}_2\text{H}_5)\text{COOH}$. Properties: Blue liquid, sp.gr. 1.013 (25°C). Uses: Paint drier; whitener; catalyst.

cobalt ferrite. Developed as a new electro-mechanical switch, supposed to be 1000 times as fast as present switches. See ferrites.

cobalt glance. See cobaltite.

cobalt gluconate. Used as a dietary supplement.

cobalt hydrate. See cobaltic hydroxide and cobaltous hydroxide.

cobalt hydroxide. See cobaltic hydroxide and cobaltous hydroxide.

cobaltic acetylacetonate $\text{Co}(\text{C}_5\text{H}_7\text{O}_2)_3$.

Properties: Dark green or black crystals; sp.gr. 1.43, m.p. 241°C .

Derivation: Reaction of cobaltous carbonate with acetylacetone and peroxide.

Use: Vapor plating of cobalt.

cobaltic boride CoB .

Properties: Crystalline prisms, sp.gr. 7.25 (18°C); m.p. $>1400^\circ\text{C}$. Decomposes in water, soluble in nitric acid.

Use: Ceramics.

cobaltic fluoride. See cobalt trifluoride.

cobaltic hydroxide (cobalt hydroxide; cobalt hydrate) $\text{Co}(\text{OH})_3$, actually considered to be $\text{Co}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$.

Properties: Dark-brown powder; soluble in cold concentrated acids; insoluble in water and alcohol.

Derivation: By the addition of sodium hydroxide to a solution of a cobaltic salt; by the action of chlorine on a suspension of cobaltous hydroxide; by the action of sodium hypochlorite on a cobaltous salt.

Grades: Technical.

Containers: Tins, kegs; drums.

Use: Cobalt salts.

Shipping regulations: None.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

- cobaltic oxide** (cobalt oxide; cobalt black)
 Co_2O_3 . Sometimes incorrectly called cobalt peroxide.
 Properties: Steel-gray or black powder. Soluble in concentrated acids; insoluble in water. Sp. gr. 4.81-5.60; m. p., decomposes at 895°C.
 Derivation: By heating cobaltic hydroxide.
 Grades: Technical; C.P.
 Containers: 1-lb bottles, 100-lb drums; 350-lb kegs.
 Uses: Pigment; coloring enamels; glazing pottery.
 Shipping regulations: None.*
- cobalt iodide.** See cobaltous iodide.
- cobaltite** (cobalt glance) CoAsS . Silver-white to gray mineral, metallic luster. Contains 35.5% cobalt. Sp. gr. 6-6.3, hardness 5.5.
 Occurrence: Canada; Belgian Congo; Sweden.
 Use: An important cobalt ore; also used in ceramics.
- cobalt linoleate.** See cobaltous linoleate.
- cobalt molybdate.** A molybdenum catalyst (a gray-green powder) used in petroleum technology, in reforming and desulfurization.
- cobalt monoxide.** See cobaltous oxide.
- cobalt naphthenate.** See cobaltous naphthenate.
- cobalt nitrate.** See cobaltous nitrate.
- cobalto-cobaltic oxide** (tricobalt tetraoxide)
 Co_3O_4 .
 Properties: Steel-gray to black in anhydrous form. Insoluble in water, hydrochloric acid and nitric acid; soluble in sulfuric acid and fused sodium hydroxide, hygroscopic. Sp. gr. 6.07.
 Derivation: By heating strongly other cobalt oxides in air. Thus, the commercial oxides contain a substantial quantity of Co_3O_4 .
 Uses: Ceramics; pigments; catalysts; preparation of cobalt metal; electronic chemicals.
- cobalt octoate.** See cobalt 2-ethylhexoate.
 See also soaps, metallic.
- cobalt oleate.** See cobaltous oleate.
- cobalto-nickelous sulfate.** See nickel-cobalt sulfate.
- cobaltous acetate** (cobalt acetate)
 $\text{Co}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 4\text{H}_2\text{O}$.
 Properties: Reddish-violet, deliquescent crystals. Soluble in water, acids, and alcohol; sp. gr. 1.7043; m. p. loses H_2O at 140°C.
 Derivation: By the action of acetic acid on cobaltous hydroxide with subsequent crystallization.
 Method of purification: Recrystallization.
 Grades: Technical; pure crystalline; C.P.
 Containers: Glass bottles; barrels.
 Uses: Sympathetic inks; ingredient of varnishes used to color oilcloth; paint and varnish driers; catalyst; mineral supplement.
 Shipping regulations: None.*
- cobaltous aluminate.** See cobalt blue.
- cobaltous ammonium sulfate** (cobalt ammonium sulfate; ammonium cobalt sulfate)
 $\text{CoSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$.
 Properties: Ruby-red crystals, soluble in water; insoluble in alcohol; sp. gr. 1.902.
 Derivation: Crystallization of cobaltous sulfate with ammonium sulfate.
 Method of purification: Recrystallization.
 Grades: Technical, C.P.
 Containers: Tins; glass bottles.
 Uses: Ceramics; cobalt plating; catalyst.
 Shipping regulations: None.*
- cobaltous arsenate** (cobalt arsenate)
 $\text{Co}_3(\text{AsO}_4)_2 \cdot 8\text{H}_2\text{O}$.
 Properties: Violet-red powder. Soluble in acids; insoluble in water. Sp. gr. 2.948.
 Derivation: By the interaction of solutions of sodium arsenate and of a cobalt salt.
 Grades: Technical.
 Containers: Wooden kegs; boxes.
 Uses: Painting on glass and porcelain in light blue colors; coloring glass.
 Shipping regulations: None.*
 See erythrite for the mineral.
- cobaltous bromide** (cobalt bromide)
 $\text{CoBr}_2 \cdot 6\text{H}_2\text{O}$.
 Properties: Red violet crystals. Soluble in water, alcohol, and ether. Anhydrous crystals are red. Sp. gr. 2.46; m. p., decomposes.
 Derivation: By the action of bromine vapor or a mixture of bromine and hydrogen bromide vapors on heated cobalt. Purification by sublimation.
 Grades: Technical, C.P.
 Containers: Glass bottles.
 Use: In hygrometers, catalyst.
 Shipping regulations: None.*
- cobaltous carbonate** CoCO_3 .
 Properties: Red crystals; insoluble in water and ammonia, soluble in acids. Sp. gr. 4.13, m. p., decomposes. The cobalt carbonate of commerce is usually the basic salt (see following article).
 Derivation: By heating cobaltous sulfate with a solution of sodium bicarbonate.
 Uses: Ceramics, trace element added to soils and animal feed, temperature indicator, catalysts.
- cobaltous carbonate, basic**
 $2\text{CoCO}_3 \cdot 3\text{Co}(\text{OH})_2 \cdot \text{H}_2\text{O}$. The cobalt carbonate of commerce.
 Properties: Red violet crystals; soluble in acids; insoluble in cold water; decomposes in hot water. M. p., decomposes.
 Derivation: By adding sodium carbonate to a solution of cobaltous acetate, followed by filtration and drying.
 Grades: Technical; C.P.
 Containers: 1-lb bottles, wooden barrels; bags.
 Uses: Manufacturing cobaltous oxide; cobalt pigments; cobalt salts; intermediate.
 Shipping regulations: None.*
- cobaltous chloride** (cobalt chloride) (a) CoCl_2 ;
 (b) $\text{CoCl}_2 \cdot 6\text{H}_2\text{O}$.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

- Properties:** (a) blue, (b) ruby-red crystals. Soluble in water and alcohol. Sp. gr. (a) 3.348, (b) 1.924; m. p. (a) sublimes, (b) 86.75°C.
- Derivation:** By the action of hydrochloric acid on cobalt oxide with subsequent crystallization.
- Method of purification:** Recrystallization.
- Grades:** Technical; C. P.
- Containers:** Glass bottles; tins; drums.
- Uses:** Absorbent for ammonia; gas-masks; electroplating; sympathetic inks; hygrometers; in soils and animal feeds as needed trace element, vitamin B₁₂; flux for magnesium refining; solid lubricant; dye mordant; catalysts, barometers.
- cobaltous chromate** (basic cobalt chromate; cobalt chromate).
- Properties:** Brown or yellowish-brown powder. Variable composition. (Pure cobaltous chromate is CoCrO₄; gray-black crystals.) Soluble in mineral acids, in solution of chromium trioxide; insoluble in water.
- Grades:** Technical.
- Use:** Ceramics (tinting).
- cobaltous citrate** Co₃(C₆H₅O₇)₂·2H₂O.
- Properties:** Rose-red crystals, m. p. 150°C (-2H₂O). Slightly soluble in water; soluble in dilute acids.
- Uses:** Vitamin preparation, therapeutic agents.
- cobaltous cyanide** (a) Co(CN)₂·2H₂O, (b) Co(CN)₂.
- Properties:** (a) buff crystals, (b) blue-violet powder, sp. gr. (b) 1.872, m. p. (b) 280°C. Insoluble in water; soluble in potassium cyanide, hydrochloric acid, ammonium hydroxide.
- cobaltous fluoride** CoF₂·2H₂O.
- Properties:** Rose-red crystals or powder; sp. gr. 4.46. Soluble in cold water, hydrofluoric acid. Decomposes in hot water.
- cobaltous formate** Co(CHO₂)₂·2H₂O.
- Properties:** Red crystals; sp. gr. 2.129, m. p. 140°C (-2H₂O). Soluble in cold water.
- cobaltous hydroxide** (cobalt hydroxide; cobalt hydrate) Co(OH)₂.
- Properties:** Rose-red powder. Soluble in acids and ammonium salt solutions; insoluble in water and alkalies. Sp. gr. 3.597.
- Derivation:** By the addition of sodium hydroxide to a solution of a cobaltous salt.
- Grades:** Technical.
- Containers:** Tins; kegs, glass bottles.
- Use:** Cobalt salts; in preparation of paint and varnish driers, catalyst.
- Shipping regulations:** None.*
- cobaltous iodide** (cobalt iodide) CoI₂·6H₂O.
- Properties:** Brownish-red crystals; loses iodine on exposure to air, sp. gr. 2.90. Soluble in water and alcohol. Anhydrous cobaltous iodide, CoI₂, is in form of black crystals, sp. gr. 5.68.
- Derivation:** Digestion of cobalt powder with iodine and water. Anhydrous cobaltous iodide is prepared by heating cobalt in iodine vapor.
- Grades:** Technical.
- Containers:** Glass bottles.
- Use:** In hygrometers.
- Shipping regulations:** None.*
- cobaltous linoleate** (cobalt linoleate) Co(C₁₈H₃₁O₂)₂.
- Properties:** Brown, amorphous powder. Soluble in alcohol, ether and acids; insoluble in water.
- Derivation:** By boiling a cobalt salt and sodium linoleate.
- Grades:** Technical.
- Containers:** 100-lb kegs; 350-lb barrels or fiber drums; multiwall paper sacks.
- Use:** Paint and varnish driers; especially enamels and white paints.
- Shipping regulations:** None.*
- cobaltous naphthenate.**
- Properties:** Brown, amorphous powder or bluish-red solid. Insoluble in water. Soluble in alcohol, ether, oils. Composition indefinite.
- Derivation:** By treating cobaltous hydroxide or cobaltous acetate with naphthenic acid.
- Containers:** Drums.
- Uses:** Paint and varnish driers.
- cobaltous nitrate** (cobalt nitrate) Co(NO₃)₂·6H₂O.
- Properties:** Red crystals, deliquescent in moist air. Soluble in water and in acids. Sp. gr. 1.88; m. p. 56°C.
- Derivation:** By the action of nitric acid on cobalt hydroxide with subsequent crystallization.
- Method of purification:** Recrystallization.
- Grades:** Technical; C. P.
- Containers:** Glass bottles; wooden barrels.
- Uses:** Sympathetic inks, cobalt pigments; preparation of cobalt catalysts; additive to soils and animal feeds; vitamin preparations; hair dyes, porcelain decoration.
- Caution:** Fire hazard, dangerous, oxidizing material; in contact with organic or other readily oxidizable substances it will cause violent ignition or combustion.
- Shipping regulations:** Oxidizing material. Yellow label.*
- cobaltous oleate** (cobalt oleate) Co(C₁₈H₃₃O₂)₂.
- Properties:** Brown, amorphous powder. Soluble in alcohol and ether; insoluble in water. M. p. 235°C.
- Derivation:** By heating cobaltous chloride and sodium oleate, followed by filtration and drying.
- Grades:** Technical.
- Containers:** Wooden barrels; fiber drums.
- Use:** Paint and varnish driers.
- Shipping regulations:** None.*
- cobaltous oxalate** CoC₂O₄.
- Properties:** Reddish-white crystals; sp. gr. 3.021; insoluble in water; soluble in ammonium hydroxide.
- Uses:** Temperature indicator; preparation of catalysts (hydrated form).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

cobaltous oxide (cobalt oxide; cobalt monoxide) CoO .

Properties: Grayish powder under most conditions; can form green-brown crystals. Soluble in acids and alkali hydroxides; insoluble in water. Sp.gr. 5.7-6.7; m.p. 1800°C (dec).

Derivation: By heating cobaltous carbonate in nitrogen or carbon monoxide; by heating cobalt in nitric oxide; by heating cobaltous sulfate in air.

Grades: Technical; ceramic.

Containers: 10-lb tins; 400-lb barrels and fiber drums.

Uses: Pigment in paints and ceramics; preparation of cobalt salts; catalyst; porcelain enamels; coloring glass; feed additive.

Shipping regulations: None.*

cobaltous perchlorate $\text{Co}(\text{ClO}_4)_2$.

Properties: Red needles; sp.gr. 3.327, soluble in water, alcohol.

Use: Chemical reagent.

cobaltous phosphate (cobalt phosphate)

$\text{Co}_3(\text{PO}_4)_2 \cdot 8\text{H}_2\text{O}$.

Properties: Reddish powder; sp.gr. 2.769, slightly soluble in cold water; soluble in mineral acids, insoluble in alcohol.

Derivation: By the interaction of solutions of cobalt salts and sodium phosphate.

Grades: Technical.

Containers: Glass bottles, fiber drums.

Uses: Manufacturing cobalt pigments; coloring glass; painting on porcelain in light blue colors; animal feed supplement.

Shipping regulations: None.*

cobaltous resinate (cobalt resinate).

Properties: Brown-red powder, insoluble in water, soluble in oils.

Derivation: By cautiously heating a cobalt salt and rosin oil.

Grades: Technical; pure precipitated.

Containers: 300-lb barrels or fiber drums.

Use: Varnish drier.

Fire hazard: Dangerous.

Shipping regulations: Flammable solid.

Yellow label. Legal label name: cobalt resinate, precipitated.*

cobaltous silicate Co_2SiO_4 .

Properties: Violet crystals; sp.gr. 4.63; m.p. 1420°C; insoluble in water, soluble in dilute HCl .

cobaltous silicofluoride $\text{CoSiF}_6 \cdot 6\text{H}_2\text{O}$.

Properties: Pale red crystals; sp.gr. 2.087, soluble in water.

Use: Ceramics.

cobaltous succinate $\text{Co}(\text{C}_4\text{H}_4\text{O}_4) \cdot 4\text{H}_2\text{O}$.

Properties: Violet crystals; slightly soluble in cold water; soluble in alkalis, insoluble in alcohol.

Uses: Vitamin preparations; therapeutic agents.

cobaltous sulfamate $\text{Co}(\text{NH}_2\text{SO}_3) \cdot 3\text{H}_2\text{O}$. Soluble in water.**cobaltous sulfate** (cobalt sulfate)

(a) CoSO_4 ; (b) $\text{CoSO}_4 \cdot 7\text{H}_2\text{O}$.

Properties: Red powder; soluble in water.

Sp.gr. (a) 3.472; (b) 1.918; m.p. (a) 989°C, (b) 96.8°C.

Derivation: By the action of sulfuric acid on cobaltous oxide.

Method of purification: Crystallization.

Grades: Technical; C.P.

Containers: 1-lb bottles; 100-lb kegs; 450-lb barrels.

Uses: Ceramics; pigments; glazes; in plating baths for cobalt; additive to soils and animal feeds; catalyst.

Shipping regulations: None.*

cobaltous tungstate (cobalt tungstate; cobalt wolframate) CoWO_4 .

Properties: Reddish-orange powder; insoluble in water; soluble in hot concentrated acids; sp.gr. 8.42.

Derivation: By adding a sodium tungstate solution to a solution of a cobalt salt.

Grades: Technical.

Containers: Wooden barrels; tins; fiber drums.

Use: Pigment; drier for enamels, inks, paints, electronic field; antiknock agents.

Shipping regulations: None.*

cobalt oxide. See cobaltic oxide, cobaltous oxide, cobalto-cobaltic oxide. The commercial cobalt oxides are not usually definite chemical compounds but are mixtures of two or more cobalt oxides.

cobalt peroxide. Incorrect name for cobaltic oxide (q. v.).

cobalt phosphate. See cobaltous phosphate.

cobalt potassium cyanide $\text{K}_3\text{Co}(\text{CN})_6$.

Properties: Yellow crystals; sp.gr. 1.906, m.p., decomposes, soluble in water; insoluble in alcohol.

Grades: Pure, electronic.

Uses (suggested): Microwave studies.

cobalt potassium nitrite (cobalt yellow, potassium cobaltinitrite; Fischer's salt, potassium hexanitrocobaltate III) $\text{K}_3\text{Co}(\text{NO}_2)_6$.

Properties: Yellow, microcrystalline powder. Slightly soluble in water, insoluble in alcohol, m.p., decomposes at 200°C.

Derivation: By adding potassium nitrite and acetic acid to a solution of a cobalt salt.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles.

Uses: Medicine; yellow pigment, painting on glass or porcelain.

Shipping regulations: None.*

cobalt resinate. See cobaltous resinate.

cobalt selenite $\text{CoSe}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$. A blue-red powder, insoluble in water.

cobalt silicide. A semiconductor material reported to have as much as 15% efficiency in converting heat to electricity in the temperature range 20-800°C.

cobalt soaps. See cobaltous linoleate, cobaltous naphthenate, cobaltous oleate, cobaltous resinate.

cobalt sulfate. See cobaltous sulfate.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

cobalt tellate. Cobalt derivative of refined tall oil; of varying composition. Used as a drier in paints and varnishes. Available as a liquid in 55-gal drums, solid in 430-lb drums.

cobalt tetracarbonyl $\text{Co}_2(\text{CO})_8$.

Properties: Orange or dark brown crystals. Sp. gr. 1.78; m.p. 51°C , decomposing above this temperature. Insoluble in water, soluble in organic solvents as alcohol and ether.

Derivation: By the combination of finely divided cobalt with carbon monoxide under pressure.

Uses: High anti-knock gasoline; catalyst.

cobalt titanate Co_2TlO_4 .

Properties: Greenish-black crystals; sp. gr. 5.07-5.12. Soluble in concentrated hydrochloric acid.

cobalt trifluoride (cobaltic fluoride) CoF_3 .

Properties: Light brown, fine free-flowing powder; sp. gr. 3.88 (25°C); no odor, except HF odor developed in moist air; stable in sealed containers; reacts readily with moisture in the atmosphere to form a dark, almost black powder; reacts with water to form a black, finely divided precipitate (cobaltic hydroxide). As a fluorinating agent, yields one atom of fluorine and reverts to the difluoride.

Use: Fluorinating agent. The spent cobalt difluoride may be regenerated with elemental fluorine.

cobalt tungstate. See cobaltous tungstate.

cobalt ultramarine. See cobalt blue.

cobalt violet. See cobalt-ammonium phosphate.

cobalt wolframate. See cobaltous tungstate.

cobalt yellow. See cobalt-potassium nitrite.

"Cobenium," ¹⁵⁵ Trademark for a heat-treatable, high cobalt alloy.

Typical analysis: Cobalt, 40%, chromium, 20%; nickel, 15%, molybdenum, 7%; manganese, 2%, beryllium, 0.04%; carbon, 0.15%; iron, balance.

Properties: Corrosion resistant; non-magnetic; resistant to set and fatigue; heat-treatable, high strength; high elasticity.

Uses: Spring material; general purpose corrosion resistant alloy.

"Coblac," ¹³³ Trademark for a series of carbon black, nitrocellulose dispersions. A special process gives a high degree of dispersion of carbon black in nitrocellulose, thus making it possible to produce black lacquers without milling or grinding. Available in several types for pigmenting automotive lacquers, industrial lacquers, leather finishes, etc.

"Coblax," ⁵¹ Trademark for a series of inexpensive, dark oils used in "once through" lubrication of rough machinery. Good for outdoor, low-temperature use.

"Cobon," ¹⁶⁹ Trademark for 2-nitroso-1-naphthol used for the colorimetric determination

of cobalt. Sensitivity: 0.005 ppm cobalt.

C. O. C. Abbreviation for Cleveland open cup, a type of flash point test.

coca (erythroxylin; cuca; hayo; ipado).

Dried leaves of Erythroxylin coca, known commercially as Huanaco coca, or Truxillense rusby, known commercially as Truxillo coca. Contains a very small amount of cocaine.

Habitat: Bolivia; Chile; and Peru; cultivated in Java and British East and West Indies.

cocaine (methylbenzoylecgonine) $\text{C}_{17}\text{H}_{21}\text{NO}_4$. An alkaloid.

Properties: Colorless to white crystals, or white crystalline powder; poisonous, habit-forming drug. Soluble in alcohol, chloroform, and ether; slightly soluble in water (solution is alkaline to litmus). The hydrochloric acid solution is levorotatory.

Constants: M.p. 98°C .

Derivation: By extraction of the leaves of Erythroxylin coca with sodium carbonate solution, treatment of the latter with dilute acid and extraction with ether, evaporation of the solvent, re-solution of the alkaloid and subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical; N. F. XI.

Containers: Vials; cans.

Use: Local anesthetic (medicine, dentistry). Sold subject to strict governmental supervision in most countries.

Shipping regulations: None.*

cocaine borate.

Properties: White, crystalline powder.

Soluble in alcohol. Contains 68% (approx) cocaine.

cocaine hydrochloride $\text{C}_{17}\text{H}_{21}\text{NO}_4 \cdot \text{HCl}$.

Properties: Colorless crystals or white crystalline powder; poisonous, habit-forming drug. Soluble in water and alcohol; insoluble in ether. M.p. $183-195^\circ\text{C}$.

Derivation: By the action of hydrochloric acid on cocaine.

Method of purification: Crystallization.

Grades: Technical; U. S. P. XVI.

Containers: Vials; cans.

Use: Local anesthetic. Sold subject to strict governmental supervision in U. S. A. and most countries.

coccarboxylase (TPP; thiamine pyrophosphate chloride) $\text{C}_{12}\text{H}_{19}\text{ClN}_4\text{O}_7\text{P}_2\text{S} \cdot \text{H}_2\text{O}$. The coenzyme of the yeast enzyme carboxylase.

It is the key substance in decarboxylation, an energy-producing reaction in the body.

Properties: Crystallizes from alcohol containing some hydrochloric acid; m.p. $240-244^\circ\text{C}$ (dec); soluble in water; dry substance very stable.

Use: Biochemical research; medicine.

coccinellin. See carmine.

coccullin. See picrotoxin.

cocculus (fishberry; Malay fishberry).

Dried ripe fruit of Anamirta cocculus, a

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

woody, climbing plant. Poisonous!

Habitat: India.

Use: Medicine (vermifuge). Dangerous!

Shipping regulations: Poison, class B; poison label.*

coccus. See cochineal.

cochineal (coccus). A red coloring matter consisting of the dried bodies of the female insects of *Coccus cacti*, which live on cactus plants in Mexico, Central America, Algeria, and the East Indies. They are collected and killed by heat or by sulfur fumes. The coloring principle is carminic acid $C_{17}H_{13}O_{10}$.

Grades: Technical, N. F. XI; silver grain; black grain.

Containers: Boxes; fiber cans.

Uses: Coloring food, medicinal products, toilet preparations; manufacture of red and pink lakes and carmine; indicator in analytical chemistry; inks; dyeing.

Shipping regulations: None.*

cochineal, ammoniacal.

Properties: Brown tablets.

Derivation: Digesting cochineal with ammonia, adding gelatinous alumina, evaporating to dryness and cutting into cakes.

Use: Dyes a bluer shade than cochineal.

To a limited extent used for blueing bleached cotton.

cochinilin. See carminic acid.

cocillana (guapi bark, cocilliana, cocilliana).

Dried bark of tree *Guarea rusbyi*.

Use: Medicine.

cocoa. See cacao.

cocoa butter. See cacao butter.

cocoanut cake. See coconut cake.

cocoanut oil. See coconut oil.

cocoa oil. See cacao butter.

"Cocoloid," ³²² Trademark for an algin-carrageenin composition.

Properties: Tan-colored algin-carrageenin composition in granular form passing essentially through 40 mesh and having about 13% moisture. Soluble in milk at 160°F.

Grades: Refined.

Uses: A hydrophilic colloid especially prepared for use as a stabilizer for chocolate-milk products, sterilized cream, and other milk products.

Shipping regulations: None.*

coconut acid. Mixture of fatty acids derived from hydrolysis of coconut oil. Acid chain lengths vary from 6-18 carbons but are mostly 10, 12, and 14.

Grades: Distilled; double distilled.

Containers: Drums; tank cars.

Uses: Soaps; detergents; source of long-chain alkyl groups.

coconut butter. See coconut oil.

coconut cake (coconut palm cake; cocoanut cake; copra cake). The residual product

from expression of oil from the seed of the coconut. See coconut oil meal.

coconut fiber. See coir.

coconut oil (coconut palm oil, cocoanut oil; coconut butter).

Properties: White, semi-solid, lard-like fat; characteristic odor. Chief constituent: the glyceride of lauric acid, but with appreciable amounts of the glycerides of capric, myristic, palmitic and oleic acids. Soluble in alcohol, ether, chloroform, and carbon disulfide.

Constants: Sp. gr. 0.92; saponification value 250-258, iodine value 8-9.5, m. p. 20-28°C.

Derivation: From the coconut (*Cocos nucifera*), the chief commercial supply coming from India, Ceylon and the South Sea Islands. The fresh meat of the nut is pressed, boiled in water or heated with solvents, and the oil extracted.

Method of purification: Filtration.

Grades: Crude; refined; Ceylon, Cochín, Manila.

Containers: 375-, 400-lb barrels; 1000-lb casks, 8000-gal tank cars.

Uses: Soaps, butter substitutes; foodstuffs, cosmetics; candles, emulsions, dyeing cotton, alkyl resins; lubricating greases; synthetic detergents, source of glycerin and fatty acids.

Shipping regulations: None.*

See also copra oil.

coconut oil meal. The dried and crushed form of coconut cake recovered from the hydraulic or expeller process of extraction of oil from the seed. The usual product of commerce contains 24.2% crude protein, 13.3% crude fiber; 35.7% nitrogen-free extract; 7.4% ether soluble (fat) and 6.0% ash. The total digestible nutrients approximate 72%.

Containers: Bulk or bags.

Uses: Animal feeds or as a fertilizer ingredient.

Shipping regulations: None.*

coconut palm cake. See coconut cake.

coconut palm oil. See coconut oil.

"C-O-C-S," ⁵⁵ Trademark for insecticides containing copper oxychloride sulfate. Used on fruits and vegetables.

C. O. D. Abbreviation for chemical oxygen demand. See oxygen consumed, see also biochemical oxygen demand (B. O. D.) and dissolved oxygen (D. O.).

codecarboxylase (pyridoxal phosphate)

$C_8H_8NO_2 \cdot H_2PO_4$. It is active as coenzyme in amino acid biosynthesis as well as in decarboxylation reactions.

Properties (characterized as the oxime): Nearly insoluble in water, alcohol, and ether, m. p. 229-230°C (dec.).

Source: Natural and synthetic. Synthesized (a) through the action of adenosine triphosphate, or phosphorus oxychloride, on pyridoxal, and (b) by phosphorylation of pyridoxamine followed by oxidation with

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

100% H_3PO_4 . It occurs naturally in several decarboxylases (q.v.).

Use: Biochemical research.

codehydrogenase I. See nicotinamide adenine dinucleotide.

codehydrogenase II. See nicotinamide adenine dinucleotide phosphate.

codeine (methylmorphine) $C_{18}H_{21}NO_3 \cdot H_2O$.
An alkaloid.

Properties: Colorless or white crystals or powder; poisonous! Effloresces slowly in dry air; affected by light; m.p. $154.9^\circ C$. Slightly soluble in water; soluble in alcohol and chloroform; levorotatory in acid and alcohol solutions.

Derivation: From opium by extraction and subsequent crystallization; also by the methylation of morphine.

Method of purification: Recrystallization.

Grades: Technical; N. F. XI.

Containers: Vials; cans.

Use: Medicine.

Shipping regulations: None.*

codeine hydrochloride $C_{18}H_{21}NO_3 \cdot HCl \cdot 2H_2O$.
White crystalline powder, m.p. $264^\circ C$, used in medicine.

codeine phosphate $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot 1 \frac{1}{2} H_2O$.

Properties: White crystals or powder, odorless. Effloresces in dry air and is affected by light; m.p. $235^\circ C$. Soluble in water; slightly soluble in alcohol. Solutions are acid to litmus.

Grades: Technical, U.S.P. XVI.

Containers: Vials; cans.

Use: Medicine.

codeine sulfate $(C_{18}H_{21}NO_3)_2 \cdot H_2SO_4 \cdot 5H_2O$.

Properties: White crystals or powder, effloresces in dry air, affected by light; m.p. $278^\circ C$, specific rotation (1 in H_2O) -112.5 to -115° . Soluble in water; insoluble in alcohol, chloroform, and ether.

Grades: Technical, N. F. XI.

Containers: Vials; 25-, 100-oz cans.

Use: Medicine.

Shipping regulations: None.*

cod-liver oil (morrhua oil).

Properties: Pale yellow liquid, fixed, non-drying oil; characteristic odor, slightly fishy odor and taste. Soluble in ether, chloroform, ethyl acetate, petroleum ether, and carbon disulfide; slightly soluble in alcohol.

Chief constituents: Glycerides of palmitic, stearic acids; cholesterol, butyl alcohol esters, etc.

Constants: Sp. gr. 0.918-0.927, saponification value 180-192; iodine value 145-180, maumené test 102-113, acid value 204-207.

Derivation: From the livers of codfish (*Gadus morrhua*) and other species of *Gadidae*. These are rendered by steam heat and the oil separated and chilled until the stearin solidifies, when it is pressed and the clear oil collected.

Method of purification: Filtration.

Grades: Pale; light-brown; dark-brown;

N. F. XI.

Containers: 5-gal cans; 30-, 50-gal barrels; 8000-gal tank cars.

Uses: Medicine (for its vitamin A and D content); leather dressing; chamois-leather tanning.

Shipping regulations: None.*

codoil. See rosin oil.

"**Codur.**"³³³ Synthetic baking enamels having an alkyd and urea-formaldehyde resin base.

coenzyme. Comparatively low molecular weight organic substance which can attach itself to, and thus supplement, a specific protein to form an active enzyme system. The term coenzyme is considered to be synonymous with the term prosthetic group when used in connection with conjugated proteins which have enzyme activity.

coenzyme I. See nicotinamide adenine dinucleotide.

coenzyme II. See nicotinamide adenine dinucleotide phosphate.

coenzyme A (CoA). A coenzyme essential for the formation of acetylcholine and for acetylation reactions in the body. Pantothenic acid is found in the body as a constituent of coenzyme A. It has been completely synthesized, and is known to be built up from pantothenic acid, cysteamine, adenosine, and phosphoric acid.

coenzyme Q
 $CH_3C_6(O)_2(OCH_3)_2[CH_2CH:C(CH_3)CH_2]_nH$.
Found in animal organs and yeast. Is active in the citric acid cycle in carbohydrate metabolism. The n in the formula varies according to the source, as 10 if from beef heart, 6, 7, 8, or 9 if from microbial sources.

coesite. A mineral found in the sandstone lining the floor of Meteor Crater, Arizona, or made synthetically by subjecting quartz to very high pressure. It is very stable toward heating in hydrofluoric acid.

"**Coethloblak.**"¹³³ Trademark for a black chip consisting of thoroughly dispersed carbon black in ethyl cellulose used in making jet black lacquers and tire paints. Available as:

"Coethloblak" CK-18. Composition: 31.25% medium high color impingement carbon black, 62.5% low viscosity ethyl-cellulose, 6.25% plasticizer.

Containers: 50- and 200-lb drums.

cofea. See coffee.

coffearine. See trigonelline.

coffee (cofea; cafea). Dried ripe seed of *Coffea arabica* or *C. liberica*.

Habitat: Ethiopia; Arabia, cultivated in Brazil, Colombia, Java, India, Hawaii, Central America.

Use: Roasted, for preparation of a beverage.

Source of caffeine (q.v.); has been considered as raw material for production of plastics.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

coffinite $U(SiO_4)_{1-x}(OH)_{4x}$ (or $USiO_4$ with appreciable $(OH)_4$ in place of some SiO_4). A naturally occurring uranium mineral. Color black; sp. gr. 5.1; luster adamantine; commonly fine grained and mixed with organic matter and other minerals.

Occurrence: Colorado, Utah, Wyoming, Arizona.

Use: An important ore of uranium in some mines on the Colorado plateau.

cognac ether. See ethyl cocoinate.

cognac oil. See ethyl oenantheate.

cogwheel ore. See bournonite.

cohosh, black. See cimicifuga.

cohune-nut oil. See cohune oil.

cohune oil (cohune-nut oil; corozo-nut oil).

Properties: Yellowish, fixed, semi-liquid fat. Soluble in ether and benzene, insoluble in water.

Constants: M. p. 18-20°C, saponification value 253.9, iodine number 12.9-13.6.

Derivation: From the cohune-nut of the palm, *Attalea cohune*, by expression.

Uses: Foods; soaps.

"Collife," ³⁰⁸ Trademark for special epoxy resin encapsulation of random wound stators utilizing solventless epoxy resin formulations and rotational seasoning process.

colir. Fiber from the coconut shell. Used in ropes and matings.

coke. Commonly used specifically to designate the residue from destructive distillation of coal. Also applied to the residues from destructive distillation of other types of carbonaceous materials, such as pitch, petroleum, etc.

coke-oven gas. See coal gas.

coke, petroleum. The solid residue remaining after destructive distillation of petroleum materials. The fixed or solid carbon content is 90-95%, and because of its purity such coke is used extensively in metallurgical processes, also for the Hall electrolytic process for aluminum.

coking coal. A coal suitable for making coke (q. v.). Different types of coals may be mixed to produce a good coking coal.

cola (kola; kola nuts; kola seeds; soudan coffee; guru).

Derivation: Seeds of *Cola nitida* or other species of *Cola*.

Habitat: West Africa; West Indies; India.

Containers: Bags.

Use: In soft drinks.

colamine. See ethanolamine.

Colburn process. A method of forming window glass. The molten glass is drawn up from the melt tank in a ribbon, rolled flat, annealed, and then sent to be cut into the desired size and shape. The rolling and annealing are done horizontally.

colchicine $C_{22}H_{25}NO_6$. An alkaloid.

Properties: Yellow crystals or amorphous powder; odorless or nearly so. Soluble in water, alcohol, and chloroform; moderately soluble in ether; affected by light; m. p. 135-150°C. Solutions are levorotatory.

Derivation: From *Colchicum autumnale* by extraction and subsequent crystallization. Has recently been synthesized.

Method of purification: Recrystallization.

Grades: Technical, U.S.P. XVI.

Containers: $\frac{1}{8}$ -, 1-oz vials; 5-, 10-, 15-grain vials; bottles.

Use: Medicine; to induce chromosome doubling in plants.

Caution: Very poisonous!

Shipping regulations: None.*

colchicine tannate.

Properties: Yellow powder; soluble in alcohol. Contains 38-40% colchicine.

colchicum (meadow saffron; autumn crocus; wild saffron, meadow crocus). Dried root and seed of *Colchicum autumnale*.

Habitat: Central and southern Europe and North Africa.

Grades: Technical.

Containers: Bales.

Uses: Extraction of colchicine; medicine.

Shipping regulations: None.*

cold area. A laboratory or plant area free from radioactive materials. See hot area.

cold light. See luminescence.

cold rubber. Synthetic rubber produced by polymerization at relatively low temperatures; specifically, SBR or butadiene-styrene type rubber produced by polymerization at about 40°F compared with the regularly used temperature of about 120°F. A special catalyst system is required, but the product has considerably improved strength and abrasion resistance compared with the rubber polymerized at the higher temperatures.

colemanite $Ca_2B_6O_{11} \cdot 5H_2O$. A natural hydrated calcium borate. Color, white or colorless; white streak; vitreous to dull luster. Contains 50.9% B_2O_3 , 27.2% CaO, balance water.

Constants: Sp. gr. 2.26-2.48, hardness 4-4.5. Occurrence: United States (California).

Use: One of the raw materials in the United States for boric acid, sodium borate, etc.

"Colfoam," ¹⁴⁴ Trademark for urea-formaldehyde foams.

Properties: Snow-white, fluffy cubes or shreds of an interwoven crystalline nature containing 99% trapped air by volume.

Weight 0.8 lb/cu ft. Thermal conductivity (K factor) at mean temperature of 75°F is 0.18. Odorless, mildewproof, chemically inert under low temperatures; able to withstand sustained temperatures up to 120°F; resistant to fire and corrosion.

Containers: 10-lb multiwall bags; cardboard cartons.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Uses: Low temperature insulation; reduce evaporation losses from crude oil tanks; reduce bulk density of plastics, ceramics, coatings, concrete and plaster.

collagen. Albuminoid comprising the major portion of the white fiber in connective tissues of the animal body, particularly in the skin, bones and tendons. Considered an aggregate of cyclopeptide micelles. Converted to gelatin by boiling with water.

"Collargol." ³⁸ (colloidal silver). Trademark for a shiny, silver-gray solid containing approximately 78% silver in a soluble and stabilized form.

Properties: Dispersible in water.

Use: Medicine (antiseptic).

collaurin (collaurum, colloidal gold). An aqueous colloidal suspension of metallic gold free from other materials. Used in medicine.

collaurum. See collaurin.

2,4,6-collidine (2,4,6-trimethylpyridine) $(CH_3)_3C_5H_2N$.

Properties: Colorless liquid. B.p. 170.4°C, freezing point -44.5°C; sp.gr. 0.913 (20/20°C), refractive index (n_D 20/D) 1.4981.

Soluble in alcohol, slightly soluble in water.

Grades: Technical (97.5% purity).

Containers: 1-, 5-, 55-gal drums.

Uses: Chemical intermediate, dehydro-halogenating agent.

collodion. See also pyroxylin.

Derivation: Solution of nitrated cellulose (mixture of trinitrocellulose and tetra-nitrocellulose) in ether and alcohol.

Properties: Pale yellow, syrupy liquid, very flammable, odor of ether. When exposed in thin layers, evaporation occurs to leave a tough colorless film.

Constants: Collodion U.S.P. XVI: Typical specifications: U.S.P. XVI formula pyroxylin 40 g, ether 750 cc, alcohol 250 cc (making a total of about 1000 cc); wt/gal 6.37 lbs (25°C)(approx); sp.gr. 0.765-0.775.

Collodion Flexible U.S.P. XVI: Collodion U.S.P. XVI plasticized with camphor and castor oil. Typical specifications: U.S.P. XVI formula camphor 20 g, castor oil 30 g, collodion U.S.P. XVI 950 g, (making a total of 1000 g), wt/gal 6.46 lbs (25°C)(approx).

Grades: Technical, U.S.P. XVI.

Containers: Glass bottles; 1-, 5-, 6-, 10-lb cans, 30-, 60-lb drums.

Uses: Photographic films; cementing; coating wounds and abrasions; patent and artificial leather; solvent for drugs; corn removers; process engraving and lithography; artificial pearls.

Fire hazard: Dangerous! Flammable!

Flash point under 80°F; keep lights and fire away.

Shipping regulations: Flammable liquid. Red label.*

collodion cotton. See nitrocellulose.

collodion, flexible. See collodion.

colloid. Most frequently a special type of liquid mixture or suspension in which the particles of suspended liquid or solid are present in very finely divided form (i.e., particle size from about 1 to 500 millimicrons in diameter). The colloidal suspension of liquids in liquids is an emulsion.

Unlike ordinary suspensions, colloids do not exhibit the phenomenon of settling to a noticeable degree. Because of their exceedingly high ratio of surface area to volume, the rate of sedimentation is very slow, so that the slightest convection currents (as from small temperature differences) are sufficient to keep the particles in uniform distribution.

The suspended particles may contain from a few molecules to hundreds of molecules of small or average size. Such particles are actually too small to be seen by the ultramicroscope, but can be studied by means of reflected light, and can be resolved by the electron microscope. Suspensions in which the particles are very large molecules (proteins, polymers, etc.) may behave like colloids even though the particles are single molecules as large as half a micron in diameter. The realm of colloids also includes suspensions of finely divided liquids or solids in gases (fogs and smokes) and systems of thin films, bubbles or filaments whose thickness is of the above dimensions.

colloidal clay. See bentonite.

colloidal gold. See collaurin.

collophanite. See apatite.

"Colloresine." ³⁰⁷ Trademark for a series of thickening, binding, and finishing agents. Composition: Sodium carboxymethyl cellulose, 99.5% active (dry basis).

Properties: White powder.

Uses: Primarily used as thickening, binding or finishing agent in paper, leather and textile printing trades. Thickening agent for latex dispersions. Used as builder in detergent formulations.

Grades: All "Colloresine" brands are chemically similar but differ in viscosity of aqueous solutions.

"Colloresine" HMS: Viscosity of 1% solution ranges from 100-300 cps.

"Colloresine" HV: Viscosity of 1% solution ranges from 1300-2200 cps.

"Colloresine" LV: Viscosity of 2% solution ranges from 25-50 cps.

"Colloresine" MV: Viscosity of 2% solution ranges from 300-600 cps.

colloxylin. See nitrocellulose.

colocynth (bitter apple; bitter cucumber; bitter gourd). Peeled, dried, unripe fruit of *Citrullus colocynthis*.

Habitat: Mediterranean region, Asia and Africa.

Grades: Technical, N. F. XI.

Containers: Boxes; barrels.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Use: Medicine.

Shipping regulations: None.*

Cologne brown. See Vandyke brown.

Cologne earth. See Vandyke brown.

Cologne spirits. A very pure grade of ethyl alcohol.

Shipping regulations: Flammable liquid.

Red label.*

"Coloidex." ¹³³ Trademark for a series of surface treated carbon blacks. Designed for cement and water systems. Sold in powder form. "Coloidex 3" is a regular color impingement carbon black.

colophony. See rosin.

"Colorex" Textile Stripper. ¹ Trademark for titanium trichloride in aqueous solution with zinc chloride. Dark violet to black liquid.

Typical specifications: Grade No. 20:

Titanium trichloride, 20%; zinc chloride, 16% approx; hydrochloric acid, 7-9%; water and stabilizer, 50-57%.

Grade No. 23: Titanium trichloride, 23%; zinc chloride, 19% approx; hydrochloric acid, 7-9%; water and stabilizer, 44-51%.

Containers: 5-, 13-gal carboys; 1-gal bottles (boxed).

Uses: Powerful reducing agent, dye stripper.

Shipping regulations: Corrosive liquid.

White label.*

colorimetry. A means of analysis based on measuring the color intensity of a particular substance or a colored derivative of it.

color lake. See lake.

colorless dye. Synonym for optical bleach (q. v.).

colors. See dyes.

"Colorundum." ²⁰⁵ A balanced mixture of abrasive aggregates, mineral oxide color, and stearate for surfacing concrete floors, in a choice of colors.

Colour Index number. See dyes.

"Colton." ¹⁴⁴ Trademark for polyvinyl homopolymer and copolymer resins, emulsions, and other polymer products.

"Columbia." ²¹⁴ Trademark for activated carbons.

Properties: Hard, durable, inert pellets and granules. Low ash content. Unaffected by most chemical agents and conditions. Numerous grades available.

Constants: Real densities 1.75-2.10, apparent densities of individual particles 0.6-0.9; apparent densities of packed mass of particles 0.42-0.55; weights of packed mass of particles 26-34 lbs/cu ft; moisture contents 0.5-2.5%; ash contents 0.5-10%.

Containers: 1-, 5-lb friction top tin cans;

25-, 200-lb fiber drums.

Uses: Solvent recovery; gas purification; air conditioning; gas separation; gas masks, catalyst carriers.

columbite (tantalite, niobite)

(Fe,Mn)(Nb,Ta)₂O₆. A natural oxide of niobium, tantalum, ferrous iron, and manganese, found in granites and pegmatites. Some tin or tungsten may be present in the mineral.

Properties: Color iron black to brownish black; streak dark red to black; luster sub-metallic; sp. gr. 5.2-7.9; hardness 6.

Occurrence: South Dakota, Colorado, New Mexico, Maine, North Carolina; Greenland; U. S. S. R.; Germany.

Use: Source of niobium and tantalum.

columbium Cb. Obsolete name for the element niobium. The latter name became official in 1949.

colza oil. See rape-seed oil.

"Comal." ⁵¹ Trademark for a grease for heavy industry. It is a mixed-base, oxidation-resistant grease formulated for use on plain and anti-friction bearings, and for application by grease gun or centralized system.

"Combiotic." ²⁹⁹ Trademark for a preparation containing penicillin and dihydrostreptomycin.

"Combistrep." ²⁹⁹ Trademark for a preparation containing streptomycin and dihydrostreptomycin.

common rosin. See rosin.

"Com-Plex." ¹⁰¹ Trademark for series of plasticizer extenders. Available as:

"Com-Plex" 4000: sp. gr. 0.880-0.895; boiling range 530-700°F; f. p. below -65°F; flash point 275°F.

"Com-Plex" 8200: sp. gr. 0.875-0.890; boiling range 545-700°F, f. p. below -65°F, flash point 275°F.

Uses: Vinyl processing industry.

complex compound. A compound formed by combination of substances that are themselves capable of independent existence. Examples are double salts, hydrates, coordination compounds and inclusion complexes.

See also complex ion, and coordination compound.

complex ion. An ion formed by combination of a simpler ion with another ion or with an atom or a molecule. Thus copper ion Cu⁺⁺ joins with ammonia molecules to form Cu(NH₃)₄⁺⁺, copper ammonia complex ion.

"Complexon." A German sequestrant of several varieties, similar to, and including ethylenediaminetetraacetic acid.

complexones. A group of aminopolycarboxylic acids basically derived from iminodiacetic acid and containing at least one -N(CH₂COOH)₂ group. These form stable complexes with many cations under varying conditions and these complexes are only very slightly ionized. The most commonly used of these is ethylenediaminetetraacetic acid (q. v.), which has been used in titrimetric procedures for the indirect

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

determination of metal ions and as a sequestering agent for separation and removal of metal contaminants. See also chelate; sequestration.

component. One of the minimum number of substances required to state the composition of all phases of a system. In the absence of chemical reaction, any one of the substances in a mixture.

composition metal leaf. See copper-aluminum alloy leaf.

compound. A substance composed of atoms or ions of two or more different elements. A compound has definite proportions by weight of the constituent elements and may thus be represented by a chemical formula. Each compound has its own characteristic properties, different from those of its elements, and from properties of other compounds.

Compound B. See corticosterone.

Compound E. See cortisone.

Compound F. See hydrocortisone.

compreg. A hardwood impregnated with a phenol-formaldehyde resin under heat and pressure.

"Compregnite." ⁶⁵ Trademark for a phenol-formaldehyde liquid resin used for impregnation of wood to improve density and physical properties.

compressed petroleum gas. See liquefied petroleum gas.

"Compresto." ⁸⁴ Trademark for an electrical conductor consisting of layers of shaped pure aluminum wires concentrically stranded about a single round core wire.

Compton effect. One of the principal processes by which high energy electromagnetic radiation, or gamma rays, interact with or are absorbed by matter. In the Compton process, the gamma ray frees an electron in matter as if the electron was unbound, dividing the momentum of the gamma ray between the ejected electron and a new gamma ray of lower energy going off in a new direction.

"Com-Sol" 176. ¹⁰¹ Trademark for a saturated highly aromatic hydrocarbon solvent.

Properties: Sp. gr. 0.829, refractive index 1.4657 (25°C); flash point 128°F; aromatic content 63%; naphthenic and paraffinic content 37%; boiling range 358-481°F.

Use: Replacement of dipentene or other terpene-type solvents in rubber solution formulations; solvent for chlorinated insecticides; preparation of resin solutions for paints and coatings.

"Conac S." ²⁸ Trade name for N-cyclohexyl-2-benzothiazole sulfenamide, $C_6H_5SNCSNHCHC_4H_9CH_2$.

Properties: Cream colored powder; sp. gr. 1.27, m. p. 200-212°F.

Containers: 50-lb bags.

Use: To accelerate and improve the vulcanization of natural and synthetic rubber.

conarachin. A globulin derived with arachin from peanut meal. Differs from arachin largely in sulfur content.

"Concentals." ³²⁵ Brand name for a series of highly sulfated organic compounds. Used in cotton softening and finishing operations.

concentration.

1. The amount of a given substance in a stated unit of a mixture, solution, or ore. Common methods of stating concentration are per cent by weight or by volume, normality, weight per unit volume, as grams per cubic centimeter or pounds per gallon.

2. The process of increasing the amount of the given substance/unit of mixture, etc.

conchinine. See quindine.

concrete.

1. A conglomerate of gravel, pebbles, broken stone, blast-furnace slag or cinders, termed the aggregate, embedded in a matrix of either mortar or cement, usually standard Portland cement in the U. S. Ancient and medieval concretes had lime-mortar matrices. Reinforced concrete, ferro-concrete, and armored concrete are concretes in which steel in various forms is used to strengthen the concrete. See cement, Portland.

2. (perfumery). A waxy solid which results from the solvent extraction (usually by refined ligroin) of a perfume source such as rose petals. When the concrete is dewaxed by use of a properly chosen second solvent, the desired essential oil remains. At this point it is called an absolute.

concrete, cellular. A light-weight concrete foam which may be made in several ways:

1. By the addition of aluminum powder to the concrete mix and applying heat, which sets hydrogen free to make the concrete cellular.

2. By whipping air into the mix containing an entraining agent.

3. By adding preformed foam to the mix. Such foams are made from a foaming agent such as dried blood, a stabilizer such as ferrous or aluminum sulfates, organic solvents, and a germicide such as chlorinated phenol or mercury salts.

condensation. A chemical reaction in which two or more molecules combine, with the separation of water or some other simple substance. If a polymer is formed, the process is called polycondensation (ASTM definition, ASTM D883-54T).

condensed asphalts. See blown asphalt.

"Con Det." ²³⁶ Trademark for a low foaming concentrated synthetic detergent for use in preparation of low-solids-content drilling muds for oil wells. Also provides lubricating and emulsifying properties and is

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

useful as a general purpose liquid detergent.

Containers: 5-gal cans and 55-gal drums.

condor vine. See *condurango*.

"**Conductex**." ¹³³ Trademark for a group of carbon blacks designed to provide high electrical conductivity where required in rubber, plastics, coatings etc.

conduction (heat). The transfer of heat from one point to another within a body, or from one body to another when both bodies are in physical contact, in the absence of motion in the medium.

Conductive Silver Preparations. ²⁸ Specially compounded materials containing silver powder in a suitable vehicle, with or without ceramic flux; can be coated on base materials such as titanate bodies, mica, glass, porcelain, steatite, plastics, wood, cloth and paper by stencil screening (squeegee), spraying, dipping, brushing, roller coating, banding wheel, or other suitable method. Fixed by air-drying, baking at low temperatures, or firing at elevated temperatures.

Uses: To produce capacitor electrodes, ceramic-to-metal solder seals, electrical shields, surfaces of high conductivity on nonconductive materials; as a base for electroplating on ceramic and nonceramic surfaces.

condurango (*cundurango*; eagle vine; *mata-perro*; *condor vine*). Bark of *Marsdenia cundurango*.

Habitat: Ecuador and Peru.

Grades: Technical.

Containers: Bales.

Use: Medicine.

Shipping regulations: None.*

Condy's liquid. A dilute solution of potassium permanganate used as disinfectant.

cone flower. See *echinacea*.

conformation. The overall spatial arrangement of the atoms and groups in a polymer molecule, i. e., the general shape of a polymer molecule. See *polymer*, *stereospecific*. Also applied to spatial arrangement of atoms and groups in any complex molecule.

conglutin.

Properties: White powder; contains 18% nitrogen and 0.6% sulfur; used in medicine as a 6% solution. Soluble in weak alkaline solutions.

Derivation: A vegetable casein derived from almonds.

Congo copal. A natural fossil resin available in various commercial grades from water-white transparent to pale dust. The raw material is almost completely insoluble in all solvents but can be subjected to high temperatures and the Congo molecule cracked. Volatile compounds 20-25% of the original weight are given off during cracking at 650-675°F. The process is

dangerous without special equipment due to flammability at that temperature. Can be purchased in processed form to avoid the fire hazard and to obtain a more uniform resin. The raw material has refractive index (*n*_D²⁰) 1.540-1.541; *sp. gr.* 1.05-1.07; direct acid number 92-115.

Containers: Bags.

Uses: Protective coatings. See also *copal*.

Congo red. Sodium diphenyl-bis- α -naphthylaminesulfonate $C_{22}H_{22}O_6N_4S_2Na_2$. Properties: Brownish-red powder; soluble in water and alcohol; insoluble in ether; odorless; decomposes on exposure to acid fumes.

Derivation: Combination of tetraazotized benzidine and naphthionic acid.

Uses: Dye; medicine; indicator; biological stain.

conhydrine (*oxyconiine*; 2(α -hydroxypropyl) piperidine) $C_5H_{10}NCH(OH)C_2H_5$.

Properties: Colorless crystalline alkaloid; poisonous! Soluble in alcohol, ether, and chloroform, slightly soluble in water. *M. p.* 120.6°C; *b. p.* 220-226°C.

Derivation: By extraction of the seeds of *Conium maculatum* and subsequent crystallization.

Method of purification: Recrystallization.

coniferin $C_{16}H_{22}O_8$. A glucoside contained in pine bark and other conifers. When decomposed it yields coniferyl alcohol which can be oxidized to vanillin. Used as a raw material for manufacture of synthetic vanillin.

coniine (propyl pyridine) $C_5H_{10}NC_3H_7$.

Properties: Colorless, oily liquid alkaloid, mousy odor; poisonous! Soluble in alcohol, ether, and oils; slightly soluble in water. *M. p.* -25°C, *b. p.* 166°C.

Derivation: By extraction of *Conium maculatum* and subsequent distillation.

coniine hydrochloride $C_5H_{17}N^+HCl^-$.

Properties: White crystals; poisonous. Soluble in water and alcohol; insoluble in ether. *M. p.* 210-220°C.

Derivation: By the action of hydrochloric acid on coniine.

Method of purification: Crystallization.

conium (poison hemlock; spotted hemlock; poison parsley; spotted cowbane). (The synonym hemlock is not officially recognized because of the confusion with the hemlock tree.) Poisonous!

Derivation: Full grown, but unripe carefully dried fruit of *Conium maculatum*.

Habitat: Europe; Asia; United States.

Grades: Technical.

Containers: Boxes.

Use: Source of coniine.

Shipping regulations: None.*

conjugated double bonds. Two or more double bonds each separated from one another by a single bond, as in the structural formulas for butadiene-1,3 ($H_2C=CH-CH=CH_2$) or in maleic acid (the $O=C-C=C-C=O$ skeleton).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

conjugate layers. Two layers of a liquid system each composed of a different ternary mixture and in equilibrium with one another.

"Conpernik." ¹⁰⁶ Trademark for an alloy of approximately equal proportions of iron and nickel having constant permeability over a range of low flux densities. It is used where constant inductance cores are required over a low range of inductions.

consistency. A term used in rheology to designate the property of a material or composition which is evidenced by its resistance to flow and is represented by a composite of its properties. For Newtonian liquids, consistency and viscosity are synonymous. For non-Newtonian liquids, it qualitatively represents plastic flow.

constant-boiling mixture. See azeotropic mixture.

cont. Abbreviation for containers or content.

contact acid. Sulfuric acid made by the contact process (q. v.).

contact process. A process for manufacture of sulfuric acid and oleum, in which the sulfur dioxide is oxidized to sulfur trioxide by contact with a platinum or vanadium pentoxide catalyst.

Air used for burning sulfur or pyrites is first dried by scrubbing with 95-98% sulfuric acid. After combustion, the burner gases are usually run through waste-heat boilers for the generation of steam. If pyrites is burned, it is necessary to remove dust by means of electrostatic precipitation, and to scrub out halogens in sulfuric-acid wastetowers.

Prior to entry into the first catalytic converter, the burner gas temperature is adjusted to 575°C to obtain a high rate of conversion of most of the sulfur dioxide. Before entering the second converter, the temperature is adjusted to 450°C. The rate of conversion is relatively slow at this temperature but the equilibrium is such that 98% conversion can be realized. The sulfur trioxide is then cooled before going to the absorbers.

The converted gases pass through an oleum absorber, which is a packed tower. Sulfuric acid (98-99%) is trickled down the packing, and 20% oleum (100% sulfuric acid containing 20% free sulfur trioxide) leaves the tower. This may be further concentrated by distillation, the sulfur trioxide given off from the still being absorbed in 20% oleum in mechanically-stirred water-cooled vessels.

From the oleum absorber, the converted gases proceed to the final absorber, again a packed tower, where they are scrubbed with 98% sulfuric acid before being discharged into the atmosphere. The 98% acid is considerably concentrated in passing down this tower, so it is pumped to a diluting tank where water or dilute

acid is added, and from which it is continuously circulated through the tower. Sulfuric acid (98%) to be sold is removed from the diluting vessel.

contact resins (impression resins, low-pressure resins). Synthetic thermosetting resins characterized by cure at relatively low pressure. The usual components are an unsaturated high molecular weight monomer such as an allyl ester, or a mixture of styrene or other vinyl monomer with an unsaturated polyester or alkyl. Cure requires heat and a catalyst as well as some pressure. The curing does not result in water formation as with phenol-formaldehyde resins.

contamination (radioactive). Radioactive materials which have been deposited anywhere that radioactivity is not desired. The removal of radioactive contamination is known as decontamination. Decontamination procedures vary with the type and intensity of the radiation and with the object involved. Many ordinary objects may be decontaminated by washing with water or with chemical solutions. Skin contamination is best treated by washing thoroughly with soap and water. Contaminated clothing should be appropriately stored until the extent of radioactivity is small enough to permit laundering. Objects and clothing still too radioactive to handle after preliminary treatment must be buried until the radiation level is safe, or they must be disposed of in a proper manner. No radioactive material should be burned in an open incinerator. Decontamination crews should wear protective clothing, footwear, gloves, masks, etc., depending upon the circumstances and the extent of contamination.

"Continental." ¹⁰⁴ Trademark for a line of channel blacks used in natural and synthetic rubber, paints, inks and plastics.

Continex." ¹⁰⁴ Trademark for furnace blacks used in rubber, plastics, paints, paper.

continuous distillation. Distillation in which a feed, usually of nearly constant composition, is supplied continuously to a fractionating column and the product is continuously withdrawn at the top, bottom, and sometimes at intermediate points.

Controlled Solubility Phosphates 15-J, 1-P, 1-R, 19-R. ¹⁰⁸ Series of sodium-calcium phosphates in true glassy form with an active P_2O_5 content of 68%.

Containers: Available in pails, drums and cans.

Uses: Prevent the formation of "gyp" and scale in producing oil wells, heat treaters, salt water disposal systems, water floods.

control rod. See nuclear reactor.

convallaria (lily-of-the-valley; May lily; park lily; May blossom). Dried flowers, dried rhizome and roots of *Convallaria majalis*.

Habitat: United States; Europe and northern

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Asia; cultivated in United States.

Use: Medicine.

convection (heat). The transfer of heat from one place to another by a moving gas or liquid. Natural convection results from differences in density that are caused by temperature differences. Thus warm air is less dense than cool air; the warm air rises relative to the cool air, and vice versa. Forced convection involves motion caused by pumps, blowers, or other mechanical devices.

"Convertit." ¹⁷³ Trademark for an invertase preparation for production of stable soft cream centers in candies.

"Coolanol" ^{45, 58} Trademark for dielectric coolant for electronic equipment. A clear, amber liquid useful from -65° to 400°F.

"Coomassie." ²⁰⁶ Brand name for a proprietary line of acid dyestuffs.

coordination compound (Werner complex). A complex compound whose molecular structure contains a central atom bonded to other atoms by coordinate covalent bonds. These are bonds based on a shared pair of electrons both of which come from a single atom or ion. Examples of coordination compounds are cobalt III hexammine chloride [Co(NH₃)₆]Cl₃ and potassium chloroplatinate, K₂[PtCl₄]. In these cases the Co and Pt atoms are joined to the NH₃ and Cl respectively by coordinate covalent bonds.

Chelate compounds are a special kind of coordination compound (see chelate).

copaiba balsam. See copaiba resin.

copaiba oil.

Properties: Essential oil; colorless to yellowish or bluish; characteristic copaiba-balsam, pepperlike odor, bitter, grating, lingering taste.

Constants: Sp. gr. 0.88-0.91 (15°C), optical rotation -1 to -33°, refractive index 1.494-1.500; acid no. 0-1.9, insoluble in water; soluble in 5-6 vols 95% alcohol, soluble in ether, carbon disulfide.

Chief constituent: Caryophyllene, a sesquiterpene, C₁₅H₂₄.

Derivation: Distilled from copaiba balsam.

Containers: Bottles; 25-, 50-lb cans.

Use: Medicine.

Shipping regulations: None.*

copaiba resin (Jesuits' balsam; copaiba balsam; balsam capivi).

Properties: Transparent, viscous, light yellow to brownish-yellow liquid; peculiar odor. Soluble in alcohol, ether, chloroform, benzene and carbon disulfide, insoluble in water. Sp. gr. 0.940-0.990.

Derivation: The oleoresin from one or more South American species of copaiba.

Habitat: Brazil, Venezuela, and Colombia.

Grades: Technical. Copaiba resins are classified commercially according to port of export, and include Para, Maracaibo, Bahia, Marnaham, Cartagena and Maturin.

The first two are the most important.

Containers: 1-, 5-lb bottles; 10-, 50- to 55-lb cans.

Uses: Medicine; varnishes; lacquers; brightening old paintings; tracing papers; tracing cloths; odor fixative.

Shipping regulations: None.*

copaivic acid C₂₀H₃₀O₂. A monobasic acid derived from the resin of copaiba.

copal. A class of natural resins, both recent and fossil. The principal recent, or soft, copals are Philippine, Manila, and pontianak; the principal fossil, or hard, copals are Congo and kauri.

Properties: Yellow to red, semitransparent, brittle lumps having a conchoidal fracture and vitreous luster. In general, the copals have higher acid numbers than the dammar resins. The soft copals are partly soluble in alcohol, chloroform, and turpentine. The hard copals are nearly insoluble in the usual solvents but, on strong heating, the resins lose 10-25% of their weight and become soluble in turpentine and linseed oil.

Habitat: East Indies; Philippines; Australia; Africa.

Grades: Technical, nubs, chips, seeds.

Containers: Bags.

Uses: Varnishes and lacquers.

Shipping regulations: None.*

See also animé; Zanzibar gum.

copal oils. Oil sometimes used in the preparation of oil varnishes. They are obtained by the dry distillation of copal.

"Copeel." ³³³ Trade name for a removable protective coating used during storage and shipment to protect painted and unpainted equipment.

"Copeenblak." ¹³³ Trademark for a series of carbon dispersions in polyethylene for pigmenting cables and jackets, film and pipe stocks.

"Copel." ¹⁶⁶ Trademark for 55-45 copper-nickel alloy used as a resistor material in the construction of electrical instruments where temperature coefficient of resistance must be very low.

copolymer. The substance produced by the polymerization or addition of two or more dissimilar monomers; as SBR synthetic rubber, from styrene and butadiene.

"Cop-o-zink." ⁹³ Trade name for an intimate mixture of insoluble salts of copper and zinc in definite proportion.

Containers: 50-lb bags; 48-lb cases (12x4-lb bags).

Use: Fungicide with secondary benefit as source of nutritional trace elements. Synergistic action greatly enhances effectiveness. Compatible with DDT, BHC, organic and inorganic insecticides.

copper Cu. A metallic element of atomic number 29, of group Ib of the periodic system.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Distinctive reddish color; sp. gr. 8.96; m. p. 1083°C; b. p. 2325°C; ductile; good conductor of electricity. Dissolves readily in nitric and hot concentrated sulfuric acid; in hydrochloric and dilute sulfuric acid slowly but only when exposed to the atmosphere. More resistant to atmospheric corrosion than iron, forming a superficial layer of green basic carbonate. Readily attacked by alkalis.

Occurrence: Sometimes native and also in the following minerals: azurite, atacamite, azurmalachite, bornite, brochantite, chalcantite, chalcocite, chalcopyrite (copper pyrites), chrysocolla, covellite, cuprite, enargite, malachite, stromeyerite, tennantite, tenorite, tetrahedrite. Leading producers are U. S. A.; Chile; Peru; Canada; Africa; U. S. S. R.

Derivation: Varies with the type of ore. With sulfide ores the steps may be (1) concentration (of low grade ores), (2) roasting, (3) formation of copper "matte" (40-50% Cu), (4) reduction of matte to "blister" copper (96-98%), (5) electrolytic refining to 99.9 + % copper.

Forms available: Ingots, sheet, rod, wire, tubing, shot, powder; high purity (impurities less than 10 ppm).

Uses: Electric wiring; switches, plumbing, heating, roofing material; chemical and pharmaceutical machinery; alloys (brass, bronze, monel metal, etc); electroplating; cooking utensils. Copper powder and massive copper used in making beryllium, beryllium-copper alloys, beryllium oxide. Flakes used as insulation for liquid fuels.

copper-8. Slang for copper-8-quinolinolate.

copper abietate (cupric abietate)

$\text{Cu}(\text{C}_{20}\text{H}_{29}\text{O}_2)_2$.

Properties: Green scales; poisonous! Soluble in alcohol, and in oils, with fine green color; insoluble in water.

Derivation: By heating copper hydroxide with abietic acid.

Containers: Barrels.

Use: Preservative metal paint; fungicide.

copper acetate (cupric acetate; crystals of Venus; verdigris, crystallized)
 $\text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot \text{H}_2\text{O}$.

Properties: Greenish-blue, fine powder; poisonous! Soluble in water, alcohol and ether.

Constants: Sp. gr. 1.9; m. p. 115°C; decomposes at 240°C.

Derivation: By the action of acetic acid on copper oxide and subsequent crystallization.

Use: Synthetic rubber.

copper acetate, basic (copper subacetate; verdigris; verdigris, blue; verdigris, green).

Properties: Masses of minute silky crystals either pale green or bright blue in color.

Blue variety, approximate formula

$(\text{C}_2\text{H}_3\text{O}_2)_2\text{Cu}_2\text{O}$. Green variety, approximate formula $\text{CuO} \cdot 2\text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2$. Coppery taste. Poisonous! The green rust with

which uncleaned copper vessels become coated and which is commonly termed verdigris is a copper carbonate and must not be confused with true verdigris. Apart from its impurities, verdigris is a variable mixture of the basic copper acetates.

Soluble in acids; insoluble in alcohol; very slightly soluble in water.

Derivation: By the action of acetic acid on copper in the presence of air.

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden kegs; fiber drums,

Uses: Paint pigment; insecticide; fungicide; mildew preventive; mordant in dyeing and printing fabrics; copper acetoarsenite.

Shipping regulations: None.*

copper acetoarsenite (cupric acetoarsenite; Paris green; Schweinfurth green; imperial green; king's green; emerald green; new green; patgreen; moss green; mitis green; Vienna green; emperor green; parrot green; kaiser green; meadow green)
 $(\text{CuO})_3\text{As}_2\text{O}_3 \cdot \text{Cu}(\text{C}_2\text{H}_3\text{O}_2)_2$.

Properties: Emerald-green powder; poisonous! Soluble in acids; insoluble in alcohol and water. Toxic to many plants.

Derivation: By reacting sodium arsenite with copper sulfate and acetic acid.

Grades: Technical; C. P.

Containers: 1-lb bottles; wooden kegs; fiber drums.

Uses: Pigment; insecticide; wood preservative preparations.

Warning! Poisonous if swallowed. MCA warning label.

Shipping regulations: Poison, class B. Poison label.*

copper acetylacetonate $\text{Cu}(\text{C}_5\text{H}_7\text{O}_2)_2$. Crystalline powder; slightly soluble in water. Resistant to hydrolysis. A chelating non-ionizing compound.

"**Copper-A Compound.**"²⁸ See tetracopper calcium oxychloride.

copperah oil. See copra oil.

copper albuminate (copper, albuminated).

Properties: Dark green scales. Soluble in dilute acids, alkalis.

copper albuminated. See copper albuminate.

copper alum. See copper, aluminated.

copper, aluminated (divine stone; copper alum; eye stone). A combination of copper and aluminum sulfates with potassium nitrate and some camphor.

Properties: Light green solid; soluble in water.

Use: As a caustic (medical).

copper-aluminum alloy leaf (composition metal leaf). Usually signifies the alloy containing equal parts of copper and aluminum, often in leaf or sheet form, and used as a master alloy.

copper amalgam.

Properties: Hard, brown leaflets. Contain 74% (approx) mercury and 24% (approx)

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

copper. Soluble in nitric acid.

Grades: Technical.

Use: Dental cement.

copper aminoacetate. See copper glycinate.

copper aminosulfate. See copper sulfate, ammoniated.

copper-ammonium chloride (ammonium-copper chloride, ammonium-cupric chloride) $\text{CuCl}_2 \cdot 2\text{NH}_4\text{Cl} \cdot 2\text{H}_2\text{O}$.

Properties: Blue or bluish-green crystals. Soluble in alcohol, water. Sp. gr. 1.98.

copper-ammonium rayon. See cuprammonium rayon.

copper arsenate.

Properties: Light blue, blue, or bluish-green powder. Variable composition. Contains 33% (approx) copper and 29% (approx) arsenic. Soluble in dilute acids, ammonium hydroxide, insoluble in alcohol, water.

Uses: Insecticide, fungicide.

Shipping regulations: Poison, class B.

Poison label.*

copper arsenite (cupric arsenite, copper orthoarsenite; Scheele's green) CuHAsO_3 ; or, $\text{Cu}_3(\text{AsO}_3)_2 \cdot 3\text{H}_2\text{O}$, variable.

Properties: Fine, light-green powder; poisonous! Soluble in acids; insoluble in water and alcohol.

Constants: M. p., decomposes.

Derivation: By the interaction of copper sulfate and sodium arsenite.

Grades: Technical, C. P.

Containers: 1-lb bottles, wooden kegs, fiber drums.

Uses: Pigment (paints, wall paper, calico printing), insecticide.

Shipping regulations: Poison, class B.

Poison label.*

copper arsenite, ammoniacal. See chemonite.

copperas. See ferrous sulfate.

copperas, blue. See copper sulfate.

copperas, green. See ferrous sulfate.

copperas, white. See zinc sulfate.

copper benzoate $(\text{C}_6\text{H}_5\text{COO})_2\text{Cu} \cdot 2\text{H}_2\text{O}$.

Properties: Blue, crystalline, odorless powder, slightly soluble in cold water and alcohol.

Derivation: A salt of benzoic acid and a copper salt are reacted in water solutions.

copper-beryllium (beryllium-copper). Alloys having hardness of steel but which do not produce sparks when struck.

Uses: Fabrication of tools, apparatus and equipment for use where sparks would be hazardous, as in explosives operations or where explosive gas or gasoline mixtures are likely to be present.

copper bichromate. See copper dichromate.

copper, blister. See copper under "Derivation;" also see blister copper.

copper blue. See mountain blue and Bremen blue.

copper borate. See copper metaborate.

copper bromide (cupric bromide) CuBr_2 .

Properties: Black crystalline powder or crystals, deliquescent. Soluble in acetone, alcohol, water. M. p. 498°C.

Grades: Technical; C. P.

Uses: Photography (intensifier); organic synthesis (brominating agent).

copper carbonate (cupric carbonate; copper carbonate, basic, artificial malachite; mineral green. For the native mineral see malachite) $\text{Cu}_2(\text{OH})_2\text{CO}_3$.

Properties: Green powder; poisonous!

Soluble in acids, insoluble in water.

Constants: Sp. gr. 3.7-4.0; decomposes 200°C.

Derivation: By adding sodium carbonate to a solution of copper sulfate, filtering and drying.

Grades: Technical; C. P.

Containers: 1-, 5-lb bottles; 25-lb boxes, 100-lb kegs; 300-, 400-lb barrels or fiber drums.

Uses: Pigments; pyrotechnics; insecticides, copper salts, coloring brass black; astringent in pomade preparations, antidote for phosphorus poisoning, smut preventive; fungicide.

Caution! Harmful if swallowed. MCA warning label.

Shipping regulations: None.*

copper carbonate, basic. See copper carbonate.

copper carbonate, basic, hydrated. See azurite

copper carbonate, blue. See azurite.

copper carbonate, green. See malachite.

copper, chessy. See azurite.

copper chloride (cupric chloride) (a) CuCl_2 , (b) $\text{CuCl}_2 \cdot 2\text{H}_2\text{O}$.

Properties. (a) Brownish-yellow powder; hygroscopic, (b) green, deliquescent crystals. Poisonous! Soluble in water.

Constants. Sp. gr. (a) 3.054, (b) 2.39.

M. p. (a) 498°C.

Derivation. (a) By the union of copper and chlorine. (b) Copper carbonate is treated with hydrochloric acid and the product crystallized.

Grades: Technical, C. P.; reagent.

Containers: 1-, 5-lb bottles; 25-lb boxes; bags, 100-lb kegs; 300-lb barrels or fiber drums.

Uses: Chemical (oxidizing agent; catalyst in Deacon chlorine process); mordant in dyeing and printing fabrics; sympathetic ink; disinfectant, pyrotechnics; wood preservation; metallurgy (refining copper, gold, silver, recovering mercury from its ores by the wet process, electroplating copper on aluminum), chrome brown; preservation of pulpwood and ground pulp; deodorizing and desulfurizing petroleum distillates; photography; water purifications; feed additive.

Shipping regulations: None.*

See also cuprous chloride.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

copper chromate (basic cupric chromate)

Properties: Light chocolate-brown powder; poisonous! Loses water at 260°C. Soluble in nitric acid; insoluble in water.

Derivation: By the action of chromic acid on copper hydroxide.

Grades: Technical.

Containers: Wooden kegs; fiber drums.

Use: Dyeing (mordant).

Shipping regulations: None.*

copper compounds. For divalent (cupric)

compounds, see under copper; for monovalent (cuprous), see under cuprous.

copper cyanide (cupric cyanide) $\text{Cu}(\text{CN})_2$

Properties: Green powder; exceedingly poisonous! Keep well stoppered! Soluble in acids and alkalis; insoluble in water.

Derivation: By the addition of potassium cyanide to a solution of copper sulfate, cupric cyanide is precipitated. This can be dried, but is not stable.

Grades: Technical.

Containers: Glass bottles; special drums.

Uses: Electroplating copper on iron; intermediates (introduction of the cyanide group in place of the amino radical in aromatic organic compounds).

Danger: Contact with acid liberates poisonous gas. MCA warning label.

Shipping regulations: None.*

See also cuprous cyanide.

copper, deoxidized. Copper metal specially treated to remove all or a part of the 0.05% oxygen normally present. It is more ductile than ordinary copper metal.**copper dichromate** (copper bichromate; cupric dichromate) $\text{CuCr}_2\text{O}_7 \cdot 2\text{H}_2\text{O}$

Properties: Brown-red crystals; soluble in water, alcohol, and ammonium hydroxide. Hygroscopic. Caution! Keep well stoppered! Sp.gr. 2.286.

copper dihydrazinium sulfate

Properties: M.p. greater than 300°C, starts to decompose at 140°C; very slightly soluble in water, 250 ppm at 80°C.

Use: Foliage fungicide.

Caution! May cause skin and eye irritation. Harmful if swallowed or inhaled as mist or dust.

copper, electrolytic. Copper refined by electrolysis. The purest form of copper available commercially.**copper ethylacetoacetate** $\text{Cu}(\text{C}_6\text{H}_7\text{O}_3)_2$

Properties: Blue-green powder; m.p. 192-193°C. Insoluble in water; soluble in most organic solvents.

Use: Research and development.

copper ethylhexoate. See soaps, metallic.**copper ferrocyanide** (cupric ferrocyanide)

Properties: Reddish-brown powder; very insoluble in water and acids; soluble in NH_4OH and KCN solutions. As a paint pigment, copper ferrocyanide retains

desirable color, light-fastness, and chalking resistance and is compatible with high quality organic red and maroon pigments.

Uses: Paints and enamels; analytical test for traces of copper; inorganic osmotic membranes.

copper fluoride (cupric fluoride) $\text{CuF}_2 \cdot 2\text{H}_2\text{O}$

Properties: Blue crystals; poisonous!

Slightly soluble in water; soluble in acids.

Derivation: By decomposing copper carbonate with hydrofluoric acid and subsequent crystallization.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Wooden kegs; fiber drums.

Uses: Ceramics; enamels.

Shipping regulations: None.*

copper fluosilicate (copper silicofluoride; cupric fluosilicate; cupric silicofluoride) $\text{CuSiF}_6 \cdot 4\text{H}_2\text{O}$

Properties: Blue, hygroscopic crystals; poisonous! Soluble in water; slightly soluble in alcohol. Sp.gr. 2.158; decomposed by heat.

Derivation: By the interaction of copper hydroxide and hydrofluosilicic acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden kegs.

Uses: Dyeing and hardening white marble; treating grape vines for "white disease."

Caution! Harmful if swallowed. MCA warning label.

Shipping regulations: None.*

copper glance. See chalcocite.**copper gluconate** (cupric gluconate)

Properties: Odorless, light blue, fine, crystalline powder. Soluble in water; insoluble in acetone, alcohol, and ether.

Method of purification: Crystallization.

Grades: Pharmaceutical.

Containers: Cans; 25-lb fiber drums.

Use: Medicine; feed additive.

Shipping regulations: None.*

copper glycinate (copper aminoacetate; glycoll-copper) $(\text{NH}_2\text{CH}_2\text{COO})_2\text{Cu}$

Properties: Blue triboluminescent crystals; m.p. 130°C. Slightly soluble in water and alcohol; insoluble in hydrocarbons, ethers and ketones.

Grades: Anhydrous; hydrated (one H_2O).

Uses: Catalyst for rapid biochemical assimilation of iron; electroplating baths.

copper green. See verte antique.**copper hemioxide.** See copper oxide, red.**copper hydrate.** See copper hydroxide.**copper hydroxide** (cupric hydroxide; hydrated copper oxide; copper hydrate) $\text{Cu}(\text{OH})_2$

Properties: Blue powder; poisonous! Soluble in acids; insoluble in water.

Constants: Sp.gr. 3.368; m.p., decomposes.

Derivation: By the interaction of a solution of a copper salt with an alkali.

Grades: Technical.

Containers: Wooden kegs; fiber drums.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Uses: Copper salts; mordant; cuprammonium rayon; pigment; staining paper; feed additive.

Shipping regulations: None.*

copper 8-hydroxyquinoline. See copper 8-quinolinolate.

copper, indigo. See covellite.

"**Copper Inhibitor 50.**"²⁸ Trade name for 50% disalicylalpropylenediamine, $\text{HOC}_6\text{H}_4\text{CHNCH}_2\text{CH}(\text{CH}_3)\text{NCHC}_6\text{H}_4\text{OH}$, and 50% aromatic solvent.

Properties: Amber colored liquid; sp. gr. 0.99.

Containers: 250-lb drums.

Use: To prevent catalytic action of copper on oxidation of natural and synthetic rubbers.

copper iodide. See cuprous iodide.

Copperized CZC Chromated Zinc Chloride.²⁸

Special wood preserving formulation based on zinc chloride, sodium dichromate, and copper chloride for severe service exposures. A companion product to CZC Chromated Zinc Chloride (q. v.).

Properties: Granular material with slight brownish color, or 50% water solution; sp. gr. of solution approximately 1.525, freezing point -35°F .

Containers: Solution: tank cars; dry: 575-lb drums.

Uses: For preserving wood by impregnation for use under severe service conditions against decay and termite attack; and for application as a fire retardant. Treated lumber is clean, odorless, paintable, and safe to handle.

copper lactate (cupric lactate)

$\text{Cu}(\text{C}_3\text{H}_5\text{O}_3)_2 \cdot 2\text{H}_2\text{O}$.

Properties: Greenish-blue crystals or granular powder; soluble in water.

Uses: As a source of copper in copper plating; fungicides.

Caution! Harmful if swallowed. MCA warning label.

"**Copper Lume.**"⁷² Trade name for bright copper plating process. Prepared with copper cyanide, sodium cyanide and/or potassium cyanide and sodium and/or potassium hydroxide and organic and inorganic brightening agents.

Uses: Decorative plating applications in which smoothness and brightness of subsequent plated deposits are desirable.

copper matte. See copper, also matte.

copper-mercury iodide. See mercuric-cuprous iodide.

copper metaborate (copper borate; cupric borate) $\text{Cu}(\text{BO}_2)_2$.

Properties: Bluish-green, crystalline powder; insoluble in water; soluble in acids.

Derivation: By the interaction of copper hydroxide and boric acid.

Grades: Technical; C. P.

Containers: 1-lb bottles; kegs; tins.

Uses: Oil pigments; painting on porcelain; insecticides (especially wheat-rust compounds).

Caution! Harmful if swallowed. MCA warning label.

Shipping regulations: None.*

copper methane arsenate $\text{CH}_3\text{AsO}_3\text{Cu}$.

Properties: Greenish solid.

Derivation: Reaction of disodium methyl arsenate with copper salts.

Use: Algicide.

copper monoxide. See copper oxide, black.

copper naphthenate.

Properties: Green-blue solid. High germicidal power. Soluble in gasoline and mineral oil distillates. Dissolves in benzene to give green solution.

Derivation: Addition of solution of cupric sulfate to aqueous solution of sodium naphthenate.

Grades: 6, 8, 11 $\frac{1}{2}\%$ copper.

Containers: 1- to 55-gal drums.

Uses: Wood, canvas, and rope preservative; insecticide; fungicide.

copper nitrate (cupric nitrate)

(a) $\text{Cu}(\text{NO}_3)_2 \cdot 3\text{H}_2\text{O}$, (b) $\text{Cu}(\text{NO}_3)_2 \cdot 6\text{H}_2\text{O}$.

Properties: Blue, deliquescent crystals; poisonous! Soluble in water and alcohol.

Constants: Sp. gr. (a) 2.174; (b) 2.074.

M. p. (a) 114.5°C ; (b) 26.4°C ; (a) decomposes 170°C .

Derivation: By treating copper or copper oxide with nitric acid. The solution is evaporated and product recovered by crystallization.

Method of purification: Recrystallization.

Grades: Technical, C. P.

Containers: 1-, 5-lb bottles; wooden barrels; drums.

Uses: Medicine; preparation of light-sensitive papers, analytical reagent; dyes; insecticide for vines; coloring copper black; electroplating; production of burnished effect on iron, paints, varnishes, enamels; pharmaceutical preparations; textiles; catalyst.

Fire hazard: Dangerous oxidizing material. In contact with organic or other readily oxidizable substances it will cause violent combustion or ignition.

Shipping regulations: Oxidizing material.

Yellow label.*

copper nitrite (basic copper nitrite; cupric nitrite) $\text{Cu}(\text{NO}_2)_2 \cdot 3\text{Cu}(\text{OH})_2$; variable.

Properties: Green powder. Soluble (with decomposition) in dilute acids, ammonium hydroxide; slightly soluble in water.

copper nitrite, basic. See copper nitrite.

copper octoate. See soaps, metallic.

copper oleate (cupric oleate) $\text{Cu}(\text{C}_{18}\text{H}_{33}\text{O}_2)_2$.

Properties: Brown powder or greenish-blue mass; poisonous! Soluble in ether; insoluble in water.

Derivation: By the interaction of copper sulfate and sodium oleate.

Grades: Technical.

Containers: Tins.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Uses: Medicine; preserving fish nets and marine lines; fungicide; insecticide; ore flotation agent.

Shipping regulations: None.*

copper ore, gray. See fahlore.

copper ore, plush See cuprite.

copper ore, purple. See bornite.

copper ore, ruby. See cuprite.

copper ore, yellow. See chalcopyrite.

copper orthoarsenite. See copper arsenite.

copper oxide, black (cupric oxide; copper monoxide) CuO . For native black copper oxide see tenorite.

Properties: Brownish-black, amorphous or crystalline powder. Soluble in acids; insoluble in water. Sp. gr. 6.32; m.p. 1064°C .

Derivation: By the ignition of copper carbonate or copper nitrate.

Grades: Technical; C.P.

Containers: 1-, 5-lb bottles; 1-, 5-lb cans; 25-lb boxes; 100-lb kegs; 1,000-lb barrels or fiber drums.

Uses: Producing green or blue colors on glass, faience, porcelain and stoneware; reagent in analytical chemistry; insecticide for potato plant; catalyst in the reduction of organic compounds; purification of hydrogen; batteries and electrodes; aromatic acids from cresols; electroplating, solvent for chromic iron ores; imitation precious stones; desulfurizing oils; rayon, medicine, paints.

Caution! Harmful if swallowed. MCA warning label.

Shipping regulations: None.*

copper oxide, hydrated. See copper hydroxide.

copper oxide, red. (cuprous oxide; copper protoxide, copper hemioxide; copper suboxide) Cu_2O . For the native ore see cuprite.

Properties: Reddish-brown crystalline powder. Soluble in acids, insoluble in water. Sp. gr. 5.75-6.09; m.p. 1210°C , b.p. 1800°C .

Derivation: (a) By the oxidation of finely divided copper. (b) By the addition of bases to cuprous chloride. (c) By the action of glucose on cupric hydroxide.

Grades: Technical, C.P.; 97% Min (for pigments); also USN Type I (97%); USN Type II (90%).

Containers: 1-, 5-lb bottles; 25-lb cans, 25-lb boxes; 100-lb kegs; 1000-lb barrels.

Uses: Copper salts; ceramics; porcelain red glaze; red glass; electroplating; anti-fouling paints; fungicide.

Caution! Harmful if swallowed. MCA warning label.

Shipping regulations: None.*

copper oxychloride (cupric oxychloride) composition variable, possibly $3\text{CuO} \cdot \text{CuCl}_2 \cdot 3\frac{1}{2}\text{H}_2\text{O}$.

Properties: Bluish-green powder. Soluble in acids, ammonia; insoluble in water.

Caution! Harmful if swallowed. MCA warning label.

Use: Pigment; pesticide.

copper phenolsulfonate (copper sulfocarbolate) $[\text{C}_6\text{H}_4(\text{OH})\text{SO}_3]_2\text{Cu} \cdot 6\text{H}_2\text{O}$.

Properties: Green prismatic crystals.

Soluble in water and alcohol.

Derivation: Interaction of barium phenol-sulfonate and copper sulfate.

Use: Medicine.

Shipping regulations: None.*

copper phosphate (cupric phosphate) *

$\text{Cu}_3(\text{PO}_4)_2 \cdot 3\text{H}_2\text{O}$.

Properties: Light-blue powder. Soluble in acids, ammonium hydroxide; insoluble in water.

Grades: Technical.

Caution! Harmful if swallowed. MCA warning label.

Uses: Analysis; medicine; fungicide.

copper phosphide (cupric phosphide) Cu_3P_2 .

Properties: Grayish-black, metallic powder.

Soluble in acid; insoluble in water.

Sp. gr. 6.67.

Derivation: By heating copper and phosphorus.

Grades: Technical.

Containers: Wooden kegs; fiber drums.

Use: Manufacturing phosphor-bronze.

Shipping regulations: None.*

copper phthalate $\text{C}_8\text{H}_4\text{O}_4\text{Cu}$.

Properties: Fine blue powder; assay, minimum 95%; insoluble or very slightly soluble in common organic solvents or water.

Use: Fungicide.

Caution! Harmful if swallowed. MCA warning label.

copper phthalocyanine blue. See phthalocyanine pigments.

copper phthalocyanine green. See phthalocyanine pigments.

copper plating. The process for the production of a coating of substantially 100% pure copper on a metallic cathode. This process is carried out in an aqueous electrolyte, using copper anodes. Copper plating baths are of two types. The alkaline or cyanide bath in which copper is present as the cyanide is always used when copper is to be plated on die castings and on iron or steel, and is preferred for plating over brass or bronze. The acid bath, in which copper is present in the electrolyte as copper sulfate, is used for plating copper over nickel or over copper previously deposited on steel from the cyanide bath.

copper-potassium chloride (potassio-cupric chloride; potassium-copper chloride) $\text{CuCl}_2 \cdot 2\text{KCl} \cdot 2\text{H}_2\text{O}$.

Properties: Bluish-green crystals. Soluble in water.

Grades: Technical; C.P.; reagent.

Use: Analytical reagent.

Shipping regulations: None.*

copper-potassium cyanide. See potassium-copper cyanide.

* See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

copper potassium ferrocyanide (potassium copper ferrocyanide) $K_2CuFe(CN)_6 \cdot H_2O$.
Properties: Brownish-red powder. Insoluble in water. Used for pigment.

copper protoxide. See copper oxide, red.

copper pyrites. See chalcopyrite.

copper pyrophosphate. Used as a feed additive.

copper-8-quinolinolate (copper-8; copper 8-hydroxyquinoline) $Cu(C_9H_6ON)_2$.

Properties: Yellow-green nonhygroscopic, odorless powder. Solubility in neutral water about one part per million. Somewhat soluble in weak acids, soluble in strong acids. Insoluble in most organic solvents, but somewhat soluble in pyridine and quinoline. Solubilized copper-8 refers to the product formed by heating copper-8-quinolinolate with certain organic acids (naphthenic, lactic, stearic, etc.) or their salts. In such products the copper-8-quinolinolate does not settle out on standing, even after dilution with various solvents.

Derivation: From 8-quinolinol and copper salt such as copper acetate.

Grade: 10% active salt (1.8% Cu), solubilized.

Containers: Drums.

Uses: Fungicide and mildew-proofing of fabrics; in analysis for copper.

copper resinate (cupric resinate).

Properties: Green powder; poisonous!

Soluble in ether and oils; insoluble in water.

Derivation: By heating copper sulfate and rosin oil and filtering and drying the precipitate.

Grades: Technical.

Containers: Wooden kegs or fiber drums.

Uses: Preservative metal paint, particularly for ships' bottoms; insecticide.

Shipping regulations: None.*

copper ricinoleate $Cu(C_{17}H_{32}OHCOO)_2$. A green plastic solid; soluble in water and aliphatic hydrocarbons; partially soluble in alcohols and glycols; soluble in ketones and aromatic hydrocarbons.

Warning! Poisonous!

Uses: Fungicides; insecticides.

copper salts. For divalent (cupric) salts, see under copper; for monovalent (cuprous), see under cuprous.

copper scale. A coating which forms on copper after heating. It is composed of a mixture of cupric and cuprous oxides.

copper selenate (cupric selenate)
 $CuSeO_4 \cdot 5H_2O$.

Properties: Light-blue crystals. Soluble in acids, ammonium hydroxide, water; insoluble in alcohol. Sp. gr. 2.559.

copper silicates. Complex mixtures precipitated by solutions of copper salts from sodium silicate solutions. They are used in pigments, catalysts and insecticides.

copper silicide. See silicon-copper.

copper silicofluoride. See copper fluosilicate.

copper-sodium chloride (sodio-cupric chloride; sodium copper chloride)
 $CuCl_2 \cdot 2NaCl \cdot 2H_2O$.

Properties: Light-green crystals. Soluble in water.

copper-sodium cyanide. See sodium-copper cyanide.

copper stearate (cupric stearate)

$Cu(C_{18}H_{35}O_2)_2$.

Properties: Light blue, amorphous powder; poisonous! Soluble in ether, chloroform, benzene and turpentine; insoluble in water. M. p. about $170^\circ C$.

Derivation: By the interaction of copper sulfate and sodium stearate.

Grades: Technical.

Containers: Wooden kegs; tins; fiber drums.

Uses: Bronzing plaster statues; paint; see also soaps, metallic.

Shipping regulations: None.*

"Copper Steel." ²⁵¹ Trademark for a copper-bearing steel with good corrosion resistance; available in hot-rolled and galvanized sheets.

copper steels. Copper (0.15-0.25%) in steel improves resistance to atmospheric corrosion and also the resistance to sulfuric acid. Similar proportions of copper (0.25-0.5%) also render steel more resistant to oxidation at higher temperature. Up to about 4%, copper increases the fluidity of the melt, improves tensile and yield strength with only minor loss in ductility. The copper may be alloyed with one-third nickel to prevent surface checking.

Used for structural steels where corrosion resistance is a factor.

copper subacetate. See copper acetate, basic.

copper suboxide. See copper oxide, red.

copper sulfate. (cupric sulfate; blue vitriol; blue stone; blue copperas) $CuSO_4 \cdot 5H_2O$.

Properties: Blue crystals or blue crystalline granules or powder, slowly efflorescing in air; white when dehydrated; nauseous metallic taste; poisonous! Found in nature as chalcantite (q.v.). Soluble in water and slowly soluble in glycerin. Sp. gr. 2.284.

Derivation: (a) By the action of dilute sulfuric acid on copper or copper oxide in large quantities, with evaporation and crystallization.

Method of purification: Recrystallization.

Grades: Technical; C. P.; N. F. XI; also sold as monohydrate.

Containers: Multiwall paper sacks; drums.

Uses: The most important copper salt industrially; textile mordant; leather industry; germicides; insecticides; additive to some soils; pigments; electric batteries; electrolytic baths; copper salts; hair dyes; reagent in analytical chemistry; medicine; feed additive; improving casein glues; wood preservative; preservation of pulp wood and ground pulp; process engraving and lithography; ore flotation; destroying

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

algae and low forms of animal life in drinking water; in petroleum industry; synthetic rubber; steel manufacture; treatment of natural asphalts. The anhydrous salt is used as a dehydrating agent. Caution! Harmful if swallowed. MCA warning label.

Shipping regulations: None.*

copper sulfate, ammoniated (cupric ammonia sulfate; ammonio-cupric sulfate; copper aminosulfate) $\text{CuSO}_4 \cdot 4\text{NH}_3 \cdot \text{H}_2\text{O}$.

Properties: Dark blue, crystalline powder; decomposes in air; soluble in water; insoluble in alcohol.

Derivation: By dissolving copper sulfate in ammonium hydroxide and precipitating with alcohol.

Method of purification: Crystallization.

Grades: Technical; C. P.

Containers: 1-lb bottles; wooden kegs; fiber drums.

Uses: Calico printing; manufacturing copper arsenate; insecticide; treating fiber products.

Caution! Harmful if swallowed. MCA warning label.

Shipping regulations: None.*

copper sulfide (cupric) CuS .

Properties: Black powder or lumps. Soluble in nitric acid; insoluble in water. Occurs as the mineral covellite. Sp. gr. 3.9-4.6; m. p. 1100°C.

Derivation: By passing hydrogen sulfide gas into a solution of a copper salt.

Grades: Technical; C. P.

Containers: 1-lb bottles; wooden barrels.

Uses: Copper metal; protective paint for vessels; dyeing with aniline black.

See also cuprous sulfide.

Shipping regulations: None.*

copper sulfocarbonate. See copper phenol-sulfonate.

copper sulfocyanide. See cuprous thiocyanate.

copper tellate. See soaps, metallic.

copper tungstate (cupric tungstate; copper wolframate; normal copper tungstate) $\text{CuWO}_4 \cdot 2\text{H}_2\text{O}$.

Properties: Light-green powder; soluble in ammonium hydroxide; slightly soluble in acetic acid; insoluble in alcohol and water.

copper tungstate, normal. See copper tungstate.

copper undecylenate. Probably $[\text{CH}_2\text{CH}(\text{CH}_2)_9\text{COO}]_2\text{Cu}$. Used as a fungicide.

copper uranite. See torbernite.

copper wolframate. See copper tungstate.

copper, yellow. See chalcopyrite.

"Coppralyte" 1085. ²⁸ Trademark for a pale amber, mildly alkaline water solution of organic wetting agents; faint amine odor. Use: As an antipitting agent for copper plating.

"Coppralyte" Plating Salt-Potassium

Formulation. ²⁸ A sodium formulation is also available. White powder, gives alkaline solution in water. Copper content (as Cu) min. 25.4%; free KCN min. 1.25%, max. 3.0%.

Use: For preparing copper plating baths for producing coatings on steel, zinc diecastings, and wire.

copra.

Derivation: The dried meat of coconut.

Obtained from the South Sea Islands and the East Indies.

Grades: Cebu; Java; Macassar; South Sea; spot; sun-dried; Pacific coast; and Padang.

Containers: Bags.

Uses: For the extraction of coconut oil; confectionery; food.

Shipping regulations: None.*

copra cake. See coconut cake.

copra oil (copperah oil). The name applied to lower grades of coconut oil (q. v.).

Properties: White, wax-like, semi-solid; somewhat disagreeable odor; mild taste. Soluble in alcohol and ether; insoluble in water.

Chief constituents: Trimyristin and trilaurin.

Constants: Sp. gr. 0.910-0.926; m. p. 23-27°C; iodine number 8-9; saponification value 251-268; refractive index 1.441 (60°C).

Derivation: From the dried meat of the coconut *Cocos nucifera* by boiling and pressing.

Method of purification: Decolorizing with boneblack or fullers' earth.

Grades: Technical.

Containers: Boxes; wooden barrels; fiber drums; steel drums.

Uses: Soap; candles; food; medicine.

Shipping regulations: None.*

coprolites. Phosphatic nodules consisting of mixtures of calcium phosphate and calcium carbonate derived from the excrements of certain extinct fishes and reptiles. They were formerly used as phosphatic manures but are now rarely used due to the availability of sources of cheaper phosphates. They are mostly found in England and France, the best English grades containing up to 55 to 60% tricalcium phosphate and the French varieties containing a lower amount of phosphate.

Shipping regulations: None.*

coquina. A porous, coarse limestone composed of fragments of marine shells. Found in southern U. S. and used for road and building construction.

"Corald." ¹⁰⁰ Trademark for a powdered organic type corrosion inhibitor specifically for copper and copper alloys.

Containers: 65-lb drums.

Uses: Industrial cooling and other non-potable water systems.

"Co-Ral." ¹⁸¹ Trademark for O, O-diethyl O-3-chloro-4-methyl-2-oxo-2H-1-benzopyran-7-yl phosphorothioate (q. v.).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Coral." ²⁷⁸ Trade name for a commercial grade of stereospecific polyisoprene rubber consisting essentially of cis-1,4-polyisoprene.

Properties: Similar to those of natural rubber, both unvulcanized and vulcanized.

Use: Replacement for natural rubber.

Hazards: None.

Shipping regulations: None.*

coral. Skeletons of the coral polyps found in the warmer oceans and consisting mainly of calcium carbonate colored with ferric oxide.

"Coramine." ³⁰⁵ Trademark for nikethamide, U.S.P. Used in medicine.

"Coray." ⁵¹ Trademark for general-purpose, low cold test, engine oils used for industrial machinery lubrication. Available in a wide range of viscosities

"Corcast." ²⁰ Trademark for petalite material for casting.

Properties: Cast articles have service temperatures up to 2500°F; expansion coefficient of about zero, and compressive strength of 2000-3000 psi; thermal conductivity of 0.723 Btu/ft/°F/hr. and density of 110 lbs/cu ft.

Containers: Packed in 100-lb cartons.

Uses: As tools, jigs, and fixtures for metal forming.

"Cordex." ⁷⁴ Trademark for a cordage oil solution of copper naphenate containing 8% copper metal.

Use: Fungicide.

cordite. A smokeless powder which is a mixture of nitrocellulose and nitroglycerin with about 5% petrolatum added to thicken and stabilize the mixture. Materials are dissolved in acetone and mixed. Evaporation of the excess acetone leaves a gelatinous mass which is extruded into cords.

"Cordura." ²⁸ Trademark for a textile viscose rayon yarn of relatively high tensile strength. See rayon.

Containers: Cones, tubes, cakes and beams.

Uses: In fabrics and some other tensile products where high strength is important.

"Coresinblak No. 3." ¹³³ Trademark for a paste consisting of jet black impingement carbon thoroughly dispersed in an alkyd resin. Composition: 18% carbon black, 32% alkyd resin, and 50% solvent. Compatible with most medium and short oil alkyds.

Containers: 40- and 400-lb metal drums.

Use: For making high grade enamels, both air dry and baking.

"Corial Bottom." ³⁰⁷ Trademark for a series of leather finishing agents consisting of plasticized acrylic resin emulsion, 40-41% solids.

Properties: White liquids; can be diluted with water or alkaline aqueous solutions in all proportions without impairing emulsion stability. Compatible with materials commonly used in leather finishing, such as

alkaline solubilized shellac, casein and latex. Can be mixed with either clear or pigment finishes.

Grades: The different types of "Corials" form films of varying flexibility, toughness, and transparency.

"Corial Bottom" E forms the hardest and least flexible film.

"Corial Bottom" EST produces the most flexible and tacky film.

"Corial Bottom" N similar to E, but more plastic and lower in tensile strength.

coriander (coriander seed). Dried, ripe fruit of *Coriandrum sativum*.

Habitat: Native to Italy; cultivated in India, Asia Minor, North Africa, United States.

Grades: Technical; N. F. XI.

Containers: Bags.

Uses: Medicine; condiment.

Shipping regulations: None.*

coriander oil.

Properties: Colorless or slightly yellowish liquid; aromatic odor; warm, spicy taste.

Soluble in alcohol, ether, and chloroform.

Chief known constituents: Linalool; pinene.

Constants: Sp. gr. 0.863-0.878; refractive index 1.4665.

Derivation: Distilled from the fruit of *Coriandrum sativum*.

Method of purification: Rectification.

Grades: Technical; U.S.P. XVI.

Containers: Tins, glass bottles.

Use: Flavoring material.

Shipping regulations: None.*

coriander seed. See coriander.

coriandrol. Is d-linalool.

"Corilene." ²⁰⁶ Brand name for proprietary leather degreasing assistants.

cork. The light, porous, outer bark of the variety of oak tree known as cork-oak (*Quercus suber*).

Habitat: Southern Europe, northern Africa; now cultivated in southern United States.

Uses: Filler; stoppers; insulation; sound deadener, life preservers; gaskets; etc., linoleum manufacture.

cork black. A pigment obtained by charring cork.

corkboard. A mixture of ground cork and paper pulp formed into thick sheets for insulating purposes.

"Cormet A." ²⁰ Trademark for sintered, porous articles of 99+ % nickel.

Properties: Maximum yield strength of 10,000 psi, maximum operating temperature of 300°C. Available with pore diameters of 1 to 45 microns.

Uses: A non-contacting conveyor for glass of surface sensitive materials such as photographic film, adhesive materials, and plastic sheets.

corn. In United States and Canada: Indian corn or maize; in Great Britain and elsewhere: wheat, oats, or other grain.

cornelian. See carnelian.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

"Corning." ²⁰ Trademark for glass and glassware of various compositions and physical properties, and accessories used therewith.

"Corning Brand Glass No. 7280." ²⁰ Trade-mark for substantially boron-free alkali-resistant glass.

Properties: Linear coefficient of expansion per °C 0.0000064 between 0-300°C; softening point 870°C; sp. gr. 2.61; very resistant to chemical attack.

Uses: Laboratory and pharmaceutical glassware; alkali-resistant tubing.

Cornish clay. Same as Cornish stone.

Cornish stone.

1. (Cornish clay). A partially weathered feldspar, used as flux and fusible ingredient in porcelain and tiles. Sometimes called china stone.

2. A quartz crystal from Cornwall.

corn oil (maize oil).

Properties: Pale yellow liquid; characteristic taste and odor. Insoluble in water; soluble in ether, chloroform, amyl acetate, benzene, and carbon disulfide and slightly soluble in alcohol. Sp. gr. 0.914-0.921; saponification value 188-193; iodine value 102-128.

Typical analysis: 98.6% triglycerides; 1.4% unsaponifiable; 1.0% sitosterols. Of the total fatty acids, 86% are unsaturated (linoleic 56%, oleic 30%) and 13% saturated (palmitic 10%, stearic 3%).

Derivation: The germ of common corn (Indian corn, *Zea mays*) is removed from the grain and pressed.

Method of purification: Filtration.

Grades: Crude; refined; U.S.P. XVI; technical.

Containers: 375-lb barrels; 8000-gal tank cars.

Uses: Foodstuffs; soap; lubricants; leather dressing, rubber substitutes; lard substitutes, salad oil, hair dressings.

Shipping regulations: None.*

corn-oil-foots pitch. See stearin and fatty acid pitches.

corn-oil-pitch. See stearin and fatty acid pitches.

corn starch. See starch.

corn steep liquor. The dilute aqueous solution obtained by soaking corn kernels in warm 0.2% sulfur dioxide solution for 48 hours as the first step in the recovery of corn starch, corn oil, and gluten from corn. The solution contains mineral matter as well as soluble organic material extracted from the corn. It is used as a growth medium for penicillin and other antibiotics, and it is also concentrated and used as an ingredient of cattle feeds.

corn sugar. See dextrose.

corn syrup. See glucose.

"Corona." ¹⁸⁸ Trademark for a certain grade of ylang ylang oil (q. v.).

coronizing. A process for producing an unusual corrosion-resistant coating on metals by electroplating a thin layer of nickel on the base metal.

corozo-nut oil. See cohune oil.

"Corpolin." ³¹⁸ A proprietary product consisting of various organic materials in aqueous solution.

Properties: Clear, viscous liquid soluble in water and compatible with alkalies, gelatin, vegetable gums, and most other water-soluble materials; slightly alkaline reaction. Containers: 120- and 600-lb lined drums.

Uses: Hygroscopic agent for use in vat-print paste and paper plasticizer; glycerin replacement.

corr. Abbreviation for corrected, usually applied with reference to a boiling point or other temperature.

corresponding states (reduced states). Two substances are in corresponding states when their pressures, volumes (or densities) and temperatures are proportional respectively to their critical pressures, volumes (or densities) and temperatures. If any two of these ratios are equal, the third must also be equal. This principle has been useful in the development of physical and thermal properties of substances.

corrinoids. Generic name for compounds of the vitamin B₁₂ series containing the corrin nucleus.

corrosion. The conversion of iron, steel, and other alloys and metals into oxides, hydrated oxides, carbonates, or other compounds due to the action of air or water or both. The minor components present in the air or water are important factors in the rate of corrosion and the kind of corrosion products. Natural minor components such as carbon dioxide in air and water cause serious corrosion, but contaminants introduced by all types of air and water pollution usually accelerate corrosion. Salts, as in sea water, are serious causes of corrosion. Sulfur in fuels such as coal, oil, gasoline and natural gases and other fuels is also an important source of corrosion, so that removal treatments are common except for coal. Electric currents from power sources, or from differences in composition of materials in the ground or different parts of metal objects are also accelerators of corrosion.

"Corrosion Inhibitor NPA." ²¹⁹ Tradename for nonylphenoxo acetic acid, C₉H₁₉C₆H₄O-CH₂COOH.

Properties: Light amber liquid. Miscible with organic solvents, insoluble in water; soluble in alkali. Flow point 0°C; viscosity (25°C) 6500 cps.

Uses: Corrosion inhibitor for turbine oils, lubricants, fuels; greases; hydraulic fluids, cutting oils and metal coolants.

corrosive sublimate. See mercuric chloride.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"**Cortamp.**" ²⁰ Trademark for zircon material for compaction forming.

Properties: Formed articles have service temperatures up to 4000°F; expansion coefficient of about 3×10^{-6} per °F; compressive strength of 10,000-12,000 psi; thermal conductivity of 1.08 Btu/ft./°F/hr., and density of 200 lb/cu ft.

Containers: 100-lb cartons.

Uses: As tools, jigs, and fixtures for metal forming.

"**Cortate.**" ³²¹ Brand name for deoxycorticosterone acetate.

"**Cortef.**" ³²⁷ Trademark for hydrocortisone, U. S. P. grade.

Use: Medicine.

"**Cortef**" Cyclopentyl Propionate. ³²⁷ Trademark for hydrocortisone cyclopentyl propionate ($C_{29}H_{42}O_6$).

Properties: A white, odorless solid practically insoluble in water. Will dissolve in the following solvents to form 100 ml. of solution: 3.28 g. in 95% alcohol; 0.272 g. in ether; and 35.9 g. in chloroform.

Use: Medicine.

corticoid hormones. Adrenal cortical hormones produced or isolated from the cortex (external layer) of the adrenal gland. An animal dies if deprived of these hormones, and may be seriously ill if suffering from a lack or excess of them. These hormones have a strong effect on salt and water metabolism, carbohydrate and protein metabolism, and the ability of the animal to withstand various types of stress. The rate of synthesis and secretion of nearly all the adrenal steroids in the body is regulated by ACTH (q. v.), a hormone secreted by the pituitary gland.

Corticoid hormones now used in medicine include cortisone, hydrocortisone, deoxycortisone, fludrocortisone, prednisone, prednisolone, methyl prednisolone, triamcinolone, dexamethasone, and aldosterone. Some occur naturally in adrenal extract; others are modifications of the natural hormones. All are now made synthetically. They are derivatives of the cyclopentanophenanthrene nucleus.

corticosterone (Compound B) $C_{21}H_{30}O_4$. One of the less-active adrenal cortical steroid hormones.

Properties: Crystalline plates; m. p. 180-182°. Soluble in organic solvents; insoluble in water.

Derivation: Isolation from adrenal cortex extract; synthesis from deoxycholic acid

Use: Biochemical research.

corticotropin. See ACTH.

"**Cortifan.**" ³²¹ Brand name for hydrocortisone.

cortisol. See hydrocortisone.

cortisone (11-dehydro-17-hydroxycorticosterone; Compound E) $C_{21}H_{28}O_5$. One of the adrenal cortical steroid hormones. It has an effect on carbohydrate and protein

metabolism and is used as an antiinflammatory agent. The total synthesis was first reported in 1951.

Properties: White crystalline solid; m. p. 220-224° (dec). Dextrorotatory in solutions. Slightly soluble in water; sparingly soluble in ether, benzene, and chloroform; fairly soluble in methanol, ethanol, and acetone.

Derivation: Isolation from adrenal gland extract (usually from cattle) (historical method); synthetically, from bile acids, from other steroids or sapogenins, by chemical means or microbiologically.

Use: Medicine (usually as acetate salt).

cortisone acetate (CA). The commonly used form of cortisone.

Properties: White or practically white, odorless, crystalline powder. Stable in air; m. p. about 240° (dec). Freely soluble in chloroform; soluble in dioxane and acetone; slightly soluble in alcohol; insoluble in water. Sensitive to light.

Derivation: See under cortisone.

Grade: U. S. P. XVI.

Use: Medicine.

"**Cortogen Acetate.**" ³²¹ Brand name for cortisone acetate.

"**Cortone.**" ¹²³ Trademark for cortisone.

"**Cortril.**" ²⁹⁹ Trademark for hydrocortisone.

corundum Al_2O_3 . Natural aluminum oxide, sometimes with small amounts of iron, magnesium, silica, etc. Found in metamorphic rocks, pegmatites and igneous rocks.

Properties: Color, variable; luster vitreous to adamantine; sp. gr. 4.02; hardness 9.

Varieties:

(a) Precious corundum. Vividly colored gem stones: true and oriental ruby (red); oriental topaz (yellow); oriental emerald (green); sapphire (blue); oriental amethyst (purple). The term sapphire is often used to cover all colors of corundum gem stones except red.

Occurrence: Burma; Siam; Ceylon; Montana,

North Carolina; India; Australia.

Use: Gem stones.

(b) Ordinary Corundum. Light blue to gray, brown or black.

Occurrence: Eastern United States; Canada;

South Africa; India.

Use: Abrasives.

(c) Emery. A mixture of corundum and magnetite or other iron oxide. Dull black,

dark gray or bluish black color.

Occurrence: New York; Greece; Asia Minor.

Use: Various polishing and abrasive

operations.

See also aluminum oxide; diasporite.

"**Coryban.**" ²⁹⁹ Trademark for a combination drug containing purified hesperidin, ascorbic acid, salicylamide, acetophenetidin, caffeine, and propenpyridamine maleate.

corynine. See yohimbine.

cosalite. A natural sulfide of lead and bismuth $2PbS \cdot Bi_2S_3$. Contains 42% bismuth. Found

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

in United States (Washington); Sweden; Mexico.

cosaprin. See sodium acetylsulfanilate.

"**Cosa-Signemycin.**" ²⁹⁹ Trademark for glucosamine-potentiased antibiotic combination containing tetracycline hydrochloride and triacetyloleandomycin.

"**Cosa-Terramycin.**" ²⁹⁹ Trademark for glucosamine-potentiased oxytetracycline hydrochloride.

"**Cosa-Tetracycl.**" ²⁹⁹ Trademark for glucosamine-potentiased tetracycline hydrochloride.

cosmic rays. Penetrating radiations appearing to come from a source in outer space. It is believed that the original rays are fairly simple. High altitude studies have shown that outside the earth's atmosphere most cosmic rays are protons with energies ranging from 1-100,000 billion electron volts, compared with a maximum of about 6 billion electron volts for particles produced in various man-made accelerators today (bevatron and cosmotron). The cosmic rays change when they pass through the atmosphere. They then consist mainly of mesons, protons, neutrons, electrons and photons. Almost all cosmic radiation absorbed at the earth's surface is of the latter type. Some cosmic rays have been detected under the surface of the earth in mines. Cosmic rays, like other high-energy atomic particles, are detected with cloud chambers. These contain a gas saturated with a vapor. A ray or particle passing through the chamber produces ions which serve as seeds to bring about condensation of the vapor to produce a fog track. This shows the path of the particles through the chamber. The range (distance traveled), the energy, and the nature of the particles causing the tracks can thus be determined.

"**Cosmol.**" ²²¹ Sperm oil esters with applications in textile chemicals, lubricants and cutting oils.

cosmotron. See cyclotron.

"**Cosol.**" ²¹ Brand name for high boiling coal-tar solvents for use in alkyd resin enamels and synthetic lacquers.

"**Costyreneblak.**" ¹³³ Trademark for a series of carbon black polystyrene dispersions. Used for coloring polystyrene scrap. Available in chip form in several grades.

cotarnine chloride (cotarnine hydrochloride) $C_{12}H_{14}NO_3Cl$.

Properties: Yellow odorless crystalline powder; deliquescent, poisonous! Soluble in water and alcohol. M.p. 142-144°C.

Derivation: By the action of hydrochloric acid on an alkaloid prepared from narcotine by oxidation with nitric acid.

cotarnine hydrochloride. See cotarnine chloride.

cotarnine phthalate. $C_6H_4(COO)_2(C_{12}H_{14}O_3N)_2$
Properties: Yellow powder. Soluble in

water

Use: Medicine

cotton (gossypium). Staple fibers, usually 3/4-2 1/2 in. long, surrounding the seeds of various species of Gossypium. Cotton is the major textile fiber and is also an important source of cellulose, which constitutes 88-96% of the fiber.

Properties: Tensile strength 44,000-109,000 psi; elongation 3-7%; sp. gr. 1.54; moisture regain 7% (70°F, 65% relative humidity); yellows slowly at 250°F, decomposes about 300°F, burns readily. Decomposed by acids; swells in caustic but is undamaged. Soluble in cuprammonium hydroxide. Subject to mildew.

Sources: United States; Brazil; Egypt; India.

Uses: All types of apparel; industrial and household fabrics; automobile tires; upholstery.

See also cellulose, cellulose, oxidized; nitrocellulose.

cotton, acetylated. Cotton fibers, threads, or fabrics treated with acetic anhydride, acetic acid, and perchloric acid catalyst to improve the heat, rot, and mildew resistance by forming a surface coating of cellulose acetate.

cotton, aminized. A cotton fabric produced by reacting 2-aminoethylsulfuric acid with the cellulose of the fabric in a strongly alkaline solution. The treated cotton can take acid wool dyes and can be made rot-resistant and water-repellent.

cotton balls. See ulexite.

cotton, cyanoethylation of. Process for improving the properties of cotton by treatment with acrylonitrile. The cotton fabric is passed through a caustic bath, which induces mild swelling of the fiber and catalyzes the subsequent reaction with acrylonitrile. The fabric is then neutralized with acetic acid, washed and dried. The treatment leaves 3-5% nitrogen attached to the cellulose polymer. The cyanoethylated fiber is claimed to have permanent rot- and mildew-resistance, greater retention of strength after exposure to heat, improved receptiveness to dyes, and higher abrasion- and stretch-resistance than the original cotton.

cotton flock. Finely ground cotton rags used as a filler in plastics and as a finish on rubber fabrics.

cotton linters. See linters.

cotton oils (cotton spraying oils). Compounded oils sprayed (in the form of a fine mist) onto cotton to condition the fibers for yarn-making operations. Used to lubricate the fibers, to reduce static, "fly," and dust and generally improve the suppleness and strength of the fibers.

cottonseed cake (seed oil cake). The press cake derived from the extraction of cottonseed for its oil. When ground it is termed cottonseed meal.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

cottonseed foots pitch. See stearin and fatty acid pitches.

cottonseed meal (cottonseed cake). The pulverized cottonseed press cake. Depending on the extractive process, varying percentages of protein will remain in the meal and it is normally sold with 36 to 45% protein content. The 42% product contains approximately 42% crude protein; 6% crude fiber; 25% nitrogen-free extract; 10% ether extract (fat) and 7% ash. The total digestible nutrient averages 79%. The ash is high in potash and phosphate.

Containers: Bulk or bags.

Uses: Animal feeds; fertilizer ingredient, filler for synthetic resin products.

Shipping regulations: None.*

cottonseed oil (seed oil).

Properties: Pale yellow or yellowish-brown to dark ruby-red or black-red, fixed, semi-drying oil depending on the nature and condition of the seed. The pure oil is odorless and has a bland taste. Soluble in ether, benzene, chloroform and carbon disulfide; slightly soluble in alcohol.

Constants: Sp. gr. 0.915-0.921, saponification value 190-198, iodine value 109-116.

Derivation: The seeds of the cotton plant (*Gossypium herbaceum*) are crushed in a mill, the meal is heated in iron kettles at 75-90°C and pressed in cloths, under 3,000-4,000 psi. An alternate process uses solvent extraction of the cottonseed.

Method of purification: Filtration.

Grades: Crude, refined; prime summer yellow, bleachable; U. S. P. XVI.

Containers: 375-lb barrels, 8000-gal tank cars.

Uses: Medicine, leather dressing; soap stock; lubricant; glycerol, base for cosmetic creams, food (oleomargarine and butter substitutes, in solid state as lard substitute, salad oil, cooking oil, packing sardines); waterproofing compositions, phonograph records.

Shipping regulations: None.*

cottonseed-oil pitch. See stearin and fatty acid pitches.

cotton solution. See nitrocellulose.

cotton spraying oils. See cotton oils.

cotton-stearin pitch. See stearin and fatty acid pitches.

Cottrell precipitator. An electrostatic device whereby negatively charged dust or fume particles are attracted to a wire electrode positively charged enclosed in a flue, the walls of which act as the other electrode. Widely used for treating sulfuric acid mist, cement mill dust, power-plant fly ash, metallurgical fumes, etc.

coulomb. The quantity of electricity which will deposit 0.001118 g of silver from a solution of silver nitrate.

coumarin (cumarin; benzopyrone; tonka bean camphor) $C_9H_6O_2$.

Properties: Colorless crystals, flakes or

powder; fragrant odor similar to vanilla; bitter, aromatic burning taste; m. p. 69°C; b. p. 290°C. Soluble in 10 vols of 95% alcohol, in ether, chloroform, and fixed volatile oils; slightly soluble in water.

Derivation: (a) By heating salicylic aldehyde, sodium acetate and acetic anhydride; (b) fine grades are isolated from Tonka beans.

Method of purification: Crystallization.

Grades: Technical.

Containers: 1-, 5-, 20-lb tins; 25-, 200-lb fiber drums.

Uses: Deodorizing and odor enhancing agent; used in perfumes, soaps, tobacco, inks, rubber and other products where aromatic ingredients are required; flavoring; pharmaceutical preparations.

Shipping regulations: None.*

coumarone (cumarone; benzofuran) C_9H_6O , a bicyclic ring compound. Parent substance for the coumarone resins.

Properties: Colorless liquid; aromatic odor; sp. gr. 1.078, m. p. -18°C; b. p. 169°C. Insoluble in water; soluble in alcohol and ether.

Derivation: From the coal-tar naphtha fraction boiling between 150-200°C.

Use: See coumarone-indene resins.

coumarone-indene resins (coal tar resins).

Resins obtained by heating mixtures of coumarone and indene (such as occur in the light-oil fraction from coal-tar refining) with sulfuric acid so as to cause polymerization to thermoplastic materials with softening points up to about 150°C.

Properties: Vary from fairly viscous liquids to hard resins, color pale yellow to nearly black, sp. gr. 1.05-1.10, soluble in hydrocarbon solvents, pyridine, acetone, carbon disulfide and carbon tetrachloride, insoluble in water and alcohol.

Uses: Components of aluminum paint, concrete curing compounds, pipe oils, rubber compounding, adhesives, chewing gum, printing inks, floor tile binding, phonograph records.

See "Nevindene" and "Paradene."

coumarouna bean. See tonka.

countercurrent. Applied to purification and other processes in which a liquid and a vapor stream, or two streams of immiscible liquid, or a liquid and a solid, are caused to flow in opposite directions and past or through one another with more or less intimate contact so that the individual substances present are more or less completely transferred to that stream in which they are more soluble or stable under the conditions existing. The streams leaving such a process are usually of higher purity than can be attained otherwise at equal cost. For example see extraction, liquid-liquid. Distillation with a fractionating column is also a typical countercurrent process, in which rising vapor is purified by contact with descending liquid. Leaching, washing and chemical reaction are frequently carried out in a countercurrent manner.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

countercurrent extraction. See extraction, liquid-liquid.

counts. The external indication given by a radiation detector such as a Geiger counter of the amount of radioactivity to which the detector is exposed. The background counts are those which come from a source external to that being measured. Background counts may arise from cosmic rays, the presence of other radioactive materials in the location of the counter, electrical disturbances within the instrument, etc.

coupling. The combination of an amine or phenol with a diazonium compound to give an azo compound, the reaction by which azo dyes are prepared; thus meta-phenylenediamine $C_6H_4(NH_2)_2$ couples with benzene diazonium chloride $C_6H_5N_2Cl$ to produce the dye chrysoidine $C_6H_5N_2C_6H_3(NH_2)_2$.

"Covarnishblak." ¹³³ Trademark for a series of dry powders consisting of carbon black dispersed in a hydrocarbon fossil resin. Used for pigmenting alkyd and oleoresinous enamels. Also useful in coloring rubber cements. Can be dissolved in the vehicle by simple stirring. Available in 50- and 200-lb drums.

covellite (indigo copper) CuS . Dark indigo-blue mineral, lead-gray to black streak, submetallic to resinous luster. Often shows fine purplish color when moistened. A mineral of secondary origin found in the enriched portions of copper sulfide veins. Contains 66.44% copper, 33.56% sulfur. Soluble in nitric acid; slowly soluble in hydrochloric acid. Constants: Sp. gr. 4.59-4.64; hardness 1.5-2.

Occurrence: United States (Montana, Wyoming, California, Colorado, Utah, Alaska), Germany, Yugoslavia, Chile, Japan. Use: Source of copper.

"Covinyblaks." ¹³³ Series of dry chips consisting of carbon black thoroughly dispersed in vinyl resin. High grade vinyl coatings can be made from solution type "Covinyblaks" by dissolving chips in ketone solvents and compounding with other materials as required. Another series is available for coloring vinyl plastics such as wire jackets, vinyl sheets, etc.

Containers: 50- and 200-lb drums.

"Cowaxblak." ¹³³ Trademark for a series of chips consisting of carbon black thoroughly dispersed in resinous chlorinated paraffin. Used for coloring vinyl, polystyrene, polyethylene and other plastics. Available in several grades.

Containers: 75- and 300-lb drums.

"Cowles Silicone Monomer M-5-124." ⁴²⁸

Trade name for a concentrated, stable solution of sodium propyl silicate.

Properties: On dilution with water, the silicone becomes surface-active and is oriented toward surfaces that are siliceous

or cellulosic in nature. On dehydration, it becomes insoluble and highly water repellent.

Uses: In paper pulp and cement slurries and asbestos fiber dispersions.

"Cowles SS-2DN." ⁴²⁸ Trade name for an aqueous, highly alkaline solution of sodium vinyl silicate.

Properties: At the concentration and in the state supplied, the solution is quite stable. The critical pH of SS-2DN solution as supplied is 10.5. At and below this pH a rapid condensation to the polymer occurs. Above this pH the solution is quite stable and has a room temperature shelf life in excess of three years.

Uses: When acidified to a sol is used as a size for glass fibers.

Cox chart. A special semilogarithmic plot of vapor pressures vs. temperature especially useful for the petroleum hydrocarbons. The graph corresponding to each separate hydrocarbon is a straight line. All the lines appear to intersect at a point outside the chart.

cozymase. See nicotinamide adenine dinucleotide.

cp. Abbreviation for centipoise (q.v.).

C.P. Abbreviation for chemically pure. It signifies a minimum of impurities, but does not imply 100% pure.

"CP" 40. ³⁰⁶ Trademark for a chlorinated paraffin. Approximately $C_{24}H_{43}Cl_7$.

Properties: Light, honey-colored, viscous liquid. Its vapor pressure and evaporation rate are negligible at room temperature. Under prolonged storage in iron at elevated temperatures, "CP"-40 tends to develop acidity due to the liberation of hydrochloric acid, causing it to pick up iron and darken in color. B.p., decomposes; pour point 0°C; refractive index 1.508 (n_{20/D}); flash point (open cup) none; sp. gr. 1.185 (15.5/15.5°C); color, 1.5-2.5 (ASTM). Soluble in most organic solvents.

Uses: For waterproofing and fireproofing fabrics, as a plasticizer and extender for plastics, increases adhesiveness to metallic surfaces and adds to water and flame repellent qualities; ingredient in traffic paints and fire retardant paints.

"CPA-1800." ²⁴⁴ Trademark for a compound containing fluorine compounds and trivalent chromium.

Properties: Light green, free-flowing powder; soluble in water and chromic acid solutions.

Containers: 5-lb moisture-proof, fiber containers with tin-plated tops and bottoms; four 5-lb units per carton.

Uses: In the electroplating industry as an additive to the chromium plating solution, acts as catalyst to improve performance.

"C-P-B." ²⁴⁸ Trademark for dibutyl xanthogen disulfide.

Properties: Amber-colored, free-flowing liquid; sp. gr. 1.15; soluble in acetone,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

benzol, gasoline, and ethylene dichloride; insoluble in water.

Use: Accelerator for proofing, pure gum hand-made druggist sundries and medical supplies, bathing shoes, bathing caps, novelties, and cold-cure cements.

CPR. Abbreviation for cyclonene-pyrethrin-rotenone. Applied to various insecticide formulations containing as active ingredients approximately 10 parts piperonyl cyclonene, 5 parts rotenone, and 1 part pyrethrin.

cps. Abbreviation for centipoise (q.v.).

Cr. Symbol for chromium.

cracking. The decomposition by heat, with or without catalysis, of petroleum or heavy petroleum fractions, with production of lower-boiling materials that are useful as motor fuels, domestic fuel oil, or other needed products. See also hydro-cracking.

The term cracking is also applied more generally to thermal decomposition processes; thus ammonia (NH_3) may be cracked to nitrogen and hydrogen, and natural gas hydrocarbons such as methane (CH_4) are cracked into carbon and hydrogen, or into other hydrocarbons.

"Crag." Trademark for agricultural chemicals including:

"Crag" Fly Repellent (active ingredient, butoxy polypropylene glycol). Colorless liquid, 100% active material.

Uses: Formulating dairy and livestock sprays for protection against biting and nuisance insects, such as horse flies, horn flies, stable flies, house flies, mosquitoes, and gnats.

"Crag" Fungicide 974 (active ingredient, 3,5-dimethyltetrahydro-1,3,5-2H-thiadiazine-2-thione). Wettable powder, 85% active material.

Uses: For the control of fungi and bacteria in the production and processing of paper, leather, glue, casein, starch, and other materials; for the control of dry rot of gladioli; for testing on other crops as a soil fungicide, nematocide and herbicide.

"Crag" Glyodin Solution (active ingredient, 2-heptadecyl glyoxalidine acetate) 34% active solution.

Uses: Control of scab, sooty blotch, Brooks spot, bitter rot, fly speck, and black rot of chrysanthemums; black spot of roses; rust of snapdragons.

"Crag" Herbicide-1 (SES) (active ingredient, sodium 2,4-dichlorophenoxyethyl sulfate). Water-soluble powder, 90% active material.

Uses: Preventing weeds in peanuts, strawberries, turf, asparagus, corn grown for seed, potatoes, perennial flowers, and nursery stock.

cramp bark. See viburnum opulus.

cranberry tree. See viburnum opulus.

cranes-bill. See geranium.

cream of tartar. See potassium bitartrate.

cream of tartar, borated. See potassium borotartrate.

cream of tartar, soluble. See potassium borotartrate.

creatine (N-methyl-N-guanylglycine; (alpha-methylguanido) acetic acid)
 $\text{HN:C}(\text{NH}_2)\text{N}(\text{CH}_3)\text{CH}_2\text{COOH}$. A nitrogenous acid found widely distributed in the muscular tissue of the body.

Properties: (Monohydrate) prisms from water; anhydrous at 100°C ; decomposes 303°C ; slightly soluble in water; insoluble in ether.

Source: Commercially isolated from meat extracts.

Grades: Technical; C.P.

Use: Biochemical research.

creatinine $\text{C}_4\text{H}_7\text{N}_3\text{O}$. The anhydride of creatine (q.v.); a metabolic waste product.

Properties: Leaflets from water; decomposes about 300°C ; soluble in water; slightly soluble in alcohol; nearly insoluble in ether, acetone, and chloroform.

Use: Biochemical research.

creosote, beechwood. See creosote, wood-tar.

creosote carbonate.

Properties: Clear, colorless or yellowish, viscous liquid; slight creosote odor and taste, or odorless and tasteless. Soluble in alcohol; insoluble in water.

Derivation: Mixture of carbonates of various constituents of creosote.

Containers: 1-lb bottles; carboys.

Use: Medicine.

Shipping regulations: None.*

creosote, coal-tar (creosote oil; liquid pitch oil; tar oil).

Properties: Yellowish to dark green-brown, oily liquid; clear at 38°C or higher; characteristic odor, poisonous! Frequently contains substantial amounts of naphthalene and anthracene; distilling range $200\text{--}400^\circ\text{C}$; soluble in alcohol, benzene, and toluene.

Derivation: (a) Directly by the fractional distillation of coal-tar. (b) By redistillation of a coal-tar fraction. (c) A coal-tar from which the phenols and naphthalene have been partly extracted. (d) A mixture of two or more coal-tar fractions. Very similar materials are obtained from the tar accumulating from blast-furnace producer gas, and from similar gas-making operations.

Method of purification: Rectification.

Grades: Technical; crude; refined.

Containers: Iron drums; tank cars.

Uses: Wood preservative; disinfectants.

Caution: May cause skin irritation. MCA warning label.

Shipping regulations: None.*

creosote oil. See creosote, coal-tar.

creosote, wood-tar (creosote, beechwood).

Properties: Colorless or faintly yellow, oily liquid; characteristic smoky odor; caustic, burning taste. Miscible with

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

alcohol, ether, and fixed or volatile oils.
 Constants: Sp.gr. 1.080; b.p. 203-220°C.
 Derivation: A mixture of phenols and phenol derivatives obtained by the destructive distillation of wood-tar.
 Grades: Technical; N.F. XI.
 Containers: 44-lb carboys; 55-gal drums; tank cars.
 Uses: Medicine; poison; ore-flotation agent.
 Shipping regulations: None.*

cresidine (meta-amino-para-cresol, methyl ether) $\text{CH}_3\text{C}_6\text{H}_3(\text{NH}_2)\text{OCH}_3$.
 Properties: White crystals; m.p. 51.5°C; b.p. 235°C. Soluble in alcohol and ether; sparingly soluble in hot water; volatile with steam.
 Derivation: 2-Nitro-para-cresol, obtained by the action of nitrous and excess nitric acids upon para-toluidine, is methylated and reduced.
 Method of purification: Distillation.
 Grades: Technical.
 Containers: Drums.
 Use: Dyes.
 Shipping regulations: None.*

"Creslan." ⁵⁷ Trademark for an acrylic fiber.

cresol (methyl phenol; cresyl alcohol) $\text{CH}_3\text{C}_6\text{H}_4\text{OH}$. See also cresylic acid. Mixtures of the ortho-, meta-, and/or para-cresols are sold in a variety of grades, (see cresol, U.S.P. XVI for one grade) depending on color, distillation range, water, acid, or phenol content, use, and other criteria.
 Containers: Drums; tank cars.
 Uses: Phenolic resins, tricresyl phosphate; disinfectants; surfactants, flotation agents; scouring compounds; chemical intermediates; lube oil additives; enamel solvent.
 Danger: Rapidly absorbed through skin. Causes severe burns. MCA warning label.

meta-cresol (meta-cresylic acid; meta-oxytoluene; 3-methylphenol) $\text{CH}_3\text{C}_6\text{H}_4\text{OH}$.
 Properties: Colorless to yellowish liquid, phenol-like odor; poisonous! Soluble in alcohol, ether, and chloroform, slightly soluble in water.
 Constants: Sp.gr. 1.034; m.p. 12°C; b.p. 203°C; wt/gal 8.66 lbs.
 Derivation: By fractional distillation of crude cresol (from coal tar).
 Method of purification: Rectification.
 Grades: Technical (95-98%).
 Containers: Drums.
 Uses: Disinfectant; fumigating compositions; production of synthetic resins, photographic developer; nitrocresol explosives; ore flotation; intermediate; ink, paint and varnish remover; reclaiming rubber. See cresol.
 Danger: Rapidly absorbed through skin; causes severe burns. MCA warning label.
 Shipping regulations: None.*

ortho-cresol (ortho-cresylic acid; ortho-oxytoluene; 2-methylphenol) $\text{CH}_3\text{C}_6\text{H}_4\text{OH}$.
 Properties: White crystals; phenol-like odor; poisonous! Soluble in alcohol, ether, and

chloroform; slightly soluble in water.
 Constants: Sp.gr. 1.0511; m.p. 30.9°C; b.p. 191°C; lbs/gal 8.61.
 Derivation: By fractional distillation of crude cresol from coal tar.
 Method of purification: Crystallization.
 Grades: According to freezing point: 25°, 29°, 30°, 30.5°, etc.
 Containers: 53-gal drums, tank trucks, tank cars.
 Uses: Disinfectant; coumarin; organic intermediate. See cresol.
 Danger: Rapidly absorbed through skin; causes severe burns. MCA warning label.
 Shipping regulations: None.*

para-cresol (para-cresylic acid; para-oxytoluene; 4-methylphenol) $\text{CH}_3\text{C}_6\text{H}_4\text{OH}$.
 Properties: Crystalline mass; phenol-like odor; poisonous! Soluble in alcohol, ether, and chloroform; slightly soluble in water; wt/gal 8.66 lb.
 Constants: Sp.gr. 1.039; m.p. 35°C; b.p. 202°C.
 Derivation: (a) By dehydrogenation of monocyclic terpenes to para-cymene, and subsequent oxidation. (b) By fractional distillation of crude cresol. (c) By fusing para-toluenesulfonic acid with caustic. (d) From benzene by the cumene process (see phenol).
 Method of purification: Crystallization.
 Grades: Technical; 98%.
 Containers: Drums; tank trucks; tank cars.
 Uses: Disinfectant; fumigating compositions; cresotinic acid; dyestuffs; organic intermediate. See cresol.
 Danger: Rapidly absorbed through skin; causes severe burns. MCA warning label.
 Shipping regulations: None.*

cresolphthalein. An acid-base indicator, changes from colorless to red between pH 8.2 and 9.8.

cresol purple. Meta-cresolsulfonphthalein, an acid-base indicator, showing color change from yellow to purple over the range pH 7.4-9.0.

cresol red. Ortho-cresolsulfonphthalein, an acid-base indicator, changes from orange to amber between pH 2 and 3 and from amber to red between pH 7.2 and 8.8.

cresol, U.S.P. XVI. A mixture of ortho-, meta-, and para-cresols.
 Properties: Colorless, yellowish or pinkish liquid, highly refractive, becoming darker with age and exposure to light; phenol-like odor; sp.gr. 1.030-1.038; 90% by volume should distil between 195-205°C. Wt/gal 8.67 lbs. Slightly soluble in water, forming a cloudy solution; saturated solution is neutral or slightly acid to litmus; soluble in alcohol, ether, glycol and dilute alkalis.
 Grade: U.S.P. XVI.
 Derivation: From coal tar.
 Containers: 53-gal drums; tank trucks; tank cars.
 Uses: Disinfectant; antiseptic; textile soaps; wetting-out agents.
 Danger: Rapidly absorbed through skin. Causes severe burns. MCA warning label.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"Cresophan." ¹⁹ Brand name for a proprietary product. Tertiary butyl derivative of cresols. High coefficient germicide and fungicide. Specific against fungoid skin diseases of the ringworm type (athlete's foot).

cresotic acid (cresotinic acid; hydroxytoluic acid) $C_6H_3COOHCH_3$. There are ten possible isomers, of which the most common is the 2-hydroxy-3-methylbenzoic acid, also known as ortho-cresotic acid or ortho-homosalicylic acid. The description which follows is of this isomer.

Properties: White crystals or powder; m.p. $166^{\circ}C$; b.p. about $250^{\circ}C$, insoluble in water; soluble in alcohol and ether.

Derivation: Treatment of ortho-cresol with caustic and carbon dioxide under pressure.

Containers: Fiber cans; drums.

Uses: Dye intermediate; research on plant growth inhibition.

cresotinic acid. See cresotic acid.

"Crestalkyd" Resins. ²⁶³ Proprietary product. Long, medium and short oil alkyd resins. Several grades: oil length varying from 30% to 80%, A.V. < 15.

Use: High quality paints, lacquers, enamels, and varnishes. Plasticizing resin for nitrocellulose and similar finishes.

"Crestamide" Resins. ²⁶³ Proprietary product. Pure and modified sulfonamide resins. Very pale or almost colorless, m.p. $70-90^{\circ}C$; A.V. < 20.

Uses: Cellulose lacquers, enamels, adhesives.

meta-cresyl acetate $CH_3C_6H_4OCOCH_3$.

Properties: Colorless oily liquid, odor similar to phenol; b.p. near $112^{\circ}C$, distills with steam; insoluble in water, soluble in common organic solvents.

Use: Medicine.

para-cresyl acetate. $CH_3C_6H_4OCOCH_3$.

Properties: Colorless liquid having a floral odor suggestive of narcissus. Soluble in 2.5 vols of 70% alcohol.

Constants: Sp. gr. 1.0532 ($15^{\circ}C$); optical rotation (100 mm) 0° , refractive index 1.500 to 1.504, acid value 0.7, ester value 341.6.

Grades: Technical.

Use: Perfumery.

cresyl alcohol. See cresol.

cresyl diglycol carbonate (diethylene glycol bis(cresylcarbonate)) $C_{20}H_{22}O_7$.

Properties: Colorless liquid of low volatility. Sp. gr. 1.19 ($20/4^{\circ}C$), boiling point approximately $250^{\circ}C$ (2 mm), flash point $475^{\circ}C$; Saybolt viscosity 2170 centipoises; refractive index 1.523 ($20^{\circ}C$); evaporation rate 0.006 mg/sq cm/hr ($100^{\circ}C$). Insoluble in water (very stable to hydrolysis). Widely soluble in organic solvents. Compatible with many resins and plastics.

cresyl diphenyl phosphate ("Cellulflex 112"; "Santicizer" 140). $(CH_3C_6H_4)(C_6H_5)_2PO_4$.

Properties: Clear, transparent liquid; sp. gr.

1.200 ($20/20^{\circ}C$).

Uses: Plasticizer with high degree of flame-resistance; good low temperature qualities; food packaging; gasoline additive.

ortho-cresyl-alpha-glyceryl ether. See mephenesin.

cresylic acid (See also cresol.) The trade designation for commercial mixtures of phenolic materials boiling above the cresol range. Cresylic acid consists of phenols, cresols, and xylenols and higher phenols in various proportions, according to its source and boiling range.

Derivation: Petroleum; coal tar. Imported cresylic acid (ADF, meaning American Duty-Free), is derived from coal tar.

Containers: 5-, 55-gal drums; tank trucks; tank cars.

Uses (in approximate order of volume):

(a) Petroleum-derived cresylic acid: tricresyl phosphate, disinfectants, metal cleaning compounds, phenolic resins, flotation agents, surfactants, chemical intermediates, oil additives. (b) Coal tar-derived cresylic acid: phenolic resins, wire enamel solvent, tricresyl phosphate, solvent refining of lubricating oils, disinfectants, scouring compounds, detergents; pesticides.

para-cresyl methyl ether. See methyl-para-cresol.

cresyl silicate $(CH_3C_6H_4O)_4Si$.

Properties: Colorless liquid, b.p. $450^{\circ}C$.

Derivation: Reaction of cresol and silicon tetrachloride.

Uses: Heat transfer fluid.

cresyl-para-toluene sulfonate (tolyl-para-toluene sulfonate) $CH_3C_6H_4SO_2C_6H_4CH_3$.

Properties: Brown, oily liquid, faint odor; sp. gr. 1.207, flash point $184^{\circ}C$; m.p. $69-70^{\circ}$.

Derivation: From reaction of para-toluene-sulfonyl chloride with para-cresol.

Use: Has been used as a plasticizer.

"C.R.I." ²³⁹ A concentrated rust inhibiting germicide containing 12.5% (by weight) alkyl (mostly C_{12} , C_{14} , C_{16} but ranging from C_8 to C_{18}) dimethyl benzyl ammonium chloride as active ingredient. Inert ingredients are 40% 2-hydroxypropylamine nitrite, water (47.5%), and Fastusol Turquoise Blue.

critical. See chain reaction.

critical constants. A maximum or minimum value for a physical constant which is characteristic of the substance in question; e.g., the critical temperature is the temperature above which a gas cannot be liquefied by an increase in pressure.

critical humidity. The humidity value above which a solid salt will always become damp and below which it will always stay dry.

critical mass. See chain reaction.

critical size. See chain reaction.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

critical solution temperature. The temperature above or below which two liquids are miscible in all proportions.

critical temperature. The temperature above which a gas cannot be liquefied by an increase in pressure.

croceic acid. See crocein acid.

crocein acid (croceic acid, Bayer's acid; 2-naphthol-8-sulfonic acid) $C_{10}H_6OHSO_3H$. Derivation: Sulfonation of beta-naphthol at a low temperature and recrystallization from a salt.

Grade: Sold as the sodium salt in 100-lb fiber drums.

Use: Dye intermediate.

crocidolite (blue asbestos) $Na_2Fe_3^{+2}Fe_2^{+3}(Si_4O_{11})_2(OH)_2$. A natural sodium-iron silicate. One of the amphibole group of minerals. Lavender-blue or leek-green color, streak, same. One of the commercial forms of asbestos. Its chief use is in filters.

CROCUS (saffron; Spanish saffron, French saffron). Stigmas of *Crocus sativus*. Habitat. Western Asia, Asia Minor, Egypt, France and Spain.

Containers: Boxes, tins.

Uses: Coloring, flavoring.

Shipping regulations: None.*

CROCUS MARTIS. A name used for impure red ferric oxide pigments and polishing powders, usually produced by heating iron sulfate containing calcium sulfate, lime, or other inert filler. Also sometimes applied more generally to other impure oxides of red or yellow color.

CROCUS MARTIS ADSTRINGENS. Name given to red varieties of ferric oxide. See iron oxide reds.

CROCUS, POLISHING. A name given to red varieties of ferric oxide used for polishing or as pigments.

CROCUS, RED. A red pigment based on ferric oxide but containing a large proportion of calcium sulfate or similar material. Similar to Venetian red.

"Cromophtals." ⁴⁴³ Trade name for organic pigments used for organic coatings, plastics and printing inks.

"Cronar." ²⁸ Trademark for polyester photographic film base, a polyethylene terephthalate condensation polymer.

"Cronox." ⁸⁹ Trademark for bactericides and corrosion inhibitors for metal surfaces in oil production and refining.

crossed discharge. Combined high and low frequency electric discharge stated to give high conversion of air to nitric oxide.

CROSS SECTION (microscopic cross section, nuclear cross section). A term used particularly in nuclear physics and in nuclear reactor technology in regard to the reaction between nuclear particles.

It is the effective target area that a particular nucleus exhibits in a nuclear process or reaction of a given kind. For example, the U-235 nucleus may react with neutrons to scatter them, capture them, or be fissioned by them, and is said to have a different cross section for each process. Cross sections are usually quoted in barns (q. v.). The rate of a nuclear reaction is the product of the flux of incident particles times the number of target particles times the cross section of the target particle. See also macroscopic cross section.

crotonitron (N-ethyl-ortho-crotonotoluide) $CH_3C_6H_4N(C_2H_5)COCH:CHCH_3$.

Properties: Light yellow, oily liquid with a faint fish odor. Very soluble in alcohol; practically insoluble in water; stable to light and air.

Grade: N. N. D.

Use: Medicine.

croton. See tigilium.

crotonaldehyde (2-butenal; crotonic aldehyde; beta-methyl acrolein; propylene aldehyde) $CH_3CH:CHCHO$. Commercial crotonaldehyde is the trans isomer.

Properties: Water-white mobile, flammable liquid, pungent, suffocating odor; turns to a pale yellow color in contact with light and air. An effective lachrymator. Slightly soluble in water, miscible in all proportions with alcohol, ether, benzene, toluene, kerosene, gasoline, solvent naphtha.

Constants: Sp. gr. 0.858 (15.6/4°C); b. p. 104-105°C; flash point 55°F, f. p. -74°C, vapor pressure 19.0 mm (20°C); specific heat 0.705; refractive index 1.4373 (20°C), wt/gal 7.11 lbs (20°C).

Derivation: Condensation of two molecules of acetaldehyde.

Grades: Technical, 87% water-wet form.

Containers: 5-, 10-, 55-, 110-gal drums.

Uses: Intermediate for n-butyl alcohol; solvent; preparation of rubber accelerators, purification of lubricating oils; insecticides; chemical warfare; fuel-gas warning agent; organic synthesis; leather tanning; alcohol denaturant.

Fire hazard: Dangerous.

Shipping regulations: Flammable liquid. Red label.*

crotonchloral. See butyl chloral.

crotonic acid (butenoic acid; beta-methacrylic acid) $CH_3CH:CHCOOH$. Exists in cis and trans isomeric forms, the latter being the stable isomer used commercially. The cis form melts at 15°C and is sometimes called isocrotonic acid.

Properties: White crystalline solid; sp. gr. 0.9730; m. p. 72°C, b. p. 185°C; soluble in water, ligroin, ethanol, toluene, acetone.

Derivation: Oxidation of crotonaldehyde.

Grade: 97%.

Containers: Glass bottles; fiber drums.

Uses: Synthesis of resins, polymers, plasticizers, drugs.

crotonic aldehyde. See crotonaldehyde.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

croton oil (tiglum oil).

Properties: Brownish-yellow liquid; poisonous! Sp.gr. 0.935-0.950 (25°C); refractive index ($n_{40/D}$) 1.470-1.473. Soluble in ether, chloroform and fixed or volatile oils; slightly soluble in alcohol.

Chief constituents: Glycerides of stearic, palmitic, myristic, lauric and oleic acids and croton resin, a vesicant.

Derivation: By expression from the seeds of *Croton tiglium*.

Method of purification: Rectification.

Grades: Technical.

Containers: 25-lb tins, 1-, 5-, 10-lb glass bottles.

Use: Medicine.

Caution: Causes eruptions when applied to skin.

Shipping regulations: None.*

crotonolic acid. See tiglic acid.**crown bark.** See cinchona bark, Loxa.

crown filler. A mineral filler, usually calcium sulfate or carbonate or a mixture thereof used in paper manufacture.

crown glass. A carefully made lime-soda-alumina glass with high refraction and low dispersion, used for optical glass.

crucible clays. Ball clays that are relatively refractory, for use in producing crucibles that will withstand high temperatures.

crucible steel. Steel which has been manufactured by the "crucible process" in which the steel is smelted in crucibles placed in a coke-fired furnace of special design. Very high grade steels are produced but are being largely replaced by electric furnace steels which permit more precision in forming alloys.

crude oil. See petroleum.

"Cryogel." ³²⁹ Trademark for an aluminum soap used as a low-temperature gelling agent for hydrocarbons.

cryogenics. The field of science dealing with the behavior of matter at very low temperatures and with low temperature techniques. The use of the liquefied gases oxygen, nitrogen and hydrogen, at temperatures to about -260°C, is now common industrial practice. Some useful electronic devices and specialized instruments, such as the cryogenic gyro, operate at liquid helium temperatures (about 4°K). Most cryogenic research centers around the anomalous behavior of substances at the liquid helium temperature or below.

See absolute temperature.

cryolite, natural (Greenland spar, icestone)

Na_3AlF_6 . A natural fluoride of sodium and aluminum. See also cryolite, synthetic.

Properties: Colorless to white; sometimes red, brown or black; luster vitreous to greasy; hardness 2.5; sp.gr. 2.95-3.0. A typical composition (exclusive of fluoride) is Al 13.23%, Na 32.71%, a little Mn_2O_3 , MgO, and vanadic and phosphoric acids.

Occurrence: Greenland (only commercial source); Colorado; U. S. S. R.

Containers: 50-, 100-lb bags; 400-lb barrels.

Uses: As an electrolyte in the production and refining of aluminum from its oxide; in ceramics; insecticide; as a binder for abrasives; in electrical insulation; flux in open hearth process; explosives; polishes.

cryolite, synthetic (sodium fluoaluminate; sodium aluminum fluoride) Na_3AlF_6 or actually, perhaps, $2\text{AlF}_3 \cdot 6\text{NaF} \cdot 3\text{CaF}_2$. See also cryolite, natural.

Properties: A white, crystalline powder; m.p. 1000°C, refractive index 1.338.

Insoluble in water; soluble in solutions of aluminum and ferric salts. Not compatible with alkaline materials.

Derivation: From fluorspar, sulfuric acid, hydrated alumina, and sodium carbonate.

Grades: Technical (low sulfate); insecticide; fluxing.

Containers and Uses: Same as cryolite, natural.

cryptohalite. See ammonium fluosilicate.**cryptopine** $\text{C}_{21}\text{H}_{23}\text{NO}_5$.

Properties: White crystalline alkaloid; poisonous! Soluble in chloroform and boiling alcohol, insoluble in water and ether. M.p. 217-221°C.

Derivation: From opium, by extraction and crystallization.

Method of purification: Recrystallization.

cryptoxanthin (provitamin A, hydroxy-beta-carotene) $\text{C}_{40}\text{H}_{56}\text{O}$. A carotenoid pigment with vitamin A activity.

Properties: Garnet-red prisms with metallic luster from benzene and methanol; soluble in chloroform, benzene, and pyridine; slightly soluble in ligroin, petroleum ether, alcohol and methanol.

Occurrence. In many plants, egg yolk, butter, blood serum.

Uses: Nutrition; medicine.

crystal. A solid with characteristic shape and cleavage caused by arrangement of its atoms, ions, or molecules into a definite pattern or crystal lattice. Crystals have flat surfaces, sharp edges, and a definite angle between a given pair of surfaces. Real crystals of any size are never perfect in the sense that all their atoms or molecules are perfectly arranged on one perfect crystal lattice system. Any actual crystal is composed of a considerable number of small crystallites that do have perfect or nearly perfect lattice structure. At the boundaries of the crystallites there are irregularities or shifts in the lattice structure. The study of these crystal imperfections and of similar imperfections caused by atoms or molecules of foreign substances in the latter, is known as solid state physics. Most important properties and uses of crystals depend upon the crystal imperfections. Relatively large single crystals of a high degree of purity and perfection are used for optical and electrical purposes and for measurement of radioactivity.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

crystal ammonia. See ammonium carbonate.

crystal carbonate. See sodium carbonate, monohydrate.

crystallite. A perfect portion of an ordinary crystal; i.e., a part of the crystal that has its atoms and molecules arranged in a perfect crystal lattice. Crystallites are usually quite small. An ordinary crystal is composed of an assemblage of a large number of such crystallites, some of which are almost perfectly aligned with one another while others are out of alignment to various extents.

crystallization. The process of forming crystals by cooling a molten material or a solution, or by evaporating a solution, or by condensing a vapor under suitable conditions. The crystals usually contain fewer impurities than the liquid (or vapor) from which they form, so that partial or fractional crystallization is much used for purification of materials. Large crystals usually are of higher purity than small ones, although not always. Formation of large crystals usually requires that the process proceed slowly. Large natural crystals or carefully grown synthetic crystals have important electrical uses. See crystal; crystallite.

crystallized verdigris. See copper acetate.

"Crystal O." ²⁰² Trademark for an odorless and tasteless U.S.P. quality castor oil for cosmetic and pharmaceutical usage and for coating applications.

crystals of Venus. See copper acetate.

"Crystalustre." ³³³ Lacquers and varnishes having a clear cellulose base. Used in coating paper, cardboard, etc.

crystal violet. See methyl violet.

"Crystamet." ⁴²⁸ Trademark for sodium metasilicate pentahydrate.

"Crystarose" ¹⁸⁸ $C_6H_5CH(CCl_3)OOCCH_3$. Brand name for a highly purified grade of trichloromethylphenylcarbinyl acetate. Relatively free of odor; enhances rose perfumes.

"Crystex." ¹ Rubber-insoluble sulfur used as vulcanizing agent in natural and synthetic rubbers; 85% of the sulfur is insoluble at the usual milling temperatures. This metastable form is converted to the stable soluble sulfur at usual vulcanizing temperatures.

Containers: Multiwall paper bags, 50 lb net.
Use: In all rubber stocks which suffer from "bloom" in the uncured state, and in some latex compounds and naphtha cements.

"Crystic" Resins. ²⁶³ Proprietary products. Unsaturated polyester resins. Several grades. Maximum viscosity 40 poises (at 25°C).

Uses: Low pressure molding and laminating for glassfiber reinforced plastics; potting, casting, and embedding resins.

"Crystodigin." ¹⁰⁰ Trademark for digitoxin, U.S.P.

"Crystolon." ²⁴⁹ Trademark for silicon carbide (q.v.).

Cs. Symbol for cesium.

C₂S. Abbreviation for dicalcium silicate, as used in cement.

See cement, Portland.

C₃S. Abbreviation for tricalcium silicate, as used in cement.

See cement, Portland.

"CS-137." ³⁰⁴ Trade name for a barium-sodium organic-complex vinyl stabilizer. Properties: Creamy-white paste, sp.gr. 1.54, refractive index 1.48.

Containers: Supplied as a 70% solids paste in DOP. Metal drums containing 60 lbs net.

Uses: Used as a stabilizer for transparent organosols and solution coatings to impart superior light and weathering resistance.

CS Corrosion Inhibitor. ¹⁰⁸ Granular, pale pink compound.

Containers: 20- and 100-lb drums.

Uses: Corrosion inhibitor for closed recirculating heating and cooling systems in air conditioning, low-pressure hot water heating, diesel engines and gas compressors.

C-stage resin (resite). The fully cured stage of phenol-formaldehyde resins (q.v.). Infusible and insoluble in all solvents. See A-stage resin.

CTC. Abbreviation for chlortetracycline.

CTP. Abbreviation for cytidine triphosphate. See cytidine phosphates.

Cu. Symbol for copper.

cubeb. See cubeba.

cubeba (cubeb; tailed pepper; Java pepper).

Derivation: Dried, unripe, but fully grown fruit of *Piper cubeb*.

Habitat: Southern Asia (Java, Borneo and Sumatra); cultivated in Ceylon and West Indies.

Grade: Technical.

Containers: Berries, in bags; powdered, in cases.

Use: Medicine.

Shipping regulations: None.*

cubebin $C_{20}H_{20}O_6$.

Properties: Inodorous white crystals; m.p. 131-132°C; soluble in chloroform and hot alcohol.

Derivation: A constituent of cubeba.

cubeb oil.

Properties: Colorless, pale greenish or yellowish liquid; characteristic odor of cubebs; warm camphoraceous taste.

Soluble in alcohol, ether and chloroform.

Chief known constituents: Sesquiterpenes; cadinene; dipentene.

Constants: Sp.gr. 0.905-0.925; b.p. 175-280°C; refractive index 1.49-1.496; optical rotation -25 to -40°.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Derivation: Distilled from the unripe fruit of *Piper cubeba*.

Method of purification: Rectification.

Grades: Technical.

Containers: 10-lb tins; 1-, 5-lb glass bottles.

Use: Medicine.

Shipping regulations: None.*

cube root (barbasco root; timbo root).

Derivation: The dried roots of various species of *Lonchocarpus*.

Habitat: South and Central America.

Contains varying amounts of rotenone, depending on the grades, as, 5% rotenone.

Containers: Bags.

Use: Manufacture of insecticides and as a fish poison.

cubic centimeter (cc). The volume of a cube with sides one centimeter long. See also milliliter.

"**Cubidow**,"²³³ Trademark for compacted salt comprising either or both calcium and sodium chloride.

"**Cubond**,"²⁹⁴ Trademark for a copper brazing paste. Consists of metallic copper powder on cuprous oxide pigments of high purity in organic or petroleum vehicles which impart satisfactory suspension properties. Available in various grades, including additions of brazing fluxes, depending on specific end use.

Containers: Pints, gallons, and 5-gal pails.

Uses: Principally for joining steel parts together. In some instances has been used as a pyrometallurgical method for surface plating with copper.

"**Cubor Dusts**,"¹⁷⁴ Trademark for insecticides containing 0.75 and 1.0% pure rotenone. Containers: 4-, 50-lb bags.

cuca. See coca.

cucumber oil (gourd oil).

Properties: Greenish-yellow, fixed, drying oil; faint red fluorescence. Soluble in alcohol, ether and benzene; insoluble in water. Sp.gr. 0.923, m.p. -16°C, saponification value 188.7; iodine number 121.

Derivation: From the seeds of the cucumber, pumpkin, etc., by pressing.

cucurbita. See pepo.

cudbear (persio). A purplish-red powder prepared from certain lichens (*Rocella de candolle*, *Locanora acharius*).

Habitat: Norway, Sweden, European mountains, Mediterranean coast, Madeira, Mozambique, Madagascar, California.

Derivation: By macerating lichens with dilute ammonia and caustic soda, with fermentation.

Uses: For its tinctorial powers.

See also litmus and orchil.

cuenca bark. See cinchona bark, Loxa.

cuite. A term applied to degummed natural silk.

cullet. Broken glass added to the batch in glass manufacture.

"**Culofix**,"³⁰⁰ Trademark for dye fixatives for application to dyed textiles. Eliminates or minimizes color bleeding in water and/or in laundering.

"Culofix" L: Fatty cationic type to eliminate bleeding of direct dyes in water.

"Culofix" WFD: Cationic resin type which prevents color bleeding in laundering.

Culver's root. See leptandra.

cu.m. Abbreviation for cubic meter.

cumaldehyde. See cuminic aldehyde.

cumarin. See coumarin.

cumarone. See coumarone.

"**Cumar**" Resins.¹⁷⁵ Trademark for a series of neutral, stable, synthetic resins of the para-coumarone-indene type, manufactured from selected distillates of tar.

Properties: Wide compatibility permits use with a great variety of solvents, oils, resins, and waxes; mills readily into natural or synthetic rubber, acting as a softener and filler-wetting agent; imparts easy-flowing qualities to extruded stocks and gloss to molded goods; improves tensile elongation and tear resistance of GR-S compounds; available grades vary from semi-liquid to hard forms. Sp.gr. 1.08-1.14 (15.5/15.5°C), color, pale yellow to brown; softening range, 7-136°C; flash point, 160-278°C; iodine no., 41-44.

Grades: W (High Melting); V (Varnish), T3, T15 (Tile), MH, RH (Rubber), P10, P25 (Plastic), EX Dark (X Grades).

Containers: Flaked grades are sold in fiber drums, viscous grades, in steel barrels, solid grades, in metal cans.

Uses: In the manufacture of varnishes, floor tile, natural and synthetic rubber products, printing ink, adhesives, and waterproofing materials, for leather, electrical, radio, paper, and other industries.

"**Cumate**,"⁶⁹ Trademark for proprietary preparation of copper dimethyldithiocarbamate $[(CH_3)_2NC(S)S]_2Cu$.

Properties: Dark brown powder, sp.gr. 1.75 ± .03, melts above 325°C; moderately soluble in acetone, benzene, chloroform; insoluble in water, alcohol, gasoline.

Uses: In SBR, primary accelerator; secondary accelerator with thiazoles. In butyl rubber, primary accelerator. For molded and extruded goods.

Also supplied in "rodform."

cumene (isopropylbenzene; isopropylbenzol; cumol) $C_6H_5CH(CH_3)_2$.

Properties: Colorless liquid. Soluble in alcohol, carbon tetrachloride, ether and benzene, insoluble in water.

Constants: Sp.gr. 0.8620; b.p. 152.7°C; wt/gal 7.19 lbs (25°C); freezing point -96°C; refractive index 1.489 (25°C); flash point 97°F; fire point 38°C; heat of vaporization 76.5 cal/g (b.p.); specific

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

heat 0.43 cal/g/°C; dielectric constant 2.3 (1,000 cycle); specific resistivity 8.6×10^{12} ohms/cm; viscosity 0.73 centipoises (25°C). Typical specifications: Boiling range < 3,0°C.

Derivation: (a) Distilled from coal tar naphtha fractions and from petroleum. Method of purification: Rectification. Grades: Technical, research; pure. Containers: Drums; tank cars; tank trucks. Uses: Additive to aviation gasoline, production of phenol, acetone, and alpha-methylstyrene; solvent. Shipping regulations: None.*

cumene hydroperoxide (alpha-, alpha-dimethylbenzyl hydroperoxide) $C_6H_5C(CH_3)_2OOH$. Properties: Colorless to pale yellow liquid, slightly soluble in water; readily soluble in alcohol, acetone, esters, hydrocarbons, chlorinated hydrocarbons.

Derivation: A solution or emulsion of cumene is oxidized with air at about 130°C.

Uses: Production of acetone and phenol; polymerization catalyst, particularly in redox systems, used for rapid polymerization.

Shipping regulations: Oxidizing material. Yellow label.*

cumenylamine. See cumidine.

cumic aldehyde. See cuminic aldehyde.

cumidine (para-isopropylaniline; cumenylamine) $(CH_3)_2CHC_6H_4NH_2$.

Properties: Colorless liquid; sp.gr. 0.957 (20/4°C); m.p. -63°C, b.p. 225°C. Insoluble in water; soluble in alcohol and ether.

See also pseudocumidine.

cumin. See cumin seed.

cuminic aldehyde (cumic aldehyde; cumaldehyde; para-isopropylbenzaldehyde) $(CH_3)_2CHC_6H_4CHO$.

Properties: Colorless to yellow liquid with a cumin odor; sp.gr. 0.976 (22°C), b.p. 235°C. Insoluble in water; soluble in alcohol and ether.

Use: Perfumery.

cumin oil.

Properties: Colorless or yellowish, limpid liquid, characteristic odor of cumin; sharp, spicy taste. Soluble in alcohol, ether and chloroform.

Chief known constituents: Cumene; cuminic aldehyde.

Constants: Sp.gr. 0.900-0.930; optical rotation +4° to +8°, refractive index 1.497-1.509 (20°C).

Derivation: Distilled from the fruit of *Cuminum cyminum*.

Method of purification: Rectification.

Grades: Technical.

Containers: 25-lb cans, 1-, 5-lb glass bottles.

Uses: Medicine, flavoring; perfumery.

Shipping regulations: None.*

cumin seed (cumin).

Derivation: Fruit of *Cuminum cyminum*.

Habitat: Mediterranean region and northern Africa.

Grades: Iranian; Moroccan; Turkish.

Containers: Bags.

Uses: Medicine; flavoring; curry powders.

Source of an essential oil used in perfumery and from which certain chemicals can be made.

Shipping regulations: None.*

cumol. See cumene.

cumyl phenol.

Properties: White to tan crystals with characteristic phenol odor. Solidifying point 72.0°C; density 1.115 g/ml (25°C); distillation range 188.9-190.9°C (10 mm); flash point 180°C (COC), fire point 204°C (COC). Containers: 200-lb fiber drums.

Uses: Intermediate for resins, insecticides, lubricants.

cundurango. See condurango.

"**Cunife**." ¹⁶⁶ A ductile permanent magnet material composed of 60% copper, 20% nickel and 20% iron. Forms available: wire, strip, finished magnets.

"**Cunilate**." ⁸ Proprietary name for "solubilized copper-8-quinolinolate." There are many different types for various conditions of use. Properties vary chiefly with the type of agent used to promote the proper dispersion for each type. A typical "Cunilate" (#2174) contains 10% copper-8-quinolinolate with 2-ethylhexoic acid and an aromatic solvent as carrier, with 40% total solids. Properties: (#2174) Sp.gr. 0.9542-0.9545 at 77°F; flash point 110°F; color, greenish yellow; pH 5.5-6.0.

Containers: Steel drums.

Uses: (#2174) For fungicidal treatment of fabrics, thread, cotton rope and other materials as well as in combination with textile treatments.

"**Cunimene**." ²²⁴³ ⁸ Trade name for cupri-magnesium dehydroabietyl amine 8-hydroxy-quinolinium 2-ethylhexoate, a fungicidal product. A typical commercial product is light green in color, contains 94% solids, is dispersed in an aromatic solvent; has sp.gr. 1.09, and flash point 110°F. An emulsifiable variety is available.

"**Cunimene**." ²²⁴⁶ ⁸ Trade name for zinc-magnesium dehydroabietyl amine 8-hydroxy-quinolinium 2-ethylhexoate. A fungicide similar to "Cunimene" 2243.

"**Cunisil-837**." ³²⁴ Trade name for an alloy containing 97.50% copper, 1.90% nickel, and 0.60% silicon. This high-strength, corrosion-resistant alloy is available in round rod, with or without the final precipitation-hardening heat treatment. Used in electrical equipment.

cupellation process. A process for freeing silver, gold or other non-oxidizing metals from base metals which can be oxidized. The metallic mixture is placed in a cupel, which is a shallow, porous cup, and roasted

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

in a blast of air. The base metal oxides are absorbed in the cupel, leaving the pure metal to be decanted.

cupferron (ammonium nitroso-beta-phenylhydroxylamine) $C_6H_5N(NO)ONH_4$.

Properties: Creamy-white crystals; m. p. 163-164°C. Soluble in water, alcohol and ether.

Derivation: By treating an ethereal solution of beta-phenylhydroxylamine with dry ammonia gas and amyl nitrite.

Method of purification: Recrystallization.

Grades: Pure; reagent.

Containers: Glass bottles.

Use: Reagent in analytical chemistry.

Shipping regulations: None.*

cuprammonium process. A process for making rayon by dissolving cellulose in an ammoniacal copper solution and spinning the solution into fibers, which are reconverted to cellulose by treatment with acid. Relatively pure alpha-cellulose (from cotton linters or treated wood pulp) is dissolved in a solution of ammonia and copper hydroxide or basic copper sulfate until the cellulose content reaches 7-10%. During an aging period, absorption of atmospheric oxygen causes degradation of the cellulose polymers and reduces the viscosity of the solution. When the proper viscosity has been attained, the solution is filtered, deaerated, and forced through minute openings of the spinneret into a bath of dilute sulfuric acid, regenerating the cellulose and stretching and thinning the filaments.

cuprammonium rayon (copper-ammonium rayon). Regenerated cellulose fibers made by the cuprammonium process. Available in continuous filament form.

Properties: Tensile strength (psi) 33,000-44,000; elongation 10-17%, sp. gr. 1.52-1.54; moisture regain 11-12.5% (70°F, 65% relative humidity); decomposes about 300°F; burns readily. Similar to cotton in chemical resistance, dyeing, and resistance to insects and mildew.

Uses: Knitted and woven material for wearing apparel such as dress fabrics.

cupreine (hydroxycinchonine; ultraquinine) $C_{19}H_{22}O_2N_2 \cdot 2H_2O$. One of the cinchona alkaloids.

Properties: Colorless crystals; m. p. (anhydrous) 198°C. Slightly soluble in water and alcohol; soluble in chloroform and ether.

Derivation: From cuprea bark *Remijia pedunculata*.

"**Cuprex**,"¹²³ Trademark for a preparation for extermination of ectoparasites on men, animals, and plants.

cupric. Form of the word copper used in naming copper compounds in which the copper has a valence of two. See the corresponding compound under copper.

cupric chromate, acid. See "Celcure."

cupric chromate, basic. See copper chromate.

cupriethylene diamine.

Shipping regulations: Solution: Corrosive liquid. White label.*

"**Cuprisote**,"¹⁷¹ Trade name for a formula known as acid cupric chromate. When impregnated into the wood fiber by vacuum pressure process, it offers ultimate protection against decay and insect attack. Clean, non-toxic to humans, paintable after processing, non-leachable.

cuprite (ruby copper ore; red oxide of copper) Cu_2O . Crimson, scarlet, vermilion, deep or brownish-red, secondary mineral; adamantine or dull luster; brownish-red streak. Superior in hardness to cinnabar and proustite and differs from them in color or streak. Inferior in hardness to hematite. Contains 88.8% cuprous oxide, 11.2% oxygen. Soluble in nitric and concentrated hydrochloric acids.

Constants: Sp. gr. 5.85-6.15; hardness 3.5-4.

Occurrence: United States; England; Germany; France, Siberia; Australia; China; Peru; Bolivia.

Use: Source of copper.

cupro-magnesium. An alloy of copper and magnesium.

"**Cupron**,"¹³⁵ Trademark for an alloy of 55% copper and 45% nickel (constantan).

Properties: Resistivity, 294 ohms per circular mil foot at 20°C; temp. coefficient of resistance $\pm 0.00004/^\circ C$ between 0-100°C; heat resistant below 1000°F; high thermal emf vs copper. Caution! Both terminals must be at same temperature.

Forms: Wire; ribbon; strip.

Uses: Rheostats and controls; resistors for electrical instruments.

cupro-tungsten. An alloy of copper and tungsten.

cuprous. Form of the word copper used in naming copper compounds in which the copper has a valence of one.

cuprous chloride $CuCl$ or Cu_2Cl_2 . (Nantokite is the naturally occurring mineral.)

Properties: White cubical crystals; sp. gr. 3.53; m. p. 422°C; b. p. 1366°C; becomes greenish on exposure to air, and brown on exposure to light. Insoluble in water; soluble in acids or ammonia.

Derivation: Copper and cupric chloride solution or copper and hydrochloric acid in air.

Grades: Technical; C. P.; reagent.

Containers: Multiwall paper sacks; glass bottles; 100-lb drums.

Uses: Catalyst; preservative and fungicide; metallurgy; absorbent for carbon monoxide.

Caution! Harmful if swallowed. MCA warning label.

cuprous cyanide $Cu_2(CN)_2$ or $CuCN$. Copper content min. 70%; cyanide content min. 28.5%.

Properties: A creamy white powder; insoluble in water; soluble in sodium cyanide and

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

potassium cyanide; sp. gr. 2.9; m. p. 475°C. Poisonous!

Containers: 100-lb drums.

Use: In copper and brass cyanide electroplating solutions.

Danger! Contact with acid liberates poisonous gas. MCA warning label.

Shipping regulations: None.*

cuprous iodide CuI .

Properties: White to brownish-yellow powder. Soluble in ammonia and potassium iodide solutions; insoluble in water.

Sp. gr. 5.653 at 15°C; m. p. 606°C.

Derivation: Interaction of solutions of potassium iodide and copper and iron sulfates.

Use: Medicine; feed additive.

cuprous oxide. See copper oxide, red.

cuprous sulfide. Cu_2S .

Properties: Black powder or lumps; soluble in nitric acid; insoluble in water. Occurs as the mineral chalcocite. Sp. gr. 5.52-5.82; m. p. about 1100°C.

Derivation: By heating cupric sulfide in a stream of hydrogen.

Grades: Technical.

Containers: Wooden barrels.

Uses: Copper metal; protective paint for vessels.

Shipping regulations: None.*

cuprous sulfite $\text{Cu}_2\text{SO}_3 \cdot \text{H}_2\text{O}$.

Properties: White crystalline powder; soluble in ammonium hydroxide, hydrochloric acid (with decomposition); insoluble in water. Sp. gr. 3.83.

cuprous thiocyanate (copper sulfocyanide) CuSCN .

Properties: Yellow-white amorphous powder. Insoluble in water; soluble in ammonia.

Uses: Manufacture of organic chemicals, antifouling paints, printing textiles.

Curacao aloe. A variety of aloe (q. v.).

"Curafos." ¹⁰⁸ Trademark for food grade sodium hexametaphosphate and sodium tripolyphosphate used for curing, preventing undesirable color change, and loss of moisture in meat.

Containers: 100-lb bags and drums.

curare. The arrow poison of South American Indians. Intensely poisonous! Designated as tube, calabash, or pot type according to container in which it is packed and transported from point of origin.

Properties: Dark brown resinous extract, thick syrup or brittle amorphous solid; soluble in water and in aqueous alcohol.

Constituents: At least 40 alkaloids have been isolated, but of these d-tubocurarine (q. v.) is most useful in medicine and least toxic.

Source: From Chondodendron tomentosum and various species of Strychnos, in South America.

Use: In medicine, as a standardized extract.

curarine $\text{C}_{19}\text{H}_{23}\text{N}_2\text{O}$. An alkaloid obtained from curare. See also tubocurarine chloride.

"Curavis." ¹⁰⁸ Trademark for a dry, pulverized, food grade, polymeric phosphate composition exhibiting high viscosity in water solution. For use in the meat packing industry.

Containers: 100-lb drums; 12-lb cartons of six 2-lb polyethylene bags.

curcuma (turmeric; curry; Indian saffron).

Rhizome of *Curcuma longa*.

Habitat: China, East Indies and many tropical countries.

Grades: Technical.

Containers: Burlap bags.

Uses: Coloring foods; condiment (curry powder); textile dyeing; indicator in analytical chemistry.

Shipping regulations: None.*

curcuma oil (turmeric oil). An orange-yellow, slightly fluorescent liquid, which has slight odor of curcuma, produced by steam distillation of root of *Curcuma longa*. Sp. gr. about 0.94; b. p. 220-250°C (decomposed above 250°C). Soluble in one half volume of 90% alcohol. Consists of turmerol, valeric and caproic acids, and phellandrene.

curcumin (turmeric yellow)

$(2\text{-CH}_3\text{OC}_6\text{H}_3\text{-1-OH-4-CH:CHCO})_2\text{CH}_2$.

Properties: Orange-yellow needles, m. p. 177-179°C. Insoluble in water and ether; soluble in alcohol.

Derivation: The coloring principle from curcuma.

Uses: Dye; analytical reagent; food dye. As an acid-base indicator it is brownish-red with alkalis, yellow with acids; an indicator for boron.

"Cure-Set." ⁶⁵ Trademark for a two-component adhesive (special latex and a catalyst vulcanizer) for bonding rubber and vinyl tile in on-grade installation where moisture may be a problem.

curie. The official unit of radioactivity, defined as exactly 3.70×10^{10} disintegrations per second. This decay rate is nearly equivalent to that exhibited by one gram of radium in equilibrium with its disintegration products. A millicurie (mc) is one thousandth of a curie. A microcurie (μc) is one millionth of a curie.

curine. See bebeerine.

curium Cm. A synthetic element with atomic number 96, first formed as the 242 isotope when plutonium was bombarded with helium ions in the cyclotron. See actinide elements. Curium is a silvery metal similar in properties to the rare earth, gadolinium. It is obtained by first preparing curium trifluoride, which is reduced with barium vapor at 1275°C. Curium forms compounds of the type CmF_3 , Cm_2O_3 , $\text{Cm}_2(\text{C}_2\text{O}_4)_3$, etc.

curled dock. See rumex.

"Curona." ¹⁷³ Trademark for sodium isoascorbate as a curing aid in cured and comminuted meat products. It is used as an anti-oxidant in the meat packing industry

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

for preserving the natural color of meat products, to shorten processing time and reduce shrinkage.

curry. See curcuma and also cumin seed.

cuscut oil. See vetiver oil.

cusparia bark. See angostura bark.

cutch extract A water-soluble tanning substance obtained by extracting the bark of several varieties of mangrove trees.

cut glass. Lead glass that has been carefully cut and polished.

cutting fluid. A liquid applied to a cutting tool to assist in the machining operation by washing away the chips or serving as a lubricant or coolant. Commonly used cutting fluids are: water; water solutions or emulsions of detergents and oils; mineral oils; fatty oils; chlorinated mineral oils; sulfurized mineral oils; mixtures of the foregoing oils.

cutting-tool lubricant. See cutting fluid.

cuttle fish bone. See sepia.

"Cyamite." ⁵⁷ Trademark for an ammonia nitrate blasting agent which is not sensitive to the shock of an electric blasting cap, rifle slug or primacord. Bore hole must be primed with regular dynamite to shoot.

"Cyamon." ⁵⁷ Trademark for an ammonium nitrate blasting agent which is designed for safe handling in the field. It is not sensitive to a blasting cap, rifle slug, primacord, flame or impact of heavy steel weights.

"Cyamon Primers" for Explosives. ⁵⁷ Trademark for special primers sensitive to an electric blasting cap and primacord, used to detonate "Cyamon" blasting agents.

"Cyan." ⁵⁷ Trade designation for a line of both blue and green phthalocyanine pigments.

"Cyana." ⁵⁷ Trademark used in connection with the textile finishes obtained by applying "Aerotex" Resins and similar products.

"Cyanadur." ⁵⁷ Trademark for a line of pigments.

"Cyanalube." ⁵⁷ Trademark for a softener for use as a lubricant in sewing cloth.

"Cyanamer." ⁵⁷ Trademark for an acrylic polymer.

cyanamide.

1. (cyanogenamide; carbodimide)

HN:C:NH or N:CNH₂.

Properties: Crystals; m.p. 42°C; sp.gr. 1.08. Very soluble in water, alcohol, ether.

Derivation: From calcium cyanamide and sulfuric acid.

2. Familiar term for calcium cyanamide (q.v.).

"Cyanatex." ⁵⁷ Trademark for textile softener or finishing agent.

Cyanide-Chloride Mixtures. ²⁸

White, fused slabs, 3" x 1 3/4" x 1" (approx. 3 oz.) or white, crystalline powder.

30% Case Hardener. Sodium cyanide content min. 30%; sodium chloride min. 25%, max. 35%; f.p. approx. 1090°F (587°C); sp.gr. 2.12 at 77°F (25°C), 1.52 at 1562°F (850°C).

45% Cyanide-Chloride Mixture. Sodium cyanide content min. 45%, sodium chloride min. 45%, sodium carbonate max. 10%; f.p. approx. 1247°F (675°C); sp.gr. 1.91 at 77°F (25°C), 1.37 at 1580°F (860°C).

75% Cyanide-Chloride Mixture. Sodium cyanide content min. 75%, sodium chloride min. 12%, sodium carbonate max. 13%; f.p. approx. 1094°F (590°C); sp.gr. 1.74 at 77°F (25°C), 1.26 at 1580°F (860°C).

Containers: 100-lb cases; 100- and 200-lb drums.

Use: Case hardening of steel.

cyanide pulp. The mixture obtained by grinding crude gold and silver ore and dissolving the precious metal content in sodium cyanide solution.

"Cyanine Fast." ²³² Brand name for a series of level-dyeing acid dyestuffs of good fastness properties.

cyanite (kyanite, disthene) Al₂OSiO₄. A natural silicate of aluminum, found in metamorphic rocks.

Properties: Color blue, green, white, gray; luster vitreous; sp.gr. 3.56-3.66; hardness 5 along length of crystal, 7 at right angles to this direction.

Occurrence: South Carolina, Virginia; India; Africa.

Use: Refractories.

See also andalusite, sillimanite.

cyanacetamide (malonamide nitrile; propionamide nitrile) CNCH₂CONH₂.

Properties: White crystals; b.p., decomposes, m.p. 119°C, soluble in water and alcohol.

Derivation: Ammonolysis of cyanoacetic ester or by the dehydration of ammonium cyanoacetate.

Method of purification: Crystallization.

Containers: Fiber drums.

Uses: Organic pharmaceutical synthesis; plastic materials.

cyanacetic acid (malonic nitrile) CNCH₂COOH.

Properties: White crystals, hygroscopic.

Soluble in water, alcohol and ether. M.p. 66.1-66.4°C; decomposed at 160°C.

Derivation: By the interaction of sodium chloroacetate and potassium cyanide solution.

Method of purification: Crystallization.

Grades: Technical.

Containers: Tins.

Use: Organic synthesis.

Shipping regulations: None.*

"Cyanobrik." ²⁸ Trademark for 97% sodium cyanide in 1-oz., pillow-shaped, briquette form.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

cyanocarbons. A new class of compounds in which the cyanide radical ($-\text{CN}$) replaces hydrogen in organic compounds, as in tetracyanoethylene, $(\text{CN})_2\text{C}:\text{C}(\text{CN})_2$, which see. The compounds are quite reactive and form colored complexes with aromatic hydrocarbons.

"**Cyanocel.**"⁵⁷ Trademark for chemically modified (cyanoethylated) cellulose.

cyanocobalamin. See vitamin B_{12} .

2-cyanoethyl acrylate $\text{CH}_2=\text{CHCOOCH}_2\text{CH}_2\text{CN}$.

Properties: Sp. gr. 1.0690; b. p., polymerizes when heated; f. p. -16.9°C , lbs/gal 8.9; flash point 145°F ; soluble in water.

Uses: Forms polymers, copolymers for viscosity index improvers; adhesives; textile finishes and sizes.

Shipping regulations: None.*

cycanoethylation. Process for introducing the group, $-\text{OCH}_2\text{CH}_2\text{CN}$, into an organic molecule by reaction of acrylonitrile with a reactive hydrogen, such as that on a hydroxyl or amino group.

See also cotton, cycanoethylation of.

cyanofornic chloride CNCOCl .

Properties: Oily substance. Poison gas characteristics! B. p. $126-128^\circ\text{C}$ (750 mm).

Derivation: Reaction between phthalyl chloride and the amide of ethyl oxalate.

"**Cyanogas.**"⁵⁷ A proprietary product. Contains not less than 42% calcium cyanide; evolves hydrocyanic acid gas on exposure to atmospheric moisture.

Properties: Slate gray powder granules and flakes for different uses.

Containers: 4-oz, 1-, 5-, 25-, 100-lb metal containers.

Uses: For killing ants, rats, mice, moles, woodchucks, prairie dogs, and other pests in nests and burrows, for fumigating flour mills, warehouses, mushroom houses, and greenhouses; for fumigating citrus trees under tents to control scale insects, for fumigating grain storage.

Fire hazard: None.

Shipping regulations: Class B poison.

Poison label.*

cyanogen C_2N_2 .

Properties: Colorless gas, pungent penetrating odor; burns with a purple-tinged flame, extremely poisonous! Soluble in water, alcohol and ether. Sp. gr. 1.8064 (air = 1); liquefaction point -21°C , solidification point -34°C .

Derivation: Potassium cyanide solution is slowly dropped into copper sulfate solution; mercury cyanide is heated.

Grades: Technical; pure.

Containers: Liquefied cyanogen: iron cylinders.

Uses: Organic synthesis; poison gas in warfare.

Fire hazard: Dangerous.

Shipping regulations: Poison; class A. Poison gas label. Not accepted by express.*

cyanogenamide. See cyanamide (1).

cyanogen bromide (bromine cyanide) CNBr .

Properties: Prismatic, or acicular, transparent crystals. Penetrating odor. Slowly decomposed by cold water. Corrodes most metals. Caution! Very irritant and toxic! Soluble in alcohol, benzene, ether; sparingly soluble in water. Sp. gr. 2.02; b. p. 61.3°C (750 mm); m. p. 52°C ; vapor density 3.6; vapor tension 63.3 (15°C); volatility 200,000 mg/cu m (20°C).

Derivation: (a) Action of bromine on potassium cyanide. (b) Interaction of sodium bromide, sodium cyanide, sodium chlorate, and sulfuric acid.

Grades: Technical.

Containers: Stoneware crocks; specially lined steel drums.

Uses: Organic synthesis; parasiticide; fumigating compositions; rat exterminants; cyaniding reagent in gold extraction processes; cellulose products treating agent; military poison gas.

Shipping regulations: Poison, class B. Poison label.*

cyanogen chloride CNCl .

Properties: Colorless liquid; poisonous!

Vapors are highly irritant and very poisonous. Soluble in water, alcohol and ether. Sp. gr. 1.2; b. p. 12.5°C , m. p. -6.5°C ; vapor density 2.1; vapor tension 682 mm (10°C); volatility 2,600,000 mg/cu m (15°C), heat of volatilization 109 cal (0°C), coefficient of thermal expansion 0.0015 (0°C).

Derivation: By the action of chlorine on moist sodium cyanide suspended in carbon tetrachloride and kept cooled to -3°C , followed by distillation.

Method of purification: Rectification.

Grades: Technical.

Containers: Iron cylinders.

Uses: Organic synthesis; manufacture of military poison gas.

Shipping regulations: Containing less than 0.9% water, poison liquid, class A. Poison gas label (by freight). Not accepted by express.*

cyanogen fluoride (fluorine cyanide) CNF .

Properties: Colorless gas. Forms a white, pulverulent mass if cooled strongly and sublimates at -72°C . Caution! Very irritant! Insoluble in water.

Derivation: Interaction of silver fluoride and cyanogen iodide.

Grades: Technical.

Containers: Glass containers (eventually, under the influence of light, it attacks the glass).

Uses: Organic synthesis; military poison gas (lachrymator).

cyanogen iodide (iodine cyanide) ICN .

Properties: Colorless needles, very pungent odor; acrid taste; violent poison! Soluble in water, alcohol, and ether; m. p. 146.5°C ; sp. gr. 2.84.

Derivation: By heating a metal cyanide with iodine.

Method of purification: Crystallization.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Grades: Technical.

Containers: Glass bottles.

Use: Taxidermists' preservatives.

Shipping regulations: Poison, class B.

Poison label. *

cyanogen mud. A mud formed in gas purifiers when coal gas is brought into contact with a saturated solution of ferrous sulfate for the removal of cyanogen. It contains about 30% Prussian blue.

"Cyanogran." ²⁸ Trademark for a 97% sodium cyanide in granular form. White crystalline solid crushed to pass 100% through 10 mesh and retained on 50 mesh.

Containers: 100- and 200-lb. drums.

cyanoguanidine. See dicyandiamide.

"Cyanogum." ⁵⁷ Trademark for a gelling agent.

ciano(methylmercuri)guanidine (methyl mercury dicyandiamide) $C_3H_5HgN_4$. Toxic! A disinfectant and fungicide used for treating seeds.

Danger! Poisonous by inhalation or swallowing. May cause skin irritation or delayed chemical burns. MCA warning label.

3-cyanopyridine C_5H_4NCN .

Properties: B.p. 206.2°C (760 mm); f.p. 49.6°C; soluble in water.

4-cyanopyridine C_5H_4NCN .

Properties: B.p. 195.4°C (760 mm), f.p. 78.5°C; partially soluble in water; soluble in most organic solvents.

cyanosilicones. Made from chlorosilanes (as trichlorosilane) and acrylonitrile.

Forms: Fluids, solutions, pastes, solids.

Uses: Adhesives; sealing and caulking; vehicle components.

cyanuramide. See melamine.

cyanuric acid (tricarbamide; tricyanic acid) $HO_2CNC(OH)NC(OH)N \cdot 2H_2O$. See also isocyanuric acid, which is the ketone isomer.

Properties: White crystals; odorless; slight bitter taste. Soluble in water, alcohol and hot mineral acids. Sp. gr. 1.768.

Derivation: By heating urea or by the action of water on cyanuric chloride.

Method of purification: Crystallization.

Grades: Technical.

Containers: Glass bottles; tins.

Use: Organic synthesis.

Shipping regulations: None. *

cyanuric chloride (2,4,6 trichloro-1,3,5-triazine) $C_3N_3Cl_3$ (cyclic).

Properties: Crystals with pungent odor; sp. gr. 1.32; m.p. 146°C; b.p. 194°C (764 mm). Soluble in chloroform, carbon tetrachloride, hot ether, dioxane, ketones. Very slightly soluble in water (hydrolyzes in cold water).

Typical specifications: 97% pure.

Caution: Irritating to skin and eyes; handled commercially with proper precautions.

Containers: 50-lb steel drums; glass bottles.

Uses: Chemical synthesis; dyestuffs; pharmaceuticals; explosives; surfactants.

"Cyaqua." ⁵⁷ Trademark for surface coating resins.

"Cyasorb." ⁵⁷ An absorber for ultraviolet light.

"Cyclaine." ¹²³ Trademark for an anesthetic consisting of hexylcaine hydrochloride.

cyclamate calcium. See calcium cyclamate.

cyclamates. Salts of cyclohexylsulfamic acid, $C_6H_{11}NHSO_3H$.

cyclamate sodium. See sodium cyclamate.

cyclamen alcohol. The alcohol corresponding to cyclamen aldehyde (q.v.), used as a stabilizer of cyclamen aldehyde.

cyclamen aldehyde (methyl para-isopropyl phenylpropyl aldehyde) $(CH_3)_2CHC_6H_4CH(CH_3)CH_2CHO$.

Properties: Colorless liquid having a heavy floral odor. Sp. gr. 0.949-0.959; refractive index 1.507-1.520. Soluble in 1 volume of 80% alcohol.

Use: Perfumery, for floral odors and soap perfumes.

cyclandelate (3,3,5-trimethylcyclohexyl mandelate) $C_6H_5CHOHCOOC_6H_8(CH_3)_3$.

Grade: N. N. D.

Use: Medicine.

cyclothrin 3-(2-cyclopentenyl)-2-methyl-4-oxo-2-cyclopentenyl ester of chrysanthemum-mono-carboxylic acid. As insecticide with applications similar to allethrin and other analogs. Accepted as generic name by Ent. Soc. See also furethrin, barthrin, ethythrin.

Properties: Viscous brown liquid, soluble in petroleum solvents and other common organic solvents. Formulated principally as liquid for spray applications corresponding to natural pyrethrins. Toxicity class of pyrethrin I and II.

cyclizine hydrochloride (1-diphenylmethyl-4-methylpiperazine hydrochloride) $(C_6H_5)_2CHC_4H_4N_2CH_3 \cdot HCl$.

Properties: White crystalline powder or small colorless crystals. Odorless or nearly so; bitter taste; m.p. 285°C with decomposition; slightly soluble in water, alcohol, chloroform; insoluble in ether; pH (2% solution) 4.5-5.5.

Grade: U.S.P. XVI.

Use: Medicine.

cyclobarbitol [5-(1-cyclohexenyl)-5-ethyl-barbituric acid; tetrahydrophenobarbital] $C_{12}H_{16}N_2O_3$.

Properties: White crystals or crystalline powder; odorless; bitter taste; m.p. 170-174°C; soluble in alcohol or ether; very slightly soluble in cold water or benzene.

Derivation: Hydrogenation of phenobarbital with colloidal palladium in alcohol as a catalyst.

Use: Medicine.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

cyclobarbital calcium (calcium cyclohexenyl-ethylbarbiturate) $C_{24}H_{30}CaN_4O_6$.

Properties: White powder, somewhat soluble in water.

Grade: N. F. XI.

Use: Medicine.

cyclobutane (tetramethylene) C_4H_8 .

Properties: Colorless gas. Sp. gr. 0.7083 (11°C); b. p. 13°C; m. p. -80°C.

Derivation: From petroleum.

cyclobutene (cyclobutylene) C_4H_6 .

Properties: Gas; sp. gr. 0.733; b. p. 2.0°C.

cyclobutylene. See cyclobutene.

"**Cyclocel**." ⁹⁹ Trademark for a reforming catalyst for gasolines and naphthas. Developed primarily for the Cyclo-version Process which incorporates catalyst re-activation facilities. Mesh grades 4/8, 4/10.

Typical analysis (volatile free basis):

Al_2O_3 81.5%; Fe_2O_3 3.5%; TiO_2 3.5%;

SiO_2 9.5%; Insolubles: 2.0%; Volatile

Material: 2.0%.

Containers: 400-lb (net) steel drums.

cyclocitrylideneacetone. See ionone.

cyclocumarol $C_{20}H_{18}O_4$. A synthetic anticoagulant.

Properties: White, crystalline powder with slight odor. M. p. 164-168°. Insoluble in water; slightly soluble in alcohol.

Use: Medicine.

"**Cyclodex**." ⁷⁴ Trademark for an emulsifiable cobalt catalyst to speed curing of latex paint films.

cycloform. See isobutyl-para-aminobenzoate.

cycloheptane (heptamethylene; suberane) C_7H_{14} .

Properties: Colorless liquid. Soluble in alcohol, insoluble in water. Sp. gr. 0.809, b. p. 118.1°C; m. p. -12°C; aniline equivalent -6.

Grades: Technical.

Use: Organic synthesis.

cycloheptanone (suberone) $C_7H_{12}O$.

Properties: Colorless, oil of peppermint odor; b. p. 179°C.

Uses: Research and intermediate.

cyclohexane (hexamethylene; hexanaphthene; hexahydrobenzene) C_6H_{12} .

Properties: Colorless, mobile liquid. Pungent odor. Somewhat similar to benzene but less toxic. Miscible with most lacquer solvents. Sp. gr. 0.779; b. p. 80.7°C; f. p. 6.3°C; refractive index 1.4263; aniline equiv. 7. Insoluble in water. Flash point (98% grade) -1°F.

Derivation: (a) By the catalytic hydrogenation of benzene. (b) Constituent of crude petroleum.

Grades: 85, 98, 99%.

Containers: Special metal cans and drums; tank cars.

Uses: Manufacture of nylon; solvent for cellulose ethers, fats, oils, waxes, bitumens; resins, crude rubber; extracting

essential oils; chemical (organic synthesis, recrystallizing medium); paint and varnish remover; molding industry; glass substitutes.

Danger! Extremely flammable. Use with adequate ventilation. MCA warning label.

Shipping regulations: Flammable liquid; red label.*

cyclohexane carboxylic acid. See hexahydrobenzoic acid.

1,4-cyclohexanedimethanol $C_6H_{10}(CH_2OH)_2$.

Cis and trans isomers are known.

Properties of pure (99.8% wt) substances:

Liquid; b. p. 286.0°C (735 mm, cis-isomer), 283°C (735 mm, trans-isomer);

m. p. 41-61°C; density (super-cooled)

1.0381 (25/4°C), flash point 330°F (COC);

fire point 340°F (COC); refractive index

(n 20/D) 1.4893. Soluble in water, ethyl alcohol.

Uses: Preparation of polyester films and protective coatings; reduction of reaction time in esterification.

cyclohexanol (hexahydrophenol) $C_6H_{11}OH$.

Properties: Colorless, oily liquid, camphor-like odor; hygroscopic. Sparingly soluble in water; miscible with most organic solvents and oils. Sp. gr. 0.937 (37/4°); m. p. 23°C, b. p. 160.9°C; wt/gal approximately 8 lbs; flash point 68°C; refractive index 1.465 (22°C).

Derivation: Phenol is reduced with hydrogen over active nickel at 160 to 170°F. The cyclohexanone is removed by condensing with benzaldehyde in the presence of alkali.

Grades: Technical.

Containers: 1-, 2-, 5-, 10-, 55-gal drums; tank cars.

Uses: Soap making to incorporate solvents and phenolic insecticides; manufacture of celluloid, source of adipic acid for nylon; textile finishing, solvent for rubber, nitrocellulose, resins, benzyl abietate, metallic soaps, dyes, vegetable, essential and mineral oils, cellulose esters and ethers; blending agent; lacquers, paints and varnishes; finish removers; dry cleaning; emulsified products; leather degreasing; polishes; solvent mixtures; plasticizers; plastics, germicides.

Caution: Vapor harmful. Use with adequate ventilation. MCA warning label.

Shipping regulations: None.*

cyclohexanol acetate (cyclohexanyl acetate) $CH_3COOC_6H_{11}$.

Properties: Colorless, nonflammable, non-explosive, slightly toxic liquid. Has an odor resembling that of amyl acetate.

Miscible with most lacquer solvents and diluents, and with halogenated and hydrogenated hydrocarbons. Soluble in alcohol; insoluble in water; sp. gr. 0.966; b. p. 177°C.

Uses: Solvent for nitrocellulose, cellulose ether, bitumens, metallic soaps, basic dyes, blown oils, crude rubber, many natural and synthetic resins and gums; lacquers.

cyclohexanone (pimelic ketone; keto-hexamethylene) $C_6H_{10}O$.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Water-white to pale yellow liquid with acetone- and peppermint-like odor. Miscible with most solvents. B.p. 156.7°C; f.p. -47°C; sp.gr. 0.948; flash point (open cup) 129°F; refractive index (n_{20/D}) 1.4507; vapor pressure (212°F) 136 mm.

Typical specifications: Purity 97.7%; water 0.5% max, distillation range 2°C including 155.5°C; sp.gr. 0.9430-0.9460; refractive index 1.4460-1.4500; color, grams K₂Cr₂O₇/liter, 0.005 max.

Derivation: By passing cyclohexanol over copper with air at 280°F; also by oxidation of cyclohexanol with chromic acid or oxide.

Containers: 5-gal. cans; 55-gal drums, tank cars.

Uses: Organic synthesis, particularly of adipic acid and caprolactam, polyvinyl chloride and its copolymers, and methacrylate ester polymers; solvent for DDT in aerosol bombs, also a solvent for basic dyes, fats, blown oils, waxes, crude rubber, resins, and various other materials, used in wood stains, paint and varnish removers, spot and stain removers, degreasing of metals, in polishes, as a leveling agent in dyeing and delustering silk.

Caution: Vapor harmful. MCA warning label.

Shipping regulations: None.*

cyclohexanone-delta (cyclohexanone-Δ) C₆H₈O. Volatile liquid (flash point 93°F) sometimes confused with cyclohexanone. There are two less hydrogen atoms per molecule in the so-called delta derivative, which is generally encountered only in the laboratory.

cyclohexanyl acetate. See cyclohexanol acetate.

cyclohexene (1,2,3,4-tetrahydrobenzene) C₆H₁₀.

Properties: Colorless liquid. Sp.gr. 0.8102; b.p. 83°C; m.p. -103.7°C, refractive index 1.445 (25°C); flash point 11°F; aniline equivalent 10; wt/gal 6.7 lbs (25°C). Soluble in alcohol; insoluble in water.

Grades: Technical, 95%; 99%; research.

Containers: Tank cars; barges.

Use: Organic synthesis; catalyst solvent; oil extraction.

Shipping regulations: Flammable liquid. Red label.*

3-cyclohexene-1-carboxaldehyde (1,2,3,6-tetrahydrobenzaldehyde) CH₂CH:CHCH₂CH₂CHCHO.

Properties: Liquid; sp.gr. 0.9721, b.p. 164.2°C; f.p. -100°C; lbs/gal 8.1 (20°C); flash point 135°F; slightly soluble in water.

Containers: Drums.

Uses: Intermediates; improved water resistance to textiles.

Shipping regulations: None.*

cyclohexenylethylbarbituric acid. See cyclo-barbital.

cyclohexenylethylene. See vinyl cyclohexene.

cyclohexenyltrichlorosilane. C₆H₉SiCl₃.

Properties: Colorless liquid. B.p. 202°C; sp.gr. 1.263 (25/25°C); refractive index (n_{25/D}) 1.488; flash point (Cleveland open cup) 200°F. Readily hydrolyzed by moisture, with the liberation of hydrochloric acid.

Grades: Technical.

Use: Intermediate for silicones.

Shipping regulations: Corrosive liquid.

White label.*

cyclohexylamine (hexahydroaniline; aminocyclohexane) C₆H₁₁NH₂.

Properties: Clear, nearly colorless liquid, with amine odor. Poisonous! Distillation range 132-137.5°C; sp.gr. 0.870-0.874 (15/15°C). Strong organic base; pH of 0.01% aqueous solution 10.5; forms an azeotrope with water, b.p. 96.4°C.

Grades: Technical (98%).

Containers: 375-lb drums, tank cars.

Uses: Corrosion inhibitor; boiler water treatment, petroleum additive; intermediate for dyes, insecticides, pharmaceuticals, synthetic sweetening agents.

cyclohexylbenzene. See phenylcyclohexane.

cyclohexyl bromide C₆H₁₁Br.

Properties: A liquid, not more than faintly yellow, having a penetrating odor. Sp.gr. 1.32-1.34 (25/25°C); refractive index 1.4926-1.4936 (25°C).

2-cyclohexylcyclohexanol C₆H₁₁C₆H₁₀OH.

Properties: Colorless liquid; freezing point 29°C, b.p. 271-277°C (760 mm); sp.gr. 0.977 (25/25°C), lbs/gal 8.13; refractive index 1.495 (25°C), flash point 255°F. Soluble in methanol and ether. Very slightly soluble in water.

cyclohexyl methacrylate H₂C:C(CH₃)COOC₆H₁₁.

Properties: Colorless monomeric liquid with pleasant odor. B.p. 210°C; refractive index (20°C) 1.4578; sp.gr. (20/20°C) 0.9626; viscosity (25°C) 5.0 centipoises, insoluble in water.

Uses: Optical lens systems, dental resins; potting resins for electronic assemblies.

1-cyclohexyl-2-methylaminopropane. See propylhexedrine.

para-cyclohexylphenol C₆H₁₁C₆H₄OH.

Properties: Crystals; m.p. 120°C (min).

Grades: Technical.

Use: Intermediate for resins and organic synthesis.

cyclohexylphenyl-1-piperidinepropanol hydrochloride. See trihexylphenidyl hydrochloride.

cyclohexyl stearate C₆H₁₁OOCC₁₇H₃₅.

Properties: Pale yellow color; sp.gr. 0.882 at 30/15.5°C; m.p. 26-28°C. Soluble in benzene, toluene and acetone; insoluble in water.

Uses: Plasticizer for natural and synthetic resins.

cyclohexylsulfamic acid. See "Hexamic Acid" and salts, calcium and sodium cyclamate.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

cyclohexyl-para-toluenesulfonamide. See

"Santicizer 1-H."

cyclohexyl trichlorosilane $C_6H_{11}SiCl_3$.

Properties: Colorless to pale yellow liquid. B. p. 206°C; sp. gr. 1.226 (25/25°C); refractive index (n_D²⁵) 1.4759; flash point (Cleveland open cup) 185°F. Readily hydrolyzed by moisture, with the liberation of hydrochloric acid.

Derivation: By Grignard reaction silicon tetrachloride and cyclohexylmagnesium chloride.

Grades: Technical.

Containers: 1-, 10-lb bottles; 100-lb drums.

Use: Intermediate for silicones.

Shipping regulations: Corrosive liquid.

White label.*

"Cyclol," ²⁹³ Trademark for 2-hydroxy-methyl-5-norbornene (q. v.).

cyclomethycaine 3-(2-Methylpiperidine)-propyl-para-cyclohexyloxybenzoate.

Properties: A white, odorless, crystalline powder. It is sparingly soluble in water, alcohol, and chloroform and very slightly soluble in acetone, ether and dilute acids.

Use: Medicine.

cyclomethycaine sulfate $C_{22}H_{34}ClNO_3 \cdot H_2SO_4$.

Properties: Crystals; somewhat soluble in water.

Grade: N. N. D.

Use: Medicine (surface anesthetic).

cyclonite (sym-trimethylene trinitramine, hexahydro-1, 3, 5-trinitro-sym-triazine; trinitrotrimethylenetriamine, RDX) $(CH_2)_3N_3(NO_2)_3$ (a cyclic molecule).

Properties: White crystalline compound; sp. gr. 1.82; m. p. 203.5°C. Soluble in acetone, insoluble in water, alcohol, carbon tetrachloride, and carbon disulfide, slightly soluble in methanol and ether.

Derivation: Ammonia and formaldehyde yield hexamethylene tetramine which is reacted with concentrated nitric acid.

Containers: Special lined drums.

Use: Very powerful explosive, 1.5 times as powerful as TNT.

Shipping regulations: Explosive, class A. High explosive label.*

"Cyclonol," ¹⁹ Trademark for powdered crystal form of 3, 3, 5 trimethylcyclohexanol.

cyclononane C_9H_{18} .

Properties: Colorless liquid. Sp. gr. 0.769, b. p. 170°C.

1, 5-cyclooctadiene $HC:CH(CH_2)_2CH:CHCH_2CH_2$.

Properties: Liquid; freezing point -56.39°C; distillation range 301-303°F (technical); b. p. 149.34°C (pure); sp. gr. 0.88328 (20/4°C); lbs./gal 7.38; vapor pressure 0.50 psia (100°F); refractive index 1.4933 (20/D); flash point 100°F.

Grades: Technical; 95%; 99%.

Containers: Up to 1-gal bottles; 5-gal drums.

Shipping regulations: None.*

cyclooctane C_8H_{16} .

Properties: Colorless liquid. Sp. gr. 0.835;

b. p. 148°C; m. p. 14°C.

cyclooctatetrene $HC:CHCH:CHCH:CHCH:CH$ or C_8H_8 .

Properties: Colorless liquid; m. p. -27°C; b. p. 42.4°C (17 mm); sp. gr. 0.943 (0/4°C); refractive index 1.5394 (n_D²⁰). In spite of cyclic structure of molecule with alternate double bonds, the material does not resemble benzene. It behaves more like an aliphatic hydrocarbon, is relatively reactive and resinifies on standing in air.

Derivation: Polymerization of acetylene.*

cycloparaffin. A hydrocarbon in which three or more of the carbon atoms in each molecule are united in a ring structure, and each of these ring carbon atoms is joined to two hydrogen atoms, or alkyl groups. The simplest members are cyclopropane (C_3H_6), cyclobutane (C_4H_8), cyclopentane (C_5H_{10}), cyclohexane (C_6H_{12}), and derivatives of these such as methylcyclohexane ($C_6H_{11}CH_3$).

1, 3-cyclopentadiene $CH:CHCH:CHCH_2$. A colored liquid with sp. gr. 0.805 and b. p. 42.5°C; insoluble in water; soluble in alcohol, ether and benzene.

Derivation: From coal-tar.

Uses: Chemical intermediate; finishes.

cyclopentamine hydrochloride (1-cyclopentyl-2-methylaminopropane hydrochloride) $C_5H_9CH_2CH(CH_3)NHCH_3 \cdot HCl$.

Properties: White, crystalline powder.

Mild characteristic odor and bitter taste.

M. p. 113.0-116.0°C. Freely soluble in water, alcohol and chloroform, soluble in benzene; slightly soluble in ether. pH (1% solution) about 6.2.

Grade: N. N. D.

Use: Medicine.

cyclopentane (pentamethylene) C_5H_{10} .

Properties: Colorless liquid; soluble in alcohol; insoluble in water. Sp. gr. 0.7445 (20/4°C); b. p. 49.27°C; f. p. -94°C; refractive index 1.406 (20/D); flash point -37°C.

Derivation: From petroleum.

Grades: Technical, 95%, 99%; research.

Use: Solvent for cellulose ethers.

Containers: Steel drums; bottles.

Shipping regulations: Flammable liquid, red label.*

cyclopentanol (cyclopentyl alcohol)

$CH_2CH_2CH_2CH_2CH_2OH$.

Properties: Colorless, viscous liquid, pleasant odor; sp. gr. 0.946 (20/4°C); refractive index 1.4575 (20°C); b. p. 139-140°C. Slightly soluble in water; soluble in alcohol.

Containers: Glass bottles; 5-gal cans; 55-gal drums.

Uses: Special perfume and pharmaceutical solvent; intermediate for dyes, pharmaceuticals and other organics.

cyclopentanone (adipic ketone) C_5H_8O .

Properties: A water-white, mobile liquid with a mild, distinctive ethereal odor;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

b. p. 125-126°C (630 mm), sp. gr. 0.943, refractive index 1.437; flash point (closed cup) 87°F.

Containers: Glass bottles; 30-, 55-gal drums.

Use: Suggested intermediate for pharmaceuticals, biologicals, insecticides, and rubber chemicals.

cyclopentanone oxime C_5H_9NOH .

Nearly colorless and odorless crystalline material; m. p. 56°C; b. p. 196°C; soluble in water, alcohol. Used as intermediate in synthesis of amino acids, proline, ornithine, and citrulline.

cyclopentene $\overline{CH:CHCH_2CH_2CH_2}$.

Properties: Colorless liquid, sp. gr. 0.772; b. p. 44°C; f. p. -135.21°C, refractive index (20/D) 1.4225.

Grades: Technical; research.

Containers: Bottles.

Uses: Organic synthesis; plastics.

Shipping regulations: Flammable liquid. Red label.*

cyclopentenyl acetone

[1-(1-cyclopentenyl)-2-propanone]

$C_5H_7CH_2COCH_3$.

Properties: Clear, colorless liquid having a characteristic, ketone odor; b. p. 170°C, refractive index 1.4545-1.4550 at 25°C.

3-(2-cyclopentenyl)-2-methyl-4-oxo-2-cyclopentenyl ester of chrysanthemum monocarboxylic acid. See cyclothrin.

1-(1-cyclopentenyl)-2-propanone. See cyclopentenyl acetone.

cyclopentolate hydrochloride

$C_5H_9(OH)CH(C_6H_5)CO_2CH_2CH_2N(CH_3)_2 \cdot HCl$. beta-Dimethylaminoethyl(1-hydroxy-cyclopentyl)-phenylacetate hydrochloride.

Properties: White, odorless, crystalline solid. M. p. 137-141°C, very soluble in water; freely soluble in alcohol; practically insoluble in ether, pH (1% solution) 5.0-5.4.

Grade: N. N. D.

Use: Medicine.

cyclopentylacetone (1-cyclopentyl-2-propanone)

$C_5H_7CH_2COCH_3$.

Properties: Liquid, sp. gr. 0.893 (25/25°C), b. p. 180-184°C, refractive index 1.4420 (25°C).

cyclopentyl alcohol. See cyclopentanol.

cyclopentyl bromide (bromocyclopentane)

C_5H_9Br .

Properties: Clear, mobile liquid with sweet aromatic odor. B. p. 137-138°C, sp. gr. 1.3866 (20/4°C), wt/gal 11.6 lb (20°C); refractive index (n_D 20/D) 1.4885, flash point (closed cup) 108°F. Insoluble in water.

Grades: Technical.

Containers: 5- and 13-gal carboys.

Uses: Organic synthesis (pharmaceuticals).

Shipping regulations: None.*

1-cyclopentyl-2-methylaminopropane hydrochloride. See cyclopentamine hydrochloride.

1-cyclopentyl-2-propanone. See cyclopentenyl acetone.

cyclopentyl propionic acid $C_5H_9CH_2CH_2COOH$.

Properties: Liquid; b. p. 130-132°C (12 mm).

Containers: Glass bottles; 5-gal carboys.

Use: Intermediate.

cyclopentylpropionyl chloride (cyclopentyl-propionic acid chloride) $C_5H_9CH_2CH_2COCl$.

Properties: Liquid; b. p. 81-82°C (10 mm).

Containers: Glass bottles; 5-gal carboys.

Use: Intermediate.

Shipping regulations: Corrosive liquid.

White label.*

"Cyclophos."¹⁷² Trade name for colorless crystalline, hydrated sodium polyphosphate. Cyclic compound.

Properties: Coagulates albumen and certain other proteins. Soluble in water.

Containers: 15-gal fiber drums.

Uses: Precipitation of proteins.

cyclophosphamide (endoxan) $C_7H_{15}Cl_2N_2O_2P$.

A chloroethyl phosphorus derivative, related chemically to the nitrogen mustards.

Use: Medicine.

cyclopropane (trimethylene) C_3H_6 .

Properties: Colorless, flammable gas of characteristic odor resembling that of solvent naphtha and having a pungent taste. Sp. gr. 0.72-0.79; b. p. -32.9°C; m. p. -126.6°C. Soluble in alcohol.

Grades: Technical, U.S.P. XVI; 99.5% min.

Use: Organic synthesis; anesthetic.

Caution! Highly flammable gas. Forms flammable and explosive mixtures with air or oxygen.

Shipping regulations: Flammable gas. Red label.*

cyclopropanespirocyclopropane. See spiro-pentane.

cycloserine. See amino-3-isoxazolidone.

cyclosilane. See silanes.

"Cyclotene."²³³ Trademark for a proprietary synthetic aromatic chemical. A white crystalline solid; soluble in propylene glycol, certain alcohols and water; odor and taste of maple-licorice with a definite suggestion of walnut.

cyclotron. A device usually used to accelerate positively charged particles such as protons, deuterons, and alpha particles to high energies (speeds). The cyclotron consists of a pair of flat, hollow, semi-circular electrodes (called Dees) enclosed in a vacuum chamber. The chamber is placed between the poles of a magnet. The ions which are formed by auxiliary equipment in the vacuum chamber travel within the Dees and are repeatedly accelerated by successive boosts when they cross the strong alternating electric field existing in the gap between the Dees. The paths of the ions are circular due to the influence of a steady magnetic field and increase in radius as the particles are accelerated to higher energies. Each time an ion passes

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

through the gap between the Dees, it is again accelerated by the electric field. When the ion reaches the outer edge of the Dee, it is directed out of the chamber for use as a bombarding particle.

The synchrocyclotron (FM cyclotron) and the synchrotron are modified versions of the cyclotron. Both of the modifications produce particles of higher energies than the ordinary cyclotron since they compensate for the variation in the interval of time within which a particle traverses one Dee and crosses the electric field, once it has attained high speeds. The bevatron and cosmotron are synchrotrons and are capable of producing particles with energies in the billion electron volt range.

cycloversion. A process using bauxite as a catalyst for (1) desulfurization, (2) reforming, and (3) cracking of petroleum to form high octane gasoline.

"Cycopol" Resins. ⁵⁷ Trademark for a series of styrene or substituted styrene-alkyd resins in organic solvent solution for air drying and baking type surface coatings.

cycrimine hydrochloride

$C_5H_2C(OH)(C_6H_5)CH_2CH_2C_5H_{10}N \cdot HCl$.
Cyclopentylphenyl-3-(1-piperidyl)-1-propanol hydrochloride.

Properties: White, odorless, bitter solid. M. p. 241-244°C (dec). Slightly soluble in alcohol, chloroform, and water; practically insoluble in benzene and ether; pH (0.5% solution) 4.9-5.4.

Grade: N. F. XI.

Use: Medicine.

"Cydac." ⁵⁷ Trademark for an accelerator for the vulcanization of rubber.

cydonia (quince seed).

Derivation: Seed of *Cydonia vulgaris*.

Habitat: Southern Asia and Europe; widely cultivated.

Containers: Bags.

"Cyfor Drylite." ⁵⁷ Trademark for rosin size for use in paper manufacture.

"Cykelin." ⁶⁴ Trademark for a series of linseed base dicyclopentadiene copolymers; 100% solids; produce varnish vehicles of quick, hard dry and excellent alkali and water resistance. Used in varnishes, enamels, aluminum paints.

"Cykelsoy." ⁶⁴ Trademark for a soybean base dicyclopentadiene copolymer.

Properties and Uses similar to "Cykelin" (q. v.).

"Cylanto." ⁵¹ Trademark for unfiltered, steam-refined, steam-cylinder oils with good emulsibility and oiliness. Used under widely varying conditions of load, pressure and moisture.

"Cylesso." ⁵¹ Trademark for high quality steam-refined cylinder oils of high viscosity index and high flash point. Compounded and uncompounded grades available.

cylinder oil. A heavy lubricating oil used in engine or compressor cylinders.

cylinder stock. Viscous petroleum oils obtained as residues in the distillation of crude petroleum. Used for preparation of bright stock and steam cylinder oils.

"Cylo-Mar." ⁵¹ Trademark for marine cylinder oils, steam refined from selected, paraffinic crudes and designed to meet lubrication needs of all steam cylinders. Compounded and uncompounded grades available.

"Cymel." ⁵⁷ Trademark for a line of synthetic resins based on melamine-formaldehyde filled with alpha-cellulose, cellulose, chopped fabric, glass fiber, asbestos fiber.

cymene (cymol; isopropyltoluene; isopropyltoluol; methylpropylbenzene)

$CH_3C_6H_4CH(CH_3)_2$. The ortho-, meta-, and para-isomers are known.

Properties: Colorless, transparent liquids; aromatic odor. Sp. gr.: Ortho- 0.8748, meta- 0.862, para- 0.8551; m. p.: Ortho- -182°C, meta- -25°C, para- -73.5°C; b. p.: Ortho- 177°C, meta- 175.6°C, para- 176.5°C; refractive index, para- 1.489 (20°C). Soluble in alcohol, ether, and chloroform; insoluble in water.

Derivation: Mixed cymenes are produced from toluene by alkylation. Para-cymene occurs in several essential oils, and is made from monocyclic terpenes by dehydrogenation. These terpenes can be made from turpentine, or obtained as a by-product from the sulfite digestion of spruce pulp in paper manufacture.

Method of purification: Washing with sulfuric acid, water, and alkali.

Grades: Technical.

Containers: Drums; glass bottles.

Uses: Solvents; synthetic resin manufacture; metal polishes; organic synthesis (oxidation to hydroperoxides used as catalysts for synthetic rubber manufacture. Cymene alcohols are made by hydrogenating the hydroperoxides.) Pure para-cresol and carvacrol are made from para-cymene.

cymol. See cymene.

"Cynol" Agents. ⁵⁷ Trademark for a series of rewetting, softening and defoaming agents used in the manufacture of paper. Available in liquid form.

"Cypan" Drilling Mud Conditioner. ⁵⁷ Trademark for a synthetic organic chemical used to modify and control the properties of oil well drilling fluids.

"Cypel." ⁵⁷ Trademark for a paper resin.

cypress oil.

Properties: Pale yellow liquid; characteristic odor. Soluble in alcohol, ether, and chloroform.

Chief known constituents: Pinene, cymene, camphene, furfural, terpineol, cypress camphor.

Constants: B. p. 160-250°C; optical rotation

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

+4° to +31°; sp. gr. 0.88-0.89.

Derivation: Distilled from the fresh leaves and tender shoots of the cypress tree *Cupressus sempervirens*.

Method of purification: Rectification.

Grades: Technical.

Containers: Tins; glass bottles.

Use: Medicine.

Shipping regulations: None.*

"Cyprex," ⁵⁷ Trademark for dodine (a fungicide), N-dodecylguanidine acetate.

cypripedium (lady's slipper; American valerian; nerve root; Noah's ark; yellow moccasin flower). Dried rhizome and roots of *Cypripedium bulbosum* or other species of *Cypripedium*.

Habitat: Nova Scotia south to Alabama and west to Nebraska and Missouri.

Grades: Technical.

Containers: Bags.

Use: Medicine.

Shipping regulations: None.*

"Cyquest 40," ⁵⁷ Trademark for a sequestrant.

"Cyrea," ⁵⁷ Trademark for a urea feed compound.

"Cyron" Chemical Size. ⁵⁷ Trademark for a synthetic sizing material for the paper industry. "Cyron" permits sizing of alkaline as well as acid paper and may be added either to the pulp or as a coating.

cysteamine (2-aminoethanethiol; mercaptamine; thioethanolamine) $\text{HSCH}_2\text{CH}_2\text{NH}_2$.

Properties: Crystals with unpleasant odor; oxidizes on contact with air; m. p. 97°C, soluble in water.

Uses: Medicine, in radiation sickness; believed to offer protection against radiation.

cysteine (alpha-amino-beta-thiolpropionic acid; amidothiolactic acid; beta-mercaptoalanine) $\text{HSCH}_2\text{CH}(\text{NH}_2)\text{COOH}$. An amino acid derived from cystine, occurring naturally in the L(+) form.

Properties: Colorless crystals; soluble in water, ammonium hydroxide, and acetic acid; insoluble in ether, acetone, benzene, carbon disulfide, and carbon tetrachloride.

Derivation: Hydrolysis of protein, degradation of cystine. Found in urinary calculi.

Uses: Biochemical and nutrition studies; believed to offer protection against radiation. Available commercially as L(+)-cysteine hydrochloride.

cysteine hydrochloride. The hydrochloride of L(+)-cysteine (q. v.).

Properties: Crystals; m. p. 175-178°C (dec); soluble in water, alcohol, and acetone.

Use: Biochemical research; medicine. Commercially available.

cystine (beta, beta'-dithiobisalanine; di[alpha-amino-beta-thiolpropionic acid])

$\text{HOOCCH}(\text{NH}_2)\text{CH}_2\text{SSCH}_2\text{CH}(\text{NH}_2)\text{COOH}$.

The chief sulfur-containing amino acid of protein.

Properties: White crystalline plates; soluble

in water; insoluble in alcohol. Shows optical activity:

DL-cystine, m. p. 260°C

D(+)-cystine, m. p. 247-249°C

L(-)-cystine, m. p. 258-261°C with decomposition; the naturally occurring form.

Derivation: Hydrolysis of protein (keratin); organic synthesis. Found as small hexagonal crystals in urine.

Use: Biochemical and nutrition studies.

cytidine $\text{C}_9\text{H}_{13}\text{N}_3\text{O}_5$. The nucleoside consisting of D-ribose and cytosine.

Properties: White, crystalline powder; soluble in water, acid, alkali; insoluble in alcohol.

Derivation: From yeast ribonucleic acid.

Also available as the hemisulfate,

$(\text{C}_9\text{H}_{13}\text{N}_3\text{O}_5)_2 \cdot \text{H}_2\text{SO}_4$.

cytidine phosphates. Nucleotides used by the body in growth processes; important in biochemical and physiological research. Those isolated and commercially available (as sodium salts) are the monophosphate (CMP), the diphosphate (CDP) and the triphosphate (CTP).

cytidine-3-phosphoric acid. See cytidylic acid.

cytidylic acid (cytosylic acid; cytidine-3-phosphoric acid; cytosine nucleotide)

$\text{C}_9\text{H}_{14}\text{N}_3\text{O}_8\text{P}$.

Properties: White crystalline powder; odorless, mild sour taste; m. p.: crystals from 50% alcohol, 230-233°C (with decomposition); crystals from water, 227°C (with decomposition). Soluble in water and dilute alkalis, slightly soluble in 50% alcohol; insoluble in alcohol and other organic solvents.

Derivation: From nucleic acid by hydrolysis.

Use: Experimental work.

cytisine (ulexine) $\text{C}_{11}\text{H}_{14}\text{N}_2\text{O}$. An alkaloid.

Properties: Colorless or yellowish-white crystals. Soluble in water and alcohol; insoluble in ether; m. p. 152-153°C.

Derivation: By extraction of the seeds of *Cytisus laburnum*, and many other Papilionaceae, and subsequent crystallization.

cytochemistry. The branch of biochemistry dealing with chemical compounds in and the chemical activity of animal and plant cells.

cytochrome c. The most abundant of the cytochromes. Molecular weight about 13,000.

Properties: Amorphous powder; stable to dilute acids, alkalis, and boiling.

Source: It is isolated from plasmolyzed yeast, ox and horse heart, algae, and wheat germ.

Use: Medicine; biochemical research.

cytochrome oxidase. An iron-porphyrin-containing protein which is an important enzyme in cell respiration. It catalyzes the oxidation of cytochrome c (q. v.) and is reduced itself in the reaction; it is then reoxidized by oxygen.

cytochromes. A class of iron-porphyrin proteins (see porphyrins) which are of

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

great importance in cell metabolism. They are pigments which are found in the cells of nearly all animals and plants which use oxygen. There are several types of cytochromes which have been identified; cytochrome c (q.v.) is the most abundant and has been obtained in pure forms. The cytochromes and cytochrome oxidase have important functions in cell respiration.

cytosine $C_4H_5N_3O$. 2-Oxy-4-aminopyrimidine. A pyrimidine found in both ribonucleic and deoxyribonucleic acids, and certain coenzymes.

Properties; (monohydrate): Lustrous platelets; decomposes at 320-325°C. Slightly soluble in water and alcohol; insoluble in ether.

Derivation: Isolation following hydrolysis of nucleic acids; organic synthesis.

Use: Biochemical research.

cytosine nucleotide. See cytidylic acid.

cytosylic acid. See cytidylic acid.

"Cyuram." ⁵⁷ Trademark for tetramethylthiuram disulfide pellets.

"Cyzac." ⁵⁷ Trademark for surface coating resins.

"Cyzate." ⁵⁷ Trademark for an accelerator for the vulcanization of rubber.

CZC Chromated Zinc Chloride. ²⁸ Special formulation of zinc chloride and sodium dichromate.

Properties: Granular material with slight brownish color or 50% water solution; sp.gr. about 51.7°Bé; f.p. -35°F.

Containers: Solution: tank cars; dry material: 50- and 625-lb drums.

Uses: For preserving wood by impregnation against decay, termite attack; for application as a fire retardant. Treated lumber is clean, odorless, paintable, and safe to handle. See also Copperized CZC Chromated Zinc Chloride.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

D

d-. Prefix meaning dextrorotatory. See D-.

D. Symbol for deuterium (q.v.).

D- (or L-) Is a prefix signifying the stereoisomeric form of an organic substance, and means it has been correlated with the structure of D- or L- glyceraldehyde. However, for amino acids, D- or L- refers to the configuration of the lowest numbered asymmetric center (alpha-carbon atom) while for carbohydrates it refers to the configuration of the highest numbered asymmetric center. Small d- and l- mean simply dextro- and levorotatory, but (+)- and (-)- are now preferred for these.

See optical isomerism.

2,4-D (2,4-dichlorophenoxyacetic acid)

Properties: White to yellow crystalline powder; not easily soluble in water or oils; soluble in alcohols. Stable; m.p. 138°C; b.p. 160°C (0.4 mm).

Derivation: By reaction of 2,4-dichlorophenol and chloroacetic acid in aqueous sodium hydroxide.

Forms available: Sodium salt (60-85% acid); amine salts (10-60% acid); esters (10-45% acid), such as the ethyl, isopropyl, or butyl esters. These forms are preferred to 2,4-D itself because they are dispersible in water and can be applied as sprays.

Grade: Technical.

Containers: Bags; 100- and 250-lb drums, (butyl, isopropyl esters) tank cars.

Use: Selective weed killer because of its growth-regulating action on plants. In general, plants of the grass family are more resistant than other groups.

Warning! Irritating to eyes, nose and throat. MCA warning label. Should be used with great caution around desirable plants, feed supplies, water supplies, etc.

"DA-1." ²⁴¹ Trademark for a silica-alumina fluid catalyst (86.6% SiO₂, 13.2% Al₂O₃). Marketed in four grades (F-1, C-1, C-2, C-3). Available in hopper cars or drums for cracking petroleum gas oil fractions.

dachlaurin (D-L). Composed of 65% bromochloromethane and 35% carbon dioxide; used by Germans for extinguishing aircraft fires. Nitrogen sometimes added for use at high altitudes.

"Dacolyte." ²⁸ Trademark for an addition agent for acid copper plating solution for heavy deposits. A dark brown, amorphous,

fine powder; sharp odor.

Containers: 5-, 10-, 25-, and 50-lb fiber drums.

"Dacron." ²⁸ Trademark for a polyester fiber made from polyethylene terephthalate. Available as filament yarn, staple, tow, and fiberfill. See also polyester fiber, dimethyl terephthalate, terephthalic acid, and polyethylene terephthalate.

Properties: Sp. gr. 1.38; tensile strength (psi) 53,000-141,000; break elongation 10-36%; moisture regain 0.4%; soluble in meta-cresol (hot), trifluoroacetic acid, and ortho-chlorophenol; m.p. 250°C.

Derivation: By reaction of dimethyl terephthalate and ethylene glycol. The resulting polymer is melt extruded through a spinneret and stretched.

Containers: Cores, tubes, bales, cartons and cases.

Uses: Apparel, curtains, ropes, belts, fire hose, filled products, and other textile and industrial applications.

dacthal (dimethyl tetrachloroterephthalate)

Grades: 50% wettable powder, dusts.

Use: Pre-emergence treatment for crab grass control.

"dag" Dispersion No. 41. ⁴⁶ Trademark for a concentrated colloidal dispersion of pure electric-furnace graphite in lacquer-diluent naphtha.

Properties: Liquid consistency; solids content 10%, average particle size 0.5 micron; maximum particle size 4 microns; sp. gr. 0.773; flash point 3°C; completely miscible with naphtha.

Uses: Dry-film metalworking lubricant for drawing, extruding, and stretch-forming, of aluminum and magnesium.

Shipping regulations: Flammable liquid. Red label.*

"dag" Dispersion No. 154. ⁴⁶ Trademark for a concentrated colloidal dispersion of pure electric-furnace graphite in isopropanol.

Properties: Paste consistency; solids content 20%; average particle size 10 microns; sp. gr. 0.90; flash point 11°C; completely miscible with trichlorethylene, alcohols, ethers, esters, ketones, etc.

Uses: Electrically conductive coating for static bleeding, etc.; dry-film lubricant; opaque and transfer coating for graphic arts.

Shipping regulations: Flammable liquid. Red label.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

"dag" Dispersion No. 193. ⁴⁶ Trademark for a concentrated dispersion of refined vermiculite in water.

Properties: Liquid consistency; solids content 32%; sp. gr. 1.26; b. p. 100°C; f. p. 0°C; completely miscible with water.

Use: Refractory coating for metal molding.

"dag" Dispersion No. 200. ⁴⁶ Trademark for a concentrated colloidal dispersion of refined molybdenum disulfide in petroleum oil.

Properties: Liquid consistency; solids content 10%; average particle size 0.5 micron; sp. gr. 0.97; flash point 238°C; completely miscible with petroleum oil.

Uses: General industrial lubrication, especially where extreme-pressure characteristics are required; oil additive for internal-combustion engines, etc.; formulation of specialty lubricants.

"dag" Dispersion No. 2404. ⁴⁶ Trademark for a concentrated colloidal dispersion of pure electric-furnace graphite in mineral spirits.

Properties: Liquid consistency; solids content 10%; average particle size 0.5 micron; maximum particle size 4 microns; sp. gr. 0.845; flash point 34°C; completely miscible with petroleum hydrocarbons.

Uses: General high-temperature lubricant for conveyor chains, bearings, etc.

"Dalamar." ²⁸ Trademark for an azo yellow pigment.

Dalmatian insect powder. See pyrethrum flowers.

"Dalpac." ²⁶⁶ Trademark for several grades of butylated hydroxytoluene (di-tert-butylpara-cresol). Supplied as flakes, powder, or liquid.

Uses: Antioxidant in food, animal feed, and nonfood industrial uses.

"Daltolac." ²⁰⁶ Brand name for proprietary alkyd resins for curing with isocyanates.

Dalton's law. The partial pressure of a gas or vapor in a perfect gaseous mixture is equal to its mole fraction in the mixture multiplied by the total pressure.

"Dalyde." ³⁴⁸ Trademark for dibromsalicylaldehyde, used in medicine.

damar. See dammar.

dammar (damar). A class of natural resins, principally of recent origin. Dammar resins are marketed under the classes Singapore, Siam, and East India. The latter class, which is of semi-fossil origin, is further graded as batu, pale, or black.

Properties: White to yellow, semitransparent lumps, having a conchoidal fracture. The dammar resins are all soluble in alcohol, benzene, turpentine, and oils; in general, they have lower acid numbers than the copals; other physical properties are highly variable.

Derivation: A resinous exudation from several species of trees in the East Indies and Malay.

Grades: Technical; bold, nubs, chips, and dust.

Containers: Bags and cases.

Uses: Spirit varnishes; impregnation of paper and fabric.

Shipping regulations: None.*

danalite. A cobalt-bearing iron arsenic sulfide, used as a source of arsenic.

dandelion. See taraxacum.

danthron. See 1,8-dihydroxyanthraquinone.

"Dantoin." ⁷³ Trademark for 1,3-dichloro-5,5-dimethylhydantoin (q. v.).

DAP. Abbreviation for diallyl phthalate (q. v.).

"Dapon M." ⁵⁵ Trademark for diallyl isophthalate prepolymer (q. v.).

"Daraprim." ³⁰¹ Trademark for pyrimethamine, an antimalarial.

D'Arcet metal. See data under fusible alloys.

"Darco." ⁸⁹ Trademark for activated carbon. Comes in various grades for use in sugar refining; removal of impurities from electroplating solutions; purification of dry-cleaning solvents; drug and chemical purification; and purification and decolorization of animal and vegetable oils, fats, and waxes.

"Daricon." ²⁹⁹ Trademark for oxyphenyclimine hydrochloride.

"Dariloid." ³²² Trademark for a series of milk-soluble algin compositions, light tan or cream colored powders containing about 12% moisture. Hydrophilic colloids used as stabilizers in foods, especially milk and milk products.

Containers: 10-, 50-, 100-, 300-lb drums.

"Darlan." ¹¹⁹ Trademark for dinitrile fiber (copolymer of vinylidene dinitrile), a synthetic fiber notable for resilience, unusually high elastic recovery properties, resistance to storage at temperatures up to 330°F, dimensional stability to laundering and heat, resistance to the effects of outdoor exposure, and a soft, luxurious hand. This fiber is adaptable to the manufacture of many fabrics for sweaters, dresses, suits, coats, and can also be woven into a deep piled fabric with the softness, resilience, and appearance of natural fur.

"Daronyx." ³²⁸ Brand name for a dispersible organic solvent mixture that serves as dyeing assistant for "Dacron" polyester fiber.

"Dartal." ⁷⁰ Trademark for a brand of thiopropazate hydrochloride, 1-(2-acetoxyethyl)-4-[3-(2-chloro-10-phenothiazinyl)propyl]piperazine dihydrochloride.

Use: Medicine.

"Darvan." ⁶⁹ Trademark for a series of anionic surfactants which are used as dispersants, emulsion stabilizers, and latex stabilizers.

"Darvan No. 1." Sodium salts of polymerized alkyl naphthalene sulfonic acid; 77% active.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Buff powder; soluble in water to 40%.

Uses: Dispersant for latex compounding materials in water. Its wetting capacity is slight except towards certain specific materials. Stabilizer for SBR, natural and neoprene latices.

"Darvan No. 2." Sodium salts of polymerized substituted benzoid alkyl sulfonic acids; 84.5% active minimum.

Properties: Dark brown powder soluble in water to 25%.

Uses: Dispersant for high solids clay and filler slurries. Emulsifier for latex compounding ingredients.

"Darvan No. 3." Sodium salts of polymerized substituted benzoid alkyl sulfonic acids combined with an inert inorganic suspending agent; 84.5% active minimum.

Properties: Light gray-brown powder dispersible in water to 20%.

Uses: Dispersant for sulfur in water.

"Darvan No. 7." Aqueous solution of a poly-electrolyte; 35 ± 1% active.

Properties: Water white clear to slightly opalescent liquid.

Uses: Dispersant which causes minimum discoloration, is effective over a wide pH range, has low foaming tendency, and exhibits slight wetting capacity except towards certain specific materials. Stabilizer for emulsions and latices.

"Darvon." ¹⁰⁰ Trademark for d-propoxyphenyl hydrochloride (q.v.).

DAS. Abbreviation for 4,4'-diamino-2,2'-stilbenedisulfonic acid.

dating. Any of a variety of methods used to determine the age of a naturally occurring substance or artifact. When a process is known to go on at a known rate in a material, leading to either the buildup or loss of a component, the age may be determined by an analysis that measures the amount of the buildup or loss. These processes may be chemical or nuclear, and the latter may be either spontaneous, or induced by cosmic rays. Examples of the former include the dating of ancient bones from the known rate of deposition of fluoride in bone when exposed to ground waters, and the dating of glass from the change in the vitrification. Nuclear methods have been uniquely valuable for dating since the rates of such processes are known not to be changed within the range of extremes of conditions found on earth. By measuring the amount of helium or of lead in uranium bearing minerals the age of the substance, or at least the length of time that the substance has existed as a solid deposit, may be calculated. By inference, this same measurement applied to igneous rocks gives this kind of an age of the earth. A similar measurement of the accumulation of the daughter products of thorium decay (q.v.) has also allowed the tentative dating of ocean sediments. With the discovery that

radioactive carbon-14 is formed in the atmosphere from nitrogen and is thus incorporated in all living substances through the metabolism of carbon dioxide by plants, a process that ceases with death, and that the C-14 decays away after death at a known rate, the dating of many objects back through the first ice age has become possible. In general there is a most appropriate age range determinable by each of the above processes. The C-14 method applies to the interval from two to thirty thousand years of age, thorium in the millions of years, and uranium from hundreds of millions to billions of years.

daturine. See atropine.

daughter element. The element formed when another element undergoes radioactive decay. The latter is called the parent. The daughter may or may not be radioactive.

"Davco Granulated." ²⁴¹ Brand name for mixed fertilizers.

"Davco Quality." ²⁴¹ Brand name for mixed fertilizers.

"D-B-A." ²⁴⁸ Trade name for dibenzylamine ($C_6H_5CH_2$)₂NH.

Properties: Pale yellow to brown free-flowing liquid, sp. gr. 1.03; good storage stability; soluble in acetone, benzol, ethylene dichloride and gasoline. Insoluble in water.

Uses: Rubber activator; chemical intermediate.

DBM. Abbreviation for dibutyl maleate.

DBMC. Abbreviation for di-tert-butyl-metacresol.

"DB" Oil. ²⁰² Trademark for a specially refined castor oil with minimum acidity and moisture content for dielectric and sonar applications, and for urethane polymers.

DBP. Abbreviation for dibutyl phthalate.

DBPC. Abbreviation for di-tert-butyl para-cresol.

"dbpc." ¹¹ Trademark for di-tert-butyl-para-cresol, a solid alkylated phenol used as an antioxidant.

Properties: White to pale yellow colored solid; does not undergo reactions typical of phenols; insoluble in alkalis.

Grades: Technical; food.

Uses: Antioxidant for hydrocarbon materials; lubricating oil additive; stabilizer of gasoline for the prevention of gum formation; nonstaining rubber antioxidant; stabilizer for insecticidal preparations; antioxidant for industrial fats, greases, electrical insulating oils, turbine oils, and waxes. Preservative for edible oils and fats, fatty foods, baked goods, and animal and poultry feeds.

"DBS." Abbreviation for dibutyl sebacate.

DCA. See deoxycorticosterone acetate.

DCB. Abbreviation for 1,4-dichlorobutane.

D & C dyes. Coal tar colors formerly certified by the Food and Drug Administration for use in drugs and cosmetics. They might contain no more than 20 ppm lead, 2 ppm arsenic, and 30 ppm other heavy metals. Similarly, dyes for foods also, FD & C dyes, were held to no more than 10 ppm lead, 1.4 ppm arsenic and a trace of other heavy metals, and were nontoxic in substantially larger quantities than would ever be used commercially. Examples are eosin (D & C Red No. 21); indigo (D & C Blue No. 6); uranine (D & C Yellow No. 8); amaranth (FD & C Red No. 2); indigo carmine (FD & C Blue No. 2); and yellow OB (FD & C Yellow No. 4).

DCHP. Abbreviation for dicyclohexyl phthalate (q.v.).

DCO. Abbreviation for dehydrated castor oil. See castor oil, dehydrated.

DCP. Abbreviation for dicapryl phthalate.

"D. C. P." ³³⁰ Trademark for calcium phosphate, dibasic, CaHPO_4 .

DCPC. Abbreviation for dichlorophenyl methyl carbinol. See di(para-chlorophenyl)-ethanol.

"D-D." ¹²⁵ Trademark for a soil fumigant which is 100% active and contains 1,3-dichloropropene, 1,2-dichloropropene, 3,3-dichloropropene, and related C_3 chlorinated hydrocarbons.

Properties: Pungent, dark brown liquid; approximate boiling range 50-115°C; slightly soluble in water; soluble in most common organic solvents; corrosive, especially to aluminum containers.

Containers: 30-gal drums, (300 lb net); 55-gal drums, (550-lb net).

Warning! May be fatal if swallowed, inhaled, or absorbed through skin. Hazardous vapor and liquid.

Shipping regulations: None.*

DDBSA. Abbreviation for dodecylbenzene-sulfonic acid.

DDD. Abbreviation for dichlorodiphenyldichloroethane. See TDE.

DDDM. Abbreviation for 2,2'-dihydroxy-5,5'-dichlorodiphenylmethane. See dichlorophene.

DDH. Abbreviation for dichlorodimethylhydantoin.

DDM.

1. Abbreviation for 2,2'-dihydroxy-5,5'-dichlorodiphenylmethane. See dichlorophene.

2. Abbreviation for n-dodecyl mercaptan.

"DDM." ²⁴⁸ Proprietary name for a primary alkylmercaptan composed mainly of n-dodecyl mercaptan.

Properties: An off-white liquid; sp.gr. 0.84; soluble in most organic solvents; insoluble in water.

Uses: A polymerization modifier for SBR and nitrile rubbers.

DDP. Abbreviation for didcyl phthalate.

DDS. Abbreviation for diamino-diphenylsulfone. See sulfonyldianiline.

DDT (dichloro-diphenyl-trichloroethane; chlorophenothane, dicophane; 1,1,1-trichloro-2,2-bis(para-chlorophenyl)ethane) ($\text{ClC}_6\text{H}_4)_2\text{CHCCl}_3$. DDT has been accepted as a generic name by the Ent. Soc.

Properties: Colorless crystals or white to slightly off-white powder. Odorless or with slight aromatic odor. M.p. 108.5-109°C (pure); U.S.P. grade congeals at 89°C or above; b.p., decomposes. Insoluble in water; soluble in acetone, ether, benzene, carbon tetrachloride, kerosene, dioxane, and pyridine. Not compatible with alkaline materials.

Derivation: By condensing chloral or chloral hydrate with chlorobenzene in the presence of fuming sulfuric acid.

Grades: Technical; purified; aerosol; U.S.P. XVI.

Containers: Bottles; tins; bags; fiber drums.

Uses: Insecticide and miticide.

Caution! Harmful if swallowed; absorbed through skin when in solution. MCA warning label.

Shipping regulations: None.*

"DDT Gran." ¹⁴⁷ Brand name for a free-flowing granular insecticide containing 5 or 10% DDT.

Containers: 50-lb bags.

Uses: Specially formulated for European corn borer and mosquito control.

DDVP (dimethyl dichlorovinyl phosphate) ($\text{CH}_3\text{O})_2\text{P}(\text{O})\text{OCH}_2\text{CCl}_2$. Accepted as a generic name by the Ent. Soc. for a compound used as a systemic insecticide and as a fumigant in tobacco warehouses.

Containers: To 55-gal drums.

DE. Abbreviation for diatomaceous earth. See diatomite.

DEA. Abbreviation for diethanolamine.

"De-Acidite." ¹⁸⁴ Trademark for a quaternary amine-type anion exchange resin.

Deacon's process. A process for the production of chlorine (q.v.) by passing hydrogen chloride and air through a heated tube. The original process was inefficient and has long been obsolete. The economic advantage of producing chlorine without attendant caustic soda as a byproduct has renewed interest in methods of oxidizing hydrogen chloride. One of the modifications of the Deacon's process now employed utilizes a catalyst of ferric oxide and potassium chloride.

dead-burned magnesite. See magnesite, dead-burned.

deadly nightshade. See belladonna.

dead soft steel. Normally a basic open-hearth steel, completely annealed, and with

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

carbon less than 0.1% and manganese from 0.2 to 0.5%.

deanol. See 2-dimethylaminoethanol.

"Dearborn Red." ¹⁴¹ Trade name for azo color pigments.

Properties: Good resistance to light and good outdoor durability, non-bleeding in water.

Grades: Light, medium and deep red shades.
Uses: Paints and enamels.

death's herb. See belladonna.

deblooming agents. Products added to mineral oils to mask fluorescence. Nitronaphthalene and yellow coal-tar dyes are among the products so used.

dec. Abbreviation for decomposes.

DEC. Abbreviation for beta-diethylaminoethyl chloride hydrochloride.

decaborane B₁₀H₁₄.

Properties: Crystals; stable indefinitely at room temperatures; decomposes slowly into boron and hydrogen at 300°C; density (25/4°C) 0.94; m.p. 99.7°C; sp.gr. 0.78 (100°C); b.p. 213°C (extrapolated). Very toxic! Slightly soluble in cold water; hydrolyzes in hot water; soluble in benzene, hexane, toluene. Forms shock-sensitive solutions with oxygenated and halogenated solvents.

Derivation: Obtained as a by-product of the pyrolysis of diborane or tetraborane.

Uses: Solid propellants; polymer synthesis; corrosion inhibitor; fuel additive; stabilizer; rayon delustrant; mothproofing agent, dye stripping agent; rubber vulcanization, reducing agent; fluxing agent, oxygen scavenger.

Shipping regulations: Flammable solid.
Red label.*

decahydronaphthalene C₁₀H₁₈. Cis- and trans-forms are known.

Properties: Colorless liquid; aromatic odor. Insoluble in water; soluble in alcohol and ether.

Constants: Cis: Sp.gr. (20/4°C) 0.8927; m.p. -43.2°C; b.p. 194.6°C; refractive index (n_D 20) 1.48113. Trans: Sp.gr. (20/4°C) 0.8700; m.p. -31.5°C; b.p. 185.5°C; refractive index (n_D 20) 1.46968.

Derivation: By treatment of naphthalene in a fused state (above 100°C) with hydrogen in the presence of a catalyst such as finely divided copper or nickel oxide.

Grades: Technical.

Containers: 1-, 2-, 5-, 10-, 50-gal drums.

Uses: Solvent for oils, fats, waxes, resins, rubber, etc.; substitute for turpentine; cleaning machinery; stain-remover; shoe creams, floor waxes, etc.; cleaning fluids; lubricants; parallel uses to tetrahydronaphthalene (q.v.).

Shipping regulations: None.*

"Decalin." ²⁸ Trademark for decahydronaphthalene (C₁₀H₁₈).

"Decalso." ¹⁸⁴ Trademark for a precipitated

gel-type sodium aluminosilicate cation exchanger.

decamethylenediamine H₂N(CH₂)₁₀NH₂.

Properties: Colorless liquid; b.p. 140°C (12 mm).

n-decanal (capraldehyde; capric aldehyde; n-decyl aldehyde; aldehyde C-10)
CH₃(CH₂)₈CHO.

Properties: Colorless to light yellow liquid having a pronounced floral-fatty odor; sp.gr. 0.831-0.838 (15°C); refractive index (n_D 20) 1.427-1.431. Soluble in 80% alcohol, fixed oils, volatile oils, mineral oil; insoluble in water and glycerol.
Derivation: Occurs in lemongrass, citronella, orange, and many other oils. May be made synthetically by oxidation of the corresponding alcohol or reduction of the acid.

Use: Perfumery.

n-decane (decyl hydride) CH₃(CH₂)₈CH₃.

Properties: Colorless liquid; sp.gr. 0.7298; b.p. 174°C, m.p. -30°C; refractive index (n_D 20) 1.4114; flash point 44°C. Soluble in alcohol; insoluble in water.

Grades: Technical; 95%; 99%; research.

Containers: Bottles; drums.

Uses: Organic synthesis, solvent; standardized hydrocarbon.

decanedioic acid. See sebacic acid.

decanoic acid. See capric acid.

1-decanol (n-decyl alcohol, alcohol C-10)

CH₃(CH₂)₈CH₂OH.

Properties: Colorless, water-white liquid. Sweet fat-like odor, sp.gr. 0.829; b.p. 232.9°C, m.p. 6°C, flash point (open cup) 180°F; refractive index (n_D 20) 1.4372. Insoluble in water (25°C), soluble in alcohol and ether.

Derivation: Reduction of coconut oil fatty acids.

Grades: Technical; high purity.

Containers: 55-gal drums; 10,000-gal tank cars.

Uses: Antifoam, perfume intermediate; making detergents, and esters; preparation of lube oil additives, plasticizers, adhesives, and metal polishes.

decanoyl chloride (sometimes called caproyl

chloride) CH₃(CH₂)₈COCl. Available in 1-, 5-lb bottles; carboys and drums. Used as an intermediate.

decantation. Pouring or siphoning off the upper liquid from a precipitate or sediment or from a lower immiscible liquid as a partial means of separating the two phases.

decarboxylases. A group of enzymes in the living cell that remove carbon dioxide from various carboxylic acids without oxidation.

1-decene. See decylene.

"Deceresol." ⁵⁷ Trademark for textile wetting and rewetting agents.

"Declomycin." ³¹⁵ Trademark for demethylchlorotetracycline (q.v.).

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

"Declostatin." ⁵⁷ Trademark for demethyl-chlortetracycline hydrochloride and mystatin.

decoction. Pharmaceutical term for a liquid produced by boiling one or more drugs in water and filtering.

decoic acid. See capric acid.

decolorizing agents. Charcoals, blacks, clays, earths or other materials of highly adsorbent character which are used to remove undesirable color, as in the refining of sugar or oils. Also used in reference to bleaches involving a chemical reaction for removing color.

decontamination. See contamination.

"Decroline D." ³⁰⁷ Trademark for a stripping agent and discharge printing agent, consisting of normal zinc sulfoxylate formaldehyde; 90% active.

Properties: White, coarse, granular powder. Soluble in water.

Uses: Textile stripping agent; for best stripping results, "Decroline D" is applied in an acid liquor. Used as a discharge printing agent.

"Decroline X-4." ³⁰⁷ Trademark for a stripping agent consisting of basic zinc sulfoxylate formaldehyde; 88-90% active.

Properties: Fine, gray colored powder; soluble only in acid solutions.

Uses: Stripping agent primarily for wool and union yarn, piece goods and raw stock.

decyl acetate (acetate C-10) $\text{CH}_3(\text{CH}_2)_9\text{OOCCH}_3$.

Properties: Liquid with floral orange-rose odor; b.p. 187-190°C; sp.gr. 0.862-0.864, refractive index 1.426. Soluble in 80% alcohol, ether, benzene, glacial acetic acid; insoluble in water.

Derivation: By gently boiling together, for a long time, capric aldehyde and glacial acetic acid in the presence of zinc dust or powder; precipitating with water and distilling under reduced pressure.

Grades: Technical.

Use: Perfumery.

n-decyl alcohol. See 1-decanol.

decyl alcohol (mixed isomers). This is sold in drums and tank cars for many of the same uses as those of 1-decanol.

n-decyl aldehyde. See n-decanal.

decylamine $\text{CH}_3(\text{CH}_2)_9\text{NH}_2$.

Properties: Water-white; amine odor; boiling range 215-221°C; sp.gr. 0.797 (20/20°C); refractive index 1.437 (20°C), flash point 210°F.

decyl carbinol. See 1-undecanol.

decylene (1-decene) $\text{C}_{10}\text{H}_{20}$ or $\text{H}_2\text{C}:\text{CH}(\text{CH}_2)_7\text{CH}_3$.

Properties: Colorless liquid; sp.gr. 0.7396 (20/4°C); b.p. 172°C; m.p. -66.3°C; refractive index (n 20/D) 1.4220. Soluble* in alcohol; insoluble in water.

Grades: Technical; high purity.

Use: Organic synthesis of flavors, perfumes,

pharmaceuticals, dyes, oils, resins.

decyl hydride. See n-decane.

decylic acid. See capric acid.

decyl mercaptan $\text{C}_{10}\text{H}_{21}\text{SH}$.

Properties: Liquid; m.p. -26°C; b.p. 114°C (13 mm); sp.gr. 0.8410 (20/4°C); refractive index 1.4536 (n 20/D).

Grades: 95% (min.) purity.

Uses: Intermediate; synthetic rubber processing.

decyl-octyl methacrylate

$\text{H}_2\text{C}:\text{C}(\text{CH}_3)\text{COO}(\text{CH}_2)_n\text{CH}_3$. (n equals 7-9).

Containers: Drums.

Uses: Polymerizable monomer for plastics, molding powders, solvent coatings, adhesives, oil additives; emulsions for textile, leather, and paper finishing.

"Dednox." ⁴²³ Trademark for asphalt-gilsonite railroad protective coatings.

"DeeGee." ²¹² Trademark for a glucose oxidase-catalase enzyme system also called "DeeO" (q.v.).

"Deenate" 50W. ²⁸ Trademark for agricultural and horticultural insecticide formulations based on DDT. Wettable powder containing 50% DDT Technical.

Containers: 3-, 4- and 50-lb bags.

"Deenax." ²⁹ Trademark for di-tert-butylpara-cresol (DBPC), an oxidation inhibitor used especially in waxes and natural fats.

"DeeO." ²¹² ("DeeGee"). Trademark for a glucose oxidase-catalase enzyme system, for removal of either oxygen or glucose. Properties: Dry, fine white powder; water soluble; non-hazardous; nonflammable. Optimum pH range 4.5-8.0; optimum temperature 70-100°F.

Grade: For food products and analytical applications.

Containers: 1-oz to 1-lb bottles; 25- and 50-lb fiber drums.

Uses: In removing oxygen from canned or bottled beverages to prevent oxidation; in removing glucose from food products to increase shelf-life characteristics.

deep chrome. See chrome yellows.

deerberry. See gaultheria.

deer's tongue. See liatris.

"DEF." ¹⁸¹ Trademark for S, S, S-tributyl phosphorotrithioate (q.v.).

defecation. Purification; used specifically of the industrial clarification of sugar solutions.

deflagration. Sudden and sparkling combustion.

DeFlorez process. Process for the cokeless cracking of petroleum crudes in pipe stills. When the furnace pressure is 100 lbs, cracking takes place in the vapor phase; at 400 lbs pressure in the furnace, the unit operates as a liquid-phase cracking process.

defluorinated phosphate. Phosphate rock from which fluorine has been removed by high

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

temperature calcination.

Properties: Soluble in neutral ammonium citrate, 2% citric acid and 0.4% hydrochloric acid.

Grades: By % phosphorus, as 14, 18, 19% P.

Containers: Paper bags.

Use: Feed for stock and poultry.

"Defoamer PC-1244." ⁵⁸ Trade name for an antifoam.

Properties: Clear light yellow liquid, sp. gr. 0.86 (60/60°C); viscosity, SUS at 100°F, 190; 7.72 lbs/gal. Soluble in benzene, toluene, kerosene, petroleum ether, carbon tetrachloride, isopropanol, tert-amyl alcohol, butyl "Cellosolve" and ethyl acetate. Insoluble in water, methanol, ethanol, and methyl "Cellosolve."

Containers: 55-gal nonreturnable black iron drums; 5-gal cans; tank cars.

defoaming agents (anti-foam agents). Products such as 2-octanol, sulfonated oils, or silicones, used for reducing foaming, which often interferes with processing operations. Such foams may be caused by casein, glue, gases, nitrogenous and other substances.

defoliant. A chemical agent which removes leaves from growing plants. The effects may be produced by a number of specific herbicides as well as pesticides and the result is a matter of degree of application. Minimal dosages of herbicides may remove leaves without damaging the plant structure or associated desirable portion of the plant. Preferable defoliants do not translocate largely beyond the application area. Examples of selective use are found in commercial leaf removal prior to harvest in the cotton and sugar beet industries. Defoliation has been also an undesirable associated effect with non-specific herbicides in areas adjacent to that where applied.

Examples are liquid or solid forms of commercial herbicides and/or pesticides of the group of the phenoxyacetic acids, carbamates, nitro compounds, of the organic types and arsenic acid, cyanides, cyanamides, cyanates, and thiocyanates, chlorates, of the inorganic type.

DEG. Abbreviation for diethylene glycol.

DEGN. Abbreviation for diethylene glycol dimitate.

degras (sod oil; wool grease; tanning grease; leather grease).

Properties: Dark-brown unctuous fat; contains lanolin; disagreeable odor, sp. gr. 0.9322-0.9449; solidification point 38-40°C; saponification no. 84-127, iodine no. 15-21.5; acid no. 0.5-4.3; soluble in alcohol, ether, and benzene.

Derivation: Crude grease obtained by washing sheep's wool with trichloroethylene or by other washing processes.

Grades: American; English; common (15-17% free fatty acids); neutral (over 2% free fatty acids).

Containers: 400-lb drums.

Uses: Leather stuffing; belt-dressing compound; producing lanolin; printing inks, special soaps; varnishes.

Shipping regulations: None.*

degras, moellon.

Derivation: A by-product of the tannage of chamois leathers by impregnation with cod or menhaden fish oils. An oxidation of a part of the fatty acids of the oils takes place. When the tannage is complete, the excess of the oil contained in the skins is pressed out. This, when compounded, forms the moellon degreas of commerce.

Grades: Anhydrous; 20% water; 30% water; 35% water.

Containers: Wooden barrels.

Uses: Stuffing leathers, belt dressing.

Shipping regulations: None.*

"D. E. H." ²³³ Trademark for epoxy resins.

de Haens salt. See antimony salt.

dehumidification. The removal of moisture (water vapor) from air. Also sometimes extended to analogous processes of removing a vapor from a gas mixture.

"Dehydratine No. 22." ²⁰⁵ Liquid silicone water repellent for coating masonry walls.

"Dehydratine No. 80." ²⁰⁵ Liquid admixture to accelerate hardening of concrete.

dehydration. The loss or removal of water from a substance or mixture either through ordinary drying or heating, or by absorption, adsorption, chemical reaction, condensation of the water vapor, or by centrifugal force or hydraulic pressure. The term dehydration is not usually applied to the loss of water from a water solution by evaporation or boiling.

"Dehydrite." ¹⁶ Trademark for anhydrous granular magnesium perchlorate.

Properties: Anhydrous salt, $Mg(ClO_4)_2$.

Vapor pressure at ordinary temperature 0.000, stable to 250°C, absorbs over 30% of its weight of water by the formation of hydrates, will absorb a similar percentage of ammonia.

Spent "Dehydrite," $Mg(ClO_4)_2 \cdot 6H_2O$: M. p. 140-145°C, regenerated by heating gradually (10 hrs) to 250°C under vacuum (0.1 mm), channels do not form in the salt, deterioration is accompanied by contraction in volume, reducing tendency to clog.

Containers: 250-, 500-g bottles.

Uses: A dehydrating agent for use as a water absorbent in carbon combustions in steel analysis, in the ultimate analysis of organic substances, and in the drying of gases, including respiratory gases and carbon monoxide in air and blood.

Shipping regulations: May not be mailed.*

dehydro- A prefix meaning removal of hydrogen, or sometimes removal of water, from a compound.

dehydroacetic acid (DHA)

$CH_3C:CHC(O)CH(COCH_3)C(O)O$. 3-Acetyl-6-methyl-2(H)-pyran-2,4(3H)dione; 2-

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

acetyl-5-hydroxy-3-oxo-4-hexenoic acid delta-lactone.

Properties: Colorless, odorless, tasteless crystals. M.p. 108.5°C. Soluble in acetone, alcohol, and ether; insoluble in water.

Derivation: (a) By action of N-bromosuccinimide on ketene dimer; (b) by strong heating of acetoacetic ester.

Grades: Technical.

Uses: Fungicide and bactericide; plasticizer; chemical intermediate.

dehydroascorbic acid

$\text{OCOCOC}\ddot{\text{O}}\text{CHCHOHCH}_2\text{OH}$. The oxidized form of ascorbic acid (q.v.) with the same vitamin activity.

Properties: Needles; m.p. 225° (dec); soluble in water at 60°.

Derivation: Synthesized from ascorbic acid.

Use: Nutrition; medicine.

7-dehydrocholesterol (provitamin D₃)

$\text{C}_{27}\text{H}_{44}\text{O} \cdot \text{H}_2\text{O}$. A sterol found in the skin of man and animals which forms vitamin D₃ upon ultraviolet irradiation.

Properties: Slender platelets from ether-methanol; m.p. 150°C, insoluble in H₂O; soluble in organic solvents.

Use: Nutrition; medicine.

See also following article.

7-dehydrocholesterol, activated (cholecalciferol; vitamin D₃) $\text{C}_{27}\text{H}_{44}\text{O}$

A free vitamin D₃, isolated in crystalline state from the 3,5-dinitrobenzoate; produced by irradiation and equivalent in activity to the vitamin D₃ of tuna liver oil.

Properties: White colorless crystals. Unstable in light and air. Insoluble in water. Soluble in alcohol, chloroform and fatty oils. Melting range 84-88°C.

Grade: U.S.P. XVI.

Package: Hermetically sealed under nitrogen.

Use: Medicine, as antirachitic vitamin.

dehydrocholic acid $\text{C}_{24}\text{H}_{34}\text{O}_5$

Properties: White, fluffy, odorless powder with bitter taste, m.p. 231-240°C. Almost insoluble in water; slightly soluble in ether and alcohol; soluble in chloroform, glacial acetic acid, and solutions of alkali hydroxides and carbonates.

Derivation: By oxidation of cholic acid.

Grade: U.S.P. XVI.

Containers: Drums.

Use: Medicine; pharmaceutical intermediate.

dehydroepiandrosterone. See dehydroisoandrosterone.

dehydrogenase. An enzyme which catalyzes oxidation by the removal of hydrogen. See oxidase.

dehydrogenation. The process whereby hydrogen is removed from compounds by chemical means.

11-dehydro-17-hydroxycorticosterone. See cortisone.

dehydroisoandrosterone (dehydroepiandrosterone) $\text{C}_{19}\text{H}_{28}\text{O}_2$. An androgenic steroid; a metabolic product of the adrenal steroid

hormones. It possesses about one-third the androgenic activity of androsterone (q.v.).

Properties: Dimorphous: Needles with m.p. 140-141°; leaflets with m.p. 152-153°; precipitated by digitonin; soluble in benzene, alcohol, and ether. Sparingly soluble in chloroform and petroleum ether.

Derivation: Isolated from male urine; synthesis from cholesterol or sitosterol.

Use: Medicine; biochemical research.

Also available as the acetate salt.

"Dehydrol." ¹⁴¹ Trade name for dehydrated castor oil used as a drying oil in the manufacture of varnishes and alkyd resins. It has excellent color retention, good drying properties, good water resistance, and good durability.

3-dehydroretinol. Vitamin A₂. See vitamin A.

dehydrothio-para-toluidine (2-(para-aminophenyl)-6-methylbenzothiazole)

$\text{CH}_3\text{C}_6\text{H}_3\text{SC}(\text{C}_6\text{H}_4\text{NH}_2)_2\text{N}$.

Properties: Long, yellowish, iridescent needles. Solutions have a violet-blue fluorescence. M.p. 191°C; b.p. 434°C. Soluble in alcohol; very slightly soluble in water.

Derivation: By heating para-toluidine and primuline base with sulfur and separation from the primuline base by distillation in vacuo.

Use: Dyestuff.

de-inkable inks. Special inks prepared so as to be readily removable thus facilitating re-use of the paper.

de-inking of paper. The removal of inks from paper by use of strong alkaline solutions such as soda-ash liquor, caustic soda or lime which dissolve varnish and free the ink carbon. Removal of the carbon is accomplished by use of colloidal agents such as talc or bentonite and by mechanical agitation with water.

deionized water. Water that has been purified of salts by passage in succession through a cation-exchange resin to replace metal ions such as calcium and iron by hydrogen ion, and then through an anion-exchange resin to remove both the hydrogen ions and the corresponding negative ions. When non-ionic impurities are absent, such water is the equivalent of distilled water.

"Dekatyl." ²⁸ Trademark for a line of cationic dyes especially suited for dyeing "Dacron" type 62 and 64 polyester fiber.

deKhotinsky cement. A thermoplastic cement, which is not attacked by water, sulfuric acid, nitric acid, hydrochloric acid, carbon disulfide, benzene, gasoline, or turpentine, and is very little affected by ether, chloroform, alkalis, but is readily dissolved by ethyl alcohol. Articles to be cemented are heated and cement is applied.

Derivation: Shellac and pine tar are heated together and stirred for several hours without overheating. Various degrees of hardness and variations in properties are

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

obtained by changing the proportions and the exact nature of the ingredients. Thus, the pine tar is sometimes replaced by a mixture of terpeneol and wood creosote.

Grades: Hard, for cementing glass, metal, and porcelain; medium, for wood and for lathe and milling machine work.

"**Delac-S.**" ²⁴⁸ Trade name for N-cyclohexyl-2-benzothiazole sulfenamide, a delayed action accelerator.

Properties: A cream colored powder; sp. gr. 1.27, melting range 95-100°C; soluble in acetone, ethylene dichloride and benzol; insoluble in water and gasoline.

Uses: An all-purpose accelerator for tires, footwear, soling and mechanical goods. Used in natural, SBR and nitrile rubbers.

"**Delalutin.**" ⁴¹² Trademark for hydroxyprogesterone caproate (q. v.).

"**Delamin.**" ²⁶⁶ Trademark for a technical grade of high molecular weight primary amine, derived from 18-carbon fatty acids of tall oil origin. Waxlike solid.

Uses: Beneficiation (flotation) of nonmetallic ores.

Delanium. An English product, an unusually hard form of carbon made from specially chosen coals. Mechanically strong, impermeable to liquids, easily fabricated. Used for heat exchangers, corrosion resistant linings and packings.

"**Delatestryl.**" ⁴¹² Trademark for testosterone enanthate (q. v.).

"**Delestrogen.**" ⁴¹² Trademark for estradiol valerate (q. v.).

delhi hard. A ferrous alloy (sp. gr. 7.75; m. p. 1500°C) containing in addition to iron 16.5 to 18% chromium, 1 to 1.1% carbon, 0.75 to 1% silicon, 0.35 to 0.5% manganese. It is resistant to cold ammonium hydroxide in all concentrations, and to mine and sea waters and moist sulfurous atmospheres.

"**Delnav.**" ²⁶⁶ Trademark for technical grade of 2,3-para-dioxanedithiol S,S-bis(O,O-diethyl phosphorodithioate) containing about 70% cis and trans isomers. Viscous brown liquid.

Uses: Miticide on cotton, citrus and ornamental plants, control of livestock pests.

"**Delphicol.**" ⁵⁷ Trademark for choline-methionine-inositol-folic acid-B.

delphinine $C_{34}H_{47}NO_3$.

Properties: White, crystalline alkaloid; poisonous! Soluble in alcohol and ether; insoluble in water.

Constants: Melts at 191-195°C with decomposition.

Derivation: By extraction from the seeds of *Delphinium staphisagria*.

"**Delrin.**" ²⁸ Trademark for acetal resin of composition $(-OCH_2-)_n$ derived by polymerization of formaldehyde.

"**Delsan.**" ²⁸ Trademark for seed protectants containing insecticide-fungicide combinations, such as thiram plus dieldrin.

Uses: For treatment of beans, seed corn, and pea seed; for control of certain fungi and soil insects.

delta acid. See 2-naphthylamine-7-sulfonic acid.

"**Delta-Cortef.**" ³²⁷ Trademark for prednisolone, a derivative of hydrocortisone, 11b, 17a, 21-trihydroxy-1,4-pregnadiene-3,20-dione ($C_{21}H_{28}O_5$).

Use: Medicine.

"**Deltalin.**" ¹⁰⁰ Trademark for calciferol, U. S. P.

"**Deltasone.**" ³²⁷ Trademark for prednisone, a derivative of cortisone, 17a, 21-dihydroxy-1,4-pregnadiene-3, 11, 20-trione ($C_{21}H_{26}O_5$).

Use: Medicine.

"**Deltra.**" ¹²³ Trademark for prednisone (q. v.).

"**Deltyl.**" ²²⁷ Trademark for a mixture of isopropyl esters of lauric, myristic and palmitic acids. Colorless liquid; color No. 4 maximum; practically odorless. Available in two grades.

"**Deltyl**" Extra, predominantly isopropyl myristate.

Properties: Sp. gr. 0.847-0.854 (25/25°C), refractive index 1.433-1.436 (20°C); melting point max. 5°C.

"**Deltyl**" Prime, predominantly isopropyl palmitate.

Properties: Sp. gr. 0.850-0.855 (25/25°C); refractive index 1.435-1.429 (20°C); m. p. max. 14°C. Soluble in 4 parts of 90% alcohol; soluble in mineral, peanut, sesame, olive and almond oils; insoluble in water.

Uses: "Deltyl" Extra replaces vegetable or mineral oils in cosmetics.

delustrants. Chemical agents used to produce dull surfaces on synthetic fibers either before or after spinning so the resulting product more nearly resembles natural silk.

"**Delvex.**" ¹⁰⁰ Trademark for dithiazanine iodide (q. v.).

"**Delvinal.**" ¹²³ Trademark for sodium vinylbarbital.

demecarium bromide $C_{32}H_{52}Br_2N_4O_4$. Decamethylenebis-(meta-dimethylaminophenyl-N-methylcarbamate) dimethobromide.

Properties: White, slightly hygroscopic powder; decomposes 162-167°C. Freely soluble in water, alcohol; sparingly soluble in acetone; insoluble in ether. Aqueous solutions are neutral, stable and may be sterilized by heat.

Use: Medicine.

"**Demerol**" Hydrochloride. ¹⁶² Trademark for meperidine hydrochloride.

11-demethoxyreserpine. See deserpidine.

demethylchlortetracycline $C_{21}H_{21}ClN_2O_6 \cdot 1.5 H_2O$. (7-Chloro-6-demethyltetracycline.)

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: M.p. 174-178°C (decomposes).
Use: Medicine (antibiotic).

demeton. A commercial systemic insecticide; accepted as a generic name by the Ent. Soc. for O,O-diethyl-O-(and S)-2-(ethylthio)ethyl phosphorothioate (q.v.).

DEMH. Abbreviation for 1,3-dibromo-5-ethyl-5-methylhydantoin (q.v.).

demulsifier. An agent which makes an oil resistant to emulsification.

"D. E. N." ²³³ Trademark for epoxy resins.

denaturants for alcohol. Chemicals or mixtures specified by the U.S. government (and other governments) for addition to ethyl alcohol to make it completely unsuitable for human consumption, and also to prevent recovery of the alcohol from the mixture. The denaturants do not prevent useful employment of the alcohol in industry and the arts.

The following are among the chemicals that are or have been used as denaturants: acetone, acetaldehyde, aldehydes, almond oil, ammonia water, animal oil, bay oil, benzoic acid, benzol, bergamot oil, brucine sulfate, butyl alcohol, camphor, cassia oil, cedar leaf oil, chloroform (crude), cinnamon oil, citronella oil, cinchonidine sulfate, clove oil, diethylphthalate, ethyl acetate, ethylamines, ethyl ether, ethyl propionate, emetine hydrochloride, eugenol, eucalyptol, gasoline, glycerine, guaiacol, iodine, ipecac, kerosene, menthol, mercuric iodide, methanol (wood alcohol), nicotine, phenol, pine oil, pyridine bases, salicylic acid, soaps, sulfuric acid.

denatured alcohol. In the United States it is divided into two kinds as follows:

Completely denatured alcohol: Ethyl alcohol which has been rendered entirely unfit for beverage use by the addition of denaturants prescribed by the Federal government.

Specially denatured alcohol (SDA): Ethyl alcohol so treated with denaturants as to permit its use in a greater number of specialized arts and industries than completely denatured alcohol. The character of the denaturant or denaturants is such that it may be sold, possessed and used only pursuant to permit and bond except as otherwise provided in Government regulations.

Uses: Solvent or thinner (cellulose, resins, and similar products, for toilet products and pharmaceutical products used externally, for processing industrial, food and drug products, and for cleaning, preserving and flavoring materials); raw material for the synthesis of other chemicals; fluid such as anti-freeze or in brake fluids; fuel (airplane, motor, etc.); experimental studies; tobacco sprays and flavors (denatured rum used); manufacture of acetaldehyde.

Shipping regulations: Flammable liquid. Red label.*

dendritic. Pine-tree shaped; used of crystals or the particles in powders.

denier. The weight unit of a yarn: the weight in grams of 9000 meters of a yarn equals 1 denier. A 100-denier yarn is one of which 9000 meters weighs 100 grams.

DeNora cell. A mercury-cathode cell for the electrolytic production of chlorine and caustic soda. The electrolysis compartment consists of a long, narrow steel trough lined with chemically resistant stone, into which sodium chloride brine is pumped. The mercury cathode flows continuously along the bottom of the trough, becoming enriched in sodium, while chlorine is released from graphite anodes. The sodium amalgam is decomposed in a steel tower packed with graphite, where the sodium reacts with water to form hydrogen and sodium hydroxide. The mercury is pumped back to the electrolysis compartment.

"Densitol." ³ Trademark for brominated sesame oil.

Properties: Clear, reddish-brown, oily liquid with no taste or odor; sp. gr. 1.325-1.335 at 25°C.

Use: Weighting agent for citrus oils in the production of citrus emulsions for use in soft drinks.

density. Mass per unit volume, usually expressed in grams per cubic centimeter or in pounds per cubic foot or gallon. As a specific term it has been applied in electricity, photography and other areas with reference to length-force-time systems of units. See specific gravity.

density, apparent. The weight of a unit volume of powder, usually expressed as grams per cubic centimeter, determined by a specified method. (M.P.A. definition, M.P.A. Standard 9-50T). See density, specific gravity.

density, bulk. An alternate term for apparent density, used industrially to specify a simple dimensional measurement of powdered and granular materials in terms of weight of a unit volume. The measure may be carried out by the weight of material in a fixed volume container or by solvent displacement (usually water) of a known volume of material. See specific gravity.

dental plaster. See gypsum cements.

"Deo-Base." ⁴⁵ Trade name for light petroleum distillate; superfine grade of kerosene without the objectionable odor of kerosene.

"Deodall #1." ⁴¹² Trademark for a multi-purpose masking agent and deodorant. A mixture of synthetic aromatic chemicals and derivatives.

Uses: To deodorize organic solvents and petroleum products and mixtures containing them.

deodorants. Products used for destroying, masking, or modifying foul and unpleasant odors.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

In physical form, deodorants may appear as cakes, blocks, balls, powders, ointments, pencils, creams, or liquids. They may or may not possess a strong, distinctive odor of their own and they may consist either of a single chemical, or a mixture. They find application in hospital procedures, in industry for various purposes, in housekeeping for treating atmospheric odors from cooking, refrigerators, garbage pails, water closets, drains, urinals, floors, dog kennels, and the like. The cosmetic industry markets products for masking perspiration odors and laundry and dry-cleaning establishments use one or several products in sequence for breaking down odors either from perspiration or from vomit and other stains.

deodorized oils. Oils which have been subjected to hydrogenation or other treatment to remove objectionable odors, in order to make them fit for human consumption.

deoxidizer. An agent which removes oxygen from a compound or from a molten metal.

deoxy-. Preferred prefix indicating replacement of hydroxyl by hydrogen in the parent compound. The meaning is identical to that of desoxy- and used interchangeably.

deoxylizarin. See anthrarobin.

deoxycholic acid (desoxycholic acid) $C_{24}H_{40}O_4$. A bile acid, contains one less hydroxyl group than cholic acid.

Properties: Crystals; m.p. 172-73°. Not precipitated by digitonin. Practically insoluble in water and benzene; slightly soluble in chloroform and ether; soluble in acetone and solutions of alkali hydroxides and carbonates, freely soluble in alcohol.

Derivation: Isolation from bile; organic synthesis.

Containers: Drums.

Use: Medicine; precursor for organic synthesis of cortisone.

Also available as sodium salt.

11-deoxycorticosteroid. See deoxycorticosterone.

deoxycorticosterone (desoxycorticosterone, 4-pregnen-21-ol-3,20-dione; 11-deoxycorticosteroid) $C_{21}H_{30}O_3$. One of the adrenal cortical steroid hormones. Active in causing the retention of salt and water by the animal kidney.

Properties: Crystalline plates; m.p. 141-142°C. Freely soluble in alcohol and acetone.

Derivation: From adrenal cortex extract; synthesis from other steroids.

Use: Medicine (usually as acetate).

deoxycorticosterone acetate (desoxycorticosterone acetate; DCA; DOCA; desoxycortone acetate) $C_{23}H_{32}O_4$. The acetate salt of deoxycorticosterone.

Properties: White, or creamy white, crystalline powder; sensitive to light; m.p. 155-161°C; odorless; stable in

air. Sparingly soluble in alcohol, acetone, and dioxane; slightly soluble in vegetable oils; practically insoluble in water.

Grade: U.S.P. XVI.

Use: Medicine.

deoxycorticosterone trimethylacetate (desoxycorticosterone trimethylacetate) $C_{26}H_{38}O_4$. Properties: White, or creamy white, crystalline powder. Odorless; stable in air. Soluble in dioxane; sparingly soluble in acetone; slightly soluble in alcohol, methanol, ether; practically insoluble in water. M.p. 198-204°C.

Grade: U.S.P. XVI.

Use: Medicine.

deoxyephedrine hydrochloride. See methamphetamine hydrochloride.

deoxypentose nucleic acid. See deoxyribonucleic acid.

deoxyribonuclease. See pancreatic dornase.

deoxyribonucleic acid. (desoxyribonucleic acid; DNA; TNA; thymus nucleic acid; deoxypentose nucleic acid) $C_{39}H_{51}O_{25}N_{15}P_4$. Considered to be the prime genetic substance in the cell. Found in combination with protein in the chromosomes and genes. Constituents are adenine, guanine, cytosine, thymine, D-2-deoxyribose and phosphoric acid. It is now known that the molecule is a double helix in which the two strands of nucleotides are identical or at least probably genetically identical.

Properties: White or cream colored amorphous powder, odorless; slight sour taste; sp. gr. 1.700. Slightly soluble in water, readily soluble in alkali solutions; insoluble in alcohol and other organic solvents. Solutions are highly viscous.

Derivation: Can be extracted from the thymus gland, produced commercially from fish milt.

Uses: Biochemical and physiological research in the mechanisms of heredity, tumor growth and related processes.

D-deoxyribose (D-desoxyribose) $CH_2OHCHOHCHOHCH_2CHO$. A five-carbon atom sugar that is unusual because there is no oxygen atom attached to the second carbon atom. It is found as a constituent of deoxyribonucleic acid (q.v.).

deoxyribose nucleic acid. See deoxyribonucleic acid.

"Depban." ²³³ Trademark for paraffin inhibitors for use in oil well equipment.

DEPC. Abbreviation for gamma-diethylaminopropyl chloride hydrochloride.

"Dependip." ²⁰⁰ Trademark for a petroleum solvent prepared by straight-run overhead distillation.

Properties: Water-white; sp. gr. 0.758 (60°F); wt/gal 6.31 lb (60°F); flash point,

" Tag closed cup, 52°F; considered non-toxic.

Caution: Flammable; keep fire and lights away.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Use: Solvent in rubber dipping cement.
Shipping regulations: Flammable liquid.
Red label.*

dephlegmation. Partial condensation of vapor from distillation operation to produce liquid richer in higher boiling constituents than the original vapor. The residual vapor is of course richer in the lower boiling constituents.

depilatories. Products for removing hair from skin. Sulfides are largely used for this purpose. For example, the leather industry uses large amounts of sodium sulfide for unhairing hides. The cosmetic industry also markets various preparations for removing unsightly hair.

"Depilin." ⁵⁷ A line of organic dehairing agents for the dehairing of hides.

"Depo"-Estradiol. ³²⁷ Trademark for estradiol 17-cyclopentylpropionate, ($C_{26}H_{36}O_3$).
Use: Medicine, in oil solution.

"Depo"-Testosterone. ³²⁷ Trademark for testosterone cyclopentylpropionate, ($C_{27}H_{40}O_3$); used in medicine.

dequalinium. Short for decamethylene-bis(4-aminoquinaldinium acetate). Used as an antibiotic oral antiseptic.

"D. E. R." ²³³ Trademark for epoxy resins.

"Deraspan." ²³³ Trademark for epoxy resins and curing agents.

derby red. See chrome red.

"Dergon." ³⁰⁰ Trademark for a series of liquid detergents used for textile scouring.

"Dergon" MF: Polyoxyethylene fatty ester composition.

"Dergon" OM: Alkanolamine fatty acid condensation product.

"Dergon" T: Highly sulfated fatty ester.

"Dergopal." ³⁰⁰ Trademark for a series of fluorescent whitening agents for natural and synthetic textile fibers. Different members applied to specific fibers. Includes both coumarin and stilbene types.

"Deriphat." ²⁵⁹ Trademark for a series of amphoteric surfactants. Salts or free acid forms of N-alkyl beta-aminopropionic acid or N-alkyl beta-iminodipropionic acid.

Derivation: Condensation of primary amines (from fatty acids) with acrylic monomers.

Grades: Flaked (sodium salts) and liquid (free acid or partial salt).

Containers: Flaked products in polyethylene-lined fiber drums. Liquid products in 55-gal steel drums and 5-gal pails.

Uses: Cosmetic and shampoo preparations; industrial and household cleaners; corrosion inhibitors; emulsion polymerization; emulsification, metal fabrication.

derris root. The root of the shrubs *Derris elliptica* and *D. malaccensis*. Toxic to lower animals and to insects but not to humans. Constituents: Rotenone, toxocarol, tephrosin. Use: Insecticides.

desacetyl lanatoside. See deslanoside.

desalting. Any process for making potable water from sea water or other saline waters. Distillation is the oldest method. Reuse of vapors through compressive distillation or multiple effect evaporation is practiced in order to limit heat consumption. Distillation with solar heat is expensive because the large areas required result in high equipment investments.

Electrodialysis is an inherently good method because the energy is used to remove the small proportion of salt from the relatively large amount of water instead of removing the water from the salt. Its practical use is restricted because of membrane deterioration, scale formation, and inefficient use of energy. Other proposed methods are freezing by direct contact of refrigerant with sea water, foam separation, liquid-liquid extraction, and various non-electric membrane processes, and ion exchange.

deserpine (canescine; 11-demethoxyreserpine) $C_{32}H_{38}N_2O_8$.

Properties: Crystals; decomposes 230-234°C. An ester alkaloid.

Derivation: Isolated from *Rauwolfia canescens* Linn.

Grade. N. N. D.

Use: Medicine.

"Desiccite." ²¹⁷ Brand name of adsorbent used for static dehumidification in protective packaging of metal equipment, food, and pharmaceuticals.

"Desicote." ²⁷⁴ Trademark for a mixture of hydrophobic monomers stabilized in chlorinated hydrocarbon and aromatic solvents.

Properties: Rapidly decomposes on contact with sorbed water of glass surfaces, leaving surface water-repellent.

Derivation: Mixed silanes.

Grades: Green label (approved for U. S. Parcel Post); yellow label (approved for Railway Express), red label (special precautions required for shipment).

Note: The Green label is the commercial stock in general use.

Containers: Two-ounce glass bottles with heavy molded cap and special cap liners packed in friction top steel can with absorbent filler to conform to safety requirements, approved by U. S. Post Office.

Uses: "Desicote" is a material which may be used safely on the most delicate glassware such as absorption cells of "Pyrex,"

"Vycor," and fused silica and which will not give any interference in the visible or ultraviolet range. May also be used for pH-sensitive glass electrodes and the like.

Hazards: Avoid contact with skin or mucous membrane; use adequate ventilation.

Shipping regulations: See grades above.*

desiodothyroxine. See thyronine.

deslanoside (desacetyl lanatoside) $C_{47}H_{74}O_{19}$.
Properties: Colorless or white crystals or

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

white, crystalline powder. Odorless, hygroscopic; m.p. 220-235°C. Insoluble in water; very slightly soluble in chloroform; slightly soluble in alcohol; soluble in methanol.

Grade: U.S.P. XVI.

Use: Medicine.

Caution: Very poisonous!

desmolase. An enzyme whose catalytic activity causes a split in or formation of a C-C bond without transfer of a radical or group within the substrate.

desorption. The process of removing an adsorbed material from the solid on which it is adsorbed. See adsorption. Desorption may be accomplished by heating or reduction of pressure or by the presence of another more strongly adsorbed substance or by a combination of these means.

desoxy-. Prefix identical in meaning to deoxy-, which is preferred.

desoxyanisoin $\text{CH}_3\text{OC}_6\text{H}_4\text{COCH}_2\text{C}_6\text{H}_4\text{OCH}_3$.

Properties: Off-white to buff, crystalline powder with a sweet, faint cinnamon-like odor; m.p. 110-112°C.

desoxycholic acid. See deoxycholic acid.

desoxycorticosterone. See desoxycorticosterone.

desoxycorticosterone acetate. See deoxycorticosterone acetate.

desoxycorticosterone trimethylacetate. See deoxycorticosterone trimethylacetate.

desoxycortone acetate. See desoxycorticosterone acetate.

desoxyephedrine hydrochloride. See methamphetamine hydrochloride.

"Desoxyn." ³ Trademark for methamphetamine hydrochloride (q.v.).

desoxypentose nucleic acid. See deoxyribonucleic acid.

desoxyribonucleic acid. See deoxyribonucleic acid.

D-desoxyribose. See D-desoxyribose.

destructive distillation. The decomposition of a material by heat and simultaneous distillation of the volatile products, e.g., the destructive distillation of coal to form coke, coal tar, and other liquid and gaseous products.

"Desyphed" Hydrochloride. ¹⁶² Trademark for methamphetamine hydrochloride.

"Detamide" 95. ⁴²⁸ Trade name for N,N-diethyl-meta-toluamide (q.v.).

"Detect-A-Leak." ⁴¹⁴ Trademark for a leak-detecting fluid for pressure pipe lines. Containers: 8 oz. cans; 1-, 5-, 55-gal. containers.

detergent. Formerly, a substance or mixture that has cleansing action due to a combination of properties including lowering of surface tension, wetting action, emulsifying

and dispersing action and foam formation. Ordinary soap is the best known example. However, the word detergent is now coming to mean the synthetic variety, in distinction to soap, which is derived from natural fats and oils.

See also detergents, synthetic.

detergent alkylate. Generic term, particularly in the soap industry, applied to the reaction product of benzene or its homologues with a long-chain olefin (such as propylene trimer or tetramer) to produce an intermediate used in the manufacture of detergents. See, for example, dodecylbenzene.

"Detergent Alkylate No. 2." ¹³⁶ Trade name for a mixture of alkyl benzenes produced by the alkylation of benzene with propylene polymer; sp.gr. 0.8708 (60/60°F). Used as raw material for producing alkyl aryl sulfonate type detergents or surface active materials.

detergents, synthetic (syndets). Materials which have a cleansing action like soap but are not derived directly from fats and oils. Synthetic detergents are surface active agents and have structurally unsymmetrical molecules containing both hydrophilic, or water-soluble, groups and hydrophobic, or oil-soluble hydrocarbon chains. There are three types, as follows:

(1) Anionic detergents form negatively charged ions containing the oil-soluble portion of the molecule. The ionizable group is the hydrophilic portion. Soap is an example of this class and the synthetic members are sodium salts of organic sulfonates or sulfates. Approximately 50% of all synthetic detergents are alkylaryl sulfonates (e.g., sulfonates of dodecylbenzene), about 20% of the total are sulfates of straight chain primary alcohols, either fatty alcohols or products of the Oxo process (e.g., sodium lauryl sulfate). Still another group are the lignin sulfonate derivatives.

(2) Cationic detergents, or invert soaps, ionize so that the oil-soluble portion is positively charged, the principal examples are quaternary ammonium halides. See, for example, benzethonium chloride, cetalkonium chloride. Outstanding germicidal activity overshadows the detergent applications of this type, which accounts for only about 1% of the total synthetic detergent production in the U.S.

(3) Nonionic detergents do not ionize but acquire hydrophilic character from an oxygenated sidechain, usually polyoxyethylene. The oil-soluble part of the molecule may come from fatty acids, alcohols, amides, or amines. By suitable choice of the starting materials and regulation of the length of the polyoxyethylene chain, the wetting, foaming, and detergent properties of nonionics may be varied greatly. Furthermore, compounds of this type, which comprises about 25% of the total synthetic detergent production, can be used in combination with either anionic or cationic detergents.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

For examples, see "Ninol," and "Surfynol."

Synthetic detergents are now produced in greater volume than soaps, mainly because of their acceptance for household use. They are not only highly efficient cleansers, but are unaffected by hard water. Many of them can be used equally well in salt water or acid solutions. They are usually used in combination with inert diluents, such as sodium sulfate, or with builders, such as polyphosphates, polysilicates, or sodium carboxymethylcellulose.

Uses: Primarily, as household cleansers. Industrially, for textile scouring, bleaching, desizing, dyeing, printing, and finishing; metal cleaning and pickling; cleaning and sterilizing food processing equipment; in cosmetics; tanning and dyeing leather; ore flotation; fire fighting; emulsion polymerization of synthetic rubber; antibacterials (cationics).

determination. The ascertainment of the quantity or concentration of a specific substance in a sample.

"**Dethdiet**," ³⁴² Trademark for red squill rodenticide concentrates.

"**Dethmor**," ³⁴² Trademark for warfarin rodenticide concentrates.

deuterium D (heavy hydrogen). An isotope of hydrogen with atomic weight 2.016. M.p. 18.65°K; b.p. 23.6°K.

deuterium oxide. See heavy water.

deuteron (deuton). A nuclear particle having mass 2 and a positive charge of +; identical with the nucleus of the deuterium atom.

deuton. See deuteron.

Devarda's alloy. See Devarda's metal.

Devarda's metal (Devarda's alloy).

Properties: Gray powder. Contains copper, aluminum, and zinc in the proportion of 50:45:5. Slightly soluble in hydrochloric acid.

Grades. Technical, reagent.

Use: Analysis (testing for nitrogen).

"**Devcon**," ⁴⁴⁵ Trade name for a plastic metal consisting of approximately 80% fine steel powders and 20% of an extremely strong plastic. Available in two types: "Devcon" A, a non-sagging putty-like material; and "Devcon" B, a semi-viscous liquid. Containers: 1-, 4-lb and bulk containers. Uses: For metal forming and repairing. Hazards: Not to be taken internally or exposed to sensitive skin.

developed dyes. Those dyes that are produced by chemical reaction of the necessary materials after they have been absorbed by the fibers. Azoic dyes are the most important example.

developing agents. A term applied in the dyeing industry to certain organic compounds which, in combination with some other organic compound already deposited

upon the fiber, will develop a colored compound, or if united with a dye already upon the fiber, will form a new coloring matter possessing a more desirable or a faster color. Also, a substance used in photography to produce a "latent" image by chemical reduction of a silver compound to metallic silver more rapidly in the portions exposed to light than in those not exposed.

devil's apple. See stramonium and podophyllum.

devil's dung. See asafetida.

"**Devlex**," ²³³ Trademark for oxazolidinone polymers.

dew point. Temperature at which air is saturated with moisture, or in general the temperature at which a gas is saturated with respect to a condensable component.

dexamethasone (9alpha-fluoro-16alpha-methylprednisolone) $C_{22}H_{29}FO_5$. A corticosteroid. Properties: Crystals; m.p. 262-264°C.

Soluble in water and organic solvents.

Use: Medicine and veterinary medicine.

dexbrompheniramine maleate

$C_{16}H_{19}BrN_2 \cdot C_4H_4O_4$. Dexbrompheniramine is the d-isomer of parabromdylamine, or 3-(para-bromophenyl)-3-(2-pyridyl)-N,N-dimethylpropylamine.

Properties: Crystals; soluble in water and alcohol; pH of 2% aqueous solution approx. 5.0.

Use: Medicine.

"**Dexedrine**," ⁷¹ Trademark for dextroamphetamine sulfate. See amphetamine sulfate.

"**Dexet**," ²³³ Trademark for aluminous cement, and related ingredients for use chiefly in oil wells.

"**Dexon**," ¹⁸¹ Trademark for para-dimethylaminobenzenediazo sodium sulfonate (q.v.).

dextran (macrose). Certain polymers of glucose which have chain-like structures and very high molecular weights (up to 200,000 or higher). It is produced from sucrose by *Leuconostoc* bacteria; occurs as slimes in sugar refineries, on fermenting vegetables or on dairy products. Clinical dextran is standardized to a low molecular weight (75,000); is made by partial hydrolysis and fractional precipitation of the high molecular weight particles.

Uses: As blood plasma substitute (clinical dextran); confections; lacquers; oil well drilling muds.

dextrin (British gum; amylin; gommeline; starch gum; artificial gum; vegetable gum; leiocom; sago dextrin; tapioca dextrin). An intermediate product formed by the hydrolysis of starches. Industrially it is made by treatment of various starches with dilute acids or by heating dry starch. The yellow or white powder or granules are soluble in water; insoluble in alcohol and ether. It is colloidal in properties and describes a class of substances, hence has no definite formula.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Uses: Adhesives; thickening agent; sizing paper and textiles; substitute for natural gums; food (polishing rice and cereal grains, polishing coffee, baking, etc.); decorating ceramics; matches; glass-silvering compositions, printing inks; felt manufacture; process engraving.

"Dextrinase." ²¹² Trademark for a fungal amylase which converts starches and dextrans to maltose and dextrose.

Properties: Dry, fine white powder, water-soluble, non-hazardous, non-flammable. Optimum pH 5.0, acetate buffer. Optimum temperature 40°C.

Grade: For food products and industrial applications.

Containers: 1-, 5-, 10-, and 25-lb drums.

Uses: For the production of syrups and other products high in reducing sugars.

dextrin, cassava.

Derivation: A dextrin prepared from cassava starch.

Grades: Technical.

Containers: Bags; barrels; fiber drums.

Uses: Adhesives; textile printing, confectionery, etc.

Shipping regulations: None.*

dextrin, crystallized. A brittle mass produced by decolorizing dextrin with animal charcoal and evaporating the product.

dextro-amphetamine phosphate. N. F. XI name for dextrorotatory amphetamine phosphate, monobasic.

dextro-amphetamine sulfate. U.S.P. XVI name for dextrorotatory amphetamine sulfate.

dextro-chlorpheniramine maleate. A dextrorotatory variety of chlorpheniramine maleate.

dextroglucose. See dextrose.

dextromethorphan hydrobromide

$C_{18}H_{25}NO \cdot HBr \cdot H_2O$. d-3-Methoxy-N-methylmorphinan hydrobromide.

Properties: Practically white crystals or crystalline powder possessing a faint odor; slightly soluble in water; freely soluble in alcohol and chloroform, insoluble in ether. Specific rotation 200 mg/10 ml solution +26 to +28°; pH (1 in 50 solution) 5.2-6.5.

Grade: N. F. XI.

Use: Medicine.

dextrorotatory. Having the property when in solution of rotating the plane of polarized light to the right or clockwise. Dextrorotatory compounds are given the prefix d- or (+) to distinguish them from their levorotatory, l- or (-) isomers.

See optical isomerism.

dextrose (dextroglucose; D(+)-glucose, baker's sugar; grape sugar; corn sugar)

$C_6H_{12}O_6 \cdot H_2O$. The sugar found in the blood of animals and occurring widely in plants.

Properties: Colorless crystals or white, crystalline or granular powder. Odorless

with a sweet taste; sp. gr. 1.544; m. p. 146°C. Soluble in water; slightly soluble in alcohol.

Derivation: Hydrolysis of starch and starchy substances by action of hydrochloric acid; pure dextrose is obtained by complete conversion, under proper conditions; incomplete conversion gives glucose in a mixture of dextrose, dextrin and water. See also glucose.

Grades: Technical, U.S.P. XVI, C. P.; anhydrous; hydrated.

Containers: 1-, 5-lb bottles, 1-, 5-lb cans; 50- to 100-lb slabs; 100-lb bags; 400-lb barrels; fiber drums.

Uses: Confectionery; jams; various foods (especially infant foods); preparing tobacco, chrome-tanning liquors; logwood and dye-wood liquors; brewing and wine manufacture; sizing, weighting and ingredient of printing pastes for textiles, solubilizer for natural gums, viscose and cuprammonium rayon precipitating baths; medicine; intermediate.

Shipping regulations: None.*

DDDT (difluorodiphenyltrichloroethane) ($FC_6H_4)_2CHCCl_3$. Fluorine analog of DDT, first developed in Germany.

Properties: A low-melting white solid; m. p. 45.5°C. A faint odor resembling ripe apples, less poisonous to warm-blooded animals and fish than DDT (according to U.S. Public Health Service), but unlike DDT it does not have a long residual value. It does not have broad killing power of DDT toward all insects but is more effective against flying insects, especially house flies.

Derivation. By condensing chloral and fluorobenzene in the presence of sulfuric acid or chlorosulfonic acid.

Uses: Poison, pesticide.

DFP. Abbreviation for diisopropyl fluorophosphate.

"DHA." ²³³ Trademark for fungicides comprised of dehydroacetic acid and its salts.

DHS. Abbreviation for dihydrostreptomycin.

Di. Symbol for didymium.

di-. Prefix meaning two or twice. A compound not found under di- should be looked for under bi- or bis-, since bi-, bis-, and di- are nearly equivalent prefixes, assigned with slight differences in meaning for particular compounds, or according to customary usage.

diabase. A basic igneous rock, usually occurring in dikes or intrusive sheets, and composed essentially of plagioclase feldspar and augite with small quantities of magnetite and apatite. The plagioclase forms lath-shaped crystals lying in all directions among the dark irregular augite grains, giving rise to the peculiar diabasic or ophitic texture, which is a distinctive feature in the coarse-grained occurrences. Occurrence: Canada, Connecticut, Maryland,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Massachusetts, Newfoundland, New Jersey, New York, Virginia, and Pennsylvania.

Uses: Building stone; cement aggregate; paving; railroad ballast.

"Diabinese." ²⁹⁹ Trademark for chlorpropamide.

diacetic acid. See acetoacetic acid.

diacetic ester. See ethyl acetoacetate.

diacetin (glyceryl diacetate)

$\text{CH}_2\text{O}(\text{OCCH}_3)\text{CHOHCH}_2\text{O}(\text{OCCH}_3)$.

Properties: Hygroscopic liquid. It is a mixture of isomers. Sp. gr. 1.18; b.p. 259°C (approx.); refractive index 1.44. Miscible with water, benzene, and alcohol; the commercial mixture gels about -30°C.

Derivation: Heating one mole of glycerin with two moles of glacial acetic acid.

Grades: Technical.

Containers: Glass bottles; 5- and 10-gal cans.

Uses: Plasticizer and softening agent; solvent for cellulose derivatives, "Glyptal" resins, shellac.

diacetoacetyl ethylenediamine

$(\text{CH}_2\text{NHCOCH}_2\text{COCH}_3)_2$.

Properties: White, crystalline solid.

Slightly soluble in water. M.p. 164°C.

diacetone. See diacetone alcohol.

diacetone alcohol (diacetone; 4-hydroxy-4-methylpentanone-2; 4-hydroxy-2-keto-4-methylpentane) $\text{CH}_3\text{COCH}_2\text{C}(\text{CH}_3)_2\text{OH}$.

Properties: Colorless, pleasant-odored liquid. Flammable; sp. gr. 0.9406 at 20/20°C, b.p. (760 mm) 169.1°C; vapor pressure 1.1 mm (20°C), flash point 170°F, wt/gal 7.8 lbs (20°C), approximate change in wt. 0.0032 lb/gal/°F; viscosity 0.032 poise (20°C); f.p. -42.8°C; refractive index 1.42416 (20°C); coefficient of expansion 0.00097 (20°C).

Typical specifications: Acetone-free grade.

Acidity not more than 0.05% (as acetic); sp. gr. 0.937-0.942 (20/20°C); boiling range (760 mm) below 135°C none, below 158°C not more than 5%, above 170°C none; dryness, miscible with 19 vol 60° Be gasoline (20°C); color (500 mm tube) not more than 3 yellow Lovibond; average wt/gal 7.81 lbs (20°C). Technical grade: Acidity not more than 0.02% (as acetic), sp. gr. 0.915-0.920 (20/20°C); boiling range (760 mm) below 60°C none, below 160°C not more than 30%, above 170°C none; dryness, miscible with 19 vols 60° Be gasoline (20°C); color not more than 3 yellow Lovibond (500 mm tube); average wt/gal 7.63 lbs (20°C).

Miscible with alcohols, aromatic and halogenated hydrocarbons, esters, and water. A constant boiling mixture with water has b.p. 99.6°C and contains approx. 13% diacetone alcohol.

Derivation: By the condensation of acetone. *

Grades: Technical; acetone-free.

Containers: 1-, 5-gal cans; 55-gal (non-returnable) drums; tank cars.

Uses: Solvent for nitrocellulose, cellulose acetate, various oils, resins, waxes, fats, dyes, tars; lacquers, dopes, coating compositions; wood preservatives; stains; rayon and artificial leather; imitation gold leaf; dyeing mixtures; celluloid cements; antifreeze mixtures; extraction of resins and waxes; preservative for animal tissue; metal-cleaning compounds; hydraulic compression fluids; stripping agent (textiles). The technical grade, containing acetone, has greater solvent power.

Shipping regulations: None.*

diacetonyl sulfide $(\text{CH}_3\text{COCH}_2)_2\text{S}$.

Properties: Crystals; b.p. 136-137°C (15 mm); m.p. 47°C.

Derivation: Interaction of chloroacetone and hydrogen sulfide gas.

diacetyl (biacetyl; butanedione; diketobutane; dimethyldiketone; dimethylglyoxal) $\text{CH}_3\text{COCOCH}_3$.

Properties: Yellow liquid; strong odor; extremely dilute solutions possess a distinct butter odor. Soluble in water, alcohol, and ether. Sp. gr. 0.990 (15/15°C); m.p. -3 to -4°C; b.p. 88-91°C; refractive index (n_D¹⁸) 1.3933.

Grades: Technical; flavor grade.

Containers: Glass bottles; 5-lb aluminum containers.

Use: Aroma carrier of butter, vinegar, coffee, honey, etc.

diacetylaminoozotoluene (4-ortho-tolylazo-ortho-diacetotoluene)

$[\text{CH}_3\text{C}_6\text{H}_4\text{N}:\text{NC}_6\text{H}_3(\text{CH}_3)\text{N}(\text{CH}_3\text{CO})_2]$.

Properties: Crystalline powder. Color varies from yellowish-red, through rose to red. Acted upon by humidity in the atmosphere. Keep well stoppered! Soluble in alcohol, chloroform, and ether; as well as fats, oils, and greases; insoluble in water.

Constants: M.p. 74-76°C.

Use: Medicine (external).

3,5-diacetylamino-2,4,6-triiodobenzoic acid, methylglucamine salt. See methylglucamine diatrizoate.

diacetyldihydroxyphenylisatin (acetphenolisatin; endophenolphthalein) $\text{C}_{24}\text{H}_{19}\text{O}_5\text{N}$.

Properties: White, odorless, tasteless, crystalline powder; m.p. 241-242°C.

Soluble in alcohol, ether, and benzene.

Use: Medicine.

diacetylenes. Unsaturated hydrocarbons containing two triple bonds, with the type formula $\text{C}_n\text{H}_{2n-6}$. The simplest member of the group is butadiyne or biacetylene, $\text{HC}\equiv\text{CC}\equiv\text{CH}$, a gas which boils at 10°C.

1,2-diacetylene. See acetonyl acetone.

diacetylmethane. See acetylacetone.

diacetylmorphine (diamorphine; heroin)

$\text{C}_{17}\text{H}_{17}\text{NO}(\text{C}_2\text{H}_5\text{O}_2)_2$.

Properties: White, odorless, bitter crystals or crystalline powder; poisonous; habit-forming drug! Soluble in alcohol.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

M.p. 173°C.

Derivation: By the acetylation of morphine.
Method of purification: Crystallization.

Grades: Technical.

Containers: Tins; glass bottles.

Use: Prohibited in the United States because of its habit-forming character. Formerly used in medicine.

Shipping regulations: None.*

dialcetylmorphine hydrochloride

$C_{21}H_{23}O_5N \cdot HCl \cdot H_2O$.

Properties: White crystalline powder; m.p. about 230°C; soluble in water and alcohol, insoluble in ether.

dialcetyl peroxide. See acetyl peroxide.

dialcetylannin. See acetylannic acid.

"Diadem Chrome." ²³² Brand name for a series of chrome dyestuffs suitable for application by the afterchrome method.

"Diademil." ⁴¹² Trademark for hydroflumethiazide (q.v.).

"Diagen." ²⁸ Trademark for line of stabilized azoic colors that are used for printing cotton and rayon. They are tinctorially strong and have good fastness in full shades.

"Diagnex Blue." ⁴¹² Trademark for azuresin (q.v.).

"Dial." ³⁰⁵ Trademark for 5,5-diallylbarbituric acid.

Use: Medicine.

dialdehyde resin tannage. A process for chemical tanning. Hide is treated with a dialdehyde followed by controlled polymerization with urea-formaldehyde, phenol-formaldehyde or similar resin-forming substances. Permanent chemical compounds involving the leather substances are formed and properties may be varied over a wide range.

dialdehyde starch. Starch in which the original anhydroglucose units have been partially oxidized to dialdehyde form by oxidation, for example, the product of the oxidation of cornstarch by periodic acid. See "Sumstar."

Uses: Thickening agent; tanning agent; binder for leaf tobacco and paper, adhesives.

dialkylchloroalkylamine hydrochlorides. Amine salts having the formula $RC_1 \cdot HCl$, when R represents such groups as $(CH_3)_2NCH_2CH_2-$ (beta-dimethylaminoethyl chloride hydrochloride), $(CH_3)_2NCH_2CH(CH_3)-$ (beta-dimethylaminoisopropyl chloride hydrochloride), etc. Used in organic synthesis.

dialkylthioureas. Used as corrosion inhibitors. See dibutylthiourea; 1,3-diethylthiourea, diisopropylthiourea.

diallyl adipate $(CH_2CH_2COO)_2(CH_2CHCH_2)_2$.
Properties: Liquid; color-maximum #100 Pt-Co, characteristic odor; sp. gr. (20°C) 1.025.

Containers: 1-, 5-gal cans; 55-gal drums.
Use: Monomer.

diallylamine (di-2-propenylamine)

$(CH_2CHCH_2)_2NH$.

Properties: Liquid; sp. gr. (20°C) 0.7889; b.p. 112°C; f.p. -100°C; refractive index (n_{20/D}) 1.4404. Soluble in water.

Derivation: From allylamine or diallylcyanide.

Containers: Drums; tank cars.

Use: Intermediate.

diallylbarbituric acid (5,5-diallylbarbituric acid) $C_{10}H_{12}N_2O_3$.

Properties: White, odorless, crystals or crystalline powder; slightly bitter taste; soluble in alcohol or ether, slightly soluble in water; m.p. 171-173°C.

Use: Medicine.

diallyl cyanamide $(CH_2CHCH_2)_2NCN$.

Properties: M.p. less than -70°C; b.p. 222°C; density 0.90.

Use: Organic intermediate; polymers.

diallyl diglycolate $(CH_2COO)_2O(CH_2CHCH_2)_2$.

Properties: Liquid; color-maximum #100 Pt-Co, characteristic odor; sp. gr. (20°C) 1.1113.

Containers: 1-, 5-gal cans; 55-gal drums.

Use: Monomer.

diallyl isophthalate $C_6H_4(COOCH_2CHCH_2)_2$.

Properties: Monomer is liquid; color-maximum #175 Pt-Co, mild characteristic odor; sp. gr. (20°C) 1.124. Prepolymer is solid; sp. gr. (25°C) 1.256.

Containers. Monomer in 1-, 5-gal cans, 55-gal drums, prepolymer in 37 1/2-lb bags, 5-gal cans, 55-gal drums, tank cars.

Uses: Molding and laminating.

diallyl maleate $C_4H_2O_4(CH_2CHCH_2)_2$.

Properties: Colorless or straw-colored liquid. B.p. 109-110°C (3 mm); sp. gr. 1.077 (20°C), refractive index (n_{20/D}) 1.4699. Polymerizes readily when exposed to light or temperatures above about 50°C.

Grades: Technical.

Uses: Polymers and copolymers; insecticide formulations.

N,N-diallylmelamine

$(C_3H_5)_2N\overline{C}NC(NH_2)\overline{N}C(NH_2)\overline{N}$. A monomer, used for its polymers.

diallyl phthalate (DAP) $C_6H_4(COOCH_2CHCH_2)_2$.

The name is also used for the polymer.

Properties: Nearly colorless oily liquid, insoluble or limited solubility in gasoline, mineral oil, glycerin, glycols and certain amines. Soluble in most other organic liquids.

Typical specifications: Sp. gr. 1.120 (20/20°C), f.p. -70°C (viscous liquid); boiling range 158-165°C (4 mm); acidity (max) 0.03% (as acetic acid); odor mild, lachrymatory; flash point 330°F; fire point 359°F; vapor pressure 1.5 mm (150°C); refractive index 1.520 (25°C); viscosity 13 cps (20°C); surface tension 38 dynes per cm (20°C); thermal expansion 0.00076 from 10-40°C; wt/gal 9 lbs.

Containers: 1-, 5-gal cans; 55-gal drums; tank cars.

Uses: Primary plasticizer for most resins

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

which will polymerize if not inhibited; a polymerizable monomer which will polymerize with heat and catalyst into a clear, hard, insoluble polymer. It can be used to form low-pressure laminates with various fillers such as glass cloth, paper, etc. Used in electrical insulation.

diallyl sulfide. See allyl sulfide.

dialysis. Process in which smaller molecules are separated from larger ones in the same solution or mixture by use of a parchment or other semipermeable membrane that permits passage of the smaller but not the larger molecules. A common application is the removal of salts from solutions containing sugars or proteins. The process may also be used to separate large molecules in solutions from much larger colloidal particles that contain many molecules.

"Diam." ²³⁹ Trademark for N-alkyl 1,3-propylene diamines.

Derivation: The alkyl group is derived from coconut and tallow fatty acids.

Containers: 1-, 5-gal pails, 55-gal steel drums; tank trucks; tank cars.

Uses: Corrosion inhibitors; pigment treating, petroleum product additives, chemical intermediates.

"Diamid." ²⁴⁴ Trademark for a detergent formulation available in three grades: Regular, Concentrate, and Low-Foam. Uses: Milk stone removal.

diamide hydrate. See hydrazine hydrate.

diamidogen sulfate. See hydrazine sulfate.

diamine. See hydrazine.

diamine sulfate. See hydrazine sulfate.

3,6-diaminoacridine. See acriflavine.

3,6-diaminoacridinium hydrogen sulfate. See proflavine sulfate.

meta-diaminoazobenzene hydrochloride. See chrysoidine.

diaminoazoxytoluene (azoxytoluidine)

$C_6H_3(CH_3)(NH_2)N_2OC_6H_3(NH_2)(CH_3)$.

Properties: Yellow or orange crystals.

M.p. 168°C; soluble in alcohol; insoluble in water.

Derivation: By alkaline reduction of para-nitro-ortho-toluidine.

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden kegs; fiber drums.

Use: Dye intermediate.

Shipping regulations: None.*

diaminobenzene. See phenylenediamine.

1,3-diaminobutane $NH_2CH_2CH_2CHNH_2CH_3$.

Properties: Water-white, amine odor;

boiling range 143-150°C; sp. gr. 0.858 (20/20°C); refractive index 1.450 (20°C); flash point 125°F.

alpha, epsilon-diaminocaproic acid. See lysine.

diaminocarbamilide. See diaminodiphenylurea.

diaminodiethyl sulfide $S(CH_2CH_2NH_2)_2$.

Properties: Mobile, colorless liquid with amine-like odor. Miscible with water and benzene; insoluble in aliphatic hydrocarbons. B.p. 230-240°C; sp. gr. 1.054 (25°C).

diaminodihydroxyarsenobenzene dihydrochloride. See arspphenamine.

diaminodihydroxyarsenobenzene, sodium salt.

See sodium arspphenamine.

di-para-aminodimethoxydiphenyl. See dianisidine.

diaminodiphenic acid (benzidinedicarboxylic acid) $C_6H_3(CO_2H)NH_2C_6H_3(CO_2H)NH_2$.

Properties: White crystals; soluble in alcohol and ether; insoluble in water.

Derivation: By boiling meta-nitrobenzaldehyde with caustic soda, reducing with zinc dust and acidifying.

Use: Dyestuff.

diaminodiphenyl. See benzidine.

diaminodiphenylamine (para-para'-diaminodiphenylamine) $HN(C_6H_4NH_2)_2$.

Properties: Yellowish crystals; soluble in alcohol and ether; insoluble in water.

M.p. 158°C.

diaminodiphenylethylene. See para-diaminostilbene.

diaminodiphenylmethane $NH_2C_6H_4CH_2C_6H_4NH_2$.

Properties: Large silvery crystals; soluble in water, alcohol, ether, and benzene.

M.p. 86°C.

Derivation: By heating formaldehyde anilide with aniline hydrochloride and aniline.

Uses: Dyes; source for diisocyanates.

diaminodiphenyl sulfate. See benzidine sulfate.

4,4'-diaminodiphenyl sulfone. See sulfonyldianiline.

diaminodiphenylthiourea (diaminothiocarbanilide) $(NH_2C_6H_4NH_2)_2CS$.

Properties: Colorless plates or crystalline solid, soluble in alcohol and ether; sparingly soluble in water. M.p. 195°C

Derivation: By boiling para-phenylenediamine with carbon disulfide.

diaminodiphenylurea (diaminocarbamilide) $(NH_2C_6H_4NH_2)_2CO$.

Properties: Colorless plates; soluble in alcohol and hot water, sparingly soluble in cold water.

diaminodiphenylureadisulfonic acid

$CO(NHC_6H_3NH_2SO_3H)_2$.

Properties: Colorless, needle-like crystals; slightly soluble in water.

Derivation: Action of phosgene upon either para-phenylenediaminesulfonic acid, or 4-nitraniline-3-sulfonic acid.

•3,3'-diaminodipropylamine. See 3,3'-imino-bispropylamine.

diaminoditolyl. See tolidine.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

para, para'-diaminoditolylmethane.

Properties: Glistening, crystalline plates; soluble in alcohol and ether; m.p. 149°C.
Derivation: By heating formaldehyde and ortho-toluidine.

1,2-diaminoethane. See ethylenediamine.**6,9-diamino-2-ethoxyacridine lactate monohydrate.** See ethodin.**diaminoethoxyazobenzene hydrochloride.** See etiofloxazine.**di-para-aminoethoxydiphenyl.** See ethoxybenzidine.**1,6-diaminohexane.** See hexamethylenediamine.**3,6-diamino-10-methylacridinium chloride.** See acriflavine.**3,6-diamino-10-methylacridinium chloride hydrochloride.** See acriflavine hydrochloride.**diaminonaphthalene.** See naphthylenediamine.**1,5-diaminopentane.** See cadaverine.**1,2,4-diaminophenol** $\text{C}_6\text{H}_3\text{OH}(\text{NH}_2)_2$.

Properties: Colorless crystals; m.p. 78-80°C with decomposition. Soluble in alcohol and ether.

Derivation: By the reduction of 1,2,4-dinitrophenol.

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden barrels; glass bottles, fiber drums.

Uses: Photographic developer, organic synthesis.

Shipping regulations: None.*

1,2,5-diaminophenol $\text{C}_6\text{H}_3\text{OH}(\text{NH}_2)_2$.

Properties: Colorless crystals, m.p. 68°C, soluble in water.

Derivation: By the reduction of 1,2,5-dinitrophenol.

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden barrels, glass bottles, fiber drums.

Use: Organic synthesis.

Shipping regulations: None.*

diaminophenol hydrochloride

Properties: Grayish-white crystals, soluble in water; slightly soluble in alcohol.

Derivation: By the interaction of dinitrophenol with iron and hydrochloric acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: Kegs; boxes; glass bottles.

Uses: Photographic developer; dyeing furs and hair; analytical reagent.

Shipping regulations: None.*

2,4-diamino-6-phenyl-s-triazine. See benzoguanamine.**1,3-diaminopropane** $\text{NH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{NH}_2$.

Properties: Water-white liquid; amine odor, boiling range 133-140°C; sp. gr. 0.886 (20/20°C), refractive index 1.459 (20°C), flash point 75°F.

Shipping regulations: Flammable liquid.

Red label.*

2,6-diaminopyridine.

Properties: Crystals; f.p. 120.8°C; b.p. 285°C (760 mm); soluble in water.

Derivation: From 2-aminopyridine.

para-diaminostilbene (diaminodiphenylethylene) $\text{C}_6\text{H}_4(\text{NH}_2)\text{CHCHC}_6\text{H}_4(\text{NH}_2)$.

Properties: Colorless needles or plates; soluble in alcohol and ether; insoluble in water. M.p. 227°C.

Derivation: By the reduction of dinitrostilbene.

4,4'-diamino-2,2'-stilbenedisulfonic acid

Properties: Yellowish microscopic needles; soluble in alcohol and ether; insoluble in water.

Derivation: Boiling sodium salt of para-nitrotoluene-ortho-sulfonate in water with caustic soda and reduction with zinc dust.

Containers: Fiber kegs; polyethylene-lined steel drums.

Use: Dyestuffs.

diaminothiocarbanilide. See diaminodiphenylthiourea.**di-alpha-amino-beta-thiolpropionic acid.**

See cystine.

diaminotoluene. See toluene-2,4-diamine.**4,6-diamino-meta-toluenesulfonic acid.** See meta-tolylenediamine sulfonic acid.**diammonium ethylenebisdithiocarbamate**

Properties: M.p. 72.5°C, very soluble in water.

Grades: 42% solution in water.

Containers: 5-, 30-gal drums.

Uses: Fungicide, intermediate, corrosion inhibitor.

diammonium hydrogen phosphate. See ammonium phosphate, dibasic.**diammonium phosphate.** See ammonium phosphate, dibasic.

diamond. A mineral consisting essentially of carbon crystallized in the isometric system, usually in octahedral shape.

Properties: Colorless or white, sometimes blue, red, orange, green, black, yellow, brown, luster adamantine when cut, greasy when uncut, high refractive index and dispersion. Sp. gr. 3.51-3.53, hardness 10 (hardest substance known).

Varieties:

(a) Ordinary. Crystals ranging from stones of the first water (colorless and flawless) through various color tints, usually yellow, and full of flaws.

(b) Bort (buort). Stones too badly flawed or too off-color to be used in jewelry.

Also applied to aggregates with a radial finely crystalline structure.

(c) Carbonado. A finely crystalline type, black in color, tough and compact.

(d) Synthetic. Have been made at high

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

temperatures and pressures (3000°F, 1.3 million psi).

Occurrence: South Africa (world's principal supply), Belgian Congo; Brazil; Arkansas, Venezuela; India; Borneo; Southwest Africa.

Uses: Gemstone; in glass cutters; diamond drill bits; metal cutting; wire dies, as a powder (diamond dust) for polishing gemstones and in abrasive wheels.

"Diamond Alkali Cell D-3," ²⁴⁴ Trade name for a high output electrolytic cell for the production of chlorine and caustic soda, having an operating range up to 34,000 amperes. At this load it is capable of producing 2270 pounds of chlorine per day, an output in excess of 21 pounds of chlorine gas per square foot of cellroom floor space. Operational features include high electrical efficiency and low hydrogen content in the chlorine cell gas. The cell is rectangular in shape (7'0" by 3'7") and consists of three major components. The bottom section is a cast iron anode base, from which vertical carbon anodes extend to distribute electrical current throughout the sodium chloride cell feed. Placed on the base is a cathode assembly, which has steel screens extending between the rows of anodes to receive the current. An asbestos fiber diaphragm is deposited on these screens to separate the products of electrolysis. The cell assembly is completed by placing a concrete head on top of the cathode.

"Diamond CR-80, 85," ²⁴⁴ Trade name for two slightly different vinyl chloride-vinyl acetate copolymers.

Properties: Fine, white powders, 100% through 40 mesh, specific viscosity 0.56 and 0.58, bulk density 38 and 35.5 lb/cu ft; volatiles less than 1 and 1.5%, respectively.

Containers: 50-lb paper bags.

Uses: In phonograph record stocks and in rigid calendered sheeting.

diamond dust. See diamond.

"Diamond FCR," ²⁴⁴ Trade name for a vinyl chloride-vinyl acetate copolymer. Used for vinyl asbestos flooring applications.

"Diamond PVC," ²⁴⁴ Trade name for a series of polyvinyl chloride resins. All are fine, white powders; 100% through 40 mesh; packed in 40- or 50-lb paper bags.

PVC-30: Specific viscosity 0.63; bulk density 0.57 g/cc; low molecular weight.

Uses: When blended with conventional resins, improves processability, reduces temperature requirements, and shortens production cycles.

PVC-35: Specific viscosity 0.85; bulk density 35 lb/cu ft; moisture 0.5% max. Low molecular weight, good flow properties.

Uses: Compounds based on this resin can be processed at the relatively low temperatures normally used for copolymers.

PVC-40: Average specific viscosity 1.10; bulk density 35 lb/cu ft; moisture 0.5% max. Intermediate molecular weight.

Uses: For calendering and molding; suited as a resin base for highly filled compounds.

PVC-62: Average specific viscosity 1.40; bulk density 20.6 lb/cu ft; moisture 0.5% max. High plasticizer absorption and rapid absorption rate.

Uses: Coated fabrics; calendered film, sheeting and tape stock; tubing and profile extrusion; elastomeric compounds for molded products. A cold dry blending resin.

PVC-70: Specific viscosity 1.80; bulk density 17 lb/cu ft; high molecular weight.

Uses: Designed for plastisols and organosols. Excellent flow or rheological properties exhibited by both fresh and aged compounds.

PVC-70F: Specific viscosity 1.80; bulk density 17 lb/cu ft; high molecular weight.

Uses: For plastisol and organosol dispersions.

PVC-450: Specific viscosity 1.35; bulk density 31 lb/cu ft; moisture 0.5% max.

Uses: Coated fabrics, heavy or clear calendered sheeting, calendered film-processing aid for high polymers; unplasticized and semi-rigid sheeting; dry blend extrusion compounds; elastomeric molding compounds.

PVC-500: Specific viscosity 1.55; bulk density 30 lb/cu ft, moisture 0.5% max; plasticizer adsorption, 32.

Uses: Dry blending, extrusion, calendering and molding.

"Diamond" Soda Crystals. ²⁴⁴ Brand name for sodium sesquicarbonate, $\text{Na}_2\text{CO}_3 \cdot \text{NaHCO}_3 \cdot 2\text{H}_2\text{O}$.

diamonds, synthetic. See diamond.

"Diamond Vulcanized Fibre." ²⁸¹ Trade name for a line of products made from pure cotton rag paper chemically treated to form a permanently solid mass which is tough, hard, resilient, strong, of bone-like consistency, with excellent machining and forming qualities. Used for gears, machined or punched parts, electrical insulation, and many special uses.

diamorphine. See diacetylmorphine.

"Diamox," ⁵⁷ Trade name for acetazolamide (2-acetyl amino-1,3,4-thiadiazole-5-sulfonamide) $\text{N}_4\text{S}_2\text{O}_3\text{C}_4\text{H}_6$.

Properties: White crystalline powder, m.p. 252.3-252.6°C, very slightly soluble in water; slightly soluble in ethanol, acetone; soluble in dilute base.

Use: Medicine.

diamthazole dihydrochloride

$\text{C}_{15}\text{H}_{23}\text{N}_3\text{OS} \cdot 2\text{HCl}$. 6-(2-Diethylaminoethoxy)-2-dimethylaminobenzothiazole dihydrochloride.

Properties: Crystals, decomposes 269°C. Soluble in water, ethanol and methanol.

Grade: N.N.D.

Use: Topical therapy (medicine), antifungal agent.

di-n-amylamine (C_5H_{11})₂NH.

Properties: Colorless liquid; b.p. 202-3°C (745 mm), very slightly soluble in water,

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

soluble in alcohol and ether. Sp.gr. 0.77-0.78 (20°C); diamylamine content at least 99%; acid-insoluble none; initial b.p. not below 175°C, not less than 95% boils below 202°C, final b.p. not above 218°C; wt/gal 6.45 lbs. Viscosity 0.01264 poise (20°C), refractive index 1.430 (20°C); surface tension 24.4 dynes/cm (13°C); specific heat 0.54 cal/g (20°C); heat of vaporization 83 cal/g; coefficient of expansion 0.00102 (20-60°C); vapor pressure 9 mm (26°C).

Derivation: From reaction of amyl chloride and ammonia.

Containers: 1-, 5-gal cans; 55-gal drums; tank cars.

Uses: Rubber vulcanization accelerators; flotation reagents; dyestuffs and corrosion inhibitors; solvent for oils, resins and some of the cellulose esters.

Shipping regulations: None.*

N,N-diamyl aniline (mixed isomers)

$C_6H_5N(C_5H_{11})_2$.

Properties: Sp.gr. 0.898 (20°C); boiling range 276-292°C; color dark amber; odor faint aniline; flash point 260°F.

diamyl benzene $C_6H_4(C_5H_{11})_2$.

Properties: Sp.gr. 0.86 (20°C); b.p. 265°C; color water-white; odor aromatic, flash point 225°F.

diamyl chloronaphthalene $(C_5H_{11})_2C_{10}H_7Cl$.

Properties: Sp.gr. 1.06 (20°C); boiling range 352-377°C, color orange; odor naphthalenic; flash point 330°F.

diamylene $C_{10}H_{20}$.

Derivation: By polymerization of amylenes.

diamyl ether. See amyl ether.

2,5-di(tert-amyl)hydroquinone

[2,5-di(tert-pentyl)hydroquinone]

$(C_5H_{11})_2C_6H_2(OH)_2$.

Properties: Buff powder, m.p. 172°C (min.), sp.gr. 1.05 (25°C).

Uses: Protection of uncured rubber from oxidation; antioxidant for unsaturated resins and oils, in food packaging.

diamyl maleate $(CHCOOC_5H_{11})_2$.

Properties: Sp.gr. 0.981 (20°C); boiling range 263-300°C; color water-white; odor faintly alcoholic; flash point 270°F.

diamyl beta-naphthol $(C_5H_{11})_2C_{10}H_7OH$.

Properties: Sp.gr. 0.970 (20°C); boiling range 205-230°C (10 mm); color dark red; odor none; flash point 345°F.

diamyl nitrosamine $(C_5H_{11})_2NNO$.

Properties: Sp.gr. 0.891 (20°C); boiling range 120-130°C (10 mm); color straw; odor amine.

diamyl phenol (1-hydroxy-2,4-diamylbenzene)

$(C_5H_{11})_2C_6H_3OH$. Commercial form is a mixture of isomers including both secondary amyl and tertiary amyl groups mainly in 2,4 positions.

Properties: Light straw-colored liquid with mild phenolic odor; miscible with both aliphatic and aromatic hydrocarbons;

insoluble in water and 10% aqueous alkalis.

Typical specifications: Boiling range (ASTM 5-95%) 280-295°C; sp.gr. 0.930 (20°C); wt/gal 7.8 lbs (20°C); flash point (Tag open cup) 260°F.

Containers: 5-gal cans; 55-gal (non-returnable) black iron drums; 4000-, 6000-gal tank cars; tank trucks.

Handle with caution!

Uses: Synthetic resins; lubricating oil additives; rust preventives; plasticizers; surface active agents; synthetic detergents; antioxidants and antiskinning agents; rubber chemicals; and biologically active materials as effective germicides, fungicides, microbicides, and insecticides.

di-tert-amylphenoxyethanol

$(C_5H_{11})_2C_6H_3OCH_2CH_2OH$.

Properties: Clear to light-straw colored liquid; sp.gr. 0.960 (20°C); refractive index 1.5074; vapor pressure <0.01 mm; boiling range 318-332°C; m.p. about -35°C. Insoluble in water.

Fire hazard: Flash point 149°C.

diamyl phthalate $C_6H_4(COOC_5H_{11})_2$.

Properties: Colorless, nearly odorless oily liquid. Sp.gr. (20°C) 1.022; wt/gal 8.52 lb (20°C); refractive index (25°C) 1.488; b.p. 342°C; m.p., less than -55°C; flash point (closed cup) 357°F.

Derivation: By esterification of phthalic anhydride with amyl alcohol in the presence of approximately 1% concentrated sulfuric acid as catalyst.

Method of purification: Distillation.

Grades: Technical.

Containers: Drums.

Use: Plasticizer.

Shipping regulations: None.*

diamyl sulfide (amyl sulfide) $(C_5H_{11})_2S$. A mixture of isomers.

Properties: Yellow liquid; sp.gr. 0.85-0.91 (20/20°C); distillation; initial b.p. (mm) 170°C, not less than 95% above 180°C; average wt/gal 7.52; flash point (open cup) 185°F; refractive index 1.477 (19°C); surface tension 27.3 dynes/cm (13°C).

Containers: 1-gal can (7 lbs); 5-gal drum (35 lbs); 55-gal drum (380 lbs).

Uses: Used in preparing organic sulfur compounds, such as sulfones, sulfoxides, and other compounds through addition reactions; as a flotation agent in metallurgical processes; as a stench-producing agent (not as powerful as amyl mercaptan).

"Dianabol." ³⁰⁵ Trademark for methandrostenolone, N.N.D.

Use: Medicine.

dianhydrosorbitol. See sorbide.

"Dianil." ³⁰⁷ Direct colors of commercial fastness.

dianisidine (di-para-aminodi-meta-methoxydiphenyl; 3,3'-dimethoxybenzidine)

$[C_6H_3(OCH_3)NH_2]_2$.

Properties: White crystals; soluble in alcohol

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

and ether; insoluble in water. M.p. 137°C. Derivation: The methyl ether of ortho-*p*-nitrophenol is reduced by zinc dust and caustic soda to the hydrazo compound, which is then rearranged with hydrochloric acid.

Method of purification: Crystallization.

Grades: Technical.

Containers: 350-lb wooden barrels; fiber drums; multiwall paper sacks.

Use: Dye intermediate.

Shipping regulations: None.*

di-para-anisyl-para-phenetylguanidine hydrochloride (acoin; guanicaïne)

Properties: White crystalline powder; incompatible with iodine and alkaline iodides.

Soluble in water and alcohol. M.p. 176°C.

Use: Medicine (local).

diaphragm cell. A type of electrolytic cell for the production of caustic soda and chlorine from sodium chloride brine. The cell contains anode and cathode compartments separated by a porous diaphragm (usually asbestos fiber) to prevent mixing of the solutions. The brine is fed continuously to the anode compartment, where chlorine is released at the graphite anodes, and flows through the diaphragm to the iron cathode, where hydrogen is liberated and caustic soda accumulates in the liquid. The caustic solution, which is continuously drained from the cathode compartment, usually contains 9-12% sodium hydroxide, varying amounts of undecomposed sodium chloride, some dissolved chlorine, and traces of sodium chlorate and iron compounds. Although the mercury cathode cell (q.v.) produces a purer and more concentrated sodium hydroxide solution, it operates at a generally lower energy efficiency and is not as widely used in the U.S. Many types of diaphragm cells have been developed; for examples, see also Hooker, Nelson, Vorce cells, "Diamond Alkali Cell D-3."

"Di-Aqua."²⁴⁴ Sodium alkyl aryl sulfonate in which the alkyl aryl portion is substantially all dodecylbenzene. Available in 40% and 80% active strengths, both in powder and flake form, also 40% beads.

Properties: Light tan powder (or flake); soluble in water.

Containers: Drums and bags.

Uses: Wetting agents; detergents; emulsifier.

diaspore $\text{Al}_2\text{O}_3 \cdot \text{H}_2\text{O}$. A natural hydrous aluminum oxide, occurring in bauxite (q.v.), and with corundum and dolomite.

Properties: White, gray, yellowish, and greenish; luster vitreous to pearly; sp.gr. 3.35-3.45; hardness 6.5-7.

Occurrence: Arkansas, Missouri, Pennsylvania; Switzerland; U.S.S.R.; Czechoslovakia.

Uses: As a refractory; abrasive; possible source of aluminum.

diastase, malt (amylase). An amylolytic enzyme.

Properties: Yellowish-white amorphous powder, or syrupy liquid. Soluble in water; almost insoluble in alcohol.

Derivation: The filtrate from the mash of malted grain is concentrated at low temperatures in vacuum. The sugar acts as preservative. The diastase converts insoluble starch and starch paste into soluble maltodextrins and maltose.

Containers: Wooden kegs; cans; fiber drums.

Uses: Desizing of textiles; making up colors for calico printing; finishing of textiles; medicine; bread-making; malted foods.

Shipping regulations: None.*

"Diatol."¹⁹² Proprietary product. Said to be pure diethyl carbonate containing about 10% of unconverted anhydrous alcohol.

Constants: Flash point 82°F (approx); water solubility, 100 cc solvent dissolves 3.0 cc water (25°C); water-white color; distillation range, below 100°C not more than 15%, below 125°C not more than 50%, above 130°C none; mild odor, non-residual; purity, ester content as ethyl carbonate, not less than 90%; sp.gr. 0.954-0.957 (20/20°C).

Grades: Technical.

Containers: 1-gal cans; 5- to 36,000-lb (gross) drum cars; 6000- and 8000-gal tank cars.

Uses: A medium high-boiling nitrocellulose solvent, having the features of mild odor, stability and extremely low acidity. Because the acidity is due to the smallest trace of carbonic acid, it is considered as nearly a neutral solvent as it is possible to make. The extra ethyl alcohol content in "Diatol" contributes to solvent action, blending and flow. "Diatol" finds its chief use in lacquer formulation, and in the radio tube field.

Fire hazard: Combustible but not flammable; flash point over 80°F.

diatomaceous earth. See diatomite.

diatomite (diatomaceous earth; DE; kieselguhr; guhr; siliceous earth; tripolite; infusorial earth). A soft earthy rock composed of the siliceous skeletons of small aquatic plants called diatoms. As marketed it consists of light colored blocks, bricks, powder, or lumps resembling chalk or dried clay in appearance. Sp.gr. true 1.9-2.35, apparent 0.15-0.45; insoluble in acids except hydrofluoric; soluble in strong alkalies; able to absorb 1.5-4.0 times its own weight in water; a very poor conductor of sound, heat, and electricity.

Typical analysis:

silica (SiO_2)	86.89%
alumina (Al_2O_3)	2.32%
ferric oxide (Fe_2O_3)	1.28%
lime (CaO)	0.43%
potash (K_2O)	3.58%
water (H_2O)	4.89%

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Occurrence: California, Oregon, Nevada, Washington, Utah, Idaho, Maryland, Virginia; Europe; Algeria; U. S. S. R.
Grades: Natural; chemical.

Containers: Bulk in cars, bags, multiwall paper sacks.

Uses: In filtration, clarifying, and decolorizing of liquids in the manufacture of sugar, beer, wine, liquors, fruit juices, water, dry cleaning fluid, oils and petroleum products, glue and adhesives, soap, shellacs and varnishes. etc.; as thermal insulating material in the form of blocks, brick, aggregates and cement, as filler in the manufacture of dynamite, sealing wax, match heads, textiles, plaster, plastics, paints, rubber, fertilizers; as an absorbent for liquids; as a mild abrasive; as a support and carrier for catalysts; in building material; in ceramics; in manufacture of water glass; ingredient of textile fireproofing agents.

Shipping regulations: None.*

diatrizoate methylglucamine. See methylglucamine diatrizoate.

diatrizoate sodium. See sodium diatrizoate.

1, 4-diazabicyclo[2. 2. 2]octane

Properties: Crystals, hygroscopic, m. p. 158°C; b. p. 174°C; forms crystalline hydrate; sublimes easily; soluble in water and organic solvents.

Uses: Suggested as catalyst for urethane foams and coatings, chemical intermediate.

"Diazanil," ³⁰⁷ Direct colors for diazotizing and developing on the fiber.

"Diazine," ²⁴³ Trademark of direct dyes, applied to cotton, diazotized and then coupled into phenols or amines.

1, 3-diazine. See pyrimidine.

"Diazinon," (O, O-diethyl-O-(2-isopropyl-6-methyl-4-pyrimidinyl) phosphorothioate) $[(\text{CH}_3)_2\text{CHCH}_2\text{N}_2\text{H}(\text{CH}_3)\text{O}]\text{PS}(\text{OC}_2\text{H}_5)_2$.

Properties: Colorless liquid; b. p. 83-84°C (0.002 mm), slightly soluble in water, freely soluble in petroleum solvents, alcohol and ketones. More stable in alkaline than neutral or acid solutions.

Use: Agricultural insecticide having residual toxicity to flies. A cholinesterase inhibitor.

Toxicity: Similar to parathion (q. v.).

diazaminobenzene (diazobenzeneanilide, benzeneazoanilide) $\text{C}_6\text{H}_5\text{NNHC}_6\text{H}_5$.

Properties: Golden-yellow scales. Explodes on heating. Soluble in alcohol, ether, and benzene, insoluble in water.

Constants: M. p. 96°C, explodes when heated to 150°C.

Derivation: By the interaction of nitrous acid and an alcoholic solution of aniline.

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden kegs; fiber drums.

Uses: Organic synthesis, dyes.

4, 4 -diazaminodibenzamidine

Properties: (trihydrate) yellow powder; m. p.

203°C (with decomposition); soluble in water at pH 6.1; solutions are unstable.

Grade: Veterinary.

Use: Veterinary medicine.

diazobenzeneanilide. See diazoaminobenzene.

para-diazobenzenesulfonic acid $\text{C}_6\text{H}_4\text{SO}_3\text{N}_2$.

Properties: White or slightly red crystals, or white paste. Soluble in water and ether; insoluble in alcohol.

Caution: May explode if heated.

Derivation: From sulfanilic acid, sodium nitrite and sulfuric acid.

Uses: Dyestuffs; reagent.

para-diazodimethylaniline zinc chloride double salt (para-dimethylaminobenzene diazonium chloride, zinc chloride double salt; para-diazotized aminodimethylaniline, zinc chloride double salt)

Properties: Yellow to orange (light sensitive) crystals.

Specifications: Moisture content 5-20%; zinc 17-23%; chloride 31-35%.

Containers: Bottles, fiber drums.

Uses: Rapid diazotype coupler, used in coatings for light-sensitive paper.

Shipping regulations: None.*

diazodinitrophenol.

Shipping regulations: Explosive, class A.

Initiating explosive label. Not accepted by express.

para-diazodiphenylamine sulfate. Yellow-green solid with unpleasant odor. Sensitive to light, soluble in water. Used as a light sensitive diazo compound for coating on reproduction paper, giving direct positive prints of various colors with different developers or coupling agents.

1-diazo-2-naphthol-4-sulfonic acid

Properties: Yellow needles in paste or dry form. Slightly soluble in water. Decomposed by heating above 100°C.

Derivation: Diazotization of 1-amino-2-naphthol-4-sulfonic acid and filtering of the diazo compound.

Method of purification: None.

Grades: Technical.

Containers: Wooden barrels; fiber drums.

Uses: Azo dyes; valuable chrome dyestuff component.

Fire hazard: The dry product can be ignited by sparks or a flame.

"Diazopon AN," ³⁰⁷ Trademark for a dispersing and stabilizing agent consisting of polyoxyethylated fatty alcohol; non-ionic.

Properties: Clear, oily, yellow liquid; sp. gr. 1.03-1.04; soluble in water; stable to strong acids, alkalis and metallic ions.

Uses: Dispersing and stabilizing agent in the naphthol dyeing process to improve

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

fastness to rubbing. Used in dissolving fast color salts and has a stabilizing effect on the diazonium compound.

para-diazotized aminodimethylaniline, zinc chloride double salt. See para-diazodimethylaniline zinc chloride double salt.

diazotizing salts. See sodium nitrite.

"Diazyme." ²¹² Trademark for an amylglucosidase which splits starch almost completely to glucose.

DIBA. See diisobutyl adipate.

dibasic dextro-amphetamine phosphate.

N. F. XI name for dextrorotatory-amphetamine phosphate, dibasic.

ortho, ortho'-dibenzamido diphenyl disulfide $C_{26}H_{20}O_2N_2S_2$.

Properties: Very light buff; practically odorless; sp. gr. 1.35 (approx); melting range 136-143°C.

1, 2, 7, 8-dibenzanthraquinone $C_{22}H_{12}O_2$.

Properties: Reddish-yellow needles. Soluble in acetic acid. M. p. 227°C (sublimes).

2, 3, 6, 7-dibenzanthraquinone (6, 13-pentacenequinone) $C_{22}H_{12}O_2$.

Properties: Yellow needles. Gives a blue color in concentrated sulfuric acid but changes to red when diluted. M. p. 388°C (sublimes). Soluble in sulfuric acid.

dibenzanthrone (violanthrone) $C_{34}H_{16}O_2$.

Violet-blue vat dye.

Properties: Bluish-black powder. Soluble in nitrobenzene, conc sulfuric acid.

Derivation: From benzanthrone.

3, 3'-dibenzanthronyl $C_{34}H_{18}O_2$.

Properties: Dark yellow needles. Soluble in conc. sulfuric acid. M. p. 412°C.

4, 4'-dibenzanthronyl $C_{34}H_{18}O_2$.

Properties: Yellow needles. Soluble in nitrobenzene, slightly soluble in benzene, alcohol, ether. M. p. 320°C.

1, 2, 5, 6-dibenzcarbazole $C_{20}H_{13}N$.

Properties: Needles.

dibenzofuran. See diphenylene oxide.

"Dibenzo G-M-F." ²⁴⁸ Trade name for

dibenzoyl-para-quinonediimine, $(C_6H_5COON)_2C_6H_4$.

Properties: Brownish grey powder; sp. gr. 1.37; starts to decompose above 200°C; good storage stability. Insoluble in acetone, benzol, gasoline, ethylene dichloride and water.

Uses: Non-sulfur vulcanizing agent for natural, SBR and butyl rubber, in tire-curing bags, gaskets and wire insulation to impart heat resistance.

dibenzopyrone. See xanthone.

dibenzopyrrole. See carbazole.

dibenzothiophene $C_6H_4C_6H_4S$.

Properties: Colorless crystals; m. p. 97-98°C.

Uses: In cosmetics and pharmaceuticals;

organic intermediate.

dibenzoyl. See benzil.

trans-1, 2-dibenzoyl ethylene

$C_6H_5COCHCHCOC_6H_5$.

Properties: Yellow orange crystals; m. p. 111°C; soluble in glacial acetic acid, ethyl acetate, benzene and chloroform; sparingly soluble in alcohol; insoluble in water and petroleum ether.

Containers: Polyethylene-lined fiber drums.

Uses: Enzyme inhibitor, bactericide and chemical intermediate.

2, 4-dibenzoylresorcinol

$C_6H_5COC_6H_2(OH)_2COC_6H_5$.

Properties: Light yellow crystals; nearly odorless; m. p. 125-128°C; soluble in alcohol, ethyl acetate, methyl ethyl ketone; insoluble in water.

Use: Light absorber, best at 280-370μ.

dibenzyl. See sym-diphenylethane.

N, N-dibenzylamine $HN(CH_2C_6H_5)_2$.

Properties: Colorless to light yellow liquid; sp. gr. 1.017 (20°C); refractive index 1.5730-1.5740 (n_D²⁵); distilling range 168-172°C (10 mm).

Containers: 200-lb, 400-lb steel drums.

Uses: Intermediate.

dibenzyl-para-aminophenol

$(C_6H_5CH_2)_2NC_6H_4OH$.

Properties: Brown powder. Soluble in acetone, benzene, anhydrous methanol.

Constants: M. p. not lower than 110°C.

dibenzylaniline $C_6H_5N(CH_2C_6H_5)_2$.

Properties: Yellowish-white crystals.

Soluble in alcohol and ether; insoluble in water.

Constants: M. p. 70°C; b. p. above 300°C.

dibenzyl ether $C_6H_5CH_2OCH_2C_6H_5$.

Properties: Unstable liquid. Faint, almond odor. Insoluble in water; soluble in most organic solvents.

Constants: Sp. gr. 1.035, b. p. 298-300°C, flash point 115-135°C.

Grades: Technical.

Uses: Plasticizer for nitrocellulose; in perfumery as a solvent for nitro-musks.

N, N'-dibenzylethylenediamine dipenicillin G.

See benzathine penicillin G, under penicillin.

"Dibenzyl." ⁷¹ Trademark for phenoxy-

benzamine hydrochloride (N-phenoxyisopropyl-N-benzyl-beta-chloroethylamine hydrochloride), used in medicine.

N, N-dibenzylmethylamine $CH_3N(CH_2C_6H_5)_2$.

Properties: Colorless to light yellow liquid; Sp. gr. 0.99 (25°C); refractive index 1.5560-1.5590 (25°C), distilling range: 152-158°C (11 mm).

Containers: 200-lb, 400-lb steel drums.

Use: Intermediate.

dibenzyl sebacate $(C_6H_5CH_2OOC)_2(CH_2)_8$.

Properties: Light straw colored; b. p. 265°C (4 mm); sp. gr. 1.055 (30/20°C); complete

non-volatility and excellent low-temperature

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

flexibility.

Containers: Drums; tank cars.

Use: Plasticizer, especially for plastic linings for containers.

Shipping regulations: None.*

dibenzyl succinate. See benzyl succinate.

2,5-dibiphenyloxazole (BBO) $C_{27}H_{21}NO$.

Properties: Crystalline solid, m.p. 237–239°C.

Grade: Purified.

Use: Scintillation counter or as wave length shifter in solution scintillators.

"**Dibistine.**"³⁰⁵ Trademark for a compound containing tripeleannamine hydrochloride U.S.P. and antazoline hydrochloride U.S.P.

Use: Medicine.

diborane (diboron hexahydride; boroethane) B_2H_6 .

Properties: Colorless gas with repulsive odor. B.p. -92.5°C, m.p. -165°C, density 0.15 g/ml (17°C). Soluble in carbon disulfide; decomposes in water. Highly reactive; very flammable.

Derivation: (a) From boron trichloride or bromide and hydrogen; (b) by reaction of lithium aluminum hydride and boron trichloride in ether solution.

Containers: Gas cylinders.

Uses: Synthesis of organic boron compounds and metal borohydrides, polymerization catalyst for ethylene, fuel for air-breathing engines, and rockets, reducing agent.

Hazard: Very toxic.

diboron hexahydride. See diborane.

"**Dibromantin.**"¹⁰⁹ Trade name for 1,3-dibromo-5,5-dimethylhydantoin.

dibromoacetylene $BrC\equiv CBr$.

Properties: Heavy, colorless liquid. Disagreeable odor. Caution! Very toxic! Very unstable in the presence of oxygen! Decomposes with explosive violence if heated! Breaks down in damp air with production of powerful irritants! Soluble in most organic solvents.

Constants: Sp.gr. (approx) 2; b.p. 76–76.5°C.

Derivation: (a) Interaction of magnesium dibromoacetylene and an ethereal solution of cyanogen bromide. (b) Interaction of tribromoethylene and alcoholic potash.

Grades: Technical.

Use: Organic synthesis (halogenated ethylene).

Fire hazard: Dangerous. Flammable in air. Burns with a red flame.

Shipping regulations: Flammable liquid. Red label.*

9,10-dibromoanthracene $C_{14}H_8Br_2$ (tricyclic).

Properties: Yellow crystals. Soluble in chloroform, slightly soluble in alcohol and ether, insoluble in water.

Constants: M.p. 221°C; b.p., sublimes.

Derivation: By the bromination of anthracene.

Method of purification: Crystallization.

Grades: Technical.

Containers: Wooden kegs; fiber drums.

Use: Organic synthesis.

Shipping regulations: None.*

ortho-dibromobenzene (benzene dibromide) $C_6H_4Br_2$.

Properties: Heavy liquid with pleasant, aromatic odor. B.p. 225.5°C; freezing point 7.13°C; sp.gr. 1.9767 (25/4°C); refractive index (n_D 20) 1.6155. Miscible with alcohol, acetone, ether, benzene, carbon tetrachloride, and n-heptane; insoluble in water.

Derivation: Interaction of benzene with an excess of bromine in presence of iron.

Grades: Technical.

Containers: Steel drums.

Uses: Solvent for oils; motor fuels; top-cylinder compounds; organic synthesis; ore flotation.

Shipping regulations: None.*

para-dibromobenzene (benzene dibromide) $C_6H_4Br_2$.

Properties: Colorless crystals. Soluble in alcohol and ether.

Constants: M.p. 89°C; b.p. 219°C; sp.gr. 2.261, refractive index (n_D 20) 1.5743.

Derivation: Obtained by the interaction of benzene with an excess of bromine in presence of a little iron.

Method of purification: Crystallization.

Impurities: Monobromobenzene.

Grades: Technical.

Containers: Tins, bags.

Use: Organic synthesis of dyestuffs and drugs, manufacture of intermediates.

Shipping regulations: None.*

N,N-dibromobenzenesulfonamide.

Properties: Solid, m.p. 109–111°C. Active bromine 50.4%.

Containers: Glass bottles, fiber drums.

Use: Halogenating agent.

dibromochloromethane $CHBr_2Cl$.

Properties: Clear, colorless heavy liquid. Sp.gr. 2.38, b.p. 116°C.

Containers: 5-gal carboys.

Uses: Organic synthesis.

1,2-dibromo-3-chloropropane

$CH_2BrCHBrCH_2Cl$.

Properties: Amber to brown liquid; sp.gr. 2.05 (20°C); b.p. 195.5°C; freezing point 6.7°C; flash point (Tag open cup) 170°F.

Containers: 30-gal drums.

Uses: Soil fumigant for nematodes.

Shipping regulations: Poison, class B. Poison label.*

5,7-dibromo-2-chloro-3-pseudoindolone.

See 5,7-dibromoisatin chloride.

dibromodiethyl sulfide $(CH_3CH_2Br)_2S$. The bromine analog of mustard gas.

Properties: White crystals. Hydrolyzed by water. Caution! Irritant! Soluble in alcohol, benzene, ether; insoluble in water.

Constants: Sp.gr. 2.05 (15°C); b.p. 240°C (decomposes); m.p. 31–34°C.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: Action of hydrobromic acid on an aqueous solution of thiodiglycol.

Grades: Technical.

Use: Organic synthesis.

dibromodiethyl sulfone $(\text{CH}_3\text{CH}_2\text{Br})_2\text{O}_2\text{S}$.

Properties: Plates. Soluble in alcohol, benzene, ether. M.p. 111-112°C.

Derivation: Interaction of dibromodiethyl sulfide, chromic anhydride, and dilute sulfuric acid.

dibromodiethyl sulfoxide $(\text{CH}_3\text{CH}_2\text{Br})_2\text{OS}$.

Properties: Glittering crystals. Soluble in alcohol, benzene, ether. M.p. 100-101°C.

Derivation: Interaction of benzoyl hydrogen peroxide and a hot solution of dibromodiethyl sulfide in chloroform.

dibromodifluoromethane CF_2Br_2 .

Properties: Colorless heavy liquid; f. p. -141°C; b. p. 23.2°C, sp. gr. 2.288 (15/4°C); refractive index 1.399 (12°C). Insoluble in water; soluble in methanol and ether.

Grades: Pure (95.0% min).

Containers: Cylinders.

Uses: Synthesis of dyes, pharmaceuticals, quaternary ammonium compounds.

1, 3-dibromo-5, 5-dimethylhydantoin

$\text{BrNCONBrCOCH}(\text{CH}_3)_2$.

Properties: Free flowing cream colored powder with slight bromine odor. M. p. 187-191°C (decomposes); quite stable at 75°C. Soluble in benzene, chloroform, glacial acetic acid, slightly soluble in water and carbon tetrachloride, insoluble in hexane. Contains 55% active bromine, which is slowly released in aqueous solution.

Derivation: Bromination of dimethylhydantoin.

Grades: Technical.

Containers: Glass bottles, polyethylene-lined drums.

Uses: Controlled bromination and oxidation of organic compounds; water treatment; polymerization catalyst; potential germicide and sanitizer.

dibromoethane. See ethylene dibromide.

1, 3-dibromo-5-ethyl-5-methylhydantoin

(DEM₅) $\text{BrNCONBrCOCH}(\text{C}_2\text{H}_5)(\text{CH}_3)$.

Properties: Solid. Active bromine 52.5%.

Containers: Glass bottles; fiber drums.

Use: Halogenating agent.

2, 4-dibromofluorobenzene $\text{C}_6\text{H}_3\text{Br}_2\text{F}$.

Properties: Colorless liquid; sp. gr. (20°C) 2.047; b. p. 214°C, refractive index (n_D²⁵) 1.5790. Insoluble in water; soluble in alcohol, acetone, ether, benzene, chloroform, ethyl acetate, and glacial acetic acid.

Uses: Intermediate for agricultural and pharmaceutical chemicals.

Caution: Avoid contact with eyes and skin.

dibromoformoxime CBr_2NOH .

Properties: Crystals. Not so toxic or irritant as the chloroformoximes.

Constants: M. p. 70-71°C. Distills between 75 and 85°C (3 mm).

dibromohydroxymercurifluorescein, disodium salt. See merbromin.

dibromiodoethylene Br_2CCHI .

Properties: Liquid; sp. gr. 2.952 (24°C), b. p. 91°C (15 mm).

Derivation: Reaction of iodine and dibromoacetylene.

5, 7-dibromoisatin chloride (5, 7-dibromo-2-chloro-3-pseudoindolone) $\text{C}_8\text{H}_2\text{Br}_2\text{ClNO}$.

Soluble in organic solvents such as benzene, chlorobenzene, etc.

Derivation: Isatin is gently warmed with bromine in concentrated sulfuric acid, giving 5, 7-dibromoisatin which is then warmed with phosphorus pentachloride in an organic solvent.

1, 2-dibromoisobutane. See isobutylene dibromide.

dibromomalonic acid $\text{HOOC}\cdot\text{CBr}_2\cdot\text{COOH}$.

Properties: Light yellow needles or prisms; m. p. 147°C (decomposes).

Use: Intermediate for drugs and fine chemicals.

dibromomalonyl chloride $\text{ClOCCBr}_2\text{COCl}$.

Properties: Yellowish oily liquid; b. p. 75-77°C (15 mm).

Use: Chemical intermediate.

dibromomethane. See methylene bromide.

dibromomethyl ether $(\text{CH}_2\text{Br})_2\text{O}$.

Properties: Colorless liquid. Decomposed by water. Caution! Very toxic! Soluble in acetone, benzene, ether, insoluble in water.

Constants: Sp. gr. 2.2; b. p. 154-155°C; m. p. -34°C.

Derivation: (a) The reaction product of paraformaldehyde and sulfuric acid is treated with ammonium bromide. (b) Interaction of hydrobromic acid and paraformaldehyde.

1, 5-dibromopentane. See pentamethylene dibromide.

1, 3-dibromopropane. See trimethylene bromide.

dibromopropanol (2, 3-dibromo-1-propanol) $\text{CH}_2\text{BrCHBrCH}_2\text{OH}$.

Properties: Sp. gr. (20/4°C) 2.120; b. p. 219°C (760 mm), 90°C (8 mm). Soluble in acetone, alcohol, ether and benzene.

Uses: Intermediate in preparation of flame retardants, insecticides and pharmaceuticals.

2, 6-dibromoquinone chlorimide

$\text{OC}_6\text{H}_2\text{Br}_2\text{NCl}$.

Properties: Yellow crystals; m. p. 83°C, b. p. 121°C (decomposes).

Derivation: Reduction product of dibromonitrophenol is oxidized with chlorine in presence of alkali.

"Dibs." ⁵⁷ Trademark for an accelerator for the vulcanization of rubber.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

dibucaine $C_{20}H_{29}N_3O_2$, 2-n-Butoxy-N-(2-diethylaminoethyl)cinchoninamide.

Properties: Colorless or almost colorless powder; m.p. 62-65°C. Odorless; somewhat hygroscopic; affected by light. Soluble in hydrochloric acid and ether, slightly soluble in water.

Grade: U.S.P. XVI.

Use: Medicine (local anesthetic).

dibucaine hydrochloride $C_{20}H_{29}N_3O_2 \cdot HCl$.

2-Butoxy-N-(2-diethylaminoethyl)cinchoninamide hydrochloride.

Properties: Fine, white, lustrous crystals or as white powder. Odorless and very hygroscopic. Bitter, acrid taste with prolonged local anesthetic action. M.p. 95-100°C (dec). Sensitive to light. Soluble in water, alcohol, acetone, and chloroform, slightly soluble in cold benzene, ethyl acetate, and toluene. Solutions are acid to litmus, pH 5-6.

Grade: U.S.P. XVI.

Use: Medicine (local anesthetic).

dibutoline sulfate $(C_{15}H_{33}N_2O_2)_2SO_4$. Bis[dibutylcarbamate of ethyl-(2-hydroxyethyl)dimethylammonium] sulfate.

Properties: Hygroscopic powder, decomposes 166°C, soluble in water and benzene.

Grades: N.N.D.

Uses: Surface active agent in medicine.

2,5-dibutoxyaniline $C_6H_3(OC_4H_9)_2NH_2$.

Properties: M.p. 18°C, insoluble in water, soluble in organic solvents.

Containers: 250-lb drums.

Uses: Dyes, synthesis.

1,4-dibutoxy benzene. See hydroquinone di-n-butyl ether.

dibutoxyethyl adipate $(C_2H_4COOC_2H_4OC_4H_9)_2$.

Properties: Colorless, oily liquid. Sp.gr. (20/20°C) 0.997, f.p. -34°C, boiling range 205-215°C (4 mm), acidity, (max) 0.03% as acetic acid, mild, butyl type odor; flash point 370°F, fire point 440°F, vapor pressure <0.17 mm (150°C), viscosity, 12.5 cps (20°C), refractive index, 1.442 (25°C), surface tension 33 dynes/cm (20°C), thermal expansion 0.00078 (10-40°C), wt/gal 8 lbs. Insoluble or only slightly soluble in mineral oil, glycerine, glycols and some amines, soluble in most other organic liquids.

Containers: 5-gal cans (40 lbs net), 55-gal steel drums (450 lbs net).

Uses: Primary plasticizer for most resins, imparting flexibility at very low temperature, as well as stability to ultraviolet light, and flexibility.

dibutoxyethyl phthalate $C_6H_4(COOC_2H_4OC_4H_9)_2$.

Properties: Colorless liquid; f.p. -55°C, sp.gr. 1.06 (20°C); b.p. 220-230°C (4 mm), wt/gal 8.86 lbs; fast to light, water resistant.

Containers: 1-, 5-gal cans, 55-gal drums, tank cars.

Uses: Plasticizer for polyvinyl chloride; polyvinyl acetate and other resins.

dibutoxymethane $CH_2(OC_4H_9)_2$.

Properties: Colorless liquid. Wt/gal 6.97 lbs (20°C), refractive index 1.40615 (20°C); sp.gr. 0.838 (20/20°C); flash point 60°C (140°F); boiling range 164-186°C. Insoluble in water. Solubility of water in product 1.0 cc/100 cc (20°C).

dibutoxytetraglycol $(C_2H_4OC_2H_4OC_4H_9)_2O$.

Properties: Practically colorless liquid with characteristic odor. Slightly soluble in water (1.3% by wt); sp.gr. 0.9436 (20/20°C); lbs/gal 7.85 (20°C); b.p. 237°C (50 mm), 330°C (760 mm); vapor pressure less than 0.01 mm (20°C), freezing point -20°C; viscosity 5.7 centipoises (20°C); flash point 355°F, solubility of water in product 4.8% by wt (20°C), refractive index 1.4357.

Containers: 5-, 55-gal drums.

Use: Solvent; excellent solvent for DDT.

N,N-di-n-butyl acetamide $CH_3CON(C_4H_9)_2$.

Properties: Sp.gr. 0.890 (20°C), boiling range 245-250°C, color water-white, odor faint. Flash point 225°F.

di-n-butylamine $(C_4H_9)_2NH$

Properties: Colorless liquid with amine odor. B.p. 159.6°C; freezing point -62°C, sp.gr. (20/20°C) 0.7613, wt/gal (20°C) 6.33 lbs, refractive index (n_D 20/D) 1.4175; flash point (open cup) 125°F. Insoluble in water, soluble in alcohol and ether, miscible with hydrocarbons.

Derivation: By reaction of butanol or butyl chloride with ammonia.

Grades: Technical.

Containers: 1-gal cans, 5-, 55-gal drums, tank cars

Uses: Corrosion inhibitor, intermediate for emulsifiers, rubber accelerators, dyes, insecticides, and flotation agents.

Shipping regulations: None.*

di-sec-butylamine $(CH_3CHCH_2CH_3)_2NH$.

Properties: Water-white liquid; amine odor; boiling range 132-135°C; sp.gr. 0.754 (20/20°C), refractive index 1.412 (20°C), flash point 75°F.

Shipping regulations: Flammable liquid. Red label.*

N,N-di-n-butylaminoethanol $(C_4H_9)_2NCH_2CH_2OH$.

Properties: Sp.gr. 0.859 (20°C), boiling range 224-232°C; color water-white; odor faint, amine-like. Flash point 200°F.

Containers: 5-gal cans, 55-gal drums, tank cars.

Use: Synthesis.

3-dibutylaminopropyl-para-aminobenzoate sulfate. See butacaine sulfate.

N,N-di-n-butylaniline $C_6H_5N(C_4H_9)_2$.

Properties: Amber liquid, odor faint aniline. Sp.gr. 0.904 (20°C), boiling range 267-275°C, refractive index 1.519 (20°C). Soluble in alcohol and ether; insoluble in water. Flash point 230°F.

2,5-di-tert-butyl benzoquinone $[C(CH_3)_3]_2C_6H_2O_2$.

Properties: Yellow crystals; insoluble in water; soluble in ethyl acetate, acetone,

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

benzene; slightly soluble in ethyl alcohol.
 Typical specifications: M.p. 149-151°C.
 Containers: Fiber drums, 75 lbs net.
 Uses: Oxidant; polymerization catalyst.

dibutyl butyl phosphonate $C_4H_9P(O)(OC_4H_9)_2$.
 Properties: Colorless liquid, with mild odor.
 Stable. Insoluble in water, miscible with most common organic solvents; sp. gr. 0.948 (20/4°C); b. p. 127-128°C (2.5 mm); flash point 310°F (C.O.C.).
 Containers: 5-gal, 55-gal steel drums.
 Uses: Heavy metal extraction and solvent separation, gasoline additives, anti-foam agent; plasticizer; textile conditioner and antistatic agent.

dibutyl "Carbitol." ²¹⁴ $C_4H_9O(C_2H_4O)_2C_4H_9$.
 Trademark for diethylene glycol dibutyl ether (q. v.).

dibutyl "Cellosolve." ²¹⁴ $C_4H_9OC_2H_4OC_4H_9$.
 Trademark for ethylene glycol dibutyl ether (q. v.).

dibutyl chlorophosphate $(C_4H_9O)_2P(O)Cl$.
 Properties: Water-white liquid; b. p. 103-106°C (1.5 mm); sp. gr. 1.0742 (25°C), refractive index 1.4289 (n 25/D). Soluble in common inert organic solvents, hydrolyzes slowly in water.
 Uses: Intermediate in organic synthesis.

di-tert-butyl-meta-cresol (DBMC; 4,6-di-tert-butyl-3-methylphenol) $[C(CH_3)_3]_2CH_3C_6H_2OH$.
 Properties: Crystalline solid; m. p. 62.1°C, b. p. 282°C, sp. gr. 0.912 (80/4°C), viscosity 9.9 centistokes (80°C), 1.42 centistokes (160°C), very soluble in ethanol, benzene, carbon tetrachloride, ethyl ether, and acetone; essentially insoluble in water, ethylene glycol, and 10% aqueous sodium hydroxide.

Typical specifications: Freezing point approx 48°C, bulk density, solidified material 56 lb/cu. ft., flash point (open cup) 262°F.

Containers: 5-gal pails, 55-gal black iron drums.

Caution: Contact with eyes, skin, or clothing should be avoided.

Uses: Rubber reclaiming; rubber compounding, surface-active agents; resins and plasticizers; antioxidants and perfumes.

di-tert-butyl-para-cresol (DBPC; 2,6-di-tert-butyl-4-methylphenol, butylated hydroxy-toluene, BHT) $[C(CH_3)_3]_2CH_3C_6H_2OH$.

Properties: White, crystalline solid, freezing point 70°C, b. p. 265°C, sp. gr. 1.048 (20/4°C), viscosity 3.47 centistokes (80°C), 1.54 centistokes (120°C), refractive index (n 75/D) 1.4859; soluble in methanol, ethanol, isopropanol, "Cellosolve" (12°C), petroleum ether, benzene, methyl ethyl ketone and linseed oil, insoluble in water and 10% sodium hydroxide.

Typical specifications: White to light-yellow color; free-flowing crystals; freezing point 68°C; flash point (open cup) 260°F, boiling range 257-266°C.

Grades: Technical; food; feed.

Containers: 5-gal pails; fiber drums containing 100 lbs net; tank cars.

Caution: Contact with the eyes, skin, or clothing should be avoided.

Uses: Antioxidant to stabilize hydrocarbons such as petroleum oils, gasoline, jet fuels, rubber, and vinyl monomers. Approved by the Food and Drug Administration for use as a food antioxidant; used in animal feeds, food packaging.

2,6-di-tert-butyl-alpha-dimethylamino-para-cresol ("Ethyl" Antioxidant 703) $(C_4H_9)_2C_6H_2OH[CH_2N(CH_3)_2]$.

Properties: Light yellow crystalline solid; m. p. 201°F; flash point 280°F (open cup). Insoluble in water and 10% sodium hydroxide; soluble in organic solvents.

Containers: 100-lb drums.

Use: Antioxidant in gasoline and oils.

dibutyl diphenyl tin $(CH_3CH_2CH_2CH_2)_2Sn(C_6H_5)_2$.

Properties: Clear, slightly greenish liquid; contains 30.7% Sn; b. p. 175°C (2 mm); refractive index 1.563 (17.5°C); sp. gr. 1.19.

di-tert-butyl disulfide $C(CH_3)_3SSC(CH_3)_3$.

Properties: Liquid, sp. gr. 0.9291 (60/60°F); boiling range 375-405°F; refractive index 1.491 (20°C); flash point 170°F (approx). Containers: 1-, 5-, 54-gal drums.

Use: Intermediate.

Shipping regulations: None.*

n-dibutyl ether. See butyl ether.

dibutyl fumarate $(C_4H_9)OOCCH:CHCOO(C_4H_9)$.

Properties: Liquid; sp. gr. (20°C) 0.9873; b. p. 285.2°C, f. p. -15.6°C refractive index n (20°C) 1.4466; insoluble in water.

Containers: Drums; tank trucks; tank cars.

Use: Monomeric plasticizers; copolymers; intermediate.

dibutyl hexahydrophthalate.

Constants: Sp. gr. 1.005; flash point 152°C; boiling range 185-190°C.

2,5-di-tert-butyl hydroquinone

$[C(CH_3)_3]_2C_6H_2(OH)_2$.

Properties: White powder; soluble in acetone, alcohol, benzene; insoluble in water, aqueous alkali.

Typical specifications M. p. 210-212°C.

Grade: Technical.

Containers: Fiber drums, 75 and 150 lbs net.

Uses: Polymerization inhibitor; antioxidant; stabilizer against ultraviolet deterioration of rubber.

di-n-butyl itaconate

$CH_2C(COOC_4H_9)CH_2(COOC_4H_9)$.

Properties: Clear, colorless liquid with slight odor. B. p. 145°C (10 mm); sp. gr. 0.9833 (22°C); refractive index (n 25/D) 1.442. Insoluble in water.

Uses: Resins; lube oil additives; plasticizers.

N,N-di-n-butyl lauramide $C_{11}H_{23}CON(C_4H_9)_2$.

Properties: Sp. gr. 0.861 (20°C); boiling range 200-230°C (3 mm); color straw; odor lauric acid.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

dibutyl maleate

Properties: Only liquid. B.p. 280.6°C; freezing point, sets to a glass below -85°C; sp. gr. 0.9964 (20/20°C); wt/gal 8.3 lb (20°C); flash point (open cup) 285°F. Insoluble in water.

Grade: Technical.

Containers: 1-, 5-, 55-gal drums; tank cars.

Uses: Copolymers; plasticizers; intermediate.

2,6-di-tert-butyl-4-methylphenol. See di-tert-butyl-para-cresol.

4,6-di-tert-butyl-3-methylphenol. See di-tert-butyl-meta-cresol.

dibutyl oxalate $(\text{COOC}_4\text{H}_9)_2$

Properties: Water-white, high-boiling liquid. Mild odor.

Constants: B.p. 240-250°C; refractive index 1.425, m.p. -30°C, wt/gal 8.24 lbs (approx)(20°C); coefficient of expansion/°C 0.00095; flash point 265°F (approx); viscosity (centipoises)(10% half sec. nitrocellulose solution) 800, water solubility, 100 cc solvent dissolves 0.5 cc water (25°C).

Typical specifications: Acidity, free acid as oxalic, not more than 0.05%; color water-white; distillation range below 240°C not more than 5%, below 248°C not less than 90%, above 255°C none, dryness, miscible without turbidity with 20 vol 60° Bé gasoline (20°C); non-volatile matter not more than 0.005 g/100 cc; odor mild; purity, ester content as dibutyl oxalate, not less than 99%; sp. gr. 0.989-0.993 (20/20°C). Miscible with most alcohols, ketones, esters, oils, hydrocarbons.

Derivation: By the standard esterification process using normal butyl alcohol and oxalic acid.

Grades: According to ester content 90%; 95%; 99-100%.

Containers: 1-gal (non-returnable) cans; 5-, 55-gal (non-returnable) steel drums; tank cars.

Uses: Organic synthesis; solvent.

Fire hazard: Combustible but not flammable.

Shipping regulations: None.*

di-tert-butyl peroxide $(\text{CH}_3)_3\text{COOC}(\text{CH}_3)_3$

Typical specifications: Purity 97%, b.p. 111°C; sp. gr. 0.794 (20/4°C); refractive index (n 20/D) 1.389; flash point (Tag open cup) 65°F; stated to be stable when stored for long periods at temperatures up to 80°C; insoluble in water.

Containers: 1-, 6-, 30-lb polyethylene bottles; 98-lb steel drums.

Use: Polymerization catalyst for vinyl type monomers at temperatures above 100°C; intermediate.

Shipping regulations: Flammable liquid.

Red label.*

2,4-di-tert-butylphenol $[(\text{CH}_3)_3\text{C}]_2\text{C}_6\text{H}_3\text{OH}$

Properties: Tan crystalline solid; f.p. 48°C; b.p. 152-157°C (25 mm); sp. gr. 0.907 (60/4°C); lbs/gal 7.57 (60°C); flash point: 265°F. Soluble in methanol, ether; very

slightly soluble in water.

Use: Intermediate.

2,6-di-tert-butylphenol $[(\text{CH}_3)_3\text{C}]_2\text{C}_6\text{H}_3\text{OH}$

Properties: Light straw crystalline solid; m.p. 37°C; sp. gr. 0.914 (20°C); b.p. 253°C; flash point 245°F. Soluble in alcohol and benzene; insoluble in water.

Use: Intermediate.

dibutyl phosphite $(\text{C}_4\text{H}_9\text{O})_2\text{PHO}$

Properties: Water-white liquid; b.p. 95°C (1 mm); sp. gr. 0.9860 (25°C); refractive index 1.4228 (n 25/D); soluble in common organic solvents.

Containers: Carboys.

Uses: Solvent; antioxidant; intermediate.

dibutyl phthalate (DBP) $\text{C}_6\text{H}_4(\text{COOC}_4\text{H}_9)_2$

Properties: A colorless, odorless, non-volatile, non-toxic, stable, oily liquid. Sp. gr. 1.0484 (20/20°C); f.p. -35°C; viscosity 0.203 poise (20°C); distillation range 227-235°C (37 mm Hg); flash point (Cleveland open cup) 340°F; wt/gal 8.72 lbs (68°F); approx. change in wt 0.0016 lb/gal/°F; refractive index 1.4915 (25°C); coefficient of expansion 0.00042/°F, 0.00078/°C; dilution ratio (nitrocellulose solution method) 2.7 with toluene, 1.7 with petroleum naphtha, b.p. 340.0°C; vapor pressure 1.1 mm (150°C). Miscible with the common organic solvents; very slightly soluble in water.

Derivation: By treating n-butyl alcohol with phthalic anhydride followed by purification, which results in a product unusually free from odor and color.

Grades: Technical, 99-100% dibutyl phthalate.

Containers: Crated cans (1-, 5-gals); 5-, 10-, 50-, 100-gal steel drums; tank cars and trucks.

Uses: Plasticizer; solvent for perfume oils; perfume fixative, textile lubricating agent; safety glass; leather dopes; insecticides; printing inks; resin solvent; paper coating; adhesives; as plasticizer in solid rocket propellants.

Shipping regulations: None.*

2,5-di-tert-butyl quinone $[\text{C}(\text{CH}_3)_3]_2\text{C}_6\text{H}_2\text{O}_2$

Typical specifications: Yellow powder; m.p. 149-151°C; insoluble in water; soluble in alcohol, acetone, ethyl acetate, and benzene.

Use: Oxidizing agent.

dibutyl sebacate $\text{C}_4\text{H}_9\text{OCO}(\text{CH}_2)_8\text{OCOC}_4\text{H}_9$

Properties: Clear, colorless, odorless liquid. B.p. 349°C (760 mm), 180°C (3 mm); f.p. -11°C, sp. gr. 0.936 (20/20°C); wt/gal 7.81 lb (20°C); refractive index 1.4395 (25°C); flash point 350°F. Insoluble in water.

Grade: Technical.

Containers: 1-, 5-, 55-gal drums; tank cars.

Uses: Plasticizer; rubber softener; component of cosmetics and perfumes; in sealing rings for food containers.

Shipping regulations: None.*

N,N-dibutyl stearamide $\text{C}_{17}\text{H}_{35}\text{CON}(\text{C}_4\text{H}_9)_2$

Properties: Yellow; sp. gr. 0.860 (20/20°C);

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

boiling range 173-175°C (0.4 mm); flash point 420°F; fatty-acid odor.

di-tert-butyl sulfide $[(C_4H_9)_3C]_2S$.

Properties: Liquid; f.p. 12.3°F; boiling range 297-303°F; sp. gr. 0.8316 (60/60°F); wt/gal 6.93 lbs; refractive index 1.451 (20°C); flash point (approx) 100°F.

Containers: 1-, 5-gal drums.

Use: Intermediate.

Shipping regulations: None.*

dibutyl tartrate $C_4H_9OOCCHOHCHOHCOOC_4H_9$.

Properties: Liquid. M.p. 21°C; b.p. approx. 204°C (26 mm); refractive index 1.4463 (20°C); flash point 132.2°C (270°F); wt/gal 9.07 lbs (68°F). Typical specifications: Purity not less than 98% ester, by wt; sp. gr. 1.087-1.093 (20/20°C); acidity not more than 0.05%, calculated as tartaric acid; water, no turbidity when 1 vol is mixed with 19 vols of 60° BÉ. gasoline at 20°C; color light straw. Miscible with the common organic solvents, oils, hydrocarbons.

Grade: Technical.

Containers: 1-gal cans; 5-, 55-gal steel drums. Net content 10, 45, 490 lbs.

Uses: Solvent for nitrocellulose, cellulose acetate; plasticizer for nitrocellulose, cellulose acetate, other cellulose esters and ethers, synthetic resins; lubricant; rubberized fabrics, lacquers; dopes; transfer inks.

Shipping regulations: None.*

dibutylthiourea $C_4H_9NHCSNHC_4H_9$.

Properties: White to light tan solid; m.p. 59-69°C; slightly soluble in water, soluble in methanol, ether, acetone, benzene, ethyl acetate; insoluble in gasoline.

Uses: Corrosion inhibitor; for pickling cast iron or carbon steel with hydrochloric acid; for pickling with sulfuric acid; for reducing corrosion of ferrous metals and aluminum alloys in brine, as intermediate.

dibutyltin diacetate $(C_4H_9)_2Sn(C_2H_3O_2)_2$.

Properties: Clear yellow liquid. B.p. 130°C (2 mm); f.p. below 12°C. Soluble in water and most organic solvents.

Derivation: Reaction of acetic acid with dibutyltin oxide.

Uses: Stabilizer for chlorinated organics; catalyst for condensation reactions.

dibutyltin dichloride $(C_4H_9)_2SnCl_2$.

Properties: White crystalline solid; m.p. 43°C; b.p. 135°C (10 mm); sp. gr. 1.36 (50°C, liquid); refractive index 1.4991 (51°C).

Derivation: Reaction of butylmagnesium chloride with tin tetrachloride.

Use: Organo-tin intermediate.

dibutyltin di-2-ethylhexoate

Properties: Waxy white solid. F.p. below 65°C. Insoluble in water; soluble in most organic solvents.

Derivation: Reaction of dibutyltin oxide with 2-ethylhexoic acid.

Uses: Catalyst for silicone curing; polyether foams.

dibutyltin dilaurate $(C_4H_9)_2Sn(OOCC_{11}H_{23})_2$.

Properties: Colorless crystals; sp. gr. 1.052 (20/20°C); f.p. 8°C; flash point 440°F; viscosity 45cps (20°C); insoluble in water.

Derivation: Reaction of lauric acid with dibutyltin oxide.

Containers: 1-, 5-, and 55-gal drums (8.5, 40 and 450 lbs).

Uses: Catalyst for polyurethane foams and resins; condensation catalyst; stabilizer for polyvinyl chloride resins; anthelmintic.

dibutyltin maleate $[(C_4H_9)_2Sn(OOCC_4H_7)_2]_x$.

Properties: White amorphous powder; m.p. 110°C. Insoluble in water; soluble in benzene and organic esters.

Derivation: Reaction of maleic acid with dibutyltin oxide.

Uses: Stabilizer for polyvinyl chloride resins; condensation catalyst.

dibutyltin oxide $[(C_4H_9)_2SnO]_x$.

Properties: White powder; m.p. (decomposes). Insoluble in water.

Derivation: Hydrolysis of dibutyltin dichloride with caustic.

Uses: Condensation catalysts; intermediate for other organotins.

dibutyltin sulfide $[(C_4H_9)_2SnS]_3$.

Properties: Colorless oily liquid.

Derivation: Reaction of dibutyltin oxide with hydrogen sulfide.

Uses: Vinyl stabilizer; antioxidant; lubricating additive.

1,1-dibutylurea (N,N-dibutylurea)

$NH_2CON(C_4H_9)_2$. Solidification point 22-25°C, boiling range 118-119°C (2-3 mm); soluble in alcohol and ether. Copolymerized with simple urea by the use of formaldehyde, yields modified resins that differ in nature from those made through the use of the mono-substituted ureas. These resins tend to be permanently thermoplastic.

DIC. Abbreviation for beta-diisopropylamino-ethyl chloride hydrochloride.

dicalcium magnesium aconitate (calcium magnesium aconitate) $[C_2H_3(COO)_3]_2Ca_2Mg$.

Properties: White crystalline powder or lumps.

Derivation: By precipitation from cane molasses with lime.

Grades: Technical.

Containers: 100-lb paper bags.

Uses: Conversion to aconitic acid, tributyl aconitate and similar ester plasticizers.

dicalcium orthophosphate. See calcium phosphate, dibasic.

"Dicalcium Phosphate V-25."¹⁷² Trade name for a dentifrice grade dicalcium phosphate dihydrate, $CaHPO_4 \cdot 2H_2O$, plus a proprietary additive.

Derivation: From lime and high quality phosphoric acid.

Containers: Bags and bulk boxes.

Use: Polishing agent in dentifrices.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

"Dicalcium Phosphate Victor." ¹⁷² Trade name for a dentifrice grade dicalcium phosphate dihydrate, $\text{CaHPO}_4 \cdot 2\text{H}_2\text{O}$, plus a proprietary additive.

Derivation: Lime and high quality phosphoric acid.

Containers: Bags, drums, and bulk boxes.

Uses: Polishing agent in dentifrices.

dicalcium silicate $2\text{CaO} \cdot \text{SiO}_2$. One of the components of cement. See cement, Portland, and other cement articles. It is also obtained as a byproduct in electric furnace operation, and is used to neutralize acid soils.

"Dicalite." ²¹⁸ Trade name for a large group of materials processed from diatomite (also called diatomaceous earth, diatomaceous silica, kieselguhr, and sometimes DE) and having a wide range of industrial uses. Crude diatomite averages about 90% silicon dioxide.

Properties: "Dicalite" materials are amorphous in form, comparatively soft and friable, free from gritty matter, and chemically inert. They consist of finely divided particles and are light in weight, varying in color according to grade from pure white, gray white, light cream to buff-pink. Gardner-Coleman oil absorption, 90 to 170; particle size, from 1 to 16% retained on a No. 325 mesh screen, maximum moisture content, 0.5 to 5%; average refractive index, 1.48.

Containers: 50-lb multi-wall paper bags.

Uses: "Dicalite" processed materials include filter aids for filtration of all types of liquids; fillers for paints, paper, asphalt products; etc; insulation for high temperature equipment, catalyst carriers, and conditioning agents for chemical fertilizers; general materials such as absorbents, extenders, concrete admixture, insecticide carriers, etc.

dicapryl adipate $\text{C}_8\text{H}_{17}\text{OOC}(\text{CH}_2)_4\text{COOC}_8\text{H}_{17}$.

See note on capryl in next article.

Properties: Almost water-white liquid, b.p. (4 mm) 213-216.5°C. Good low-temperature qualities.

Use: Plasticizer used with vinyl resins and cellulose esters.

dicapryl phthalate (DCP, d_1 -(2-octyl) phthalate) $(\text{C}_8\text{H}_{17}\text{COO})_2\text{C}_6\text{H}_4$. The term capryl is common trade usage for the 2-octanol or sec-octyl derivative.

Properties: Nearly colorless, viscous liquid, b.p. (4.5 mm) 227-234°C; refractive index (20°C) 1.480; sp.gr. (25°C) 0.965; flash point 395°F. Insoluble in water, compatible with vinyl chloride resins and some cellulosic resins.

Grades: Technical.

Containers: Drums; tank cars.

Uses: Plasticizer for vinyl and cellulosic resins.

dicapryl sebacate $\text{C}_8\text{H}_{17}\text{OOC}(\text{CH}_2)_8\text{COOC}_8\text{H}_{17}$.

See note on capryl above.

Properties: Light straw colored liquid; b.p. (4 mm) 231.5-239°C; non-volatile; excellent

low-temperature flexibility.

Containers: Drums; tank cars.

Use: Plasticizer used with vinyl resins and acrylonitrile rubber.

dicapthan O-(2-chloro-4-nitrophenyl) O,O-dimethyl phosphorothioate. Used as insecticide with characteristics similar to parathion. Accepted as generic name by Ent. Soc.

dicetyl. See dotriacontane.

dicetyl ether (dihexadecyl ether).

Properties: Crystals; f.p. 54°C; b.p., decomposes at 300°C; sp.gr. 0.8117 (54/4°C).

Grade: 97% purity (min).

Uses: Electrical insulators; water repellents; lubricants in plastic molding and processing; antistatic substances; chemical intermediates.

dicetyl sulfide (dihexadecyl thioether; dihexadecyl sulfide) $(\text{C}_{16}\text{H}_{33})_2\text{S}$.

Properties: Solid, m.p. 57-58°C; b.p., decomposes; sp.gr. 0.8253 (60/4°C).

Grades: 95% (min) purity.

Uses: Organic synthesis (formation of sulfonium compounds).

dichloro (2,3-dichloro-1, 4-naphthoquinone) $\text{C}_{10}\text{H}_4\text{Cl}_2\text{O}_2$.

Properties: Yellow needles; m.p. 193°C; soluble in xylene and ortho-dichlorobenzene; slightly soluble in ethyl alcohol, glacial acetic acid and carbon tetrachloride; almost insoluble in water.

Uses: Seed disinfectant; fungicide for foliage and textiles; insecticide.

Caution! Avoid contact with skin. MCA warning label.

dichloro-. See dichloro-.

dichloramine-T (para-toluenesulfondichloroamide) $\text{CH}_3\text{C}_6\text{H}_4\text{SO}_2\text{NCl}_2$. See also chloramine-T.

Properties: Pale yellow crystals or yellow crystalline powder, containing not less than 28% nor more than 30% active chlorine; chlorine odor; stable when pure; decomposed slowly by air, rapidly by impurities, petrolatums, kerosene, olive oil, and alcohol. Soluble in glacial acetic acid, chlorinated paraffin hydrocarbons, eucalyptol, benzene, chloroform and carbon tetrachloride; almost insoluble in water. M.p. 80°C.

Derivation: The product of a reaction between toluene-para-sulfonamine and calcium hypochlorite solution is acidified with acetic acid and subjected to extraction by chloroform. The chloroform solution is dried chemically, filtered and evaporated.

Use: Medicine.

Shipping regulations: None.*

"Dichloran." ⁴³⁰ Trade name for a high-alkyl dimethyl dichlorobenzyl ammonium chloride. Used as an antiseptic.

"Dichloricide." ¹²³ Trademark for deodorizers, insecticides and insect repellents.

dichlorinated-. See dichloro-.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

dichlorisone acetate 9alpha, 11beta-Dichloro-1, 4-pregnadiene-17alpha, 21-diol-3, 20-dione-21-acetate.

Properties: A chlorinated steroid. Available as liquid and cream.

Containers: Aerosol containers; bottles.

Uses: Topical therapy in medicine.

dichloroacetaldehyde CHCl_2CHO .

Properties: Colorless flammable liquid, with a penetrating pungent odor; density (25°C) 12.1 lbs/gal.

Containers: 55-gal drums; tank cars.

Use: Manufacture of insecticides.

dichloroacetic acid (bichloroacetic acid; Urner's liquid) CHCl_2COOH .

Properties: Colorless liquid; sp. gr. 1.5724 (13°C); m. p. -4°C; b. p. 193-194°C.

Soluble in water, alcohol, and ether.

Crystalline form, m. p. +9.3°C.

Derivation: By careful chlorination of acetic acid in the presence of iodine.

Containers: Bottles; 150-lb carboys.

Uses: Intermediate; pharmaceuticals.

2, 5-dichloroacetoacetanilide

$\text{CH}_3\text{COCH}_2\text{CONHC}_6\text{H}_4\text{Cl}_2$. White, crystalline solid. M. p. 96°C.

alpha, alpha-dichloroacetophenone

$\text{C}_6\text{H}_5\text{COCHCl}_2$. Crystals; sp. gr. 1.34 (15°C); b. p. 247°C (dec); m. p. 20-21.5°C.

2, 5-dichloroaniline $\text{C}_6\text{H}_3\text{NH}_2\text{Cl}_2$.

Properties: Light brown or amber-colored crystalline mass. Insoluble in water; soluble in alcohol, benzene, and dilute hydrochloric acid. M. p. 47-50°C; b. p. 251-252°C.

Derivation: Nitration of para-dichlorobenzene with subsequent reduction.

Method of purification: Steam or vacuum distillation.

Grade: Technical (96%).

Containers: 500-lb net barrels, kegs; fiber drums.

Use: Dye intermediate.

Shipping regulations: None.*

3, 4-dichloroaniline $\text{Cl}_2\text{C}_6\text{H}_3\text{NH}_2$.

Properties: Crystals, m. p. 68-72°C; b. p. 272°C. Insoluble in water; soluble in most organic solvents.

Grade: Technical.

Containers: Up to tank cars.

Uses: Dye intermediate; intermediate for biologically active compounds.

2, 5-dichloroaniline sulfate

$\text{Cl}_2\text{C}_6\text{H}_3\text{NH}_2 \cdot \frac{1}{2}\text{H}_2\text{SO}_4$.

Properties: White powder.

Containers: Fiber kegs; polythene-lined steel drums.

Use: Intermediate.

2, 4-dichlorobenzaldehyde $\text{C}_6\text{H}_3\text{CHOCl}_2$.

Properties: White crystalline solid; b. p. 233°C; m. p. 65-67°C. Soluble in methanol, absolute alcohol, ether and acetone; slightly soluble in ethanol; insoluble in water.

Containers: Fiber drums.

Use: As an intermediate in the manufacture

of pharmaceuticals, dyes, and other organic chemicals.

2, 5-dichlorobenzaldehyde $\text{C}_6\text{H}_3\text{Cl}_2\text{CHO}$.

Properties: White crystals; soluble in alcohol and ether.

Derivation: By the chlorination of benzaldehyde in presence of iodine or antimony.

Use: As an intermediate.

3, 4-dichlorobenzaldehyde $\text{C}_6\text{H}_3\text{Cl}_2\text{CHO}$.

Properties: White crystalline solid; b. p. 230°C; m. p. 34-36°C; soluble in alcohol, ether, and acetone; slightly soluble in methanol and amyl ether, insoluble in water.

Containers: Fiber drums.

Uses: As an intermediate in the manufacture of pharmaceuticals, dyes, and other organic chemicals.

1, 2-dichlorobenzene. See ortho-dichlorobenzene.

1, 3-dichlorobenzene. See meta-dichlorobenzene.

1, 4-dichlorobenzene. See para-dichlorobenzene.

meta-dichlorobenzene (1, 3-dichlorobenzene) $\text{C}_6\text{H}_4\text{Cl}_2$.

Properties: Colorless liquid. Sp. gr. 1.288 (20/4°C); b. p. 172°C; m. p. -24°C; refractive index (20.9°C) 1.5457. Soluble in alcohol and ether, insoluble in water.

Derivation: By the further chlorination of mono-chlorobenzene.

ortho-dichlorobenzene (ortho-dichlorobenzol; 1, 2-dichlorobenzene) $\text{C}_6\text{H}_4\text{Cl}_2$.

Properties: Colorless, limpid, volatile, stable, heavy liquid. Pleasant, aromatic odor; consists of a mixture composed principally of the ortho- compound which contains varying amounts of para- and meta-isomers. Considered nonflammable although it will burn when ignited.

Purified Grade: Sp. gr. 1.305 (25°C); wt/gal 10.9 lbs; chief impurities (para-dichlorobenzene, trichlorobenzene) not over 4%; boiling range 178-180.5°C; f. p. not below -19°C, flash point 79°C (Tag closed cup).

Technical Grade: Sp. gr. 1.284; wt/gal 10.7 lbs; chief impurities (para-dichlorobenzene, trichlorobenzene) not over 15%; boiling range 172-179°C; f. p. below -20°C. Miscible with most organic solvents, insoluble in water.

Derivation: By the further chlorination of mono-chlorobenzene.

Method of purification: Rectification.

Grades: Technical; purified.

Containers: 5-, 10-, 55-, 110-gal drums; tank cars.

Uses: Solvent for resins, tars, heavy greases, gums, hides, wool, waxes, sulfur, organic sulfur derivatives, acetylcellulose, and for oxides of nonferrous metals; paints, varnishes, lacquers; paint and varnish removers; metal polishes; polishing and cleaning compounds; spotting fluid for dry-cleaners; tar solvent valuable in removing tarry residues from stills and other equipment; organic synthesis;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

termite exterminator; insecticide; solvent for repellents and preservatives in wood preservation; fumigant; removing sulfur from illuminating gases; heat-transfer fluid.

Shipping regulations: None.*

para-dichlorobenzene (1,4-dichlorobenzene; PDB) $C_6H_4Cl_2$. Widely used to protect clothing from moths.

Properties: White crystals; volatile (sublimes readily, leaving no residue); penetrating odor. Sp. gr. 1.458; b. p. 173.7°C; m. p. 53°C; flash point 67°C. Soluble in alcohol, benzene, and ether; insoluble in water.

Derivation: By the further chlorination of mono-chlorobenzene.

Grade: Technical.

Containers: Steel barrels; drums.

Uses: Insecticide; germicide; deodorant; dyes; intermediates; pharmacy; moth-proofing compositions; agriculture (fumigating soil to control the peach-tree borer; destruction of the sugar-cane grub, etc.).

N,N-dichlorobenzenesulfonamide $C_6H_5SO_2NCl_2$.

Properties: Solid; fine crystals; white color; m. p. 68-71°C.

Containers: Glass bottles; fiber drums.

Uses: A source of positive chlorine.

3,3'-dichlorobenzidine

$C_6H_3Cl_2NH_2C_6H_3Cl_2NH_2$.

Properties: Crystalline solid; soluble in alcohol and ether; m. p. 133°C.

Derivation: By the chlorination of diacetylbenzidine and subsequent saponification.

Use: Intermediate for dyes and pigments.

4,4'-dichlorobenzilic acid ethyl ester. See ethyl 4,4'-dichlorobenzilate.

2,4-dichlorobenzoic acid $Cl_2C_6H_3CO_2H$.

Properties: White to slightly yellowish powder; m. p. 158-162°C. Soluble in alcohol, ether, acetone, 5% caustic. Insoluble in water and heptane.

Grades: Assay 98% min on dry basis, ash 0.20% max.

Containers: Wooden barrels; fiber drums.

Uses: Intermediate for the preparation of antimalarials, dyes, fungicides, pharmaceuticals and other organic chemicals.

3,4-dichlorobenzoic acid $Cl_2C_6H_3CO_2H$.

Properties: White to slightly yellowish powder; m. p. 202-204°C; soluble in alkali, alcohol, ether, and acetone; slightly soluble in diacetone; insoluble in water, ethylene dichloride, and toluene.

Grade: Technical.

Containers: 200-lb wooden barrels; fiber drums.

Uses: An intermediate in the manufacture of pharmaceuticals, dyes, and other organic chemicals.

2,4-dichlorobenzotrithloride $Cl_2C_6H_3CCl_3$.

Properties: White crystalline solid; boiling range (typical) first drop 278°C, 50% 287°C, dry 292°C; f. p. (approx.) 45-48°C. Soluble in alcohol; insoluble in water.

Containers: Fiber drums.

3,4-dichlorobenzotrithloride $Cl_2C_6H_3CCl_3$.

Properties: Water-white liquid; boiling range (typical) first drop 276°C, 50% 281°C, dry 285°C; f. p. (approx.) 24.0°C; sp. gr. 1.585-1.590 (25/15°C). Soluble in alcohol, ether, and acetone; insoluble in water.

Grades: Technical.

Containers: Glass carboys.

Uses: As an intermediate in the manufacture of pharmaceuticals, dyes, and other organic chemicals.

2,4-dichlorobenzoyl chloride $Cl_2C_6H_3COCl$.

Properties: Colorless liquid; boiling range (typical) first drop 250°C, 50% 256°C, dry 260°C; f. p. 15-16°C; sp. gr. 1.500-1.510 (25/15°C). Soluble in alcohol, ether, and acetone; slightly soluble in heptane; insoluble in water.

Containers: Glass carboys.

Uses: As an intermediate in the manufacture of pharmaceuticals, dyes, and other organic chemicals.

3,4-dichlorobenzoyl chloride $Cl_2C_6H_3COCl$.

Properties: Colorless liquid; boiling range (typical) first drop 255°C, 50% 260°C, dry 270°C; f. p. 20-25°C; sp. gr. 1.508-1.513 (25/15°C). Soluble in alcohol, ether, and acetone; slightly soluble in heptane; insoluble in water.

Containers: Glass carboys.

Uses: As an intermediate in the manufacture of pharmaceuticals, dyes, and other organic chemicals.

2,4-dichlorobenzyl chloride $Cl_2C_6H_3CH_2Cl$.

Properties: Colorless liquid; boiling range (typical) first drop 245°C, 50% 248°C, dry 252°C; sp. gr. 1.415-1.420 (25/15°C). Soluble in alcohol, ether, and acetone; insoluble in water.

Containers: Glass carboys.

Uses: As an intermediate for the preparation of organic chemicals, pharmaceuticals, and dyes.

3,4-dichlorobenzyl chloride $Cl_2C_6H_3CH_2Cl$.

Properties: Colorless liquid; boiling range (typical) first drop 255°C, 50% 258°C, dry 260°C; sp. gr. 1.410-1.415 (25/15°C). Soluble in alcohol, ether, and acetone; insoluble in water.

Containers: Glass carboys.

1,1-dichloro-2,2-bis(para-ethylphenyl) ethane (diethyldiphenyldichloroethane; "Perthane"; 2,2-bis(para-ethylphenyl)-1,1-dichloroethane; di(para-ethylphenyl)dichloroethane) $CHCl_2CH(C_6H_4C_2H_5)_2$.

Properties: Crystals; m. p. 56-57°C. Soluble in acetone, kerosene, diesel fuel.

Caution: Similar to DDT as to toxicity.

Use: Insecticide, formulated as emulsifiable concentrate or wettable powder. Used especially in aerosols against insects, including moths.

1,4-dichlorobutane (tetramethylene dichloride; DCB) $ClCH_2(CH_2)_2CH_2Cl$.

Properties: Colorless, mobile liquid having a mild, pleasant odor. Sp. gr. 1.141

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

(20/4°C); boiling point 155°C (760 mm); flash point 104°F (Tag closed cup); refractive index (n_{20/D}) 1.4542. Insoluble in water; soluble in most common organic solvents.

Containers: 9-lb (1-gal) containers; 45-, 500-lb drums; 76,000-lb tank cars.

Use: Organic synthesis, including adiponitrile.

1,3-dichlorobutene-2 $\text{ClH}_2\text{CCH:CClCH}_3$.

Properties: Clear to straw-colored liquid; b.p. 125-130°C.

1,4-dichlorobutene-2 $\text{ClH}_2\text{CCH:CHCH}_2\text{Cl}$.

Properties: Colorless liquid, distinct odor. Miscible with benzene, alcohol, carbon tetrachloride. Immiscible with ethylene glycol, glycerine, and water.

Constants: B.p. 158°C (760 mm), 60°C (20 mm); m.p. 3.5°C; sp. gr. 1.1858 (25/4°C); refractive index (n_{25/D}) 1.4863.

Grades: Available as 95-98% trans-isomer, 2-5% cis-isomer. Above constants are for the pure trans-isomer.

Containers: Up to tank cars.

Use: Intermediate.

Caution! Contact with skin results in large blisters. Dilute vapor irritating to the eyes.

dichlorocarbene CCl_2 . Exists only at low temperatures and pressures. M.p. -114°C;

b.p. -20°C; decomposes on distillation at normal pressure to hexachloroethane and hexachlorobenzene. It reacts explosively with carbon; forms phosgene with oxygen.

Derivation: Reaction of carbon tetrachloride vapor with carbon at 1300°C and 10^{-3} mm Hg.

Use: Research.

2,4-dichloro-6-ortho-chloroanilino-s-triazine ("Dyrene") $(\text{C}_6\text{H}_5\text{NCl})\text{C}_3\text{N}_3\text{Cl}_2$.

Properties: Tan crystalline solid; m.p. 159-160°C; insoluble in water.

Uses: Foliage fungicide.

dichloro(2-chlorovinyl)arsine. See chlorovinyl-dichloroarsine.

2,2'-dichlorodiethyl ether. See dichloroethyl ether.

dichlorodiethyl formal. See dichloroethyl formal.

dichlorodiethyl sulfide (mustard gas; dichloroethyl sulfide) $\text{S}(\text{CH}_2\text{CH}_2\text{Cl})_2$.

Caution: Deadly vesicant war gas; causes conjunctivitis and blindness! Can be decontaminated by chloramines or bleaching powder.

Properties: Pure product: Colorless oily liquid. Technical product: Brown, oily liquid; pungent odor. Evaporates very slowly; absorbed by rubber; penetrates leather, textile fabrics. Decomposed by water. Sp. gr. 1.2741 (20°C); sp. volume 0.785 (20°C), b.p. 217.5°C (760 mm); m.p. 14.4°C (technical grade subject to impurities present); vapor density 5.4; vapor pressure 0.115 mm (20°C); volatility 0.625 mg/liter; latent ht. of fusion 25 cal;

refractive index 1.53125; coefficient of thermal expansion 0.000881. Soluble in alcohol, benzene, ether, kerosene, chlorinated solvents, carbon disulfide, fats, and oils; sparingly soluble in water.

Derivation: Bubbling ethylene through sulfur chloride; also from thiodiglycol and hydrogen chloride.

Grades: Pure; technical (containing excess sulfur as a polysulfide).

Use: Organic synthesis; military poison gas.

Shipping regulations: Poison, class A.

Poison gas label. Not accepted by express.

Legal label name: mustard gas.*

dichlorodiethyl sulfone $(\text{CH}_2\text{CH}_2\text{Cl})_2\text{O}_2\text{S}$.

Properties: Colorless crystals. Caution!

Irritant! B.p. 179-181°C (14-15 mm);

m.p. 52°C. Soluble in alcohol, chloroform, and ether; slightly soluble in water.

dichlorodifluoromethane (difluorodichloromethane; fluorocarbon-12) CCl_2F_2 .

Properties: Colorless, odorless, noncorrosive gas. B.p. -29.8°C; m.p. -158°C;

sp. gr. 1.486 (-30°C); critical pressure 43.2 atm. Slightly soluble in water;

soluble in most organic solvents.

Derivation: (a) Reaction of carbon tetrachloride and hydrogen fluoride, in the presence of an antimony halide catalyst; (b) high temperature chlorination of vinylidene fluoride (vinylidene fluorides made by addition of hydrogen fluoride to acetylene).

Method of purification: Distillation.

Containers: Cylinders.

Uses: Refrigerant and air conditioner; aerosol propellant; plastics.

Shipping regulations: Nonflammable gas.

Green label.*

1,3-dichloro-5,5-dimethylhydantoin (DDH) $\text{CINCONCICOC}(\text{CH}_3)_2$.

Properties: White powder with mild chlorine odor. M.p. approximately 130°C; sublimes about 100°C without decomposition. Contains approximately 36% active chlorine.

Slightly soluble in water with gradual liberation of hypochlorous acid; soluble in benzene, chloroform, ethylene dichloride, alcohol.

Derivation: By chlorination of dimethylhydantoin.

Grades: Technical.

Containers: Boxes; 200-lb drums.

Uses: Household laundry bleach; water treatment; mild chlorinating agent.

dichlorodinitromethane $\text{Cl}_2\text{C}(\text{NO}_2)_2$.

Properties: Liquid; b.p. 40°C (12 mm).

Derivation: Action of (fuming) nitric acid upon dichloroformoxime.

dichlorodiphenyldichloroethane. See TDE.

dichlorodiphenyltrichloroethane. See DDT.

1,1-dichloroethane. See ethylidene chloride.

1,2-dichloroethane. See ethylene dichloride.

sym-dichloroethane. See ethylene dichloride.

dichloroether. See dichloroethyl ether.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

dichloroethoxymethane. See dichloroethyl-formal.

dichloroethyl acetate $\text{CH}_3\text{COOCH}_2\text{CH}_2\text{Cl}$.

Properties: Water-white liquid. Sp. gr. 1.296 (20°C); boiling range: first drop 58°C, dry 65°C (13 mm); m. p. < -32°C; flash point 153°C; refractive index 1.444 (20°C); b. p., dec. Miscible with alcohol and ethyl ether. Immiscible with water. Use: Organic synthesis.

dichloroethylarsine. See ethyldichloroarsine.

dichloroethylcarbonate $(\text{ClH}_2\text{CCH}_2\text{O})_2\text{CO}$.

Properties: Colorless liquid. Slowly hydrolyzed by alkalis. Volatile in steam. Sp. gr. 1.3506 (20°C); b. p. 240°C (partial decomposition). Insoluble in water.

Derivation: By heating ethylene chlorohydrin and trichloromethylchloroformate together (under reflux).

sym-dichloroethylene (acetylene dichloride) ClHC:CHCl . Exists as cis and trans isomers.

Properties: Colorless, low-boiling, slightly toxic liquid. Pleasant odor. The hot vapors can be ignited but will not continue to burn unless heat is supplied. It decomposes slowly on exposure to air, light and moisture. Soluble in usual organic solvents, insoluble in water. Trans-isomer: sp. gr. 1.257; b. p. 47-49°C. Cis-isomer: sp. gr. 1.282, b. p. 58-60°C.

Derivation: Two stereoisomeric compounds made by the partial chlorination of acetylene.

Grades: Technical; as cis, trans, and mixture of both.

Containers: 300-, 550-lb drums.

Uses: Solvent for oils, gums, resins, waxes, rubber, shellac, and cellulose acetate; solvent mixtures for cellulose esters and ethers, dye extraction; perfumes, lacquers; thermoplastics; rubber, organic synthesis, medicine.

Warning: Flammable. MCA warning label.

Shipping regulations: Flammable liquid. Red label.*

dichloroethyl ether (dichloroether; dichloroethyl oxide; 2, 2'-dichlorodiethyl ether; sym-dichloroethyl ether) $\text{ClCH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{Cl}$.

Properties: Colorless, stable, non-corrosive liquid. Odor like that of ethylene dichloride. Vapor harmful! B. p. 178.5°C; sp. gr. 1.2220 (20/20°C); wt/gal 10.2 lbs (20°C); refractive index 1.457 (20°C), surface tension 41.8 dynes/cm (25°C); vapor pressure 0.7 mm (20°C), specific heat 0.369 cal (20-30°C); latent heat of evaporation 64.1 cal/g (178°C), flash point (closed cup) 55°C (131°F); apparent ignition temperature in air 396°C (745°F); viscosity 2.95 centipoise (20°C); f. p. -51.8°C. Miscible with most organic solvents; immiscible with the paraffin hydrocarbons; insoluble in water.

Derivation: Chlorination of ethyl ether.

Grades: Technical.

Containers: Glass bottles; iron drums; tank

cars.

Uses: Solvent for fats, oils, waxes, gums, tars, pectins, resins, soaps, ethylcellulose; selective solvent for production of high grade lubricating oils; solvent mixtures for cellulose esters and ethers; textile scouring and cleansing; fulling compounds; wetting and penetrating compounds; organic synthesis; paints, varnishes, lacquers; finish removers; spotting and dry cleaning; soil fumigant.

Danger! Hazardous liquid and vapor. May be fatal if swallowed or inhaled. MCA warning label.

Shipping regulations: None.*

sym-dichloroethyl ether. See dichloroethyl ether.

dichloroethyl formal (dichlorodiethyl formal; bis(2-chloroethoxy)methane; dichloroethoxymethane) $\text{CH}_2(\text{OCH}_2\text{CH}_2\text{Cl})_2$.

Properties: Colorless liquid; b. p. 218.1°C; f. p. -32.8°C; sp. gr. 1.2339 (20/20°C); wt/gal 10.3 lb (20°C); flash point (open cup) 230°F. Slightly soluble in water; decomposed by mineral acids.

Grades: Technical.

Uses: Solvent, intermediate for polysulfide rubber.

dichloroethyl oxide. See dichloroethyl ether.

dichloroethyl sulfide. See dichlorodiethyl sulfide.

dichlorofluoromethane (fluorodichloromethane) CHCl_2F .

Properties: Colorless, nearly odorless gas. B. p. 8.9°C, f. p. -135°C; sp. gr. 1.426 (0°C); critical pressure 51.0 atm. Soluble in alcohol and ether, insoluble in water.

Grades: Technical.

Containers: Drums, cylinders.

Uses: Fire extinguishers; solvent; refrigerant; aerosol propellant.

dichloroformoxime CCl_2NOH .

Properties: Colorless, prismatic crystals. Disagreeable, penetrating odor. High vapor pressure. Slowly decomposes at normal temperatures, the rate depending on temperature and humidity.

Caution! Powerful irritant! B. p. 53-54°C (28 mm); m. p. 39-40°C. Soluble in water, alcohol, ether, and benzene.

Derivation: (a) Action of chlorine on fulminic acid, HONC. (b) Reduction of trichloronitrosomethane with either aluminum amalgam or hydrogen sulfide.

alpha-dichlorohydrin (alpha-propenyldichlorohydrin; glycerol dichlorohydrin; GDCH; dichloroisopropyl alcohol, 1,3-dichloro-2-propanol) $\text{CH}_2\text{ClCHOHCH}_2\text{Cl}$.

Properties: Colorless, slightly viscous, nonflammable, unstable liquid; faint chloroform-like odor. The commercial product is a mixture of the two isomers: 1,3-dichloro-2-hydroxypropane and 1,2-dichloro-3-hydroxypropane, of which the former is in a dominant amount. Miscible with most organic solvents, vegetable oils; slightly soluble in water. Sp. gr. 1.36-1.39;

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

m. p. -4°C ; b. p. 174°C ; refractive index 1.47-1.48; flash point 74°C ; vapor pressure 7 mm.

Derivation: By the interaction of glycerol and dry hydrogen chloride gas and subsequent distillation.

Method of purification: Rectification.

Grades: Technical.

Containers: Drums.

Uses: Solvent for cellulose acetate, ethyl-cellulose, some types of cellulose nitrate, benzyl abietate, resins and gums, other products; solvent mixtures; intermediate in organic synthesis; paints, varnishes, lacquers; celluloid cements; water colors' binder; photographic lacquers.

Shipping regulations: None.*

5,7-dichloro-8-hydroxyquinadine. See chlor-quinadine.

dichloroisocyanuric acid (dichloro-s-triazine-2,4,6-trione) $\text{Cl}_2\text{H}(\text{NCO})_3$. A cyclic compound.

Properties: White, slightly hygroscopic, crystalline powder, granules. Density: (loose bulk, approx.) powder 34 lbs/cu ft; (granular) 53 lbs/cu ft. Active ingredient approximately 70% available chlorine.

Containers: 200-lb fiber drums.

Uses: Active ingredient in household dry bleaches, dishwashing compounds, scouring powders, and detergent sanitizers; replacement for calcium hypochlorite.

sym-dichloroisopropyl alcohol. See alpha-dichlorohydrin.

dichloroisopropyl ether $[\text{ClCH}_2\text{C}(\text{CH}_3)_2\text{O}]_2$.

Properties: Colorless liquid; sp. gr. 1.1135 ($20/20^{\circ}\text{C}$); b. p. 187.4°C (760 mm); vapor pressure 0.10 mm (20°C); flash point 185°F ; wt/gal 9.3 lbs (20°C); coefficient of expansion 0.00096 (20°C); viscosity 0.0230 poise (20°C). Miscible with most oils and organic solvents; immiscible with water.

Grades: Technical.

Containers: 1-gal cans; 5- and 55-gal drums. Net content 9.0, 45, 500 lbs.

Uses: Solvent for fats, waxes, greases; extractant; paint and varnish removers; spotting agents; and cleaning solutions.

Shipping regulations: None.*

dichloromethane. See methylene chloride.

dichloromethylchloroformate ClCOOCHCl_2 .

Properties: Colorless liquid. Decomposed by water and alkalis. Caution! Not so irritant as the mono-compound, but more toxic! Soluble in alcohol, benzene, and ether. Sp. gr. 1.56 (15°C); b. p. $110-111^{\circ}\text{C}$ (760 mm); vapor density 5.7 (air=1).

Derivation: (a) By chlorinating methyl formate; (b) by chlorinating methylchloroformate. In both methods the mixture of chloro-derivatives is then separated by fractionation.

sym-dichloromethyl ether (dichlorinated methyl oxide) $\text{O}(\text{CH}_2\text{Cl})_2$.

Properties: Colorless, volatile liquid.

Decomposed by heat and water; soluble in

acetone, benzene, ethyl alcohol, and methyl alcohol; insoluble in water. Sp. gr. 1.315 (20°C); b. p. 105°C .

Derivation: (a) By the action of chlorine on methyl ether; (b) interaction of hydrochloric acid and formaldehyde, with subsequent dehydration of the chloromethyl alcohol formed.

alpha',beta'-dichloromethylethylketone

$\text{ClCH}_2\text{COCH}_2\text{CH}_2\text{Cl}$.

Properties: Liquid; slowly decomposes.

Caution! Very irritant! B. p. 65°C (6 mm).

Derivation: Interaction of ethylene and chloroacetyl chloride in the presence of aluminum chloride.

5,7-dichloro-2-methyl-8-quinolinol. See chlor-quinadine.

dichloromethyl sulfate $(\text{ClCH}_2\text{O})_2\text{SO}_2$.

Properties: Colorless, odorless liquid;

soluble in alcohol, benzene, and ether.

Sp. gr. 1.60 (20°C); b. p. $96-97^{\circ}\text{C}$ (14 mm).

Derivation: (a) By bubbling sulfur trioxide through (cooled) dichloromethyl ether; (b) by heating chlorosulfonic acid with formaldehyde.

dichloronaphthalene. See chloronaphthalene.

2,3-dichloro-1,4-naphthoquinone. See dichlone.

2,5-dichloronitrobenzene (nitro-para-dichlorobenzene) $\text{Cl}_2\text{C}_6\text{H}_3\text{NO}_2$.

Properties: Pale yellow crystals.

Containers: Casks.

Use: Intermediate.

1,1-dichloro-1-nitroethane $\text{H}_3\text{CC}(\text{Cl})_2\text{NO}_2$.

Properties: B. p. 124°C , sp. gr. 1.4153

($20/20^{\circ}\text{C}$); flash point 136°F .

Uses: Grain fumigant; solvent.

dichloropentane $\text{C}_5\text{H}_{10}\text{Cl}_2$. A mixture of the dichloro-derivatives of both normal and isopentane. About 40% are amylene dichlorides having two chlorine atoms attached to adjacent carbon atoms.

Specifications: Color clear and light yellow; sp. gr. 1.06-1.08 (20°C); acidity as HCl not over 0.025%; water content none; distillation 95% between $130-200^{\circ}\text{C}$; wt/gal 8.94 lbs.

Other properties: Surface tension 31.8 dynes/cm (25°C); viscosity 1.6 cps (25°C); specific heat 0.369 cal/g; heat of vaporization 68.5 cal/g (calc'd); water solubility negligible, water azeotrope at $80-97^{\circ}\text{C}$, 66% $\text{C}_5\text{H}_{10}\text{Cl}_2$ (approx.); kauributanol value 67 cc; evaporation rate at 109°F , 100% in 90 minutes.

Containers: 1-, 5-gal cans; 55-gal drums; 8000-gal tank cars.

Uses: Solvent for oils, greases, rubber, resins and bituminous materials; removal of tar; reclaiming rubber; paint and varnish removers; degreasing of metals; insecticide; soil fumigant; removal of wax deposits on sucker rods of oil-well equipment.

Fire hazard: Flash point (open cup) 105°F ;

fire point (open cup) 115°F .

Shipping regulations: None.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

dichlorophenarsine hydrochloride (3-amino-4-hydroxyphenyl)dichloroarsine hydrochloride) $C_6H_3(AsCl_2)(OH)NH_2 \cdot HCl$.

Properties: White, odorless powder; m.p. 200°C; soluble in water, solutions of alkali hydroxides and carbonates, and in dilute mineral acids.

Use: Medicine.

dichlorophene (2,2'-dihydroxy-5,5'-dichlorodiphenylmethane; 2,2'-methylene-bis-(4-chlorophenol); bis(5-chloro-2-hydroxyphenyl)methane; DDM; DDDM) $(C_6H_3ClOH)_2CH_2$.

Properties: Light tan, free-flowing powder; weakly phenolic odor; m.p. 177°C; vapor pressure 10^{-4} mm (100°C) and about 10^{-10} mm (25°C) (extrapolated value); mol wt 369.2. Soluble in acetone and alcohols; slightly soluble in benzene, toluene, carbon tetrachloride; insoluble in water.

Derivation: Condensation of para-chlorophenol with formaldehyde in the presence of sulfuric acid.

Grades: Pure and technical.

Containers: 1-, 5-, 25-, 50-, 100-lb cans; 150-lb drums.

Hazards: None, except those normally associated with inhalation of fine powders.

Uses: Fungicide and bactericide used to preserve textiles and prevent deterioration from molds, mildews, rots, mustiness, rusts and some types of rancidity; some dermatological and cosmetic applications, veterinary medicine.

Shipping regulations: None.*

2,4-dichlorophenol $Cl_2C_6H_3OH$.

Properties: White, low-melting solid; m.p. 45°C; b.p. 210°C. Soluble in alcohol and carbon tetrachloride; slightly soluble in water.

Derivation: By chlorination of phenol.

Grades: Technical.

Containers: Drums.

Uses: Organic synthesis.

Warning: Causes burns. MCA warning label.

2,4-dichlorophenoxyacetic acid. See 2,4-D.

2,4-dichlorophenoxyacetic acid, sodium salt. See 2,4-D.

3-(3,4-dichlorophenyl)-1,1-dimethylurea (diuron) $C_6H_3Cl_2NHCON(CH_3)_2$.

Properties: White, crystalline solid; m.p. 153-155°C; vapor pressure (30°C) 2×10^{-7} mm. Very low solubility in hydrocarbon solvents; approx. 42 ppm at 25°C in distilled water. Stable toward oxidation and moisture. Decomposes at 180°C.

Caution: Avoid breathing dust or mist. Avoid contact with skin, eyes, and clothing. U.S.D.A. Pesticides regulation label.

Use: Selective weed control in certain crops; or, at higher dosage rates, to control all vegetation for an extended period of time; pre-emergence herbicide.

di(para-chlorophenyl) ethanol (1,1-bis(para-chlorophenyl)ethanol; di(para-chlorophenyl)methyl carbinol; DMC; DCPC)

$CH_3C(C_6H_4Cl)_2OH$.

Properties: Colorless crystals; m.p. 70°C; insoluble in water; soluble in common organic solvents.

Derivation: Reaction of 4,4'-dichlorobenzophenone with methyl magnesium bromide, followed by treatment with water.

Caution: Harmful if swallowed! Avoid contact with skin or eyes. Wash thoroughly after using. Avoid contamination of feed and foodstuffs. U.S.D.A. Pesticides Regulation label.

Use: Insecticide.

di(para-chlorophenyl) methyl carbinol. See di(para-chlorophenyl)ethanol.

dichlorophenyltrichlorosilane $Cl_2C_6H_3SiCl_3$. A mixture of isomers.

Properties: Straw-colored liquid; b.p. 260°C. Refractive index (n_D 20/D) 1.5638; flash point (Cleveland open cup) 286°F. Readily hydrolyzed by moisture, with the liberation of hydrochloric acid.

Derivation: Chlorination of phenyltrichlorosilane.

Grades: Technical.

Use: Intermediate for silicones.

Shipping regulations: Corrosive liquid. White label.*

3,6-dichlorophthalic acid $C_6H_2Cl_2(COOH)_2$.

Properties: Colorless, thick crystals, soluble in hot water.

Derivation: By oxidizing dichloronaphthalene tetrachloride with nitric acid.

1,2-dichloropropane. See propylene dichloride.

1,3-dichloro-2-propanol. See alpha-dichlorohydrin.

1,3-dichloropropene $CHCl:CHCH_2Cl$.

Properties: Exists in cis and trans isomeric forms, both colorless liquids. Sp. gr. 1.225 (20/4°); flash point (open cup) 95°F; insoluble in water, soluble in acetone, toluene, octane. Cis isomer b.p. 104°C, trans 112°C; refractive index (n_D 20/D) cis 1.469, trans 1.475.

Derivation: Chlorination of propylene.

Uses: Organic synthesis; soil fumigants.

alpha, alpha-dichloropropionic acid, sodium salt. See sodium 2,2-dichloropropionate.

2,6-dichlorostyrene $C_6H_3(CH:CH_2)Cl_2$.

Properties: B.p. 92-94°C (5 mm). Insoluble in water; soluble in most organic solvents. Will polymerize slowly on standing, unless inhibited.

Uses: Monomer and co-monomer in plastic research.

dichlorosulfonphthalein. See chlorphenol red.

dichlorotetrafluoroacetone $CClF_2COC(=O)ClF_2$.

Properties: Colorless liquid; b.p. 45.2°C. Soluble in water and most organic solvents. Stable to acids but not alkalis.

Uses: Solvent in acidic media; complexing agent for active hydrogen compound separation.

sym-dichlorotetrafluoroethane (fluorocarbon-114; tetrafluorodichloroethane) $CClF_2CClF_2$.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Properties:** Colorless, nearly odorless gas. B.p. 3.55°C; m.p. -94°C; critical pressure 32.3 atm.
- Grades:** Technical.
- Containers:** Cylinders up to 1 ton.
- Uses:** Solvent; fire extinguishers; refrigerant and air conditioner; aerosol propellants.
- 2,5-dichlorothiophene** $C_4H_2Cl_2S$ (cyclic).
Properties: Colorless to light yellow liquid; b.p. 161°C.
Use: Intermediate.
- 2,4-dichlorotoluene** $C_6H_3CH_3Cl_2$.
Properties: Colorless liquid; boiling range (typical) first drop 200°C, 50% 201°C, dry 202°C; f.p. (approx.) -13°C; sp.gr. 1.245-1.247 (25/15°C); refractive index 1.5480 (22°C). Soluble in alcohol, ether, and acetone; insoluble in water.
Containers: Glass carboys or drums.
Uses: As a high-boiling solvent and as an intermediate for organic synthesis.
- 3,4-dichlorotoluene** $CH_3C_6H_3Cl_2$.
Properties: Colorless liquid. B.p. 208.9°C, m.p. -15.3°C; sp.gr. 1.2475 (25/4°C); refractive index (n_D 20/D) 1.5471. Miscible with alcohol, acetone, ether, benzene, carbon tetrachloride, and n-heptane; insoluble in water.
Containers: 100-lb carboys, 500-lb drums.
Uses: As a high boiling solvent and as an intermediate for organic syntheses.
- dichloro-sym-triazine-2,4,6-trione.** See dichloroisocyanuric acid.
- beta, beta'-dichlorovinylchloroarsine** $(ClCH:CH)_2AsCl$.
Properties: Yellow or yellowish-brown liquid when pure. Darker when impure. Decomposed by water. Caution! Very irritant! Soluble in alcohol, benzene, ether, insoluble in dilute acids.
Constants: Sp.gr. 1.702 (20°C); b.p. 230°C (decomposes), vapor density 8.1 (air = 1).
Derivation: Condensation of arsenic trichloride with acetylene in the presence of aluminum chloride. The mixed arsines are separated by fractionating.
- beta, beta'-dichlorovinylmethylarsine** $(ClCH:CH)_2AsCH_3$.
Properties: Liquid. B.p. 140-145°C (10 mm).
Derivation: Interaction of acetylene and methylchloroarsine in the presence of aluminum chloride.
- dichlorophenamide** (1,3-disulfamyl-4,5-dichlorobenzene) $C_6H_2Cl_2(SO_2NH_2)_2$.
Properties: M.p. 239-241°C. Insoluble in water; soluble in alkaline solutions.
Use: Medicine.
- dichromatic.** Characterizing certain dyes and indicators for which different colors may be seen depending on the thickness of the solution viewed.
- "Dicodid."** ⁹ Trademark for dihydrocodeinone; employed in medicine as bitartrate and hydrochloride salts.
- dicophane.** See DDT.
- dicoumarol.** See bishydroxycoumarin.
- dicresyl glyceryl ether** (glyceryl ditolyl ether).
This may be a mixture of ortho-, meta-, and para-isomers.
 $CH_3C_6H_4OCH_2CHOHCH_2OC_6H_4CH_3$.
Properties: Similar to cresyl glyceryl ether (see mephenesin) in properties. Sp.gr. 1.136; refractive index 1.549; boiling range 328-340°C.
- dicresyl glyceryl ether acetate**
 $CH_3C_6H_4OCH_2CHOOCCH_3CH_2OC_6H_4CH_3$.
Properties: Fairly stable liquid.
Constants: Sp.gr. 1.115; b.p. 360°C; refractive index 1.53.
- "Dicumarol."** ³⁵⁵ Trademark for bishydroxycoumarin (q.v.).
- dicumyl peroxide** $[C_6H_5C(CH_3)_2O]_2$. Used as a vulcanizing agent.
Shipping regulations: Solid and 50% solution: oxidizing material. Yellow label.*
- "Di-cup."** ²⁶⁶ Trademark for a series of vulcanizing, polymerization, and cross-linking agents containing dicumyl peroxide (q.v.).
- "Dicurin" Procaine.** ¹⁰⁰ Trademark for merethoxylline procaine (q.v.).
- dicyandiamide** (cyanoguanidine) $NH_2C(NH)(NHCN)$.
Properties: Pure, white, crystals; sp.gr. 1.400 (25°C). Stable when dry. Melting range 207-209°C. Soluble in water and alcohol; sparingly soluble in ether.
Derivation: Polymerization of cyanamide in the presence of bases.
Method of purification: Crystallization.
Grades: 99% pure; technical.
Containers: 100-lb multiwall paper sacks.
Uses: Fertilizers; nitrocellulose stabilizer; organic synthesis, especially of melamine, barbituric acid and guanidine salts; pharmaceutical products; dyestuffs; explosives; retarding rancidity in fats and oils; fire-proofing compounds; case-hardening preparations; cleaning compounds; soldering compounds; synthetic resins; vulcanizing accelerator, thinner for oil-well drilling muds; stabilizer in detergent compositions; modifier for starch products.
Shipping regulations: None.*
- dicyclohexyl.** See bicyclohexyl.
- dicyclohexyl adipate** $(CH_2CH_2CO_2C_6H_{11})_2$.
Properties: White, crystalline solid. Odorless. Compatible with most natural and synthetic resins. Soluble in most organic solvents; insoluble in water.
Constants: Sp.gr. 1.013 (40°C); b.p. 305-310°C; m.p. 37-38°C; density 45 lbs/cu. ft.; acidity (as adipic acid) less than 0.05%.
- dicyclohexylamine** $(C_6H_{11})_2NH$.
Properties: Clear, colorless liquid with faint amine odor; sp.gr. 0.913-0.919 (15/15°C); b.p. 256°C (760 mm); 135°C (25 mm); refractive index 1.4823 (n_D 25/D); flash point 110°C. Slightly soluble in water;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

miscible with organic solvents. Toxic!
Containers: Drums; tank cars.

Uses: Intermediate; insecticides; plasticizer; corrosion inhibitors; antioxidants in rubber, lubricating oils, fuels; catalysts for paint, varnishes and inks; detergents; extractant.

Warning! Avoid breathing vapor or skin contact. Very toxic!

dicyclohexyl phthalate (DCHP).

$C_8H_4(COOC_6H_{11})_2$.

Properties: White, granular solid; non-volatile; mildly aromatic odor; sp. gr. (25/25°C) 1.20; m. p. 62-65°C.

Soluble in most of the organic solvents; practically insoluble in water; compatible with a large number of synthetic resins and plastics to which it imparts good electric properties, low volatile loss on oven-aging, and low water- and oil-absorption; high solvency for vinyl resins at normal processing temperatures.

Containers: Fiber drums of approximately 230-lb capacity.

Uses: Plasticizer for synthetic resins and plastics including nitrocellulose, ethyl cellulose, chlorinated rubber, polyvinyl acetate, polyvinyl chloride, and copolymers; when used to plasticize vinyl resins, produces tough, glossy compounds having a high modulus.

dicyclomine hydrochloride

$(C_6H_{11})(C_6H_{10})CO_2(CH_2)_2N(C_2H_5)_2 \cdot HCl$
2-Diethylaminoethyl bicyclohexyl-1-carboxylate hydrochloride.

Properties: Crystals; m. p. 164-166°C.

Soluble in water.

Grade: N. N. D.

Uses: Medicine.

dicyclopentadiene $C_{10}H_{12}$.

Properties: Solid; sp. gr. 0.979 (20/20°C), b. p. 172°C; f. p. 33.6°C; lbs/gal 8.20 (60°F); refractive index 1.5073 (n_D 31/D); flash point 80-100°F (T. O. C.) Insoluble in water.

Grade: 96%.

Containers: Drums; tank cars.

Uses: Insecticides, resins, varnishes, ferrocene compounds, paints.

dicyclopentadiene dioxide $C_{10}H_{12}O_2$.

Properties: White crystalline powder, m. p. 180-184°C; sp. gr. 1.331 (25°C); slightly soluble in water; soluble in acetone and benzene.

Containers: Up to tank car lots.

Uses: Organic intermediate for epoxy resins, plasticizers, protective coatings.

dicyclopentadienyliron. See ferrocene.

dicyclopentadienyl metal compounds (ferrocenes). A class of stable hydrocarbon (cyclopentadienyl) complexes with metals. Most important member and first one to be discovered is the dicyclopentadienyl derivative of iron (see ferrocene). These compounds possess sandwich structures, that is, the two cyclopentadiene rings lie above and below the plane on which the

metal atom is situated. They are mostly quite stable. For instance, they are inert to air, water, dilute acids and dilute bases. Most of the complexes of metals belonging to the first transition series on the periodic table, from titanium to nickel inclusive, have the same melting point, 173°C. They are also stable to high temperatures and to ultraviolet light.

Derivation: Interaction of cyclopentadiene sodium and the metal halide.

Uses: Suggested as coatings for missiles and satellites; jet fuels.

dicyclopentadienyltitanium chloride (titanium ferrocene) $(C_5H_5)_2TiCl_2$. A stereospecific catalyst having the typical ferrocene "sandwich" molecular structure (three-dimensionally).

DIDA. See diisodecyl adipate.

didecyl adipate $C_{44}H_{88}(COOC_{10}H_{21})_2$.

Properties: A light-colored liquid; sp. gr. 0.9181 (20/20°C); 7.7 lb/gal (20°C); b. p. 245°C (5 mm); vapor pressure 0.58 mm Hg (200°C); insoluble in water; viscosity 26.3 cps (20°C).

Use: Plasticizer.

didecylamine $[CH_3(CH_2)_9]_2NH$.

Properties: Light straw color; faint amine odor, boiling range 195-215°C (12 mm); sp. gr. 0.840 (20/20°C) (solid).

didecyl ether $(C_{10}H_{21})_2O$.

Properties: Liquid, m. p. 16°C; b. p. 170-180°C (6 mm); sp. gr. 0.819 (20/4°C); refractive index 1.4418 (n_D 20/D).

Grades: 95% (min) purity.

Uses: Electrical insulators; water repellent; lubricant in plastic molding and processing; antistatic substance; chemical intermediate.

didecyl phthalate (DDP) $C_{44}H_{88}(COOC_{10}H_{21})_2$.

Properties: A light-colored liquid; sp. gr. 0.9656 (20/20°C); 8.0 lb/gal (20°C); b. p. 261°C (5 mm); insoluble in water; vapor pressure 0.3 mm Hg (200°C); viscosity 113.2 cps (20°C).

Containers: Drums, tank cars; tank trucks.

Use: Plasticizer, especially for vinyl resins.

didecyl sulfide (didecyl thioether) $(C_{10}H_{21})_2S$.

Properties: m. p. 22°C, b. p. 205-206°C (4 mm); sp. gr. 0.831 (20/4°C); refractive index 1.4569 (n_D 33.5°C/D).

Grades: 95% (min.) purity.

Uses: Organic synthesis (formation of sulfonium compounds).

didecyl thioether. See didecyl sulfide.

didodecanyl thiodipropionate. See dilauryl thiodipropionate.

didodecylamine. See dilaurylamine.

didodecyl ether. See dilauryl ether.

didodecyl thioether. See dilauryl sulfide.

DIDP. See diisodecyl phthalate.

"Didrate." ³⁴² Trademark for dihydrocodeine.

didymium.

1. The name applied to commercial

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

mixtures of rare earth elements obtained from monazite sand by extraction followed by the elimination of cerium and thorium from the mixture. The name is used like that of an element in naming mixed oxides and salts. The approximate composition of didymium from monazite, expressed as rare earth oxides is 46% lanthana, La_2O_3 ; 10% praseodymia, Pr_6O_{11} ; 32% neodymia, Nd_2O_3 ; 5% samaria, Sm_2O_3 ; 0.4% yttrium earth oxides; 1% ceria, CeO_2 ; 3% gadolinia Gd_2O_3 ; 2% others. The mineral bastnaesite could also be a source of didymium mixtures. For uses, see didymium salts.

2. The name didymium has also been applied to mixtures of the elements praseodymium and neodymium since such mixtures were once thought to be an element and assigned the symbol Di.

didymium salts. Salts derived from commercial didymium mixtures (see didymium 1) are:

didymium acetate: $\text{Di}(\text{C}_2\text{H}_3\text{O}_2)_3 \cdot x\text{H}_2\text{O}$; pink crystals; soluble in water and acids.

didymium carbonate: $\text{Di}_2(\text{CO}_3)_3 \cdot x\text{H}_2\text{O}$; pink powder; insoluble in water, soluble in acids.

didymium chloride: $\text{DiCl}_3 \cdot 6\text{H}_2\text{O}$; lumps; soluble in water and acids.

didymium fluoride: DiF_3 ; nearly anhydrous pink powder; insoluble in water and acids.

didymium hydrate: Hydrated Di_2O_3 ; pink powder; insoluble in water, soluble in acids.

didymium nitrate: $\text{Di}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$; pink crystals; soluble in water and acids.

didymium oxide: Di_2O_3 , brown powder; insoluble in water, soluble in acids.

Containers: Glass bottles; fiber and steel drums.

Uses: Coloring glass, decolorizing glass; in temperature-compensating capacitors for radio, television, and radar, in glass blowers' and welders' goggles (carbonate, oxide, or oxalate), in carbon arc cores (fluoride), in stainless steel (oxide), metallurgical research.

dieldrin (HEOD) $\text{C}_{12}\text{H}_{10}\text{OCl}_4$. The assigned common name for an insecticidal product containing not less than 85% of 1,2,3,4,10,10-hexachloro-6,7-epoxy-1,4,4a,5,6,7,8,8a-octahydro-1,4-endo,exo-5,8-dimethanonaphthalene. Obtained by oxidation of aldrin with peracids. See also endrin, a stereoisomer of dieldrin.

Properties: Light-tan, flaked solid, m.p. approx 150°C . Insoluble in water, methanol, aliphatic hydrocarbons, moderately soluble in most other common organic solvents. Compatible with most fertilizers, herbicides, fungicides and insecticides.

Grades: Emulsifiable concentrate; wettable powder; dust.

Containers: 175 lb fiber drums.

MCA warning labels: (dieldrin technical and formulations, 60% and over) Warning! Poisonous by skin contact, inhalation or swallowing; absorbed through skin. (Formulations 10 to 60%) Warning! Hazardous by skin contact, inhalation or swallowing.

(Formulations less than 10%) Caution! Harmful by skin contact, inhalation or swallowing. (Similar labels required by U. S. D. A.)

dielectric. An electrical insulator, i.e., a material which will not conduct electric current. Thus different parts of a dielectric can have a difference in electric charges, and this will not be dissipated or only very slightly dissipated by conductivity. A dielectric is a material with electrical conductivity less than one millionth of a reciprocal ohm per centimeter. Materials with higher conductivity (10^{-6} to 10^{-3} mho/cm) are semiconductors, while ordinary electrical conductors such as metals have conductivity higher than 10^{-3} mho/cm.

dielectric constant. The dielectric constant of a material is the ratio of the electrical capacity of a condenser containing the material to the capacity of the same condenser with material replaced by a vacuum. It may be looked upon as a measure of ability of the material to maintain a difference in electrical charge over any specified distance.

dielectric liquids. Liquids of relatively high dielectric constant used in electrical capacitors, cables, switches, transformers, and circuit breakers to replace air and increase dielectric strength, and often also to improve heat dissipation. Commonly used materials are hydrocarbon oils, chlorinated hydrocarbons including chlorinated diphenyls, and silicone oils.

dielectric strength. The maximum electric field that an insulator or dielectric can withstand without breakdown, usually measured in kilovolts per centimeter. At breakdown a considerable current passes as an arc, usually with more or less decomposition of the material along the path of the current.

"Dielgran." ¹⁴⁷ Brand name for a free-flowing granular insecticide containing 5 or 10% dieldrin.

Containers: 50-lb bags.

Uses: Control white grubs, wireworms, corn rootworms in corn and peanuts.

Diels-Alder reaction. A very general and important organic reaction for the synthesis of six-membered rings, discovered in 1928. It involves the addition of an ethylenic double bond to a conjugated diene, i.e., a compound containing two double bonds separated by one single bond, as in 1,3-butadiene ($\text{CH}_2 = \text{CH} - \text{CH} = \text{CH}_2$) or cyclopentadiene. The ease of addition of the ethylenic compound is greatly enhanced by adjacent carbonyl groups, hence, maleic anhydride reacts quantitatively with hexachlorocyclopentadiene to form chlorendic anhydride.

dien. An abbreviation for diethylenetriamine, as used in formulas for coordination compounds. See also en, pn, py.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

diene. An unsaturated hydrocarbon or diolefin having two double bonds, as 1,3-butadiene, $\text{CH}_2=\text{CH}=\text{CH}_2$. These double bonds are conjugated, whereas in 1,4-pentadiene, $\text{CH}_2=\text{CH}-\text{CH}_2-\text{CH}=\text{CH}_2$, they are unconjugated, meaning separated by at least two single bonds.

"**Diene.**" ²⁷⁸ Trade name for a commercial stereospecific polybutadiene rubber.
Properties: Unvulcanized: Narrow molecular weight distribution; soluble in aliphatic or aromatic hydrocarbons; free from gel; low "tackiness"; no elastic memory ("nerve").
Vulcanized: High resilience; excellent hysteretic properties; excellent resistance to abrasion and cold (brittle point $<-125^\circ\text{F}$).
Containers: Boxes containing 75 lbs of "Diene" in polyethylene bags.
Uses: To enhance the low temperature and hysteretic properties of other elastomers.

dienestrol $\text{HOCH}_2\text{C}(\text{CHCH}_3)\text{C}(\text{CHCH}_3)\text{C}_6\text{H}_4\text{OH}$.
 3,4-Bis(para-hydroxyphenyl)-2,4-hexadiene; a synthetic with estrogenic activity.
Properties: Colorless, odorless needles or powder; m.p. 227°C . Soluble in alcohol; practically insoluble in water. Sensitive to light.
Grade: U.S.P. XVI.
Use: Medicine.

Diesel Ignition Improver. A substance such as amyl nitrate, which is added to diesel fuels to improve fuel ignition and to raise the cetane number of the fuel. See "Ethyl."

diesel oil. Fuel for diesel engines obtained from distillation of petroleum. Its efficiency is measured by the so-called cetane number (q.v.). It is composed chiefly of aliphatic hydrocarbons. Its volatility is similar to that of gas oil. Also used in oil base drilling muds.

"**Diesel-Treat.**" ¹⁰⁸ Brand name for dry, granular, orange sodium dichromate, used as a corrosion inhibitor. Sold in 50-lb drums.
Uses: Closed cooling systems, particularly diesel engines, cooling tower systems.

diethanolamine (DEA; di(2-hydroxyethyl)-amine) $(\text{HOCH}_2\text{CH}_2)_2\text{NH}$.
Properties: Colorless crystals or liquid; active base; m.p. 28.0°C ; b.p. 217°C (150 mm); sp.gr. 1.092 ($30/20^\circ\text{C}$); flash point (open cup) 280°F ; very soluble in water and alcohol; insoluble in ether, benzene.

Derivation: Ethylene oxide and ammonia.
Containers: Drums; tank cars.
Uses: Liquid detergents for emulsion paints, cutting oils, shampoos, cleaners and polishes; textile specialties; absorbent for acid gases; chemical intermediate for resins, plasticizers, etc.; solubilizing 2,4-D.

diethanolamine lauryl sulfate. Used in synthetic detergents. **Containers:** Drums; tank cars.

2,5-diethoxyaniline $\text{NH}_2\text{C}_6\text{H}_3(\text{OC}_2\text{H}_5)_2$.
Properties: Liquid; m.p. $83-85^\circ\text{C}$; insoluble in water; soluble in organic solvents.
Use: Intermediate.

1,4-diethoxybenzene. See hydroquinone diethyl ether.

1,1-diethoxyethane. See acetal.

diethoxyethyl phthalate. See diethyl glycol phthalate.

beta, beta'-diethoxyethyl sulfide $(\text{CH}_2\text{CH}_2\text{OC}_2\text{H}_5)_2\text{S}$.
Properties: Liquid.
Constants: Sp.gr. 0.9672 (20°C); b.p. 225°C (746 mm).

diethylacetal. See acetal.

diethyl acetaldehyde. See 2-ethylbutyraldehyde.

N,N-diethyl acetamide $\text{CH}_3\text{CON}(\text{C}_2\text{H}_5)_2$.
Properties: Sp.gr. 0.920 (20°C); boiling range $182-186^\circ\text{C}$, color water-white; odor faint. Flash point 170°F .

diethylacetic acid. See 2-ethylbutyric acid.

diethyl adipate $\text{C}_2\text{H}_5\text{OCO}(\text{CH}_2)_4\text{OCOC}_2\text{H}_5$.
Properties: Colorless liquid. Sp.gr. (25°C) 1.002, refractive index (25°C) 1.426, b.p. 245°C , m.p. -14°C . Insoluble in water.
Use: Plasticizer.

diethylaluminum chloride $(\text{C}_2\text{H}_5)_2\text{AlCl}$.
Properties: Colorless pyrophoric liquid. B.p. 208°C , f.p. -74°C . Flames instantly in contact with air; reacts violently in contact with water.

Derivation: Reaction of triethylaluminum with ethylaluminum sesquichloride.

Containers: Commercial quantities.

Uses: Polyolefin catalyst, intermediate in production of organometallics.

diethylaluminum hydride $(\text{C}_2\text{H}_5)_2\text{AlH}$. A pyrophoric mixture with triethylaluminum.
Derivation: Action of ethylene and hydrogen on aluminum.

Use: Catalyst reducing agent.

diethylamine $(\text{C}_2\text{H}_5)_2\text{NH}$.
Properties: Colorless liquid; ammoniacal odor; alkaline reaction. B.p. 55.5°C ; freezing point -49.8°C , sp.gr. ($20/20^\circ\text{C}$) 0.7062, wt/gal (20°C) 5.91 lbs, flash point (open cup) 5°F . Miscible with water, alcohol.

Derivation: From ethyl chloride and ammonia under heat and pressure.

Grades: Technical.

Containers: 1-, 5-gal cans; 55-gal drums; 8000-gal tank cars.

Uses: Rubber chemicals; textile specialties; selective solvent; dyes; flotation agents; resins; pesticides; polymerization inhibitors; pharmaceuticals; petroleum chemicals; electroplating, corrosion inhibitors.

Danger! Extremely flammable. May cause skin irritation. MCA warning label.

Shipping regulations: Flammable liquid. Red label.*

alpha-diethylaminoaceto-2,6-xylidide.
 See lidocaine.

1-diethylamino-4-aminopentane.
 See 5-diethylamino-2-aminopentane.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

5-diethylamino-2-aminopentane

(1-diethylamino-4-aminopentane)

 $\text{CH}_3\text{CH}(\text{NH}_2)(\text{CH}_2)_2\text{CH}_2\text{N}(\text{C}_2\text{H}_5)_2$.

Properties: Liquid with an amine odor; sp. gr. 0.82; b. p. 142-144°C; soluble in water, alcohol and ether.

Use: Pharmaceuticals.

diethylaminoaniline. See para-aminodiethyl-aniline.

diethylaminoethanol $(\text{C}_2\text{H}_5)_2\text{NCH}_2\text{CH}_2\text{OH}$.

Properties: Colorless, hygroscopic liquid base combining the properties of amines and alcohols; b. p. 161°C; sp. gr. 0.88-0.89 (20/20°C), vapor pressure 21 mm (20°C); flash point 135°F; wt/gal 7.14 lbs (20°C).

Typical specifications A: Sp. gr. 0.880-0.890 (20/20°C); boiling range 158-165°C (760 mm).

Typical specifications B: Color clear and water-white; sp. gr. 0.880-0.890 (20/20°C); wt/gal 7.36 lbs; diethylaminoethanol between 99.5 and 101.0%; initial b. p. not below 158°C, final b. p. not above 164°C, freezing point -70°C, soluble in water, alcohol.

Grades: Technical.

Containers: 1-gal cans, 5-, 55-gal drums; tank cars.

Uses: Making water-soluble salts; fatty acid derivatives, textile softeners; pharmaceuticals; anti-rust compositions, emulsifying agents in acid media; derivatives containing tertiary amine groups.

Shipping regulations: None.*

diethylaminoethoxyethanol

 $(\text{C}_2\text{H}_5)_2\text{NC}_2\text{H}_4\text{OC}_2\text{H}_4\text{OH}$.

Properties: Sp. gr. 0.930-0.950 (20/20°C), boiling range 95% distills between 215.0-228.0°C.

Use: Intermediate.

beta-diethylaminoethyl-para-aminobenzoate nitrate. See procaine nitrate.

2-diethylaminoethyl benzilate hydrochloride.

See benactyzine hydrochloride.

beta-diethylaminoethyl chloride hydrochloride

 $(\text{DEC}) (\text{C}_2\text{H}_5)_2\text{NCH}_2\text{CH}_2\text{Cl} \cdot \text{HCl}$.

Used as intermediate in the manufacture of pharmaceuticals, and as an organic intermediate for attaching the diethylaminoethyl radical.

2-diethylaminoethyl-2-cyclopentyl-2-(2-thienyl)-hydroxyacetate methobromide.

See penthienate bromide.

diethylaminoethyl diphenylacetate hydrochloride. See adiphenine hydrochloride.

beta-diethylaminoethyl-para-ethoxybenzoate hydrochloride (parethoxycaine hydrochloride)

 $\text{C}_2\text{H}_5\text{OC}_6\text{H}_4\text{COOC}_2\text{H}_4\text{N}(\text{C}_2\text{H}_5)_2 \cdot \text{HCl}$. Used in medicine.

diethylaminoethyl 1-phenylcyclopentane-1-carboxylate hydrochloride. See caramiphen hydrochloride.

1-diethylamino-2-methylbenzene. See N,N-diethyl-ortho-toluidine.

5-diethylamino-2-pentanone $\text{CH}_3\text{CO}(\text{CH}_2)_3\text{N}(\text{C}_2\text{H}_5)_2$.

Properties: Liquid with an amine odor.

Use: Pharmaceuticals.

meta-diethylaminophenol $\text{C}_6\text{H}_4\text{OHN}(\text{C}_2\text{H}_5)_2$.

Properties: White, crystalline solid.

Constants: M. p. 78°C; b. p. 276-280°C.

Soluble in alcohol, caustic soda, ether.

Derivation: Diethylaniline is sulfonated with oleum, and the resulting diethylaniline-meta-sulfonic acid fused with caustic soda.

Use: Dyes.

3-diethylaminopropylamine $(\text{C}_2\text{H}_5)_2\text{NCH}_2\text{CH}_2\text{CH}_2\text{NH}_2$.

Properties: Water-white; amine odor; b. p.

159°C; sp. gr. 0.82 (20/20°C); refractive index 1.442 (10°C); flash point 145°C (Tag C. C.).

Uses: Curing agent for epoxy resins; chemical intermediate.

gamma-diethylaminopropyl chloride hydrochloride (DEPC) $(\text{C}_2\text{H}_5)_2\text{NCH}_2\text{CH}_2\text{CH}_2\text{Cl} \cdot \text{HCl}$.

Used in manufacture of pharmaceuticals.

Organic chemical intermediate for attaching the diethylaminopropyl radical.

2,6-diethylaniline $(\text{C}_2\text{H}_5)_2\text{C}_6\text{H}_3\text{NH}_2$.

Properties: Brown liquid; f. p. 3°C; sp. gr.

(20°C) 0.959; b. p. 243°C, flash point (open cup) 245°F. Soluble in toluene and alcohol; insoluble in water.

Uses: Chemical intermediate for pharmaceuticals, dyestuffs, pesticides, and other products.

N,N-diethylaniline $(\text{C}_2\text{H}_5)_2\text{NC}_6\text{H}_5$.

Properties: Colorless to yellow liquid.

Constants: Sp. gr. 0.9351; m. p. -38 to -39°C;

b. p. 215-216°C; flash point 220°F.

Soluble in alcohol and ether; slightly soluble in water.

Derivation: By heating aniline hydrochloride with alcohol at 180°C under pressure.

Method of purification: Rectification.

Grades: Technical.

Containers: Drums; tank cars.

Uses: Organic synthesis; dyestuff intermediate.

Shipping regulations: None.*

N,N-diethylaniline-meta-sulfonic acid

 $(\text{C}_2\text{H}_5)_2\text{NC}_6\text{H}_4\text{SO}_3\text{H}$.

Properties: White, crystalline solid, m. p.

270°C. Soluble in water.

Derivation: From diethylaniline by sulfonation with oleum.

diethylbarbituric acid. See barbital.

diethylbenzene $\text{C}_6\text{H}_4(\text{C}_2\text{H}_5)_2$. The commercial product is a mixture of isomers.

Properties: (p, 2- or ortho-diethylbenzene);

Colorless liquid, freezing point -31.4°C;

b. p. 183.48°C (760 mm); refractive index

(n 20/D) 1.5031; sp. gr. 0.8805 (20°C);

soluble in alcohol, benzene, carbon tetrachloride, ether; insoluble in water.

(1, 3- or meta-diethylbenzene): Colorless

liquid; freezing point -83.92°C; b. p.

181.13°C (760 mm); refractive index

(n 20/D) 1.4953, sp. gr. 0.8641 (20°C).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

(1,4- or para-diethylbenzene): Colorless liquid; freezing point -43.2°C ; b.p. 183.78°C (760 mm); refractive index 1.4949 (n_{20}^{D}); sp.gr. 0.8619 (20°C); soluble in alcohol, benzene, carbon tetrachloride, ether; insoluble in water.

Typical industrial specifications for mixture: B.p. range $179.8\text{--}184.8^{\circ}\text{C}$ (760 mm); sp.gr. 0.865 ($25/25^{\circ}\text{C}$); flash point 56°C ; fire point 63°C ; soluble in alcohol, benzene, carbon tetrachloride, ether; insoluble in water.

Containers: 55-gal drums, net weight 380 lbs; tank cars.

Uses: Intermediate; solvent.

Shipping regulations: None.*

diethylbromoacetamide (acetobromal)

$\text{C}(\text{C}_2\text{H}_5)_2\text{BrCONH}_2$.

Properties: Crystalline powder; bitter, cooling taste, camphor-like odor. Decomposed by hot water.

Constants: M.p. $66\text{--}67^{\circ}\text{C}$. Slightly soluble in cold water; soluble in alcohol, benzene, ether, oils.

Use: Medicine.

Shipping regulations: None.*

di(2-ethylbutyl) azelate

$\text{C}_6\text{H}_{13}\text{OOC}(\text{CH}_2)_7\text{COOC}_6\text{H}_{13}$. (2-Ethylbutyl = $\text{C}_2\text{H}_5\text{CH}_2\text{CHCH}_2$ - $= \text{C}_6\text{H}_{13}$ -.)

Properties: Very pale-yellow to water-white liquid; sp.gr. 0.9340 ($20/20^{\circ}\text{C}$); viscosity 56 sec Saybolt (100°F); flash point 385°F ; fire point 450°F ; freezing point below -40°C ; acid number below 1.0; faint odor, stable to heat, light, and hydrolysis.

Uses: As plasticizer for polyvinyl chloride and its copolymers as well as for cellulose esters.

di(2-ethylbutyl) phthalate (dihexyl phthalate)

$\text{C}_6\text{H}_4(\text{COOC}_6\text{H}_{13})_2$.

Properties: Pale yellow liquid.

Typical specifications: Color, not more than 100 ppm Pt-Co std; sp.gr. 1.010-1.016 ($20/20^{\circ}\text{C}$); b.p. 350°C (735 mm); acidity (as phthalic acid) 0.01% max; ester content 98% max.

Grades: Technical.

Containers: Steel drums, net 400 lbs.

Uses: Plasticizer for cellulose ester and vinyl plastics.

diethyl cadmium $(\text{C}_2\text{H}_5)_2\text{Cd}$.

Properties: Colorless pyrophoric liquid; b.p. 64°C (19 mm).

Derivation: Reaction of cadmium acetate with triethyl aluminum.

Uses: TEL production; synthesis of ketones from acid chlorides.

diethylcarbamazine citrate

$\text{C}_{10}\text{H}_{21}\text{N}_3\text{O} \cdot \text{C}_6\text{H}_8\text{O}_7$. 1-Diethylcarbamy-4-methylpiperazine dihydrogen citrate.

Properties: White, crystalline powder.

Odorless or has slight odor, slightly hygroscopic. Very soluble in water; sparingly soluble in alcohol; practically insoluble in acetone, chloroform, and ether. M.p. $135\text{--}138^{\circ}\text{C}$.

Grade: U.S.P. XVI.

Use: Medicine.

N,N'-diethylcarbanilide. See sym-diethyldiphenylurea.

diethyl carbinol. See 3-pentanol.

diethyl "Carbitol." ²¹⁴ Trademark for diethylene glycol diethyl ether.

diethyl carbonate (ethyl carbonate) $(\text{C}_2\text{H}_5)_2\text{CO}_3$.

Properties: Colorless liquid. Mild odor; stable.

Constants: Sp.gr. 0.975 ($20/4^{\circ}\text{C}$); b.p. 126°C ; m.p. -43°C ; flash point 115°F (open cup). Miscible with alcohols, ketones, esters, aromatic hydrocarbons, some aliphatic solvents.

Derivation: Diethyl carbonate cannot be made by the usual esterification process, as carbonic acid is not reactive with ethyl alcohol. The successive steps in its manufacture are: (a) reacting chlorine and carbon monoxide to produce phosgene (COCl_2); (b) reacting phosgene with ethyl alcohol to make ethyl chlorocarbonate ($\text{ClCO}_2\text{C}_2\text{H}_5$); (c) reacting ethyl chlorocarbonate with anhydrous ethyl alcohol to produce diethyl carbonate. After the above steps, the crude diethyl carbonate is neutralized and redistilled.

Grades: Technical.

Containers: 1-gal (non-returnable) cans; 5-, 55-gal (non-returnable) steel drums; tank cars.

Uses: Solvent for nitrocellulose, cellulose ethers, many synthetic and natural resins; radio tube cathode fixing lacquers, organic synthesis.

Fire hazard: Combustible but not flammable; flash point over 80°F .

Shipping regulations: Requires no red caution label.*

O, O-diethyl O-3-chloro-4-methyl-2-oxo-2H-1-benzopyran-7-yl phosphorothioate ("Co-Ral") $\text{C}_{14}\text{H}_{16}\text{ClO}_5\text{PS}$.

Properties: Tan crystalline solid; m.p. $90\text{--}92^{\circ}\text{C}$; b.p. 20°C (10^{-7}mm); insoluble in water; soluble in aromatic solvents.

Uses: Insecticide, especially for control of pests attacking domestic animals.

Caution! May be harmful if swallowed, inhaled, or absorbed through the skin. Overexposure will result in cholinesterase depression.

diethyl chlorophosphate $(\text{C}_2\text{H}_5\text{O})_2\text{P}(\text{O})\text{Cl}$.

Properties: Water-white liquid; b.p. 60°C (2 mm); sp.gr. 1.1915 (25°C); refractive index 1.4153 (n_{25}^{D}). Soluble in common inert organic solvents; hydrolyzes in water.

Grades: Technical.

Use: Intermediate for organic synthesis.

Caution! Vapor intensely irritating to eye and lung tissue. Liquid can cause burns. Addition of water can cause a violent reaction.

diethylcyclohexane $(\text{C}_2\text{H}_5)_2\text{C}_6\text{H}_{10}$.

Properties: Liquid; sp.gr. 0.8037 ($20/20^{\circ}\text{C}$); b.p. 174°C ; f.p. -100°C ; insoluble in water; flash point 125°F (open cup).

N,N-diethylcyclohexylamine $\text{C}_6\text{H}_{11}\text{N}(\text{C}_2\text{H}_5)_2$.

Properties: Clear, colorless liquid; b.p.

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

194.5°C. Soluble in ether and benzene; slightly soluble in water.

Grades: Technical.

Uses: Solvent; chemical intermediate.

diethyldichlorosilane $(C_2H_5)_2SiCl_2$.

Properties: Colorless liquid; b.p. 130.4°C; sp. gr. 1.053 (25/25°C); refractive index (n_D²⁵) 1.4309; flash point (Cleveland open cup) 77°F. Readily hydrolyzed by moisture, with the liberation of hydrochloric acid.

Derivation: By the reaction of powdered silicon and ethyl chloride at about 300°C, in the presence of copper powder.

Grades: Technical.

Containers: Bottles; 85-lb drums.

Use: Intermediate for silicones.

Shipping regulations: Corrosive liquid. White label.*

O, O-diethyl S-2-diethylaminoethyl phosphorothioate hydrogen oxalate $C_{10}H_{24}NO_3PS \cdot C_2H_2O_4$.

Properties: Crystals; m.p. 98-99°C.

Use: Insecticide.

diethyl diethylmalonate $(C_2H_5)_2C(COOC_2H_5)_2$.

Colorless liquid; sweet odor; sp. gr. 0.984 (25/25°C). Used as an intermediate.

diethyldimethylmethane. See 3,3-dimethylpentane.

diethyldiphenyldichloroethane. See 1,1-dichloro-2,2-bis(para-ethylphenyl)ethane.

sym-diethyldiphenylurea $(N, N'$ -diethylcarbanilide; ethyl centralite; carbamate) $C_2H_5(C_6H_5)NCON(C_6H_5)C_2H_5$.

Properties: White crystalline solid; peppery odor; m.p. 79°C; b.p. 325-330°C, sp. gr. 1.12 (20°C); insoluble in water; soluble in organic solvents.

Uses: Stabilizer for nitrocellulose-based smokeless powder; age retarder in vulcanized rubber; stabilizer in solid rocket propellants.

diethylenediamine. See piperazine.

1,4-diethylene dioxide. See 1,4-dioxane.

diethylene disulfide. See 1,4-dithiane.

diethylene ether. See 1,4-dioxane.

diethylene glycol (dihydroxydiethyl ether) $CH_2OHCH_2OCH_2CH_2OH$.

Properties: Clear, colorless, practically odorless, syrupy liquid; extremely hygroscopic; non-corrosive; lowers freezing point of water. Miscible with water, ethyl alcohol, acetone, ether, ethylene glycol; immiscible with benzene, toluene, carbon tetrachloride.

Constants: B.p. 245.0°C; freezing point -8.0°C; sp. gr. 1.1184 (20/20°C); wt/gal 9.35 (15°C); refractive index 1.446 (25°C); surface tension 48.5 dynes/cm (25°C); viscosity 0.50 poise (15°C), 0.357 poise (20°C), 0.30 poise (25°C); vapor pressure 0.01 mm (30°C); specific heat 0.5509 (20°C); apparent ignition temperature in air 351°C (663°F); latent heat of evaporation 150 cal/g at b.p.; flash point 290°F; coefficient of expansion

0.00064 (20°C).

Typical specifications: Acidity not more than 0.02% (as acetic); color water-white; sp. gr. 1.117 to 1.120 (20/20°C); boiling range (760 mm) below 230°C none, below 240°C not more than 20%, below 250°C not less than 85%, below 270°C not less than 95%; water not more than 0.3%; average wt/gal 9.3 lbs (20°C).

Grades: Technical.

Containers: 5-, 10-, 55-, 110-gal drums; tank cars.

Uses: Textile lubricant, softening and finishing agent; conditioner and softener for casein, gelatin, vulcanized fibers, book-binding pastes, synthetic resins. Solvent for nitrocellulose, gums, resins, oils, organic compounds, dyes; moistening and softening agent for composition cork, glues, parchment, paper, tobacco, etc.; printing of textiles; manufacture of explosive diethylene glycol dinitrate; as a hygroscopic agent to remove moisture from natural gas; organic synthesis; as an anti-freeze in sprinkler systems; cosmetics; straw products; herbicide.

Shipping regulations: None.*

diethylene glycol bis(n-butyl carbonate).

See butyl diglycol carbonate.

diethylene glycol bis(chloroformate).

See diglycol chloroformate.

diethylene glycol bis(cresyl carbonate).

See cresyl diglycol carbonate.

diethylene glycol bis(phenyl carbonate).

See phenyl diglycol carbonate.

diethylene glycol diacetate (diglycol acetate) $(CH_3COOCH_2CH_2)_2O$.

Properties: Colorless liquid. Miscible with water.

Constants: Sp. gr. 1.1159; b.p. 250°C; m.p. 19.1°C; flash point 275°F, vapor pressure 0.02 mm.

Grades: Technical.

Uses: Solvent for cellulose esters, printing inks, lacquers.

diethylene glycol dibutyl ether

$C_4H_9O(C_2H_4O)_2C_4H_9$.

Properties: Practically colorless liquid with characteristic odor. Slightly soluble in water; sp. gr. 0.8853 (20/20°C); 7.4 lb/gal (20°C); b.p. 254.6°C (760 mm); vapor pressure 0.02 mm (20°C), freezing point -60.2°C, viscosity 2.39 cps (20°C).

Containers: 1-gal can; 5-, 55-gal drums; (7, 35, 400 lbs net wt).

Uses: High-boiling, inert solvent with application in extraction processes and in coatings and inks; diluent in vinyl chloride dispersions; extractant for uranium ores.

diethyleneglycol dicarbamate. See diglycol carbamate.

diethylene glycol diethyl ether.

$(C_2H_5OC_2H_4)_2O$.

Properties: Colorless liquid; extremely stable; sp. gr. 0.9082 (20/20°C); b.p. 188.9°C (760 mm); flash point 180°F;

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

wt/gal 7.6 lb (20°C); freezing point -44.3°C. Soluble in hydrocarbons and water.

Grades: Technical.

Containers: 1-, 5-gal cans; 55-gal drums.

Uses: Solvent for nitrocellulose, resins, lacquers; high boiling medium and solvent for organic synthesis.

diethylene glycol dimethyl ether ("diglyme")
 $\text{CH}_3(\text{OCH}_2\text{CH}_2)_2\text{OCH}_3$.

Properties: Colorless liquid with mild odor.

B. p. 162.0°C; m. p. -68.0°C; sp. gr.

0.9451 (20/20°C); flash point (open cup)

153°F; viscosity 1.089 cps (20°C). Miscible with water and hydrocarbons.

Grades: Technical.

Uses: Solvent; anhydrous reaction media for organo-metallic syntheses.

diethylene glycol dinitrate (DEGN; diglycol nitrate) $(\text{O}_2\text{NOCH}_2\text{CH}_2)_2\text{O}$.

Properties: Liquid; sp. gr. 1.377 (25/4°C), m. p. -11.3°C; b. p. 161°C; slightly soluble in water and alcohol; soluble in ether.

Uses: As a liquid rocket propellant, and also as an explosive plasticizer in solid rocket propellants.

Shipping regulations: Cannot be shipped by common carrier.*

diethylene glycol dipelargonate

$(\text{C}_8\text{H}_{17}\text{COOCH}_2\text{CH}_2)_2\text{O}$. A simple ester of pelargonic acid primarily used as a secondary plasticizer for vinyls. Acid number 2.0; b. p. 229°C (5 mm); pour point 10°F, viscosity (S. U. V. at 110°C) 36 seconds.

diethylene glycol distearate. See diglycol stearate.

diethylene glycol monoacetate

$\text{HO}(\text{CH}_2)_2\text{O}(\text{CH}_2)_2\text{OOCCH}_3$. Miscible with water and aromatic hydrocarbons. Solvent for nitrocellulose, cellulose acetate, camphor and rosin.

diethylene glycol monobutyl ether

$\text{C}_4\text{H}_9\text{OCH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid; faint, characteristic butyl odor; b. p. 230.6°C; sp. gr. 0.9536 (20/20°C); wt/gal 8.0 lbs (20°C); refractive index 1.4316 (20°C); viscosity 0.0649 poise (20°C); vapor pressure 0.01 mm (20°C); specific heat 0.546 cal/g (20-25°C), flash point 240°F (open cup); coefficient of expansion 0.00088 (per °C) to 20°C, f. p. -68.1°C. Soluble in oils and water.

Grade: Technical.

Containers: 1- and 5-gal cans; 55-gal drums (net content 7.5, 35, 440 lbs); tank cars up to 10,000 gals.

Uses: Solvent for nitrocellulose, oils, dyes, gums, soaps, natural and synthetic resins; plasticizer intermediate.

diethylene glycol monobutyl ether acetate

$\text{CH}_3\text{CO}(\text{OC}_4\text{H}_9)_2\text{OCH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid, miscible with most organic liquids.

Constants: Sp. gr. 0.9810 (20/20°C); b. p. (760 mm) 246.8°C; vapor pressure <0.01 mm (20°C); flash point 240°F; wt/gal 8.2

lbs (20°C); nitrocellulose-xylene dilution ratio 1.8; coefficient of expansion 0.0010 (20°C); f. p. -32.3°C; viscosity 0.0356 poise (20°C).

Grades: Technical.

Containers: 1-gal cans; 5- and 55-gal drums (net content 8, 40, 450 lbs); tank cars up to 10,000 gals.

Uses: Solvent for oils, resins, gums, also for cellulose nitrate and synthetic resin coatings, where if substances are present which are good solvents for this ester, it will be retained by the film and act as a plasticizer; lacquers and coatings.

diethylene glycol monoethyl ether

$\text{CH}_3\text{OCH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{OC}_2\text{H}_5$.

Properties: Colorless, hygroscopic liquid; mild, pleasant odor; slightly viscous; stable; b. p. 195-202°C; sp. gr. 1.0273 (20/20°C); refractive index 1.425 (n_D 25/D); wt/gal 8.6 lbs (20°C); miscible with water and the common organic solvents.

Grade: Technical.

Containers: 1-gal cans; 5- and 55-gal drums, net content 40, 80, and 450 lbs. Tank cars up to 10,000 gals.

Uses: Solvent for dyes, nitrocellulose, and resins; mutual solvent for mineral oil-soap and mineral oil-sulfonated oil mixtures; in the preparation of non-aqueous stains for wood; for setting the twist and conditioning yarns and cloth; textile printing; pyroxylin dope and plastics; textile soaps; lacquers; organic synthesis; brake fluid diluent.

Shipping regulations: None.*

diethylene glycol monoethyl ether acetate

$\text{CH}_3\text{COOCH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{OC}_2\text{H}_5$.

Properties: Colorless liquid; sp. gr. 1.0114 (20/20°C); b. p. (760 mm) 217.4°C; vapor pressure 0.05 mm (20°C); flash point 230°F; wt/gal 8.4 lbs (20°C); coefficient of expansion 0.00105 (20°C); f. p. -25°C; refractive index (30/D) 1.418, viscosity 0.0279 poise (20°C). Soluble in water; miscible with most organic solvents.

Grades: Technical.

Containers: 1-gal can; 5-, 55-gal drums; tank cars.

Uses: Solvent for cellulose esters, gums, resins; coatings and lacquers; printing inks.

diethylene glycol monohexyl ether

$\text{C}_6\text{H}_{13}\text{OC}_2\text{H}_4\text{OC}_2\text{H}_4\text{OH}$.

Properties: Water-white liquid; sp. gr. 0.9346 (20/20°C); 7.8 lbs/gal (20°C); b. p. 259.1°C (760 mm); vapor pressure <0.01 mm (20°C); f. p. -33°C; viscosity 8.6 cps (20°C).

Containers: 1-gal cans, 5-, 55-gal drums (7.5, 35, 430 lbs net wt).

Use: High-boiling solvent.

diethylene glycol monolaurate. See diglycol laurate.

diethylene glycol monomethyl ether

(2-(beta-methoxyethoxy) ethanol)

$\text{CH}_3\text{OCH}_2\text{CH}_2\text{OCH}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid; refractive index (n_D 27/D) 1.4264; sp. gr. 1.0354

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

(20/4°C); b.p. 193°C; very soluble in water.

Containers: Drums; tank cars.

Uses: Solvent; brake fluid component; intermediate.

diethylene glycol monooleate. See diglycol oleate.

diethylene glycol monoricinoleate. See diglycol ricinoleate.

diethylene glycol monostearate. See diglycol monostearate.

diethylene glycol phthalate. See diglycol phthalate.

diethylene glycol stearate. See diglycol stearate.

diethylene oxide. See 1,4-dioxane.

diethylenetriamine $\text{NH}_2\text{C}_2\text{H}_4\text{NHC}_2\text{H}_4\text{NH}_2$.

Properties: Yellow liquid; ammoniacal odor. Strongly alkaline, hygroscopic, somewhat viscous liquid. Soluble in water, hydrocarbons. Liquid and vapor irritating to skin and eyes. Corrosive to copper and its alloys.

Constants: B.p. 206.7°C; sp.gr. 0.9542 (20/20°C); vapor pressure 0.37 mm (20°C); flash point 215°F; wt/gal 7.9 lbs (20°C); viscosity 0.0714 poise (20°C); coefficient of expansion 0.00088 (20°C).

Typical specifications: Sp.gr. 0.953-0.958 (20/20°C); boiling range 185-215°C (760 mm).

Grade: Technical.

Containers: 1-gal cans; 5-, 10-, 55-gal drums; tank cars.

Uses: Solvent for sulfur, acid gases, various resins, dyes; saponification agent for acidic materials; making derivatives.

Danger! Causes severe eye and skin burns. Avoid prolonged breathing of vapor. MCA warning label.

Shipping regulations: None.*

diethylenetriamine pentaacetic acid $\text{HOOCCH}_2\text{N}[\text{CH}_2\text{CH}_2\text{N}(\text{CH}_2\text{COOH})_2]_2$.

Properties: White, crystalline solid.

Grade: Technical.

Use: Chelating agent.

N,N-diethylethanolamine $(\text{C}_2\text{H}_5)_2\text{NC}_2\text{H}_4\text{OH}$.

Properties: Colorless liquid; refractive index 1.4400 (25°C); sp.gr. 0.8851 (20/20°C); 7.4 lbs/gal (20°C); b.p. 162.1°C (760 mm); vapor pressure 1.4 mm (20°C); viscosity 3.53 centipoise (20°C). Soluble in alcohol, ether, and benzene; completely soluble in water. Hygroscopic. Flash point 140°F. Solubility of water in compound complete at 20°C.

Uses: In the synthesis of antimalarials and of procaine; in corrosion inhibitors for protection of engine parts. Its fatty esters are of value as emulsifying agents for oils and waxes to be applied under acidic conditions.

Containers: Drums; tank cars.

Shipping regulations: None.*

diethyl ether. See ether.

diethyl ethoxymethylenemalonate

$\text{C}_2\text{H}_5\text{OCH}(\text{COOC}_2\text{H}_5)_2$.

Properties: Liquid; sp.gr. 1.0855 (15/15°C); refractive index (n_D²⁰) 1.4625; b.p. 279-281°C with decomposition; insoluble in water.

Grade: 98% min (purity).

Containers: 55-gal drums.

Use: Synthesis.

uns-diethylethylene. See 2-ethyl-1-butene.

N,N-diethylethylenediamine $(\text{C}_2\text{H}_5)_2\text{NC}_2\text{H}_4\text{NH}_2$.

Properties: Colorless liquid; b.p. 145.2°C; sets to a glass below -100°C; sp.gr.

0.8211 (20/20°C); wt/gal 6.8 lb (20°C);

flash point (open cup) 115°F. Miscible with water.

Grade: Technical.

Use: Intermediate.

diethyl ethylmalonate $\text{C}_2\text{H}_5\text{CH}(\text{COOC}_2\text{H}_5)_2$.

Properties: Clear colorless liquid; ester odor; sp.gr. 0.9994 (25/25°C).

Use: Intermediate.

diethyl ethylphosphonate $\text{C}_2\text{H}_5\text{P}(\text{O})(\text{OC}_2\text{H}_5)_2$.

Properties: Colorless liquid with mild odor.

Stable. Miscible with most common organic solvents. Soluble in water. Sp.gr. 1.025 (20/4°C), b.p. 82-83°C (11 mm); flash point 220°F.

Containers: 5-, 55-gal steel drums.

Uses: Heavy metal extraction and solvent separation, gasoline additives; antifoam agent; plasticizer; textile conditioner and antistatic agent.

O,O-diethyl S-2(ethylthio)ethyl phosphorodithioate ("Di-Syston") $\text{C}_8\text{H}_{19}\text{O}_2\text{PS}_2$.

Properties: Pale yellow liquid; b.p. 62°C (0.01 mm); low water solubility but soluble in most organic solvents.

Uses: Systemic insecticide for protection of crops against aphids and mites and other sucking insect pests.

Caution! Harmful if swallowed, inhaled or absorbed through the skin. Overexposure will result in cholinesterase depression.

O,O-diethyl O(and S)-2-(ethylthio)ethyl phosphorothioates (demeton; "Systox") $\text{C}_8\text{H}_{19}\text{O}_2\text{PS}_2$.

Properties: Colorless liquid; b.p. 134°C (2 mm); sp.gr. 1.118. Slightly soluble in water; soluble in most organic solvents.

Use: Systemic insecticide (absorbed by plant, which then becomes toxic to sucking and chewing insects).

Caution: May be harmful if swallowed, inhaled, or absorbed through the skin. Overexposure will result in cholinesterase depression.

diethylglycol phthalate (diethoxyethyl phthalate) $(\text{C}_2\text{H}_5\text{OCH}_2\text{CH}_2\text{OOC})_2\text{C}_6\text{H}_4$.

Properties: Water-white to pale straw liquid; sp.gr. 1.115-1.120 (20/20°C); wt/gal 9.31 lbs.

di(2-ethylhexyl)adipate (DOA; dioctyl adipate) $\text{C}_4\text{H}_9[\text{COOCH}_2\text{CH}(\text{C}_2\text{H}_5)\text{C}_4\text{H}_9]_2$.

Properties: Light-colored oily liquid; sp.gr. 0.9268 (20/20°C); refractive index 1.4472; flash point 405°F; f.p. -70°C; b.p. 417°C

*See "I.C.C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

(760 mm), 214°C (5 mm); vapor pressure 2.60 mm (200°C); insoluble in water; viscosity 13.7 cps (20°C); 7.7 lb/gal (20°C).

Assay: 99% min.

Containers: 55-gal drums, tank cars and tank trucks.

Uses: Plasticizer, commonly blended with general purpose plasticizers, such as DOP and DIOP in processing polyvinyl and other synthetic resin compounds; solvent; aircraft lubes.

di(2-ethylhexyl)amine (dioctylamine)
 $[C_4H_9CH(C_2H_5)CH_2]_2NH$.

Properties: Water-white liquid with slightly ammoniacal odor; sp. gr. 0.8062 (20/20°C), 6.7 lbs/gal (20°C); b.p. 281.1°C (760 mm), vapor pressure 0.01 mm (20°C); viscosity 3.70 cps (20°C); flash point 270°F, high solubility in hydrocarbons and low solubility in water; solubility of water in 0.17% by wt; refractive index (n 20/D) 1.4420.

Uses: In the synthesis of dyestuffs, insecticides, emulsifying agents, and other organic compounds.

di(2-ethylhexyl)aminoethanol. See di(2-ethylhexyl)ethanolamine.

di(2-ethylhexyl)azelate (DOZ; dioctyl azelate)
 $(CH_2)_7[COOCH_2CH(C_2H_5)C_4H_9]_2$.

Properties: Odorless liquid, sp. gr. 0.919 (20/20°C); refractive index 1.4472, b.p. 376°C (760 mm), flash point 430°F (Cleveland open cup).

Uses: Plasticizer for vinyls; especially used as low-temperature plasticizer, base for synthetic lubricants.

di(2-ethylhexyl)ethanolamine (di(2-ethylhexyl)aminoethanol, dioctylaminoethanol)
 $[C_4H_9CH(C_2H_5)CH_2]_2N(CH_2)_2OH$.

Properties: Colorless liquid, insoluble in water; wt/gal 7.2 lb.

Grade: Technical.

Uses: Emulsifier; acid-stable wetting agent.

di(2-ethylhexyl) ether $[C_4H_9CH(C_2H_5)CH_2]_2O$.

Properties: Colorless, stable liquid with mild characteristic odor. Extremely low solubility in water (0.01% by wt); sp. gr. 0.8121 (20/20°C), 6.6 lbs/gal (20°C); b.p. 269.4°C (760 mm), vapor pressure <0.01 mm (20°C); sets to glass below -95°C; viscosity 2.89 cps (20°C). Solubility of water in 0.03% by wt (20°C), refractive index (n 20/D) 1.4325.

Uses: A high-boiling, inert reaction medium, also a component of certain foam breakers.

di(2-ethylhexyl) 2-ethylhexyl phosphonate
 $C_8H_{17}PO(OC_8H_{17})_2$.

Properties: Colorless liquid with a mild odor. Sp. gr. 0.908 (20/4°C), b.p. 160-161°C (0.26 mm), flash point 420°F. Insoluble in water; miscible with most common organic solvents.

Containers: 5-, 55-gal. drums.

Uses: Heavy metal extraction; solvent separation; gasoline additive; anti-foam agent; plasticizer; stabilizer; textile conditioner and antistatic agent.

di(2-ethylhexyl) hexahydrophthalate (dioctyl hexahydrophthalate)

Properties: A light-colored liquid; sp. gr. 0.9586 (20/20°C); 8.0 lb/gal (20°C); b.p. 216°C (5 mm); vapor pressure 2.2 mm (200°C); insoluble in water; viscosity 42.1 cps (20°C).

Use: Plasticizer.

di(2-ethylhexyl) hydrogen phosphate (bis(2-ethylhexyl) hydrogen phosphate)

Properties: Solid; sp. gr. 0.972 (20/4°C); flash point (Cleveland open cup) 340°F. Insoluble in water.

Use: Heavy metal extraction.

di(2-ethylhexyl) isophthalate (dioctyl isophthalate) $C_8H_4[COOCH_2CH(C_2H_5)C_4H_9]_2$.

Properties: B.p. 258°C at 10 mm; sp. gr. 0.984 (20/20°C); 8.2 lbs/gal; pour point +46°C; insoluble in water; viscosity 86.5 cps (20°C).

Use: Plasticizer.

di(2-ethylhexyl) maleate

Properties: Liquid; b.p. 209°C (10 mm); f.p. sets to glass below -60°C; sp. gr. 0.9436 (20/20°C), wt/gal 7.9 lb (20°C); flash point (open cup) 365°F. Insoluble in water.

Grade: Technical.

Containers: 1-gal cans; 5-, 55-gal drums.

Uses: Copolymers; intermediate.

di(2-ethylhexyl) phosphite (bis(2-ethylhexyl) phosphite) $(C_8H_{17}O)_2PHO$. Mobile, colorless liquid with mild odor and a high degree of thermal stability. Insoluble in water (hydrolyzes very slowly), miscible with most common organic solvents. Sp. gr. 0.937 (20/4°C); b.p. 163-164°C (3 mm); flash point 330°F.

Containers: 5-gal, 55-gal drums.

Uses: Lubricant additive, intermediate, adhesive.

di(2-ethylhexyl) phosphoric acid (dioctyl phosphoric acid) $[C_4H_9CH(C_2H_5)CH_2]_2HPO_4$.

Properties: Liquid having strong acid properties; sp. gr. 0.973 (25/25°C); f.p. -60°C; refractive index 1.4420 (n 25/D); flash point 385°F, wt/gal 8.2 lbs. Insoluble in water; soluble in organic solvents.

Uses: Metal extraction and separation; intermediate for wetting agents and detergents.

di(2-ethylhexyl) phthalate (dioctyl phthalate; DOP) $C_8H_4[COOCH_2CH(C_2H_5)C_4H_9]_2$.

Properties: A light-colored odorless liquid; sp. gr. 0.9861 (20/20°C), m.p. -55°C, refractive index 1.4836; flash point 410°F; 8.2 lbs/gal (20°C); b.p. 231°C (5 mm); vapor pressure 1.3 mm Hg (200°C); viscosity 81.4 cps (20°C); insoluble in water; miscible with mineral oil.

Derivation: Reaction of 2-ethylhexyl alcohol and phthalic anhydride.

Containers: Drums; tank cars; tank trucks.

Uses: Plasticizer for many resins and synthetic rubbers.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

di(2-ethylhexyl) sebacate (dioctyl sebacate)
(CH₂)₈(COOC₈H₁₇)₂.

Properties: Pale straw-colored liquid; sp. gr. 0.91 (25°C); refractive index 1.447 (28°C); b. p. 248°C (4 mm); m. p. -55°C; flash point (Cleveland open cup) 213°C, insoluble in water; partially compatible with cellulose acetate and cellulose acetate butyrate; compatible with ethyl cellulose, polystyrene, polyethylene, vinyl chloride, and vinyl chloride acetate.

Containers: Drums; tank cars.

Use: Plasticizer.

di(2-ethylhexyl) succinate (dioctyl succinate)
C₈H₁₇OCOCH₂CH₂COOC₈H₁₇.

Properties: Liquid; b. p. 257°C (50 mm); f. p., sets to glass below -60°C; sp. gr. 0.9346 (20/20°C); wt/gal 7.8 lbs (20°C); flash point (open cup) 315°F; vapor pressure <0.01 mm (20°C), solubility in water <0.01% by wt (20°C).

Grade: Technical.

Containers: 1-gal cans, 5-, 55-gal drums.

Uses: Plasticizer; intermediate.

Shipping regulations: None.*

di(2-ethylhexyl) sodium sulfosuccinate. See dioctyl sodium sulfosuccinate.**diethyl isoamylethylmalonate**

(C₂H₅)(C₅H₁₁)C(COOC₂H₅)₂. Colorless liquid; sweet odor, sp. gr. 0.950 (25/25°C). Used as an intermediate.

O, O-diethyl-O-(2-isopropyl-6-methyl-4-pyrimidinyl phosphorothioate. See "Diazinon."**diethylketone** (metacetone, propione; 3-pentanone, ethyl propionyl) C₂H₅COC₂H₅.

Properties: Colorless, mobile, flammable liquid, acetone-like odor; soluble in alcohol and ether. B. p. 101°C, sp. gr. 0.816, m. p. -42°C, flash point (open cup) 55°F.

Derivation: By distilling sugar with an excess of lime.

Method of purification: Rectification.

Grade: Technical.

Containers: Iron drums; glass bottles.

Uses: Medicine, organic synthesis.

Fire hazard: Dangerous.

Shipping regulations: Flammable liquid.

Red label.*

diethyl maleate (HCCOOC₂H₅)₂.

Properties: Water-white liquid; sp. gr. 1.0687; 8.92 lb/gal (20°C); refractive index (n_D 20) 1.4400; b. p. 225°C (760 mm); m. p. -11.5°C (approx.); viscosity 3.567 cps (20°C), flash point (Cleveland open cup) 250°F, dielectric constant 2.18 (calc)(25°C); surface tension 37.0 dynes/cm (20°C). Readily soluble in alcohol, diethyl ether, paraffinic hydrocarbons and most common organic solvents; sparingly soluble in water; readily hydrolyzed by alkaline solutions.

Derivation: By reacting maleic anhydride with ethyl alcohol in the presence of a catalyst.

Typical specifications: Purity 99-100% ester as diethyl maleate; sp. gr. 1.065-1.066 (25/25°C); boiling range not less than 90%

distilling in a three-degree range including 129°C (40 mm); m. p. -10 to -12°C; color, water-white.

Containers: 1-gal cans; 5-, 55-gal drums; tank cars.

Uses: Organic synthesis.

Caution: Handle with care.

Shipping regulations: None.*

diethylmalonate. See ethylmalonate.

diethylmalonylurea. See barbital.

5,5-diethyl-1-methylbarbituric acid. See metharbital.

diethyl (1-methylbutyl) malonate

[C₃H₇CH(CH₃)]CH(COOC₂H₅)₂. Colorless liquid; ester odor; sp. gr. 0.969 (25/25°C). Used as an intermediate.

diethylmethylethane. See 3-methylpentane.

N,N-diethylnicotinamide. See nikethamide.

diethyl para-nitrophenyl phosphate. See para-oxon (see under para).

O, O-diethyl-para-nitrophenyl thiophosphate. See parathion.

diethyl oxalate. See ethyl oxalate.

diethyl oxide. See ether.

di(para-ethylphenyl) dichloroethane. See

1,1-dichloro-2,2-bis(para-ethylphenyl)-ethane.

N,N-diethyl-para-phenylenediamine. See para-aminodiethylaniline.

diethyl phosphite (C₂H₅O)₂P(O).

Properties: Water-white liquid; b. p. 50-51°C (2 mm), sp. gr. 1.069 (25°C); refractive index 1.4061 (n_D 25/D); flash point 195°F (Cleveland open cup). Soluble in water, common organic solvents.

Containers: Carboys.

Uses: Paint solvent; lubricant additive; anti-oxidant; reducing agent; intermediate.

O, O-diethyl phosphorochlorodithionate

(C₂H₅O)₂P(S)Cl.

Properties: Colorless to light amber liquid; sp. gr. 1.196 (25/25°C), m. p. below -75°C; b. p. 49°C (<1 mm); refractive index 1.4705 (n_D 25/D), insoluble in water; soluble in most organic solvents. Stable at room temperature; slowly isomerizes at 100°C.

Uses: Intermediate for pesticides, oil and gasoline additives; flame retardants; flotation agents.

Caution: Exposure to vapor can cause irritation to eye and lung tissue.

diethyl phthalate (ethyl phthalate)

C₆H₄(CO₂C₂H₅)₂.

Properties: Water-white, stable, odorless, nonflammable liquid, bitter taste; m. p. -40.5°C; refractive index 1.5002 (25°C); surface tension 37.5 dynes/cm (20°C); viscosity 31.3 centistokes (0°C); vapor pressure 14 mm (163°C), 30 mm (182°C), 734 mm (295°C); b. p. 298°C; coefficient of expansion per °F 0.00042, per °C 0.00076; dilution ratio with toluene 3.8, with petroleum naphtha 0.7; flash point

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

305°F; wt/gal 9.31 lb (approx.) (20°C); sp. gr. 1.120 (25/25°C). Miscible with alcohols, ketones, esters, aromatic hydrocarbons; partly miscible with aliphatic solvents.

Typical specifications: Free acid as phthalic, not more than 0.01%; color water-white; dryness, miscible without turbidity with 20 vols 60° Bé gasoline (20°C); odorless; purity ester content as diethyl phthalate 99-100%; sp. gr. 1.115-1.125 (20/20°C).

Derivation: By reacting phthalic anhydride with ethyl alcohol, followed by careful purification.

Grades: Technical.

Containers: 1-gal (nonreturnable) cans, 5-, 55-gal (nonreturnable) steel drums; tank cars.

Uses: Solvent for nitrocellulose, cellulose acetate; plasticizer, wetting agent, insecticidal sprays, camphor substitute, plastics; perfumery; as fixative and solvent; alcohol denaturant; mosquito repellents; plasticizer in solid rocket propellants.

Shipping regulations. None.*

2, 2-diethyl-1, 3-propanediol

$\text{HOCH}_2\text{C}(\text{C}_2\text{H}_5)_2\text{CH}_2\text{OH}$

Properties: White crystals; m.p. 61.3°C; b.p. 160°C (50 mm), sp. gr. (at m.p.) 0.949; wt/gal 8.2 lb (60°C); flash point (open cup) 215°F. Soluble in water.

Grades: Technical; pharmaceutical.

Uses: Emulsifying agent; intermediate, medicine.

diethylpropion (1-phenyl-2-diethylamino-1-propanone hydrochloride)

$\text{C}_6\text{H}_5\text{C}(\text{O})\text{CH}(\text{CH}_3)\text{N}(\text{C}_2\text{H}_5)_2 \cdot \text{HCl}$. Crystals, m.p. 168°C; used as a medicine.

diethylstilbestrol (stilbestrol)

$\text{HO}_2\text{C}_6\text{H}_4\text{C}(\text{C}_2\text{H}_5)_2\text{C}(\text{C}_2\text{H}_5)_2\text{C}_6\text{H}_4\text{OH}$.

3, 4-Bis(para-hydroxyphenyl)-3-hexene.

A non-steroid, synthetic estrogen, always in the trans form. It is the most active of the commonly-used stilbene-type compounds.

Properties: White, odorless crystalline powder, m.p. 169-172°C; almost insoluble in water; soluble in alcohol, chloroform, ether, fatty oils, and dilute alkali hydroxide.

Derivation: From anethole hydrobromide, from anisole; from anisoin or deoxyanisoin.

Containers: Bottles.

Grade: U. S. P. XVI.

Uses: Medicine; research; animal feeds.

diethylstilbestrol dimethyl ether

$(\text{CH}_3\text{OC}_6\text{H}_4\text{CC}_2\text{H}_5)_2$. White crystalline powder; m.p. 123-127°C.

diethylstilbestrol dipropionate

$\text{C}_2\text{H}_5\text{CO}_2\text{C}_6\text{H}_4\text{C}(\text{C}_2\text{H}_5)_2\text{C}(\text{C}_2\text{H}_5)_2\text{C}_6\text{H}_4\text{CO}_2\text{C}_2\text{H}_5$. alpha, alpha-Diethyl-4, 4'-stilbenediol dipropionate.

Properties: Odorless, tasteless, white, crystalline powder. M.p. 105-107°C. Readily soluble in acetone, hot alcohol, benzene, chloroform, ether and hot methanol; soluble in vegetable oils; very slightly

soluble in water and dilute mineral acids; insoluble in aqueous alkalis. Suspension of 0.1 g. in 10 ml. diluted alcohol is neutral to litmus paper.

Derivation: From diethylstilbestrol by treatment with propionic anhydride in the presence of pyridine.

Grade: N. F. XI.

Use: Medicine.

diethyl succinate $(\text{CH}_3\text{COOC}_2\text{H}_5)_2$

Properties: Clear, colorless liquid with faint pleasant odor. B.p. 216.2°C; m.p. -21°C; sp. gr. 1.0418 (20/20°C); wt/gal 8.7 lb (20°C); refractive index (n_D 20) 1.4201; flash point (open cup) 230°F. Miscible with alcohol and ether; slightly soluble in water.

Grades: Technical.

Uses: Plasticizer; intermediate.

diethyl sulfate (ethyl sulfate) $(\text{C}_2\text{H}_5)_2\text{SO}_4$

Properties: Colorless liquid; faint, ethereal odor; irritating after-effect. Non-flammable. Noncorrosive, soluble in alcohol and ether, insoluble in water. Sp. gr. 1.1803; b.p. 208°C; vapor pressure 0.19 mm (20°C), flash point 250°F; wt/gal 9.8 lbs (20°C), coefficient of expansion 0.00091 (20°C), f. p. -24.4°C, viscosity 1.79 cps (20°C).

Typical specifications: Acidity not more than 0.03% (as sulfuric), purity not less than 98%, color, water-white, sp. gr. 1.177-1.182 (20/20°C); solubility, completely miscible with ethyl alcohol and ethyl ether; average wt/gal 9.82 lbs (20°C).

Derivation: By the action of fuming sulfuric acid on ethyl alcohol.

Method of purification: Rectification in vacuo.

Grades: Technical.

Containers: Drums; tank cars.

Use: As an ethylating agent in organic synthesis.

Shipping regulations: None.*

diethyl sulfide. See ethyl sulfide.

diethylsulfondimethylmethane. See sulfonmethane.

diethylsulfonmethylethylmethane. See sulfonethylethylmethane.

diethyl tartrate $\text{C}_4\text{H}_4\text{O}_6(\text{C}_2\text{H}_5)_2$

Properties: Colorless thick, oily liquid; b.p. 280°C, m.p. 17°C, soluble in water and alcohol, sp. gr. 1.204 (20/4°C).

Uses: Plasticizer for automobile lacquers; solvent for nitrocellulose, gums, and resins.

diethylthioglycol $(\text{CH}_3\text{CH}_2\text{OC}_2\text{H}_5)_2\text{S}$

Properties: Liquid; volatile in steam. Soluble in alcohol, benzene, and ether, slightly soluble in water. Sp. gr. 0.9672 (20°C); b.p. 225°C (746 mm).

1, 3-diethylthiourea $\text{C}_2\text{H}_5\text{NHCSNHC}_2\text{H}_5$

Properties: Buff solid; m.p. 68-71°C; slightly soluble in water; soluble in methanol, ether, acetone, benzene, and ethyl acetate; insoluble in gasoline.

Containers: Drums.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Uses: Corrosion inhibitor; for pickling iron or steel with hydrochloric acid or sulfuric acid; for reducing corrosion of ferrous metals and aluminum alloys in brine; as intermediate.

N,N-diethyl-meta-toluidine

Properties: Colorless liquid; mild bland odor; b.p. 160°C (19 mm) and 111°C (1 mm); sp. gr. 0.996-1.002 (25/25°C); refractive index 1.5200-1.5235 (25°C); slightly soluble in water; soluble in alcohol, ether and benzene.

Grade: U.S.P. XVI.

Containers: 1- and 5-gal containers; 55-gal drums.

Uses: Insect repellents; resin solvent; film formers.

Warning: Avoid contact with eyes or lips.

N,N-diethyl-meta-toluidine $\text{CH}_3\text{C}_6\text{H}_4\text{N}(\text{C}_2\text{H}_5)_2$

Properties: Crystals; b.p. 96-97°C (7 mm).

Grade: Technical.

Use: Dye intermediate.

N,N-diethyl-ortho-toluidine (1-diethylamino-2-methylbenzene) $\text{CH}_3\text{C}_6\text{H}_4\text{N}(\text{C}_2\text{H}_5)_2$

Properties: Prisms from water; m.p.

72.3°C; b.p. 209°C, soluble in water, alcohol, and ether.

Derivation: From ortho-toluidine.

3,9-diethyl-6-tridecanol (heptadecanol) $\text{C}_4\text{H}_9\text{CH}(\text{C}_2\text{H}_5)\text{C}_2\text{H}_4\text{CH}(\text{OH})\text{C}_2\text{H}_4\text{CH}(\text{C}_2\text{H}_5)_2$

Properties: Sp. gr. 0.8475; b.p. 309°C; flash point 310°F (open cup); refractive index 1.4531 (20°C). Insoluble in water.

Uses: Intermediate for synthetic lubricants, defoamers and surfactants.

1,1-diethylurea $\text{NH}_2\text{CON}(\text{C}_2\text{H}_5)_2$. White solid; solidification point 41-75°C; when copolymerized with simple urea by the use of formaldehyde, it yields modified resins that differ in nature from those made through the use of mono-substituted ureas. These resins tend to be permanently thermoplastic.

diethyl valeramide. See valeryl diethylamide.

diffusion. The spontaneous mixing of one substance with another, due to the passage of the molecules of each substance through the empty spaces between molecules of the other substance. Best exemplified by gases, since any gas or mixture of gases will diffuse into others. Dissolved materials diffuse readily through liquids and very slow diffusion occurs within solids.

diffusion length. A property of materials of interest to nuclear engineers, especially of materials used in reactors for a moderator or reflector. It is a measure of the distance a thermal neutron diffuses after it is thermalized until it is captured. It is related to the density of the material and to the scattering and absorption cross sections.

difluorophosphoric acid. See fluophosphoric acids.

Shipping regulations: (as difluorophosphoric

acid, anhydrous) Corrosive liquid. White label.*

1,1,1-difluorochloroethane. See 1,1,1-chlorodifluoroethane.

difluorochloromethane. See chlorodifluoromethane.

difluorodichloromethane. See dichlorodifluoromethane.

4,4'-difluorodiphenyl $\text{FC}_6\text{H}_4\text{C}_6\text{H}_4\text{F}$

Properties: White, crystalline powder; aromatic odor. Soluble in alcohol, ether, chloroform, and oils; insoluble in water. Sp. gr. 1.04; m.p. 92-95°C; b.p. 254-255°C.

Derivation: By passing gaseous hydrofluoric acid into the product of the reaction of an excess of piperidine on diazotized benzidine.

Grades: Technical.

Containers: Glass bottles.

Use: Medicine.

Shipping regulations: None.*

difluorodiphenyltrichloroethane. See DFDT.

1,1-difluoroethane (ethylidene fluoride)

Properties: Colorless, odorless gas. B.p. -24.7°C; m.p. -117°C; sp. gr. 1.004 (-25°C); index of refraction 1.255 (20°C). Insoluble in water.

Derivation: By addition of hydrogen fluoride to acetylene.

Grades: Technical.

Containers: Cylinders.

Uses: Refrigerant; aerosol propellant; intermediate.

Shipping regulations: Flammable gas. Red gas label.*

1,1-difluoroethylene. See "Genetron" 1132A.

difoline. Powder containing cardioactive principles of digitalis.

Properties: Brown, amorphous powder soluble in water and alcohol; insoluble in ether.

Derivation: From digitalis leaves. Marketed as a solution or in tablets.

diformyl-meta-tolylenediamine.

Properties: Grayish-white; soluble in alcohol; melting range 173-175°C.

Derivation: From meta-tolylenediamine.

di-2-furfurylamine

Constants: B.p. 103-106°C (2-3 mm).

Derivation: Obtained in conjunction with tetrahydro-2-furfurylamine by hydrogenating nickel hydrofuranamide in ethyl alcohol.

digallic acid. See tannic acid.

"**Digifolin**," ³⁰⁵ Trademark for purified digitalis glycosides.

Use: Medicine.

digitalin $\text{C}_{36}\text{H}_{56}\text{O}_{14}$. A digitalis glycoside.

Properties: Amorphous, white powder; m.p. 210-217°C; slightly soluble in water; soluble in alcohol.

Derivation: Solvent extraction of the seeds and leaves of Digitalis.

Containers: Bottles.

Use: Medicine.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

digitalis (foxglove; purple foxglove; fairy gloves). Dried leaves of *Digitalis purpurea*.

Habitat: Southern and central Europe; cultivated in the United States.

Grades: Technical; U. S. P. XVI.

Containers: Boxes; drums.

Use: Medicine.

Shipping regulations: None.*

digitoxin $C_{41}H_{64}O_{13}$. Most active glycoside of *Digitalis purpurea*.

Properties: White, odorless, bitter leaflets or powder; m. p. 255-256°C; slightly soluble in water or ether; soluble in alcohol.

Very poisonous!

Derivation: From digitalis leaves, usually *Digitalis purpurea*.

Containers: Bottles.

Grade: U. S. P. XVI.

Use: Medicine.

1,3-diglycidyl oxybenzene. See resorcinol diglycidyl ether.

diglycoll hydroiodide-iodine

$[(NH_2CH_2COOH)_2 \cdot HI] + I_2$. Two moles of diglycoll hydroiodide combined with two atomic weights of iodine. It contains 30.5 to 32.0 per cent of active iodine. Dark, almost black, lumpy powder with a strong odor of iodine. Freely soluble in water; only very slightly soluble in alcohol; however the iodine component is soluble. Solution in water (0.1%) is acidic (pH, about 3.0).

Use: Disinfection of drinking water.

diglycol acetate. See diethylene glycol acetate.

diglycol carbamate (diethylene glycol dicarbamate) $O(CH_2CH_2OCONH_2)_2$.

Properties: White crystalline substance; relatively stable to acid hydrolysis, but less stable to basic conditions.

Use: Manufacture of resins.

diglycol chlorohydrin. $ClCH_2CH_2OCH_2CH_2OH$.

Properties: Colorless liquid; miscible with water; sp. gr. 1.1698, b. p. 196.8°C; flash point 225°C, vapor pressure 0.17 mm.

Grades: Technical.

diglycol chloroformate [diethylene glycol bis(chloroformate)] $O(CH_2CH_2OCOC1)_2$

Properties: Liquid; b. p. 125-127°C (5 mm); soluble in acetone, alcohol, ether, chloroform, and benzene.

Use: In preparation of non-volatile plasticizers or modifying agents.

diglycolic acid $O(CH_2COOH)_2$.

Properties: White crystalline solid; m. p. 148°C; soluble in water and alcohol; pH of 10% aqueous solution 1.4. Forms a nonhygroscopic monohydrate at relative humidities above 72% at 25°C.

Containers: Multiwall paper bags (50 lbs net).

Uses: In the manufacture of resins and plasticizers; in organic syntheses.

Shipping regulations: None.*

diglycol laurate (diethylene glycol monolaurate) $C_{11}H_{23}COOC_2H_4OC_2H_4OH$.

Properties: Light straw-colored, oily liquid practically odorless, non-toxic, and edible. Sp. gr. 0.96. Dispersible in water; soluble in methanol, ethanol, toluene, naphtha, and mineral oil. Clearly miscible in certain proportions in cottonseed oil, acetone, and ethyl acetate.

Derivation: Lauric acid ester of diethylene glycol.

Containers: 1-gal cans (8 lbs); 5-gal cans (40 lbs); 55-gal drums (450 lbs).

Uses: Emulsifying agent for oils and hydrocarbon solvents in the manufacture of automobile, furniture, and shoe polishes; textile emulsions for lubrication, sizing, finishing, etc; sizing and coating emulsions for paper; lubricating and finishing emulsions for leather; fluid emulsions of oils for hand lotions, hair dressings, etc; cutting and spraying oils; dry-cleaning soap base; anti-foaming agent for casein, etc.

Shipping regulations: None.*

"Diglycol Laurate A, SE." ²⁶⁰ Proprietary brands of the modified ester of diethylene glycol and coconut fatty acids. Both are light yellow oily liquids, having a coconut odor. Acid value 2.0 max; iodine value 13.0 max; sp. gr. 0.974 (25°C); anionic. Dispersible in water.

Uses: Emulsifier and dispersing agent in cosmetic and other emulsion systems.

diglycol monostearate (diethylene glycol monostearate) $C_{17}H_{35}COOC_2H_4OC_2H_4OH$.

Properties: Small white flakes, available in regular or water-dispersible types.

Containers: Drums.

Uses: Emulsifier and thickener in cosmetics; mold release lubricant for die casting; temporary binder for ceramics and grinding wheels.

diglycol nitrate. See diethylene glycol dinitrate.

diglycol oleate (diethylene glycol mono-oleate;) $C_{17}H_{33}COOC_2H_4OC_2H_4OH$.

Properties: Light red, oily liquid; fatty odor. Soluble in ethanol, naphtha, ethyl acetate, methanol; partly soluble in cottonseed oil; insoluble in water. Sp. gr. 0.93; iodine value 65-75; titer below 0°C, pH (25°C) 7.7-8.2 (5% aqueous dispersion).

Derivation: Oleic acid ester of diethylene glycol.

Grades: Technical.

Containers: 1-gal cans (8 lbs); 5-gal cans (40 lbs); 55-gal drums (425 lbs).

Uses: Emulsifying agent for fluid water-in-oil emulsions for the manufacture of furniture polish, automobile polish; water-emulsion paints, and agricultural sprays.

Shipping regulations: None.*

"Diglycol Oleate 81, SE." ²⁶⁰ Proprietary brand of modified ester of diethylene glycol and oleic acid. Oily liquid; light yellow; fatty odor. Acid value 2.0 max; iodine value 78.0 max; sp. gr. 0.948 (25°C), anionic; dispersible in water. Flash point, open cup, 307°F.

Uses: Emulsifier and dispersing agent in cosmetic and other emulsion systems.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

diglycol phthalate (diethylene glycol phthalate).

Properties: Pale yellow, liquid resin. Soluble in methanol, ethanol, acetone, ethyl acetate; partly soluble in toluol, naphtha, mineral oil, cottonseed oil; insoluble in water. Sp. gr. 1.29; saponification value 430-450; acid value 170-175.

diglycol ricinoleate (diethylene glycol mono-ricinoleate) $C_{17}H_{32}(OH)COOC_2H_4OC_2H_4OH$.

Properties: Light yellow liquid; m. p. below $-60^{\circ}C$; sp. gr. 0.980 ($25^{\circ}C$). Soluble in alcohol, acetone, and ethyl acetate; insoluble in water.

Grades: Technical.

Containers: 1-, 5-gal cans; 450-lb drums.

Uses: Plasticizer for synthetic resins and rubbers.

diglycol stearate (diethylene glycol distearate) ($C_{17}H_{35}COOC_2H_4)_2O$.

Properties: White, wax-like solid; faint fatty odor. Disperses in hot water; soluble (hot) in alcohol, oils, and hydrocarbons. M. p. $54-55^{\circ}C$; sp. gr. 0.9333 ($20/4^{\circ}C$).

Derivation: Stearic acid ester of diethylene glycol.

Grades: Technical; cosmetic.

Containers: Drums.

Uses: Emulsifying agent for oils, solvents, and waxes; lubricating agent for paper and cardboard; suspending medium for titanium dioxide, carbon black, graphite, silica, etc. in the manufacture of polishes, cleaners, and textile delusterants; temporary binder for abrasive powders for the manufacture of abrasive and grinding wheels, also clays for ceramic insulation; protective coating for hygroscopic powders; thickening agent; pharmaceutical.

Shipping regulations: None.*

"**Diglycol Stearate, SE.**"²⁶⁰ Proprietary brand of modified ester of stearic acid and diethylene glycol. Waxy solid; white; mild fatty odor. Acid value 103 max; iodine value 7.0 max; m. p. $48-53^{\circ}C$; anionic; dispersible in water; flash point (open cup) $345^{\circ}F$.

Uses: Emulsifier in cosmetic and other type emulsion systems.

diglyme. Abbreviation for diethylene glycol dimethyl ether (q. v.).**digoxin.** A cardiotonic digitalis glycoside.

$C_{41}H_{64}O_{14}$.

Properties: Poisonous! Colorless to white crystals or white crystalline powder; odorless. Melts indistinctly at about $235^{\circ}C$ (dec). Insoluble in water, chloroform, and ether; freely soluble in pyridine; soluble in dilute alcohol.

Derivation: From the leaves of *Digitalis lanata*.

Grade: U. S. P. XVI.

Use: Medicine.

"**Di-Halo.**"²²⁵ Trademark for bromochlorodimethylhydantoin (q. v.); active bromine 33% min., available bromine 66% min.; active chlorine 14% min., available chlorine 28% min. Used in production of disinfectants

and special polymers and as reactive intermediate in synthesis.

dihexadecyl ether. See dicetyl ether.

dihexadecyl sulfide. See dicetyl sulfide.

dihexadecyl thioether. See dicetyl sulfide.

dihexyl. See n-dodecane.

di-n-hexyl adipate $(CH_2)_4(COOC_6H_{13})_2$.

Properties: Liquid; color, water-white to maximum 100 Pt-Co; sp. gr. ($20^{\circ}C$) 0.939; refractive index ($25^{\circ}C$) 1.438; surface tension ($20^{\circ}C$) 32.7 dynes/cm; viscosity ($20^{\circ}C$) 8.8 cps; b. p. (4 mm) $183-192^{\circ}C$ (midpoint $191^{\circ}C$); water solubility ($25^{\circ}C$) 0.1%; gasoline and oil solubility, complete.

Use: Rubber plasticizer in GR-S stocks at low temperatures.

di-n-hexylamine $[CH_3(CH_2)_5]_2NH$.

Properties: Water-white; b. p. $233-243^{\circ}C$; sp. gr. 0.788 ($20/20^{\circ}C$); refractive index 1.434 ($20^{\circ}C$); flash point $220^{\circ}F$.

di-n-hexyl maleate $C_6H_{11}OOCCH:CHCOOC_6H_{13}$.

Properties: Liquid; sp. gr. 0.9602 ($20/20^{\circ}C$); b. p. $179^{\circ}C$ (10 mm); refractive index 1.449 ($20^{\circ}C$); vapor pressure, less than 0.01 mm ($20^{\circ}C$), f. p. $-70^{\circ}C$; viscosity 10.2 cps ($20^{\circ}C$); solubility in water, less than 0.01% by wt ($20^{\circ}C$).

Use: Preparation of resins.

dihexyl phthalate. See di(2-ethyl butyl) phthalate.

dihexyl sebacate $(CH_2)_8(COOC_6H_{13})_2$.

Properties: Light straw-colored liquid; b. p. (4 mm) $203^{\circ}C$.

Derivation: By reacting dodecyl alcohol with sebacic acid.

Containers: Drums; tank cars.

Use: Plasticizer for vinyl resins.

Shipping regulations: None.*

dihydrazine sulfate $(N_2H_4)_2 \cdot H_2SO_4$.

Properties: White, crystalline flakes; m. p. approx. $104^{\circ}C$; decomposes at about $180^{\circ}C$; very soluble in water; insoluble in most organic solvents.

Grades: 95% grade is available commercially.

Containers: Drums.

Use: Reducing agent.

dihydroabietyl alcohol (hydroabietyl alcohol)

$C_{19}H_{31}CH_2OH$.

Properties: Solid; sp. gr. 1.007-1.008; refractive index 1.5280; vapor pressure 1.5×10^{-5} mm ($25^{\circ}C$); m. p. $32-33^{\circ}C$; flash point $190^{\circ}C$; insoluble in water.

Containers: Drums.

Use: Plasticizer.

3,4-dihydrochlorothiazide. See hydrochlorothiazide.

dihydrocholesterol (beta-cholestanol; 3-beta-hydroxycholestane) $C_{27}H_{47}OH$. A sterol found in the feces. It differs from cholesterol in that it has no double bond.

Properties: White crystals; m. p. (monohydrate) $142^{\circ}C$; optical rotation α ($25/D$) = $+23^{\circ}$. Soluble in fat solvents; insoluble

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

in water.

Derivation: By a series of oxidation and reduction reactions from cholesterol.

Use: Biochemical experimentation; pharmaceutical preparations.

dihydrocodeinone bitartrate

$C_{18}H_{21}NO_3 \cdot C_4H_6O_6 \cdot 2\frac{1}{2}H_2O$.

Properties: White, odorless, crystalline powder or crystals. Fairly soluble in water; slightly soluble in alcohol; insoluble in ether or chloroform. Affected by light.

Grade: N. F. XI.

Use: Medicine.

dihydrocoumarin. See benzodihydropyrone.

dihydrogen ferrous EDTA. See ethylenediaminetetraacetic acid salts.

2,3-dihydroindene. See indan.

dihydromorphinone hydrochloride

$C_{17}H_{19}O_3N \cdot HCl$.

Properties: Fine, white, odorless, crystalline powder; soluble in water; sparingly soluble in alcohol, nearly insoluble in ether; affected by light.

Derivation: Reducing morphine in hydrochloric acid solution.

Grades: U. S. P. XVI.

Use: Medicine.

9,20-dihydro-9-oxoanthracene. See anthrone.

2,3-dihydro-4H-pyran C_5H_8O .

Properties: Colorless, mobile liquid; ether-like odor; b. p. $84.3^\circ C$ (760 mm); freezing point $-70^\circ C$; sp. gr. 0.927 ($20/4^\circ C$); refractive index 1.4180 (25/D); flash point: $0^\circ F$ (Tag closed cup). Solubility 1.6 g./100g. water ($25^\circ C$); soluble in most organic solvents.

Containers: 1-, 5-, 55-gal drums; net weight: 7, 35 and 375 lbs, respectively.

Uses: Chemical intermediate.

Shipping regulations: Flammable liquid. Red label.*

1,2-dihydro-3,6-pyridazinedione. See maleic hydrazide.

dihydrostreptomycin (DHS) $C_{21}H_{41}N_7O_{12}$.

A derivative of streptomycin (q. v.) in which the carbonyl group of the streptose (q. v.) portion has been reduced by the addition of two hydrogen atoms. It has antibiotic properties similar to streptomycin and is mainly used in the treatment of tuberculosis.

Derivation: By hydrogenation of streptomycin.

Use: Medicine (usually as sulfate salt).

dihydrostreptomycin sulfate

$(C_{21}H_{41}N_7O_{12})_2 \cdot 3H_2SO_4$. The most commonly used form of dihydrostreptomycin.

Properties: White or practically white powder; odorless or with very slight odor. Hygroscopic but stable toward light and air. Solutions are acid or nearly neutral to litmus and are levorotatory. Freely soluble in water; very slightly soluble in alcohol; practically insoluble in chloroform.

Grade: U. S. P. XVI.

Use: Medicine.

dihydrotachysterol $C_{28}H_{46}O$. A sterol.

Properties: Colorless or white crystals, or white crystalline powder. Odorless. Practically insoluble in water. Soluble in alcohol, ether, chloroform; sparingly soluble in vegetable oils; m. p. $123.5-129^\circ C$.

Grade: U. S. P. XVI.

Use: Medicine.

dihydroxyacetone (DHA; dihydroxypropanone) $HOCH_2COCH_2OH$.

Properties: Colorless, crystalline solid; m. p. $80^\circ C$; soluble in water and alcohol; nearly insoluble in ether; insoluble in petroleum ether; characteristic odor; sweet cooling taste.

Derivation: By the action of the sorbose bacterium on glycerol.

Containers: Drums.

Uses: Medicine; intermediate; emulsifier; humectant; plasticizers; fungicides; cosmetics (creates synthetic tan).

2,4-dihydroxyacetophenone. See 4-acetylresorcinol.

dihydroxyaluminum aminoacetate (aluminum glycinate, basic; aluminum aminoacetate, basic; aluminum dihydroxyglycinate) $Al(OH)_2OOCCH_2NH_2$.

Properties: White odorless powder with faintly sweet taste; insoluble in water and organic solvents but dissolves in dilute mineral acids and solutions of fixed alkalis; forms fairly stable suspensions in water.

Derivation: Prepared by the addition of a solution of aluminum isopropoxide in isopropanol to an aqueous solution of glycine.

Grade: N. F. XI.

Use: Medicine.

1,8-dihydroxyanthranol. See anthralin.

3,4-dihydroxyanthranol. See anthrarobin.

1,2-dihydroxyanthraquinone. See alizarin.

1,5-dihydroxyanthraquinone (anthrarufin)

$C_{14}H_8O_2(OH)_2$.

Properties: Yellow crystals; soluble in alcohol; very sparingly soluble in water. M. p. $280^\circ C$.

Derivation: By heating anthraquinone with boric acid and sulfuric anhydride.

Method of purification: Crystallization.

Impurities: 1,8-dihydroxyanthraquinone.

Grades: Technical.

Containers: Wooden kegs; fiber drums.

Use: Dyes.

Shipping regulations: None.*

1,8-dihydroxyanthraquinone (chrysazin; danthron) $C_{14}H_8O_2(OH)_2$.

Properties: Orange-colored powder or reddish-brown needles; m. p. $191^\circ C$; soluble in alcohol, sparingly soluble in water.

Derivation: From 1,8-anthraquinone potassium disulfonate.

Grades: Technical; N. F. XI.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

- Containers: Kegs; fiber drums.
Uses: Dyes; medicine.
Shipping regulations: None.*
- meta-dihydroxybenzene. See resorcinol.
- ortho-dihydroxybenzene. See pyrocatechol.
- para-dihydroxybenzene. See hydroquinone.
- 2,4-dihydroxybenzenecarboxylic acid. See beta-resorcylic acid.
- 4,5-dihydroxy-meta-benzenedisulfonic acid disodium salt. See disodium 1,2-dihydroxybenzene-3,5-disulfonate.
- 2,4-dihydroxybenzoic acid. See beta-resorcylic acid.
- 2,5-dihydroxybenzoic acid. See gentisic acid.
- 3,5-dihydroxybenzoic acid. See alpha-resorcylic acid.
- 2,5-dihydroxybenzoquinone $C_6H_2(OH)_2O_2$.
Properties: Yellow-orange solid, m.p. 216°C (dec.); soluble in concentrated sulfuric acid; slightly soluble in ethyl alcohol, acetone, water, benzene. Insoluble in petroleum ether.
Derivation: From hydroquinone.
Uses: Metal chelating; insecticides; polymerization inhibitor; tanning agent; dye-stuff manufacture.
Toxic! Avoid skin and eye contact.
- 2,3-dihydroxybutane. See 2,3-butylene glycol.
- 2,5-dihydroxychlorobenzene. See chlorohydroquinone.
- dihydroxydiaminomercurobenzene $OHNH_2C_6H_3HgC_6H_3OHNH_2$. A mercury compound analogous to arspenamine (q.v.), used in medicine as a source of mercury.
Shipping regulations: None.*
- 2,2'-dihydroxy-5,5'-dichlorodiphenylmethane. See dichlorophene.
- dihydroxydiethyl ether. See diethylene glycol.
- 2,2'-dihydroxy-5,5'-difluorodiphenyl sulfide $FC_6H_3(OH)S(OH)C_6H_3F$.
Properties: White amorphous solid, m.p. 119-121°C. Soluble in acetone, ether, chloroform, ethanol, ethyl acetate and glacial acetic acid; moderately soluble in benzene, insoluble in water, petroleum ether.
Uses: Fungicide (textile), agricultural chemical.
- 5,7-dihydroxydimethylcoumarin $C_{11}H_{10}O_4$.
Properties and uses closely resemble those of 5,7-dihydroxy-4-methylcoumarin.
- dihydroxydiphenyl sulfone (sulfonyl diphenol) $(C_6H_4OH)_2SO_2$. The commercial product is a mixture of the isomers, 4,4'-bishydroxyphenyl sulfone and 2,4'-bishydroxyphenyl sulfone.
Properties: White, free-flowing, odorless crystals. M.p. 217-227°C.
Grade: Technical.
Containers: 150-lb fiber drums.
Uses: Electroplating; phenolic resins; polyvinyl chloride resins; chemical intermediate.
- 5,5'-dihydroxy-7,7'-disulfonic-2,2'-dinaphthyl-urea (J acid urea; 6,6'-ureylenebis-1-naphthol-3-sulfonic acid).
Properties: (Crude) light gray paste. Soluble in water, very soluble in alkaline solution.
Derivation: Phosgenation of J acid.
- para-di-(2-hydroxyethoxy)benzene. See hydroquinone, di(beta-hydroxyethyl) ether.
- di(2-hydroxyethyl)amine. See diethanolamine.
- N,N-dihydroxyethyl ethylenediamine $(CH_2NHC_2H_4OH)_2$.
Properties: M.p. 98°C.
Use: Manufacture of textile-finishing assistants.
- dihydroxyethyl sulfide. See thiodiglycol.
- N,N-dihydroxyethyl-meta-toluidine $CH_3C_6H_4N(C_2H_4OH)_2$.
Typical specifications: M.p. 62°C; color, light grey; dist. range 175-185°C (2 mm).
- 1,3-dihydroxy-4-hexylbenzene. See hexyl resorcinol.
- 3',4'-dihydroxy-2-isopropylaminoacetophenone hydrochloride $C_6H_3(OH)_2COCH_2NH(C_3H_7) \cdot HCl$.
A light colored crystalline powder with a faint odor. Used as an intermediate.
- 3,4-dihydroxy-alpha-(methylaminomethyl)-benzyl alcohol. See epinephrine.
- 1,8-dihydroxy-3-methylanthraquinone. See chrysophanic acid.
- 5,7-dihydroxy-4-methylcoumarin $C_{10}H_8O_4 \cdot H_2O$.
Properties: Yellow to white; solid; fluoresces blue, absorbs ultraviolet light; melting range 270-285°C; insoluble in water; benzene, ether; soluble in alcohol and sodium hydroxide.
Derivation: From phloroglucinol.
Uses: In suntan oils as a sun screen; in clothes and wall paints as a whitening agent.
- 1,2-dihydroxynaphthalene $C_{10}H_6(OH)_2$.
Properties: Silvery plates. Soluble in alcohol and ether; sparingly soluble in water. M.p. 60°C.
Derivation: By reduction of beta-naphthoquinone with sulfurous acid.
- 1,3-dihydroxynaphthalene (naphthoresorcinol) $C_{10}H_6(OH)_2$.
Properties: Transparent, crystalline plates; m.p. 124-125°C; soluble in alcohol, ether and water.
Derivation: By heating naphthalene-1,3-disulfonic acid with alkali at 230°C under pressure.
Grades: Technical; reagent.
Uses: Dyes; pharmaceuticals; analytical reagent for sugars, oils, glucuronic acid.
Shipping regulations: None.*
- 1,5-dihydroxynaphthalene $C_{10}H_6(OH)_2$.
Properties: White needles. Soluble in alcohol and ether; sparingly soluble in water. M.p. 260°C.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Derivation: By fusing naphthalene-1,5-di-sulfonic acid with caustic soda.

Grade: Technical.

Containers: Wooden casks; fiber drums.

Use: Dyes.

Shipping regulations: None.*

1,6-dihydroxynaphthalene $C_{10}H_6(OH)_2$.

Properties: White crystalline plates. Soluble in water. M.p. 136°C.

Derivation: By fusing naphthalene-1,6-di-sulfonic acid with caustic soda.

1,7-dihydroxynaphthalene $C_{10}H_6(OH)_2$.

Properties: Fine white needles. Soluble in alcohol and ether; sparingly soluble in water.

Constants: M.p. 158°C.

Derivation: By fusing naphthalene-1,7-di-sulfonic acid with caustic soda.

1,8-dihydroxynaphthalene $C_{10}H_6(OH)_2$.

Properties: White needles or plates. Soluble in alcohol and ether; sparingly soluble in water. M.p. 138°C.

Derivation: From naphthosulfone by fusion with caustic soda.

2,3-dihydroxynaphthalene $C_{10}H_6(OH)_2$.

Properties: Colorless crystals. Soluble in alcohol and ether; sparingly soluble in water. M.p. 160°C.

Derivation: From 2-naphthol-3,6-disulfonic acid by fusion with caustic soda.

2,6-dihydroxynaphthalene $C_{10}H_6(OH)_2$.

Properties: White, crystalline plates. Soluble in alcohol and ether; sparingly soluble in water. M.p. 216°C.

Derivation: From 2-naphthol-6-sulfonic acid by fusion with caustic soda.

2,7-dihydroxynaphthalene $C_{10}H_6(OH)_2$.

Properties: Long, white, crystalline needles or plates. Soluble in alcohol and ether; sparingly soluble in water. M.p. 186°C.

Derivation: From 2-naphthol-7-sulfonic acid by fusion with caustic soda.

2,8-dihydroxy-3-naphthoic acid

$C_{10}H_6(OH)_2COOH$.

Properties: Light green powder; slightly soluble in hot water; soluble in alcohol and acetone.

Use: Intermediate.

dihydroxyphenacyl chloride $C_6H_3(OH)_2COCH_2Cl$.

Purple powder; used in medicine.

1-(3,4-dihydroxyphenyl)-2-isopropylamino-ethanol esters. See isoproterenol hydrochloride and sulfate.

dihydroxypropanone. See dihydroxyacetone.

1,2-dihydroxypropane. See propylene glycol.

4,8-dihydroxyquinaldic acid. See xanthuremic acid.

8,9-dihydroxystearic acid $C_{17}H_{33}(OH)_2COOH$.

Properties: White crystals, odorless, tasteless. Soluble in alcohol and ether; insoluble in water. M.p. 135°C.

Derivation: By heating dibromide of isooleic acid with silver oxide.

dihydroxysuccinic acid. See tartaric acid.

3,5-dihydroxytoluene. See orcin.

dihyprylone (3,3-diethyl-2,4-dioxopiperidine) $C_9H_{15}NO_2$.

Properties: M.p. 102-107°C. Soluble in water, alcohol and chloroform.

Use: Medicine.

DII. Abbreviation for diesel ignition improver. See under "Ethyl."

diiodoacetylene ICl_2 .

Properties: White crystals. Unpleasant odor. Light acts upon it, causing a gradual change in color to red and a separation of iodine. Caution! Very toxic and very volatile! Its vapors affect the eyes and mucous membranes! Soluble in alcohol, ether, benzene; insoluble in water. M.p. 78.5°C.

Derivation: By dissolving iodine in liquid ammonia and passing acetylene into the solution.

Grade: Technical.

Use: Organic synthesis.

diiodoaniline $C_6H_3I_2NH_2$.

Properties: Shining, brown crystals. Soluble in alcohol, ether, chloroform, ethyl acetate, and carbon disulfide; insoluble in water. M.p. 96°C; sp.gr. 2.75.

Derivation: By the action of iodine chloride on acetanilide, followed by saponification and distillation with steam.

Method of purification: Crystallization.

Grade: Technical.

Containers: Glass bottles; tins.

Use: Medicine.

Shipping regulations: None.*

diiodobrassicidic acid ethyl ester. See ethyl diiodobrassicidate.

sym-diiododibromoethylene $BrICl_2CIBr$.

Properties: Crystals, m.p. 95-96°C.

Derivation: Reaction of iodine and dibromoacetylene.

Use: Organic synthesis.

diiododiethyl sulfide $(CH_3CH_2I)_2S$.

Properties: Bright-yellow prisms. Slowly decomposes, the rate being accelerated by light and by heat. Hydrolyzed by alkali solutions. Caution! Very toxic! Soluble in alcohol, benzene, ether; insoluble in water. M.p. 62°C.

Derivation: Interaction of dichlorodiethyl sulfide with an acetic acid solution of sodium iodide.

diiodoform. See tetraiodoethylene.

diiodoformoxime Cl_2NOH .

Properties: Crystals. Not so toxic or irritant as the chloroformoximes. M.p. 69°C.

diiodohydroxyquin (diiodohydroxyquinoline; 5,7-diiodo-8-quinolinol) $C_9H_4N_2O$.

Properties: Colorless, or light yellowish to tan, microcrystalline powder; odorless or with faint odor. Stable in air. Melts with decomposition 200-215°C. Almost insoluble

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

in water; sparingly soluble in alcohol, acetone, and ether; soluble in hot pyridine and hot dioxane.

Derivation: By action of iodine monochloride on 8-hydroxyquinoline.

Grade: U.S.P. XVI.

Use: Medicine.

diiodohydroxyquinoline. See diiodohydroxyquin.

diiodomethane. See methylene iodide.

diiodo-4-phenolsulfonic acid. See sozoiodolic acid.

3,5-diiodo-4-pyridone-N-acetic acid, diethanolamine salt. See iodopyracet.

5,7-diiodo-8-quinolinol. See diiodohydroxyquin.

3,5-diiodosalicylic acid $C_7H_4O_3I_2$.

Properties: White to pale pink crystalline powder; slightly soluble in water.

Uses: Organic source of iodine for salt blocks and salt for animal nutrition.

diiodothyronine

$HOC_6H_4OC_6H_2I_2CH_2CH(NH_2)COOH$.

3,5-Diiodothyronine. A thyronine derivative which is an intermediate obtained in the manufacture of synthetic thyroxine; also, probably an intermediate in the synthesis of thyroxine by the thyroid gland.

diisobutyl adipate (DIBA)

$[C_4H_9COOCH_2CH(CH_3)_2]_2$.

Properties: Colorless, clear liquid. Odorless. Compatible with most natural and synthetic resins. Soluble in most organic solvents; insoluble in water.

Constants: Sp. gr. 0.950 (25°C); b.p. 276-280°C; m.p. -20°C; wt/gal 7.95 lbs; acidity (as adipic acid) less than 0.05%.

Containers: 1-, 5-gal cans; 55-gal drums; tank cars.

Use: Plasticizer.

diisobutyl aluminum chloride

$[(CH_3)_2CHCH_2]_2AlCl$.

Properties: Colorless liquid.

Derivation: Reaction of isobutylene and hydrogen on aluminum.

Use: Polyolefin catalyst.

diisobutyl aluminum hydride

$[(CH_3)_2CHCH_2]_2AlH$.

Properties: Colorless pyrophoric liquid; b.p. 105°C (0.2 mm).

Derivation: Reaction of isobutylene and hydrogen with aluminum.

Use: Reducing agent in manufacture of pharmaceuticals.

diisobutylamine $[(CH_3)_2CHCH_2]_2NH$.

Properties: Sp. gr. 0.745 (20°C); boiling range 136-140°C; color water-white; odor amine.

Fire hazard: Flash point 85°F.

Use: Intermediate.

Shipping regulations: None.*

diisobutylcarbinol. See 2,6-dimethyl-4-heptanol.

diisobutyl carbonyl acetate. See nonyl acetate.

diisobutylene. This term refers to a number of isomeric compounds of the formula C_8H_{16} , of which 2,4,4-trimethyl-pentene-1 and 2,4,4-trimethyl-pentene-2 are the most important since they are formed in appreciable amounts when isobutene (isobutylene) is polymerized.

Typical properties: Sp. gr. 0.7227 (60°F); boiling range 214-220°F.

Containers: Drums; tank cars.

Uses: Alkylation; intermediates; antioxidants; surfactants; lube additives; plasticizers; rubber chemicals.

alpha-diisobutylene. See 2,4,4-trimethyl-pentene-1.

beta-diisobutylene. See 2,4,4-trimethyl-pentene-2.

diisobutyl ketone (2,6-dimethyl-4-heptanone)

$(CH_3)_2CHCH_2COCH_2CH(CH_3)_2$.

Properties: Colorless liquid. Stable.

Miscible with most organic liquids.

Constants: Sp. gr. 0.8089 (20/20°C); b.p. 168.1°C (760 mm); vapor pressure 1.7 mm (20°C); flash point 140°F; wt/gal 6.7 lbs (20°C); freezing point -41.5°C; coefficient of expansion 0.00101 (20°C).

Typical specifications: Sp. gr. 0.808-0.813 (20/20°C) boiling range, 165-170°C (760 mm); acidity, not more than 0.2% (as acetic).

Grade: Technical.

Containers: 1-gal cans; 5-, 55-gal drums; tank cars.

Uses: Solvent for nitrocellulose, rubber, synthetic resins; lacquers; coating compositions; organic synthesis; roll-coating inks; stains; rubber.

Caution: Keep away from open flame and heat. Avoid breathing vapor. Avoid contact with skin. MCA warning label.

Shipping regulations: None.*

diisobutyl phenol. See octyl phenol.

diisobutyl phthalate $C_6H_4[COOCH_2CH(CH_3)_2]_2$.

Properties: Liquid; refractive index 1.4900 (n_D 25); sp. gr. 1.040 (20/20°C); flash point 345°F; b.p. 327°C.

Containers: 55-gal drums, tank trucks, tank cars.

Use: Plasticizer.

diisocyanates. Organic compounds containing two isocyanate groups (-NCO). They are formed by treating diamines (e.g., toluene-2,4-diamine, hexamethylenediamine, para, para'-diaminodiphenylmethane) with phosgene.

Uses: Production of polyurethane foams, resins, and rubber; incorporation in phenol-formaldehyde resins to improve water and alkali resistance; bonding rubber to rayon or nylon.

disodecyl adipate (DIDA)

$C_{10}H_{21}OOC(CH_2)_4COOC_{10}H_{21}$.

Properties: Light colored, oily liquid; mild odor. Sp. gr. 0.918 (20/20°C); f.p. -71°C; boiling range 239-246°C; refractive index 1.450 (25°C); wt/gal 7.5 lbs. Insoluble or

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

limited solubility in glycerol, the glycols and some amines. Soluble in most other organic liquids.

Containers: 1-, 5-gal cans; 55-gal drums; tank cars; tank trucks.

Uses: Primary plasticizer for most resins, in sheeting, film and extrusions.

diisodecyl-4,5-epoxy-tetrahydrophthalate.

Plasticizer-stabilizer resistant to fungi; useful especially in vinyl plastics for out-doors. See "Flexol" PEP.

diisodecyl phthalate (DIDP) $C_{10}H_{18}(COOC_8H_{17})_2$.

Properties: Clear, volatile liquid with a mild odor; sp.gr. 0.966 (20/20°C); f.p. -50°C; b.p. 250-257°C (4 mm); refractive index $n_{25^\circ C}$ 1.483; viscosity 108 cps (20°C); wt/gal 8 lbs. Insoluble in glycerol, glycols and some amines; soluble in most other organic liquids.

Grade: Technical.

Containers: 55-gal drums; tank cars; tank trucks.

Use: Plasticizer for vinyl resins.

diisooctyl acid phosphate.

Shipping regulations: Corrosive liquid. White label.*

diisooctyl adipate (DIOA)

$C_8H_{17}OOC(CH_2)_4COOC_8H_{17}$.

Properties: A light straw-colored liquid; mild odor; sp.gr. 0.924 (25°C), b.p. 214-226° (4 mm), f.p. -75°C.

Containers: 1-, 5-gal cans, 55-gal drums, tank cars.

Use: Plasticizer, especially for low temperatures.

diisooctyl azelate (DIOZ). A diester of azelaic acid used primarily as a plasticizer for vinyls and as a base for synthetic lubricant fluids. B.p. 237°C (5 mm), pour point -85°F, acid number 1.0, viscosity (S.U.V. at 110°C) 36 sec.

See also di-2-ethylhexyl azelate.

diisooctyl phthalate (DIOP) $(C_8H_{17}COO)_2C_6H_4$.

Isomeric esters obtained from phthalic anhydride and the mixed octyl alcohols made by the Oxo process (see isooctyl alcohol).

Properties: Nearly colorless, viscous liquid with a mild odor; b.p. 370°C; sp.gr. (20/20°C) 0.980-0.983, wt/gal (20°C) 8.20 lbs; flash point 410°F. Insoluble in water, compatible with vinyl chloride resins and some cellulosic resins.

Grade: Technical.

Containers: 1-, 5-, 55-gal drums; tank cars, tank trucks.

Uses: Plasticizer for vinyl, cellulosic, and acrylate resins and synthetic rubber.

diisooctyl sebacate (DIOS)

$C_8H_{17}OOC(CH_2)_8COOC_8H_{17}$.

Properties: Liquid; sp.gr. 0.915 (25/25°C); flash point 440°F; pour point -40°C; viscosity 24 cps (20°C); 7.65 lb/gal.

Containers: Drums; tank cars.

Use: Plasticizer.

Shipping regulations: None.*

diisopropanolamine (DIPA)

$(CH_3CHOHCH_2)_2NH$.

Properties: White crystalline solid; sp.gr. 0.9890 (45/20°C); b.p. 248.7°C; 8.2 lbs/gal (45°C); vapor pressure 0.02 mm (42°C); freezing point 42°C; viscosity 1.98 poise (45°C); miscible with water.

Grades: Technical.

Containers: Drums; tank cars.

Uses: Manufacture of emulsifying agents for polishes, textile specialties, leather compounds, insecticides, cutting oils, and water paints.

diisopropyl. See 2,3-dimethylbutane.

diisopropylamine $[(CH_3)_2CH]_2NH$.

Properties: Colorless, volatile liquid with amine odor. B.p. 84.1°C; freezing point -96.3°C, sp.gr. (20/20°C) 0.7178; wt/gal (20°C) 6.0 lbs, flash point (open cup) 30°F. Miscible with water; soluble in most organic solvents.

Derivation: From isopropyl chloride and ammonia.

Grades: Technical.

Containers: 1-gal cans, 5-, 55-gal drums; tank cars.

Uses: Intermediate; catalyst.

Shipping regulations: Flammable liquid. Red label.*

diisopropylaminoethanol $[(CH_3)_2CH]_2NCH_2CH_2OH$.

Properties: Liquid; sp.gr. 0.873 (20/20°C); distillation range 188.0-192.0°C (760 mm), wt/gal 7.3 lbs, flash point 150°F.

Containers: 5-gal cans, 55-gal drums; tank cars.

Use: Intermediate.

beta-diisopropylaminoethyl chloride hydrochloride (DIC) $[(CH_3)_2CH]_2NCH_2CH_2Cl \cdot HCl$.

Used for organic synthesis, especially for introduction of the beta-diisopropylaminoethyl radical.

diisopropyl benzene $C_6H_4(CH_2CHCH_3)_2$.

Properties: Colorless liquid; f.p. below -50°C, boiling range 202-209°C (760 mm); sp.gr. 0.865 (25/25°C); wt/gal 7.20 lbs (25°C), refractive index 1.490 ($n_{25/D}$); flash point 170°F. Insoluble in water, soluble in methanol and ether.

Uses: Solvent; intermediate.

diisopropyl carbinol (2,4-dimethylpentanol-3) $[(CH_3)_2CH]_2CHOH$.

Properties: Colorless liquid.

Constants: B.p. 140°C, m.p. below -70°C; wt/gal 6.9 lbs; flash point 49°C.

Grades: Technical.

Containers: 55-gal drums.

Uses: Solvent; organic synthesis (intermediate); denaturant.

diisopropyl cresol. Used as antioxidant or

stabilizer in MYL (q.v.). See also isopropyl cresols.

diisopropyl dixanthogen $(C_3H_7OCS_2)_2$.

Typical specification: Yellow to greenish pellets; sp.gr. 1.28; m.p. 52°C (min); purity 98% (min.).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

Insoluble in water; soluble in ethyl alcohol, acetone, benzene and gasoline.

Grades: Commercial.

Uses: Modifier in polymerization reactions; additive for lubricants; flotation reagent; fungicide or weed killer.

Handle with caution!

diisopropylene glycol salicylate $C_{13}H_{18}O_5$.

The diisopropylene glycol mono ester of salicylic acid.

Properties: A clear light yellow liquid; sp. gr. 1.16 (25°C); refractive index 1.5150 (25°C); m. p. below -15°C; pH of 10% dispersion 5.3; soluble in aromatic paraffin and chlorinated solvents, in alcohols, esters, and vegetable oils. Totally absorbs ultraviolet radiation in range 2800-3200Å.

Uses: As an ultraviolet light absorbent to protect human skin, plastics, paints, printing inks normally affected by the ultraviolet portion of the spectrum.

N, N-diisopropylethanolamine

$[(CH_3)_2CH]_2NCH_2CH_2OH$.

Properties: A colorless liquid; sp. gr. 0.8742 (20°C); vapor pressure 0.08 mm (20°C); freezing point -39.3°C; flash point 175°F; slightly soluble in water.

Use: Synthesis.

diisopropyl fluophosphate (DFP, diisopropyl fluorophosphate; isofluorophate)

$[(CH_3)_2CHO]_2POF$. Oily liquid, in the presence of moisture forms hydrogen fluoride.

Caution! Very dangerous in the slightest traces. Do not inhale vapors or allow contact with skin.

Properties: Sp. gr. 1.05; m. p. -82°C; b. p. 46°C (5 mm), refractive index (n_D 25/D) 1.3830, slightly soluble in water; soluble in alcohol and oils.

Use: Medicine (external) (very dilute concentrations).

One member of a series of compounds, fluophosphate alkyl esters, characterized by extremely high toxicity, marked mutic effects noted even in concentrations that are chemically undetectable. Some related less toxic members have been suggested as bactericides and insecticides.

diisopropyl fluorophosphate. Same as diisopropyl fluophosphate.

diisopropyl ketone (2,4-dimethylpentanone-3)

$[(CH_3)_2CH]_2CO$.

Properties: Colorless, clear liquid.

Constants: B. p. 123.7°C; wt/gal 6.9 lbs.

diisopropylmethane. See 2,4-dimethylpentane.

2,6-diisopropylphenol $C_6H_3OH[CH(CH_3)_2]_2$.

Properties: Light straw-colored liquid; f. p. 18°C; sp. gr. 0.955 (20°C); b. p. 242°C; flash point 240°F (open cup). Soluble in toluene and alcohol; insoluble in water.

Use: Intermediate for synthetic resins, plasticizers, surface active agents.

diisopropylthiourea

$(CH_3)_2CHNHCSNHCH(CH_3)_2$.

Properties: A grayish white solid; m. p. 138.5-142.5°C; slightly soluble in water; soluble in methanol, acetone, and ethyl acetate; insoluble in ether, benzene and gasoline.

Uses: Corrosion inhibitor; for pickling cast iron or carbon steel with hydrochloric acid; for pickling with sulfuric acid; for reducing corrosion of ferrous metals and aluminum alloys in brine; as intermediate.

diketene (acetyl ketene) $CH_3COCH:CO$.

Properties: Colorless, non-hygroscopic liquid; pungent odor; readily polymerizes on standing; sp. gr. 1.0897; m. p. -6.5°C; b. p. 127.4°C. Soluble in common organic solvents; insoluble in water.

Derivation: By spontaneous polymerization of ketene which is obtained by thermal decomposition of acetone, or from bromoacetyl bromide and zinc.

Containers: Steel drums.

Uses: Source of acetoacetic esters, acetoacetanilide, phenylmethylpyrazolones, and benzoylacetone.

Shipping regulations: None.*

diketobutane. See diacetyl.

2,5-diketohexane. See acetonyl acetone.

2,5-diketopyrrolidone. See succinimide.

2,5-diketotetrahydrofuran. See succinic anhydride.

"Dilantin" Sodium. ³³⁰ Trademark for diphenylhydantoin sodium.

dilatancy. A term used in rheology to identify the flow property of certain suspensions in which the resistance to flow increases at a greater rate than the increase in the rate of flow. An example of this is quicksand or wet sea sand wherein the surface is rigid unless sustained pressure is applied, whereupon flow occurs.

"Dilaudid." ⁹ Trademark for dihydromorphine; employed in medicine as the sulfate and hydrochloride salts.

dilaurylamine (didodecylamine) $(C_{12}H_{25})_2NH$.

Properties: M. p. 45°C; sp. gr. 0.89; almost insoluble in water.

Use: Chemical intermediate.

dilauryl ether (didodecyl ether) $(C_{12}H_{25})_2O$.

Properties: M. p. 33°C; b. p. 190-195°C (1 mm); sp. gr. 0.8147 (33/4°C).

Grade: 95% (min) purity.

Uses: Electrical insulators; water repellents; lubricants for plastic molding and processing; antistatic substances; chemical intermediates.

dilauryl sulfide (didodecyl thioether) $(C_{12}H_{25})_2S$.

Properties: M. p. 40-40.5°C; b. p. 260-263°C (4 mm); sp. gr. 0.8275 (40/4°C).

Grade: 95% (min) purity.

Uses: Organic synthesis (formation of sulfonium compounds).

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

dilauryl thiodipropionate (3,3'-didodecyl thiodipropionate; didodecanyl thiodipropionate; thiodipropionic acid, dilauryl ester) $(C_{12}H_{25}OOCCH_2CH_2)_2S$.

Properties: Sp. gr. (solid, 25°C) 0.975; m. p. 37°C. Insoluble in water; soluble in most organic solvents. Extremely resistant to heat and hydrolysis.

Uses: Anti-oxidant; additive for high-pressure lubricants and greases; plasticizer and softening agent; preservative.

"**Dilecto**," ²⁸¹ Trademark for a line of laminated plastics consisting of a variety of base materials and resins, available in sheets, tubes, or rods, of numerous grades for a variety of special mechanical and electrical insulation applications.

"**Dileine**," ⁷⁸ Trademark for a series of gas-fading inhibitors used particularly in the dyeing of acetate fibers.

dilinoleic acid $C_{34}H_{62}(COOH)_2$.

Properties: Light yellow; sp. gr. 0.921 (100°C); refractive index 1.4851 (40°C); iodine value 80; N. E., 304. Heavy viscous liquid with slight odor.

Uses: As dibasic acid in alkyds as modifier; in polyamide resin; as polyester or metallic soap for petroleum additive; as emulsifying agent; in adhesives; as shellac substitute; to upgrade drying oils.

dilituric acid. See 5-nitrobarbituric acid.

dill. See anethum.

dill oil (anethum oil).

Properties: Pale yellow, volatile, essential oil; characteristic penetrating odor; sweetish taste, rapidly becoming sharp and burning. Soluble in alcohol, ether, benzene and chloroform.

Chief known constituents: Limonene and carvone.

Constants: Sp. gr. 0.895-0.915; optical rotation +70° to +80°.

Derivation: Distilled from the fruit of *Anethum graveolens*.

Method of purification: Rectification.

Grades: Technical.

Containers: Drums, glass bottles.

Uses: Flavoring agent; perfumery.

Shipping regulations: None.*

dill seed. See anethum.

"**Diluex**" and "**Diluex A**," ⁹⁸ Proprietary names for two grades of Florida fuller's earth.

Properties: Finely divided grayish white powder; sp. gr. 2.2-2.4; low abrasiveness, compatible with complex organics, metallic inorganics, and plant derivative insecticides and fungicides; wets rapidly and disperses readily without forming lumps.

Containers: 50-lb multiwall paper bags.

Uses: Carrier for insecticides and fungicides; grinding or milling aid; conditioning agent in dusts and powders.

dimagnesium orthophosphate. See magnesium phosphate, dibasic.

dimagnesium phosphate. See magnesium phosphate, dibasic.

"**Dimazine**," ⁵⁵ Trade name for uns-dimethylhydrazine (q. v.).

dimeedone (1,1-dimethyl-3,5-diketocyclohexane; 5,5-dimethyl-1,3-cyclohexanedione) $(CH_3)_2C_6H_3O_2$.

Properties: Greenish-yellow needles, or prisms; m. p. 148-149°C; slightly soluble in cold water and petroleum ether; soluble in alcohol, chloroform, benzene.

Use: Reagent for the detection of ethyl alcohol and the identification of aldehydes.

dimefox (BFPO; bis(dimethylamino)fluorophosphate; tetramethyldiamidophosphoric fluoride) $[(CH_3)_2N]_2POF$. Dimefox is accepted as a generic name by the Ent. Soc. Properties: Liquid; fishy odor; sp. gr. 1.1151 (20/4°C); b. p. 67°C (4.0 mm), 86°C (15 mm); refractive index 1.4267 (n 20/D). Soluble in water, ether, benzene; aqueous solutions are stable.

Derivation: Prepared by fluorination of bis(dimethylamido)phosphoryl chloride.

Use: A systemic pesticide, primarily for ornamental and non-food plants.

dimenhydrinate $C_{17}H_{22}NO \cdot C_7H_6ClN_4O_2$. 2-(Benzohydroxy)-N,N-dimethylethylamine-8-chlorotheophyllinate.

Properties: Crystalline, white, odorless powder. Freely soluble in alcohol and chloroform; soluble in benzene; sparingly soluble in ether, slightly soluble in water. M. p. 102-107°; pH (saturated solution) 6.8-7.3.

Grade: U. S. P. XVI.

Use: Medicine.

dimension stone. A general term for stone sold in blocks and slabs, usually of specified sizes. Types of dimension stone include granite, limestone, marble, and sandstone (q. v.). Good dimension stone occurs in large uncracked blocks and has pleasing texture and color.

Use: Building stone, monuments, paving block, curbing and flagging.

dimer. A molecule formed by union of two identical simpler molecules. Also applied to the substances composed of such double molecules. Thus C_4H_8 is a dimer of C_2H_4 . See polymer.

dimer acid. Coined name to describe a high molecular weight dibasic acid, which is liquid, stable, resistant to high temperatures, and which combines and polymerizes with alcohols and polyols to make a variety of products, such as plasticizers, lube oils, hydraulic fluids. Trimer acid, having three acid groups, is similar.

dimercaprol. See 2,3-dimercaptopropanol.

2,3-dimercaptopropanol (BAL; British Anti-Lewisite; dimercaprol; 1,2-dithioglycerol) $CH_2(SH)CH(SH)CH_2OH$.

Properties: Colorless, oily, viscous liquid with strong, offensive odor of mercaptans. B. p. 80°C (1.9 mm), 140°C (40 mm);

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page

m. p. 77°C; sp. gr. 1.2385 (25/4°C); refractive index (n_D²⁵) 1.5720. Soluble in vegetable oils; moderately soluble in water with decomposition; soluble in alcohol.

Derivation: (a) Bromination of allyl alcohol followed by reaction with sodium hydrosulfide; (b) hydrogenation of hydroxypropylene trisulfide.

Grades: U. S. P. XVI.

Uses: Medicine: antidote to Lewisite, organic arsenicals and heavy metals.

dimetan (C₁₁H₁₇NO₃). 5, 5-Dimethyldihydroresorcinol dimethylcarbamate. An insecticide with some systemic properties. Accepted as a generic name by Ent. Soc. Properties: Yellow crystals; m. p. 43-45°C; slightly soluble in water and oils but readily soluble in organic solvents. Mammalian toxicity reported low. A cholinesterase inhibitor.

1, 4-dimethanesulfonoxylbutane. See busulfan.

dimethylcone CH₃[Si(CH₃)₂O]_nSi(CH₃)₃.

Properties: A colorless silicone oil consisting of dimethylsiloxane polymers (range in viscosities from 0.65 to 1,000,000 centistokes at room temperature). Viscosity grades above 50 centistokes are immiscible in water. Miscible with chloroform, ether.

Grade: N. N. D.

Uses: Ointments and topical drug ingredient; skin protectant.

dimethisoquin hydrochloride

CH₃(CH₂)₂CH₂C₉H₉NOCH₂CH₂N(CH₃)₂·HCl.
3-Butyl-1-(2-dimethylaminoethoxy)isoquinoline hydrochloride.

Properties: White powder, odorless, with bitter, numbing taste. M. p. 144-147°C. Freely soluble in alcohol; very slightly soluble in ether, soluble in water; pH (1% solution) 3.5-5.0.

Grade: N. F. XI.

Use: Medicine.

2, 5-dimethoxyaniline NH₂C₆H₃(OCH₃)₂.

Typical specification: M. p. 79-81°C.

Insoluble in water; soluble in organic solvents.

Grades: Technical.

Containers: Fiber drums.

Use: Intermediate for dyes, pharmaceuticals and insecticides.

2, 5-dimethoxybenzaldehyde (CH₃O)₂C₆H₃CHO.

Properties: Flaked solid; m. p. 46-49°C; soluble in organic solvents; insoluble in water.

Use: Organic synthesis.

1, 4-dimethoxybenzene. See hydroquinone dimethyl ether.

ortho-dimethoxybenzene. See veratrole.

dimethoxybenzidine. See dianisidine.

3, 4-dimethoxybenzyl alcohol C₆H₃(OCH₃)₂CH₂OH.

Properties: Viscous, brown liquid or low melting solid.

Use: Organic synthesis.

1, 2-dimethoxyethane. See ethylene glycol dimethyl ether.

dimethoxyethyl adipate

CH₃OC₂H₄OCOC(CH₂)₄COOC₂H₄OCH₃.

Properties: Liquid; sp. gr. 1.075 (25°C); refractive index 1.439 (25°C); b. p. 185-190°C (11 mm); m. p. -16°C; slightly soluble in water.

Use: Plasticizer.

di(2-methoxyethyl) phthalate

C₆H₄(COOCH₂CH₂OCH₃)₂.

Properties: Oily liquid with mild odor; sp. gr. 1.172 (20/20°C); b. p. 340°C; f. p. -45°C; flash point 381°F (open cup).

Containers: 55-gal drums; tank cars; tank trucks.

Uses: Plasticizer, especially for cellulose acetate; solvent.

dimethoxymethane. See methylal.

3, 4-dimethoxyphenethylamine. See homoveratrylamine.

3, 4-dimethoxyphenylacetic acid. See homoveratric acid.

1-(3, 4-dimethoxyphenyl)-2-nitro-1-propene (CH₃O)₂C₆H₃CH=C(NO₂)CH₃. Yellow crystals; m. p. 68-75°C; used as an intermediate.

dimethoxyphenyl penicillin sodium. See penicillin.

dimethoxystrychnine. See brucine.

dimethoxytetraglycol (tetraethylene glycol dimethyl ether) CH₃(OCH₂CH₂)₄OCH₃.

Properties: Water-white, practically odorless liquid. Stable; soluble in hydrocarbons, water.

Constants: Sp. gr. 1.0132 (20/20°C); b. p. 275.8°C (760 mm), 189°C (100 mm); vapor pressure < 0.01 mm (20°C); flash point 285°F; wt/gal 8.4 lbs (20°C); freezing point -29.7°C; viscosity 0.0405 poise (20°C); coefficient of expansion 0.00091 (20°C).

Typical specification: Sp. gr. 1.011-1.016 (20/20°C); boiling range 255-285°C (760 mm); acidity not more than 0.02% (as acetic).

Grades: Technical.

Containers: 1-gal cans; 5-, 55-gal drums.

Net content 8, 40, 450 lbs.

Use: Solvent.

Shipping regulations: None.*

dimethyl. See ethane.

dimethylacetal (ethylidenedimethyl ether)

CH₃(OCH₃)₂CH.

Properties: Colorless, flammable liquid; strongly aromatic odor. Soluble in water, alcohol, ether, and chloroform.

Constants: Sp. gr. 0.848 (25°C); b. p. 62-63°C.

Derivation: By heating acetaldehyde with methyl alcohol and glacial acetic acid, and distilling.

Method of purification: Rectification.

Grades: Technical.

Containers: Glass bottles; iron drums.

Uses: Medicine; organic synthesis.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Fire hazard: Dangerous.

Shipping regulations: Flammable liquid.

Red label.*

dimethyl acetamide (DMAC) $\text{CH}_3\text{CON}(\text{CH}_3)_2$.

Properties: A colorless liquid; b. p. 166°C ; sp. gr. 0.9366 (25°C); refractive index 1.4351 (25°C); miscible with water, aromatics, esters, ketones, and ethers.

Derivation: From dimethylamine.

Containers: 55-gal drums.

Uses: Solvent for plastics, resins and gums, intermediate; catalyst; in production of "Acrilan"; paint remover.

2,4-dimethyl acetophenone $\text{CH}_3\text{COC}_6\text{H}_3(\text{CH}_3)_2$.

Properties: Colorless liquid having a strong odor suggesting mimosa; sp. gr. 0.994-0.997; refractive index 1.532-1.534; soluble in four volumes of 60% alcohol.

Use: Perfumery.

dimethylamine (DMA) $(\text{CH}_3)_2\text{NH}$.

Properties: At ordinary temperatures dimethylamine is a gas with a strong ammoniacal odor; sp. gr. 0.6865 at -6°C ; b. p. 6.88°C ; m. p. -92.2°C ; flash point of 25% solution (Tag open cup) 54°F ; wt/gal (25% solution) approx 7.8 lbs (68°F); soluble in alcohol, ether, and water.

Derivation: By the interaction of methanol and ammonia over a catalyst at high temperatures. The mono-, di-, and trimethylamines are all produced. Yields are regulated by conditions.

Method of separation: Azeotropic distillation. Grades: Technical (anhydrous, 25%, and 40% aqueous solutions); 99%.

Containers: Solution: 1-gal bottles; 5-, 55-gal drums, tank cars. Anhydrous: 25-, 50-, 100-, 1400-lb cylinders.

Uses: Acid gas absorbent; solvent; anti-oxidants; dyes; flotation agent; gasoline stabilizers; pharmaceuticals; textile chemicals; rubber accelerators; soaps and cleaning compounds; electroplating, de-hairing agent; missile fuels; pesticide propellant.

Shipping regulations: Anhydrous: Flammable gas. Red gas label. Aqueous solution: Flammable liquid. Red label.*

Danger! Extremely flammable. Hazardous liquid and vapor under pressure. Liquid causes burns. Vapor extremely irritating. MCA warning label for anhydrous dimethylamine.

dimethylaminoaniline. See para-aminodimethylaniline.

dimethylaminoantipyrine. See aminopyrine.

dimethylaminoazobenzene (methyl yellow; butter yellow) $\text{C}_6\text{H}_5\text{NNC}_6\text{H}_4\text{N}(\text{CH}_3)_2$.

Properties: Yellow crystalline leaflets; m. p. 116°C ; soluble in alcohol, ether, strong mineral acids, and oils; insoluble in water.

Derivation: Action of benzenediazonium chloride on dimethyl aniline.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Glass bottles; tins.

Uses: Indicator in volumetric analysis (see indicators); also in test for peroxidized fats.

Shipping regulations: None.*

dimethylaminoazobenzene sulfonate (sulfobenzeneazodimethylaniline)

$\text{SO}_3\text{HC}_6\text{H}_4\text{N}_2\text{C}_6\text{H}_4\text{N}(\text{CH}_3)_2$.

Properties: Violet crystals or powder; soluble in alcohol; slightly soluble in water.

Derivation: By the sulfonation of dimethylaminoazobenzene.

Method of purification: Crystallization.

para-dimethylaminobenzaldehyde

$\text{C}_6\text{H}_4[\text{N}(\text{CH}_3)_2]\text{CHO}$.

Properties: Colorless crystalline plates.

Soluble in hot water, alcohol and ether.

M. p. 73°C ; b. p. $176-177^\circ\text{C}$ (17 mm).

Derivation: By mixing dimethylaniline, anhydrous chloral and phenol and allowing the mixture to stand. The phenol is removed by shaking with dilute caustic soda and the residue dissolved in water and hydrochloric acid and crystallized.

Method of purification: Recrystallization.

Grades: Technical; reagent.

Containers: Fiber drums.

Uses: Dyes; medicine.

Shipping regulations: None.*

para-dimethylaminobenzene diazonium chloride, zinc chloride double salt.

See para-diazodimethylaniline, zinc chloride double salt.

para-dimethylaminobenzenediazo sodium sulfonate ("Dexon") $\text{C}_6\text{H}_4\text{N}_2\text{O}_3\text{SNa}$.

Properties: Solid; melts with decomposition above 200°C . Soluble in water.

Uses: Fungicide for protection of germinating seed and seedlings.

3-dimethylaminobenzoic acid

$(\text{CH}_3)_2\text{NC}_6\text{H}_4\text{COOH}$.

Properties: Pale yellow crystals; m. p. $147-153^\circ\text{C}$.

Grades: Technical.

Use: Intermediate.

dl-6-dimethylamino-4,4-diphenyl-3-heptanone hydrochloride. See methadone hydrochloride.

4,4-dimethylaminodiphenylsulfone.

Constants: M. p. $179-180^\circ\text{C}$.

2-dimethylaminoethanol (deanol; dimethylethanamine) $(\text{CH}_3)_2\text{NCH}_2\text{CH}_2\text{OH}$.

Properties: Colorless liquid with amine odor.

B. p. 134.6°C ; f. p. -59.0°C , sp. gr.

($20/20^\circ\text{C}$) 0.8879; wt/gal (20°C) 7.4 lbs;

refractive index (20°C) 1.4300; flash point

(open cup) 105°F . Miscible with water,

acetone, ether, and benzene.

Preparation: From ethylene oxide and dimethylamine.

Grades: Anhydrous and 70% aqueous soln.

Containers: 1-gal cans; 5-, 55-gal drums; tank cars.

Uses: Chemical intermediate in the synthesis of dyestuffs, textile auxiliaries, pharmaceuticals and corrosion inhibitors; medicine.

Shipping regulations: None.*

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

beta-dimethylaminoethyl benzhydryl ether hydrochloride. See diphenhydramine hydrochloride.

beta-dimethylaminoethyl chloride hydrochloride (DMC) $(\text{CH}_3)_2\text{NCH}_2\text{CH}_2\text{Cl} \cdot \text{HCl}$. Used in manufacture of antihistaminics and other pharmaceuticals. Organic intermediate for introduction of beta-dimethylaminoethyl radical.

(2-dimethylaminoethyl)-2-thenylamino-pyridine. See methapyrilene.

(2-dimethylaminoethyl)-3-thenylamino-pyridine. See thenyldiamine.

beta-dimethylaminoisopropyl chloride hydrochloride (DMIC) $(\text{CH}_3)_2\text{NCH}_2\text{CH}(\text{CH}_3) \cdot \text{HCl}$. Used in manufacture of analgesics and other pharmaceuticals.

ortho-dimethylaminomethyl-para-butyl phenol $\text{C}_6\text{H}_3(\text{OH})[\text{CH}_2\text{N}(\text{CH}_3)_2](150\text{-C}_4\text{H}_9)$. Properties: Dark red liquid; odor phenolic, free of methylamine; sp. gr. 0.960 (25/25°C); refractive index 1.510 (25°C); distillation range 95-135°C (1 mm); m. p. 16-18°C; water content (Karl Fischer) 0.5%. Readily soluble in organic solvents; insoluble in water.

dimethylaminomethyl phenols

$\text{C}_6\text{H}_4\text{OHCH}_2\text{N}(\text{CH}_3)_2$. Exists as ortho-, meta and para- isomers, but the commercially available material is a mixture of ortho- and para-.

Properties: Dark red liquid; odor phenolic, free of methylamine; sp. gr. 1.020 (25/25°C); refractive index 1.530 (25°C); distillation range 80-130°C (2 mm); water content (Karl Fischer) 0.5%. Readily soluble in organic solvents; moderately soluble in water.

gamma-dimethylamino-beta-methylpropyl chloride hydrochloride (DMMPC) $(\text{CH}_3)_2\text{NCH}_2\text{CH}(\text{CH}_3)\text{CH}_2\text{Cl} \cdot \text{HCl}$. Used as intermediate for the preparation of tranquilizers, analgesics, anti-spasmodics, local anesthetics and hypotensive agents.

4-dimethylaminophenylmethylsulfone.

Constants: M. p. 167-168°C. Grades: Technical.

1-dimethylamino-2-propanol

$(\text{CH}_3)_2\text{NCH}_2\text{CHOHCH}_3$.

Properties: Water-white; amine odor; b. p. 125.6°C; sp. gr. 0.850 (20/20°C); refractive index 1.421 (20°C); flash point 95°F; soluble in water and most organic solvents. Use: Organic synthesis.

3-dimethylaminopropylamine

$(\text{CH}_3)_2\text{NCH}_2\text{CH}_2\text{CH}_2\text{NH}_2$.

Properties: Colorless liquid; b. p. 123°C (760 mm); sp. gr. 0.8100 (30°C); refractive index (n_D²⁵) 1.4328; flash point 95°F (Tag closed cup).

Uses: Curing agent for epoxy resins; organic intermediate.

1-dimethylamino-2-propyl chloride

$(\text{CH}_3)_2\text{NCH}_2\text{CH}(\text{CH}_3)\text{Cl}$. Yellow liquid which darkens with age; distillation range 113-

120°C; refractive index 1.422-1.423 (25°C). Used as an intermediate.

gamma-dimethylaminopropyl chloride hydrochloride (DMPC) $(\text{CH}_3)_2\text{NCH}_2\text{CH}_2\text{CH}_2\text{Cl} \cdot \text{HCl}$. Used as intermediate for pharmaceutical and organic synthesis. Suggested as an intermediate for tranquilizers.

dimethylanilines. See xylinines.

N,N-dimethylaniline (aniline N,N-dimethyl) $\text{C}_6\text{H}_5\text{N}(\text{CH}_3)_2$.

Properties: Yellowish to brownish oily liquid. Soluble in alcohol and ether; insoluble in water. Sp. gr. 0.954; m. p. 2.5°C; b. p. 192.5-193.5°C; flash point 61°C; refractive index 1.5582.

Derivation: By heating a mixture of aniline, aniline hydrochloride and methyl alcohol (free from acetone) in an autoclave and distilling.

Method of purification: Rectification.

Grades: Technical; reagent.

Containers: Drums; tank cars.

Uses: Dyes; intermediates; solvent; manufacture of vanillin; stabilizer (acid acceptor).

Shipping regulations: None.*

dimethyl anthranilate (N-methyl methyl anthranilate) $\text{CH}_3\text{COOC}_6\text{H}_4\text{NHC}_6\text{H}_5$.

Properties: Colorless or pale yellow liquid with slight bluish fluorescence, with grape-like odor, sp. gr. 1.132-1.138 (15°C); refractive index 1.578-1.581 (20°C); soluble in 3 volumes or more of 80% alcohol; soluble in benzyl benzoate, diethyl phthalate, fixed oils, mineral oils and volatile oils; insoluble in glycerin and somewhat soluble in propylene glycol; congealing point 18°C (4% methyl anthranilate impurity) to 10°C (20% methyl anthranilate impurity).

Derivation: Methylation of methyl anthranilate or esterification of N-methyl anthranilic acid.

Containers: Glass; aluminum or tin-lined cans.

Uses: Manufacture of perfumes, flavorings and drugs.

Shipping regulations: None.*

dimethylarsinic acid. See cacodylic acid.

1,2-dimethyl benzene. See ortho-xylene.

1,3-dimethyl benzene. See meta-xylene.

1,4-dimethyl benzene. See para-xylene.

dimethylbenzidine. See tolidine.

dimethylbenzylcarbinol $\text{C}_6\text{H}_5\text{CH}_2\text{C}(\text{CH}_3)_2\text{OH}$.

Properties: Colorless or yellowish liquid; odor of hyacinth or lilac; sp. gr. 0.979 (16/4°C); m. p. 24°C; b. p. 228°C.

Use: Perfumery.

Shipping regulations: None.*

2,5-dimethylbenzyl chloride

(2,5-dimethyl-alpha-chlorotoluene)

$\text{C}_6\text{H}_3(\text{CH}_3)_2\text{CH}_2\text{Cl}$.

Properties: B. p. 220-226°C. Insoluble in water; soluble in hydrocarbons, alcohols and ethers.

Grade: 98% min.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Uses: Intermediate for pharmaceuticals, dyes, perfumes, plasticizers, resins, wetting agents, germicides, etc.

alpha, alpha-dimethylbenzyl hydroperoxide.
See cumene hydroperoxide.

2,2-dimethylbutane. See neohexane.

2,3-dimethylbutane (diisopropyl)

$(\text{CH}_3)_2\text{CHCH}(\text{CH}_3)_2$.

Properties: Colorless liquid; b. p. 57.9°C; sp. gr. 0.66164 (20°C); f. p. -128.41°C; refractive index 1.37495 (20°C); flash point 29°C.

Derivation: Alkylation of ethylene with isobutane using aluminum chloride catalyst.

Grades: Technical; 95%; 99%.

Containers: Bottles; drums.

Uses: High octane fuel; organic synthesis.

2,2-dimethyl-1,3-butanediol

$\text{CH}_3\text{CH}(\text{OH})\text{C}(\text{CH}_3)_2\text{CH}_2\text{OH}$.

Properties: Liquid; sp. gr. 0.9700; b. p. 202.4°C; f. p. -12.8°C; wt/gal 8.1 lbs; very soluble in water.

3-dimethylcarbamoxyphenyltrimethylammonium bromide. See neostigmine bromide.

dimethyl carbonate $\text{C}_4\text{H}_{10}\text{O}_4$. Bicyclo (2,2,1)-5-heptene-2,3-dicarboxylic acid dimethyl ester. Accepted as a generic name by the Ent. Soc.

Properties: A clear, oily liquid or crystalline solid; sp. gr. 1.165 (35/4°C); insoluble in water.

Derivation: By esterification of the Diels-Alder condensation product of maleic anhydride and cyclopentadiene.

Use: Insect repellent.

dimethylcarbinol. See isopropyl alcohol.

dimethyl carbonate. See methyl carbonate.

dimethyl chloroacetal (chloroacetaldehyde dimethyl acetal) $\text{ClCH}_2\text{CH}(\text{OCH}_3)_2$.

Properties: Colorless liquid with a pleasant odor; specifications for technical grade: boiling range 126-132°C; flash point 110°F; sp. gr. 1.082-1.092 (25/4°C); refractive index (n_D²⁵) 1.4110-1.4130; purity 97% (min); wt/gal 9.07 lbs.

Grades: Technical.

Containers: 1-gal glass bottles; 5-, 55-gal drums; tank cars.

Uses: Organic synthesis; pharmaceuticals; as a solvent.

Shipping regulations: None.*

2,5-dimethyl-alpha-chlorotoluene. See 2,5-dimethylbenzyl chloride.

dimethyl cyanamide $(\text{CH}_3)_2\text{NCN}$. An organic intermediate with unusual solvent properties; suggested for hydraulic fluids; corrosion inhibitors.

dimethylcyclohexane (hexahydroxylene). Mixture of ortho-, meta-, and para-isomers.

Properties: Water-white liquid of mild odor; sp. gr. 0.776 (15/15°C); boiling range 120°C; f. p. < -65°C; soluble in most common solvents; almost insoluble in water.

Use: Synthesis.

cis-1,2-dimethylcyclohexane (cis-ortho-dimethylcyclohexane) C_8H_{16} . The high-boiling 1,2-isomer.

Properties: Colorless liquid; sp. gr. (20/4°C) 0.7963; f. p. -50.1°C; b. p. 128.95°C; refractive index (20/D) 1.4359; flash point 16°C.

Grades: 99%; research.

Containers: Bottles.

Use: Organic synthesis.

Hazards: Flammable liquid.

Shipping regulations: Flammable liquid.

Red label.*

trans-1,2-dimethylcyclohexane (trans-ortho-dimethylcyclohexane) C_8H_{16} . The low-boiling 1,2-isomer.

Properties: Colorless liquid; sp. gr. (20/4°C) 0.7761; f. p. -88.38°C; b. p. 122.77°C; refractive index (20/D) 1.42695; flash point 11°C.

Grades: 95%; 99%; research.

Containers: Bottles.

Use: Organic synthesis.

Hazards: Flammable liquid.

Shipping regulations: Flammable liquid.

Red label.*

1,3-dimethylcyclohexane (meta-dimethylcyclohexane) C_8H_{16} .

Properties: Colorless liquid. Soluble in alcohol; insoluble in water. Sp. gr. 0.772; b. p. 121°C; m. p. -85°C; aniline equivalent 4.

1,4-dimethylcyclohexane (para) C_8H_{16} .

Properties: Colorless liquid; sp. gr. 0.767; b. p. 120.5°C; m. p. -86°C; aniline equivalent 6.

5,5-dimethyl-1,3-cyclohexanedione.

See dimedone.

N-dimethylcyclohexaneethylamine.

See propylhexedrine.

dimethylcyclohexyl adipate

$(\text{CH}_2\text{CH}_2\text{COOC}_6\text{H}_{10}\text{CH}_2)_2$.

Properties: Neutral, stable, colorless liquid.

1,2-dimethylcyclopentane C_7H_{14} .

Properties: Cis: b. p. 99.5°C; sp. gr. 0.772 (20°C). Trans: b. p. 91.8°C; sp. gr. 0.751 (20°C).

Grades: Technical.

Use: Organic synthesis.

dimethyl diaminophenazinechloride. See neutral red.

2,2-dimethyl-1,1-dianthraquinone. $\text{C}_{30}\text{H}_{18}\text{O}_4$.

Properties: Yellow crystals; soluble in hot nitrobenzene, aniline and chlorobenzene. M. p. 365-367°C.

Derivation: 1-Amino-2-methylantraquinone is dissolved in sulfuric acid and sodium nitrite is added. The isolated and dried diazonium sulfate is stirred into acetic anhydride and copper powder added. Nitrogen is evolved and the combination takes place, forming the dianthraquinonyl derivative.

Method of purification: Crystallization from

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

solvents in which it is soluble.

Use: Intermediate for dyes.

2, 5-dimethyl-2, 5-di(tert-butylperoxy) hexane
("Lupersol 101")

Properties: Stable liquid; b. p. 50-52°C (0.1 mm Hg). Active oxygen 10.5% min.

Uses: Catalyst in polyethylene cross-linking, styrene polymerization; polyester resins.

dimethyldichlorosilane $(\text{CH}_3)_2\text{SiCl}_2$.

Properties: Colorless liquid; b. p. 70°C; m. p. -86°C; sp. gr. 1.062 (20°C); refractive index (n_D²⁵) 1.4023; flash point (Cleveland open cup) 16°F. Reacts with water to form complex mixture of dimethylsiloxanes, and liberates hydrochloric acid.

Derivation: Action of silicon on methyl chloride in presence of a copper catalyst, or by Grignard reaction from methyl chloride and silicon tetrachloride.

Grades: Technical.

Containers: Steel drums.

Use: Intermediate in production of dimethyl siloxane oils (silicone oils), silicone rubber, and silicone resins.

Shipping regulations: Flammable liquid. Red label.*

dimethyl dichlorovinyl phosphate. See DDVP.

5, 5-dimethyldihydroresorcinol dimethylcarbamate. See dimetan.

1, 1-dimethyl-3, 5-diketocyclohexane. See dimedone.

dimethyldiketone. See diacetyl.

N, N'-dimethyl-N, N'-di-(1-methylpropyl)-para-phenylene diamine. A volatile, reddish-brown liquid. Forms a continuous protective film.

Use: Antiozonant in rubber.

dimethyl dioxane

Properties: Water-white liquid. Soluble in water. Sp. gr. 0.9268; b. p. 117.5°C, flash point 75°F; vapor pressure 15.4 mm at 20°C.

Shipping regulations: Flammable liquid. Red label.*

dimethyldiphenylurea $(\text{CH}_3)_2(\text{C}_6\text{H}_5)_2\text{N}_2\text{CO}$.

Properties: White crystals. Soluble in alcohol, ether and benzene; insoluble in water. M. p. 120°C.

Derivation: By saturation of monomethylaniline with carbonyl chloride, removal of benzene by distillation, washing the residue with acid water and crystallizing from alcohol. The crystals are warmed with alcoholic ammonia, diluted with water to precipitate, washed with water, dissolved in alcohol and crystallized.

Method of purification: Recrystallization.

Grades: Technical.

Containers: Tins; glass bottles.

Use: Stabilizer for smokeless powder; explosives and nitro-compounds.

Shipping regulations: None.*

dimethylenemethane. See allene.

dimethylethanolamine. See dimethylamino-ethanol.

dimethyl ether (methyl ether; methyl oxide; wood ether) CH_3OCH_3 .

Properties: Colorless, flammable gas, or compressed liquid; soluble in water and alcohol. Sp. gr. 0.661; b. p. -24.5°C; f. p. -138°C.

Grades: Technical; 99.5%.

Containers: 25-, 50-, 100-, and 150-lb pressure cylinders.

Uses: Refrigerant; solvent; extraction agent; propellant for sprays; chemical (reaction medium); welding gas; various other uses.

Shipping regulations: Flammable gas. Red gas label.*

dimethyl ethyl carbinol. See tert-amyl alcohol.

dimethylethylene. See butene-2.

sym-dimethylethylene glycol. See 2, 3-butylene glycol.

dimethylethyl-(3-hydroxyphenyl) ammonium chloride. See edrophonium chloride.

O, O-dimethyl-S-2-(ethylsulfinyl) ethyl phosphorothioate ("Meta-Systox R") $\text{C}_6\text{H}_{15}\text{O}_4\text{PS}_2$.

Properties: Amber liquid; b. p. 106°C (0.01 mm); sp. gr. 1.28 (20/4°C), soluble in water in all proportions.

Uses: Systemic insecticide.

Caution: May be harmful if swallowed, inhaled, or absorbed through the skin. Overexposure will result in cholinesterase depression.

N, N-dimethyl formamide (DMF) $\text{HCON}(\text{CH}_3)_2$.

Properties: Water-white liquid; non-corrosive; b. p. 152.8°C; m. p. -61°C; refractive index (n_D²⁵) 1.4269; sp. gr. 0.953-0.954 (15.6/15.6°C). Flash point (Tag open cup) 153°F. Miscible with water and most organic solvents, and many inorganic liquids.

Containers: 55-gal drums; tank cars; tank trucks.

Uses: Solvent for vinyl resins and acetylene, butadiene, acid gases, inorganic salts, some petroleum components, dyestuffs, and pharmaceuticals; used in making "Orlon."

dimethyl furan $\text{OC}(\text{CH}_3)\text{CHCHC}(\text{CH}_3)$.

Properties: Colorless liquid; insoluble in water; sp. gr. 0.8900; b. p. 94°C; flash point 45°F.

Grades: Technical.

Shipping regulations: Flammable liquid. Red label.*

dimethyl glycol phthalate

Properties: Colorless liquid; sp. gr. 1.17; b. p. 230°C.

Grades: Technical.

Containers: Glass bottles; tins; drums.

Uses: Solvent mixtures for cellulose esters; plasticizing mixtures for cellulose esters.

Shipping regulations: None.*

dimethylglyoxal. See diacetyl.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

dimethylglyoxime (butane dioxime)

Properties: White crystals or powder; m. p. 240-242°C; soluble in alcohol and ether; very slightly soluble in water.

Grades: Technical; C. P..

Containers: Tins; glass bottles.

Use: Analytical chemistry, especially as a reagent for nickel.

2, 6-dimethyl-4-heptanol (diisobutylcarbinol)

Properties: Colorless liquid; refractive index 1.423 (21°C); sp. gr. 0.8121 (20°C), b. p. 178°C (750 mm); insoluble in water; soluble in alcohol and ether.

Containers: Up to tank cars.

Uses: Surface active agents, lubricant additives; rubber chemicals, flotation agents; antifoam agent in textiles.

2, 6-dimethyl-4-heptanone. See diisobutyl ketone.**2, 6-dimethyl-5-hepten-1-al.** See "Melonal."**2, 6-dimethylheptene-3**

Properties: Liquid, distillation range 128 to 129°C; sp. gr. (60/60°F) 0.722; refractive index (20/D) 1.412; flash point 70°F.

Grades: 95%.

Containers: Bottles; 5-gal drums.

Shipping regulations: Flammable liquid. Red label. *

2, 5-dimethylhexadiene-1, 5

Properties: A water-white, flammable liquid with pleasant hydrocarbon odor, sp. gr. 0.740-0.760 (25/25°C); refractive index 1.426-1.429 (25°C); ASTM distillation, 90% distills between 114-123°C; soluble in hydrocarbons; insoluble in water.

2, 5-dimethylhexadiene-2, 4

Properties: Water-white, flammable liquid with pleasant hydrocarbon odor; sp. gr. 0.760-0.763 (25/25°C), refractive index 1.473-1.478 (25°C), ASTM distillation range, 95% distills between 131-138°C, insoluble in water; soluble in hydrocarbons.

2, 5-dimethylhexane 2, 5-dihydroperoxide

Properties: Fine powder; 90% peroxide.

Use: High temperature catalyst for polyester premix compounds and silicone resins.

Shipping regulations: Oxidizing material. Yellow label. *

dimethylhexanediol (2, 5-dimethylhexane-2, 5-diol) $(\text{CH}_3)_2\text{COH}(\text{CH}_2)_2\text{COH}(\text{CH}_3)_2.$

Properties: White crystals; m. p. 88.5-89°C; b. p. 214-215°C; sp. gr. (20/20°C) 0.898. Soluble in water, acetone, and alcohol; insoluble in benzene, carbon tetrachloride, and kerosine.

Containers: Fiber drums.

Uses: Chemical intermediate.

dimethylhexynediol (2, 5-dimethyl-3-hexyne-2, 5-diol) $(\text{CH}_3)_2\text{COHC}:\text{CCOH}(\text{CH}_3)_2.$

Properties: White crystals; m. p. 94-95°C; b. p. 205-206°C; sp. gr. (20/20°C) 0.949. Soluble in water; slightly soluble in benzene, carbon tetrachloride, petroleum ether; very soluble in acetone, alcohol, and ethyl acetate.

Containers: 5-, 25-, 200-lb fiber drums.

Uses: Wire-drawing lubricant; antifoaming agent; coupling agent in resin coatings; chemical intermediate.

dimethyl hexynol $\text{HC}:\text{CCOH}(\text{CH}_3)\text{CH}_2\text{CH}(\text{CH}_3)_2$ (3, 5-dimethyl-1-hexyne-3-ol).

Properties: Colorless liquid with camphor-like odor; b. p. 150-151°C; sets to a glass below -68°C; sp. gr. (20/20°C) 0.8545. Slightly soluble in water.

Containers: Drums.

Uses: Stabilizer for chlorinated organic compounds; surface active agent; intermediate.

dimethylhydantoin (DMH) $\text{HN}(\overline{\text{CONHCOC}})(\text{CH}_3)_2.$

Properties: White, crystalline solid; m. p. 178°C; soluble in water, alcohol, and ether.

Derivation: (a) From acetone, urea, and ammonium carbonate; (b) from acetone, potassium cyanate and hydrocyanic acid.

Uses: Synthesis; preparation of water-soluble resins.

dimethylhydantoin-formaldehyde resin.

Properties: Light colored brittle resin; density 1.30 g/ml; dissolves readily in cold and hot water, methanol, ethyl acetate, methyl ethyl ketone, chloroform, methylene chloride, and hot glycerol; insoluble in benzene, xylene, petroleum ether, diethyl ether, trichloroethylene, and carbon tetrachloride.

Uses: Sizing; adhesives; blending agent.

uns-dimethylhydrazine (UDMH) $(\text{CH}_3)_2\text{NNH}_2$ 1, 1-dimethylhydrazine.

Properties: Colorless, flammable liquid with ammonia-like odor; f. p. -58°C; b. p. 63°C; sp. gr. 0.782 (25°C); soluble in hydrocarbons.

Derivation: (a) Reaction of dimethylamine and chloramine; (b) reaction of a dimethylamine salt with sodium nitrite, followed by reduction of the product; (c) catalytic oxidation of dimethylamine and ammonia.

Containers: Drums; tank cars.

Uses: Component of jet and rocket fuels; chemical synthesis; stabilizer for organic peroxide fuel additives; absorbent for acid gases; photography.

dimethyl hydroquinone. See hydroquinone dimethyl ether.**dimethylhydroxybenzene.** See xlenol.**dimethylhydroxyoctanal.** See hydroxycitronellal.**N-3, 4-dimethyl-5-isoazolyisulfanilamide.**

See sulfoxazole.

dimethyl isophthalate $\text{C}_6\text{H}_4(\text{COOCH}_3)_2.$

Properties: Solid; set point (min) 66.5°C; b. p. 200°C (50 mm); flash point 280°F; soluble in most organic solvents; insoluble in water.

Containers: Polyethylene-lined drums.

Use: Plasticizer.

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

dimethylisopropanolamine

Properties: Sp. gr. 0.8645 (25/20°C); 7.4 lbs/gal (20°C); b. p. 125.8°C (760 mm); completely soluble in water; viscosity 1.51 cps (20°C); vapor pressure 9 mm (20°C); f. p. sets to glass below -85°C; refractive index 1.4189 (n 20/D); flash point 105°F; solubility of water in compound, complete at 20°C.

Uses: In the synthesis of methadone; other chemical synthesis. Combines the properties of tertiary amine and secondary alcohol.

dimethyl itaconate

Properties: White crystals with slight odor; m. p. 36°C; b. p. 91.5°C (10 mm); sp. gr. 1.27 (24°C); refractive index (n 20/D) 1.441. Slightly soluble in water.

Grades: Technical.

Uses: Polymers and copolymers; plasticizers; intermediate.

dimethylketol. See acetylmethylcarbinol.

dimethylketone. See acetone.

dimethyl maleate $\text{CH}_3\text{OOCCH}=\text{CHCOOCH}_3$.

Properties: Sp. gr. 1.153, 9.62 lbs/gal; b. p. 200.4°C; flash point (Cleveland open cup) 235°F.

dimethylmethane. See propane.

O, O-dimethyl O-[4-(methylthio)-meta-tolyl] phosphorothioate ("Baytex") $\text{C}_{10}\text{H}_{13}\text{O}_3\text{PS}_2$.

Properties: Brown liquid; b. p. 105°C (0.01 mm); insoluble in water; soluble in most organic solvents.

Use: Insecticide.

Caution! May be harmful if swallowed, inhaled, or absorbed through the skin. Overexposure will result in cholinesterase depression.

2, 6-dimethylmorpholine

Properties: Liquid; sp. gr. 0.9346; b. p. 146.6°C; f. p. -85°C; very soluble in water; wt/gal 7.8 lbs; flash point 112°F.

Uses: Corrosion inhibitors; stabilizers for chlorinated solvents; manufacture of fast drying rubbless floor polishes, rubber accelerators, germicides, and textile finishing agents.

Shipping regulations: None.*

dimethyl-alpha-naphthylamine $\text{C}_{10}\text{H}_7\text{N}(\text{CH}_3)_2$.

Properties: Colorless liquid; soluble in alcohol and ether, insoluble in water. Sp. gr. 1.045; b. p. 275°C.

Derivation: Action of methylsulfate on alpha-naphthylamine.

Method of purification: Fractional distillation.

Grades: C. P.; analytical.

Containers: Glass bottles.

Use: Determination of nitrites.

Shipping regulations: None.*

dimethyl-beta-naphthylamine $\text{C}_{10}\text{H}_7\text{N}(\text{CH}_3)_2$.

Properties: Crystalline solid; soluble in

alcohol and ether; insoluble in water; sp. gr. 1.039 (70/70°C); m. p. 46°C; b. p. 305°C.

Derivation: By the interaction of dimethylamine and beta-naphthol.

Method of purification: Crystallization.

dimethylnitrobenzene. See nitroxylylene.

O, O-dimethyl O-para-nitrophenyl phosphorothioate. See methyl parathion.

dimethyloctadienal. See citral.

dimethyloctadienol. See geraniol.

dimethyloctanediol (3, 6-dimethyloctane-3, 6-diol) $\text{C}_2\text{H}_5(\text{CH}_2)\text{COH}(\text{CH}_2)_2\text{COH}(\text{CH}_2)\text{C}_2\text{H}_5$.

Properties: White, waxy solid; m. p. 44°C; b. p. 241-242°C; sp. gr. (20/20°C) 0.919.

Soluble in water, acetone, alcohol, benzene, carbon tetrachloride, and kerosene.

Containers: Fiber drums.

Uses: Non-foaming surface-active agent; chemical intermediate.

dimethyl octanol (3, 6-dimethyl-3-octanol)

Properties: Colorless liquid; sweet rosy odor; sp. gr. 0.8366 (20/20°C); refractive index 1.4370 (n 20/D); b. p. 202-203°C; freezing point -67.5°C.

Uses: Perfumery, particularly for floral odors.

dimethyloctynediol

(3, 6-dimethyl-4-octyne-3, 6-diol).

Properties: White crystals, m. p. 55-56°C; b. p. 222°C; sp. gr. (solid, 20°C) 0.923, (liquid, 60°C) 0.908. Moderately soluble in water; slightly soluble in kerosene; very soluble in acetone, alcohol, benzene, and carbon tetrachloride.

Containers: Fiber drums.

Uses: Surface active agent; polymerization; intermediate.

dimethylol ethylene urea

$\text{O}\overline{\text{C}}\text{N}(\text{CH}_2\text{OH})\text{CH}_2\text{CH}_2\text{N}(\text{CH}_2\text{OH}).$ A cyclic urea, used in wrinkle-resistant textile finishes.

dimethylol ethyltriazone

Used in wrinkle-resistant textile finishes.

dimethylol urea $\text{CO}(\text{NHCH}_2\text{OH})_2$.

Properties: Colorless crystals; m. p. 126°C; soluble in water and methanol; insoluble in ether; capable of polymerization to synthetic resin.

Derivation: Combination of urea and formaldehyde in the presence of salts or alkaline catalysts.

Uses: The first stage in the formation of urea-formaldehyde resins; impregnating wood to increase hardness and fire resistance and to form self-binding laminations for plywood manufacture; in textiles for wrinkle resistance.

O, O-dimethyl S-4-oxo-1, 2, 3-benzotriazin-3(4H)-ylmethyl phosphorodithioate

*See "I. C. C. Shipping Regulations," page xiii.

Reference numbers refer to name of manufacturer. See "List of Manufacturers," page v.

Properties: Brown, waxy solid; m. p. 73-74°C. Very slightly soluble in water; soluble in most organic solvents.
Uses: Fruit insecticide.
Caution! May be harmful if swallowed, inhaled, or absorbed through the skin. Overexposure will result in cholinesterase depression.

2, 2-dimethylpentane (trimethylpropylmethane) $(\text{CH}_3)_3\text{CCH}_2\text{CH}_2\text{CH}_3$.
Properties: Colorless liquid; sp. gr. 0.66956 (25°C); b. p. 79.205°C; m. p. -123.79°C; soluble in alcohol; insoluble in water.
Grades: Technical.
Use: Organic synthesis.

2, 3-dimethylpentane $(\text{CH}_3)_2\text{CHCH}(\text{CH}_3)\text{C}_2\text{H}_5$.
Properties: Liquid; b. p. 89°C; sp. gr. (60/60°F) 0.699; refractive index, (20/D) 1.392; flash point 20°F.
Grades: 95%.
Containers: Bottles.
Shipping regulations: Flammable liquid. Red label.*

2, 4-dimethylpentane (diisopropylmethane) $(\text{CH}_3)_2\text{CHCH}_2\text{CH}(\text{CH}_3)_2$.
Properties: Colorless liquid; sp. gr. 0.6684 (25°C); b. p. 80.5°C; refractive index 1.382 (n 20/D); flash point -12°C; m. p. -119°C; soluble in alcohol; insoluble in water.
Containers: Bottles and 5-gal drums.
Grades: 95%; 99%; research.
Shipping regulations: Flammable liquid. Red label.*

3, 3-dimethylpentane (diethyl dimethylmethane) $\text{CH}_3\text{CH}_2\text{C}(\text{CH}_3)_2\text{CH}_2\text{CH}_3$.
Properties: Colorless liquid; sp. gr. 0.68910 (25°C); b. p. 86.071°C; m. p. -134.46°C; soluble in alcohol; insoluble in water.

2, 4-dimethylpentanol-3. See diisopropyl carbinol.

2, 4-dimethylpentanone-3. See diisopropyl ketone.

dimethylphenol. See xyleneol.

1, 5-dimethyl-2-phenyl-4-aminopyrazolone. See 4-aminoantipyrine.

dimethyl-para-phenylenediamine. See para-aminodimethylaniline.

N, beta-dimethylphenylethylamine. See phenylpropylmethyl amine.

dimethyl phosphite $(\text{CH}_3\text{O})_2\text{P}(\text{O})\text{H}$.
Properties: Mobile, colorless liquid, mild odor; sp. gr. 1.200 (20/4°C); b. p. 72-73°C (25 mm); flash point 205°F. Soluble in water, and miscible with most common organic solvents.
Containers: 5-gal, 55-gal drums.
Uses: Lubricant additives; intermediate; adhesive.

dimethylphosphoramidocyanidic acid, ethyl ester. See tabun.

O, O-dimethyl phosphorochloridothioate $(\text{CH}_3\text{O})_2\text{P}(\text{S})\text{Cl}$.

Properties: Colorless to light amber liquid; b. p. 66-67°C (16 mm); sp. gr. 1.320 (25°C); refractive index 1.4795 (n 25/D). Soluble in alcohol, benzene, acetone, carbon tetrachloride, chloroform, ethyl acetate; slightly soluble in hexane; insoluble in water.

Stability: Very slight decomposition with storage; slowly isomerizes at 100°C.

Grades: 96-100% purity.

Caution: Exposure to vapor can cause irritation to eye and lung tissues.

Uses: Intermediates for insecticides, pesticides, fungicides; oil and gasoline additives; plasticizers; corrosion inhibitors, rubber accelerators; flame retardants; floatation agents.

dimethyl phthalate $\text{C}_6\text{H}_4(\text{COOCH}_3)_2$.

Properties: Colorless, odorless, light-fast, stable, non-toxic liquid; refractive index 1.5138 (25°C), heat of combustion 5769 cal/g; sp. gr. 1.189 (25/25°C); b. p. 282°C; flash point 300°F; wt/gal 9.93 lbs (68°F); solubility of water in dimethyl phthalate 1.8% by vol (25°C); coefficient of expansion 0.00042/°F, 0.00076/°C; dilution ratio (nitrocellulose solution method) 2.9 with toluene, not miscible with petroleum naphtha; vapor pressure <0.1 mm (20°C).

Typical specifications: Acidity not more than 0.01% (as phthalic); color not more than 10 (Pt-Co scale), odor faint-not more than slightly aromatic; sp. gr. 1.189-1.191 (25/25°C); boiling range (760 mm) below 280°C none, above 285°C none, at least 95% within 2°C; purity not less than 99%, average wt/gal 9.93 lbs (20/20°C); refractive index 1.5145-1.5165 (20°C).

Miscible with common organic solvents; very slightly soluble in water.

Derivation: By means of the standard esterifying reaction between methyl alcohol and phthalic anhydride, followed by steps of isolation and purification.

Grades: Technical.

Containers: 55-gal nonreturnable drums; tank cars; tank trucks.

Uses: Plasticizer for nitrocellulose and cellulose acetate, resins, rubber and in solid rocket propellants; lacquers; plastics; rubber; coating agents; safety glass; molding powders; insect repellent; perfumes.

Shipping regulations: None.*

2, 5-dimethylpiperazine (lupetazine) $(\text{CH}_3)_2\text{C}_4\text{H}_8\text{N}_2$.

Properties: Exists as both a cis- and a trans-isomer. The trans-isomer is a free-flowing non-hygroscopic white crystalline solid melting at 118°C. The cis-isomer is a colorless liquid freezing at 18°C; soluble in water and hydrocarbons. An available commercial mixture contains 75% of the trans- and 25% of the cis-isomer.

Uses: Pharmaceuticals; polyamide resins; fungicides; rubber accelerators; corrosion inhibitors; surface active agents; solvents.

N, N'-dimethylpiperazine (1,4-dimethylpiperazine) $(\text{CH}_3)_2\text{C}_4\text{H}_8\text{N}_2$.

Properties: Sp. gr. (20/4°C) 0.8565; b. p. 131°C.

Uses: Curing agent for polyether urethane foams; intermediate for cationic surface-active agents.

dimethylpiperazine tartrate

$(\text{CH}_3)_2\text{C}_4\text{H}_8\text{N}_2 \cdot \text{C}_4\text{H}_6\text{O}_6$.

Properties: White powder; pleasant acidulous taste; m. p. 250°C. Soluble in water.

Use: Medicine.

Shipping regulations: None.*

2,6-dimethylpiperidine (2,6-lupetidine)
